What was achieved in 1921 toward the solution of the State financial problems? First, in spite of the depression, the actual budgetary revenue was increased by some 1,950,000,000 francs. Second, the State withdrew during 1921 from its control of the wheat and coal markets, the merchant marine, and purchase of petroleum, thus practically retiring from business save in the long-established ordinary monopolies of tobacco, matches, playing cards, etc. Third, the special accounts created during the war have been practically closed, and the extraordinary budget reduced to such an extent that in 1922 it was incorporated in the general budget. The financing by the government to complete its required revenue also underwent a change. Whereas for 1920 the State had issued long-term loans, it developed during 1921 that more favorable conditions could be found by the government in short-term notes, although this policy is not generally looked upon with favor, it had in this case distinct advantages, for the capital seeking long-term investment remained available for industrial loans at a rate which would have been greatly increased had the flotation of a large issue of State bonds been attempted. In this way the amount of outstanding national defense bonds increased enormously during the year, and a new series of treasury notes at 6 per cent for two years was issued, to the total of about 5,500,000,000 francs.

Operations of the Bank of France.—The clearing up of the moratorium of 1914 has continued with rapid strides. On 24 Dec. 1921 the amount of prorogued bills held by the Bank of France was 57,826,580 francs, as compared with 409,246,440 francs on 24 Dec. 1920, or a reduction during the year of 351,419,860 francs. In all, the reduction since 1914 is 4,418,000,000 francs from a maximum of 4,476,000,000 francs, or 98.7 per cent. In keeping with the general effort to improve a grave situation and to assist commercial and industrial enterprises to regain their feet, the Bank of France discount rate on commercial paper, which had been raised to 6 per cent on 8 April 1920 was reduced to 5½ per cent on 28 July 1921, with the rate on collateral loans remaining at 6½ per cent. The wide extension of credit by the bank is shown by the great increase in the number of bills discounted, although they average smaller amounts than those discounted in 1920. During 1921, 15,343,800 bills for 30,798,829,000 francs were discounted, as against a total of 12,321,400 bills for 32,023,610,000 francs during 1920. The average of bills held by the bank during the year, exclusive of those prorogued under the moratorium of 1914 or treasury bills discounted, was 2,686,800,000 francs, with a high of 3,344,000,000 francs on 5 January, and a low of 2,216,700,000 francs of 7 December. In December 1921 there were bank notes outstanding to the amount of 36,417,373,045 francs, as compared with 37,901,958,650 francs on the corresponding date of 1920. The maximum amount outstanding during the year was 38,832,838,900 francs of 4 May, and the minimum 36,246,215,500 francs on 21 December. In reserve against

this decreasing but still great quantity of paper money the Bank of France held on 24 Dec. 1921 5,524,185,000 francs gold and 279,793,000 francs silver, or a total metallic reserve of 5,803,978,000 francs, compared with 5,766,270,000 francs (5,500,155,000 francs gold and 266,115,000 francs silver) in December 1920. Thus the gold reserves were increased during the year by 24,030,000 francs and the silver by 13,678,000 francs. Of this gold, 1,948,367,000 francs is held in the Bank of England for account of the Bank of France against war credits extended and is recoverable as the credits are liquidated. According to the *Journal Officiel*, the situation on 31 May 1922 of the French budget credits for the 1922 fiscal year was as follows:

Ordinary budget:	Francs
Total credits opened for the 1922 budget.....	25,471,884,880
Amount of warrants issued during May, 1922.....	2,539,337,016
Amounts of warrants issued during previous months.....	4,446,480,716
Total of warrants issued up to 31 May 1922.....	6,985,817,732
Special budget for expenditures recoverable from Germany:	
Total credits opened for the 1922 budget.....	10,482,539,563
Amount of warrants during May, 1922.....	1,275,449,686
Amounts of warrants issued previously.....	1,303,445,570
Total of warrants issued up to 31 May 1922.....	2,578,895,257
Special account (upkeep of armies of occupation in foreign countries):	
Total credits opened for the 1922 budget.....	512,336,700
Amount of warrants issued during May, 1922.....	30,695,767
Amount of warrants issued during previous months.....	111,467,045
Total of warrants issued up to 31 May 1922.....	142,162,812

On 24 October the French Chamber of Deputies opened the debates on the general budget for 1923. The basis for the discussion was the report of the chamber finance committee, which provided for total expenditures of 22,925,000,000 francs, divided into: Debt charges, 11,501,000,000 francs; civil expenditures, 6,612,000,000 francs; national defense, 4,812,000,000 francs. The total represented a reduction of approximately 272,000,000 francs from the original estimates proposed by the Minister of Finances. Receipts are estimated at 22,927,000,000 francs, including the foreseen deficit of 3,710,000,000 francs, which must be secured by borrowing. The chairman of the senate finance committee made public the following resume of the assets and liabilities of the French state on 14 Nov. 1922:

LIABILITIES	Francs
Public debt.....	337,000,000,000
Unpaid interest on foreign debt.....	5,000,000,000
Reparations debt.....	132,000,000,000
Special accounts.....	1,000,000,000
Total.....	475,000,000,000
ASSETS	
Claim against Germany.....	124,000,000,000
Other claims on foreign governments.....	15,000,000,000
Total.....	139,000,000,000

The foreign debt is 75,164,000,000 francs, with an annual interest charge of 4,168,100,000

francs. In 1912 (time of last estimate) the national wealth of France was placed at 304,517,000,000 francs.

Army.—The army is divided into the metropolitan and colonial divisions. The former is divided into the active army, the reserve, and the territorial army. The peace establishment of the metropolitan army is 390,000, exclusive of the 95,000 men in the armies of occupation on the Rhine. The total peace establishment of both the metropolitan and colonial armies at the beginning of 1922 was 736,000 officers and men.

Navy.—In 1922 France had seven battleships of the dreadnought class, two pre-dreadnoughts, 8 armored cruisers, 5 light cruisers, 55 despatch vessels, 71 destroyers, 58 torpedo boats, and 53 submarines. The naval reserve numbers about 115,000 men and the naval personnel about 25,000 men.

Communications.—France has in operation 26,250 miles of railways including Alsace-Lorraine. Electrification of many lines is in progress. There are 5,450 miles of navigable rivers and 3,100 miles of canals. There are 23,899 miles of national roads in addition to the neighborhood roads. There are about 16,000 post-offices, 23,000 telegraph offices and 125,000 miles of telegraphic lines. France has 12,000 urban telephone systems with 37,000 miles of lines.

Government.—The executive power in the republic is vested in the President and the Ministry. The President is elected for a term of seven years by an absolute majority of votes by the senate and chamber of deputies sitting as a national assembly. The President in 1922 was Alexandre Millerand, born 10 Feb. 1859; elected to the presidency 23 Sept. 1920. The Prime Minister from 15 Jan. 1922 was M. Raymond Poincaré. Members of the chamber of deputies are elected for a term of four years by manhood suffrage. Deputies must be over 25 years of age. There are now 610 deputies in the chamber, of whom the political complexion is as follows: 133 Republicans of the Left; 130 Progressives; 83 Socialist Radicals; 72 Liberal Actionists; 68 Unified Socialists; 60 Radicals; 31 Conservatives; 27 Republican Socialists; and 6 Dissident Socialists.

The senate has 314 members, elected for terms of nine years by indirect vote of electors composed of delegates chosen by the communal councils, or of the deputies and district councillors of the departments. The senate has at present 120 Radicals, 58 Republicans of the Left, 23 Progressives, 20 Conservatives, 14 Liberal Republicans, 2 Socialist Republicans and 2 Unified Socialists. Both senators and deputies receive 27,000 francs yearly. Local government is carried on through the departmental and communal councils. The ministries of the central government have each their representatives in the departments. At the head of each department is a prefect who is the appointee of the central government. He supervises the execution of the laws, issues police regulations and nominates subordinate officials. There are in France 37,963 communes.

History.—On 12 January the Briand ministry was overthrown and on the following day Raymond Poincaré, the former president, formed a new cabinet. Briand's fall was due to his

having made certain concessions on reparations from Germany in return for a treaty with Great Britain guaranteeing protection to France against any sudden attack by Germany. The new cabinet was strongly Nationalist in character and took a firm stand in the matter of reparations. A cleavage was narrowly averted with Great Britain over the preliminaries of the Genoa Conference in respect to the guarantees demanded by France before entering that conference. Finally, the French and British premiers met at Boulogne on 25 February. The meeting resulted in a compromise that re-established cordial relations and effected a working program. France received guarantees that at the forthcoming Genoa Conference Britain would permit no limitation of the prerogatives of the League of Nations, no challenge to the treaties made by France since the Treaty of Versailles and no question of the rights of France and her Allies to their dues in the matter of reparations and full compliance of Germany and Russia with the foregoing before these nations be admitted to the conference. On 23 February the budget expenses of 13,500,000,000 francs chargeable to Germany were adopted by the chamber of deputies. The default of Germany in the payment of reparations necessitated the raising of a loan for 8,000,000,000 francs by France and the issue of new treasury bonds. France continued to insist that the government of Germany stop the issue of paper marks. The latter contended that the heavy issues of marks were necessary to meet the reparation claims. The reparations committee met in Paris on 21 March and upheld the decision of the Cannes parley that Germany in 1922 should pay 720,000,000 gold marks in cash and 1,450,000,000 marks gold value in materials. It also decided that the German Reichsbank be made autonomous and that the German budget be balanced by an internal loan of 1,000,000,000 marks gold. The French Finance Minister threatened tax delinquents with garnishee proceedings. It was found that 200,000 persons had failed to make proper returns. President Millerand made a tour of the French African colonies in April and was everywhere received with great demonstrations of welcome. The French colonial policy has come to regard the natives of its African possessions more in the light of citizens of France than mere colonials to be exploited by the mother country.

The signing of the Franco-Turkish Treaty of Angora created a profound reaction in favor of France among her Moslem subjects. On 16 April a colonial exhibition was opened at Marseilles. On the last day of the same month the Premier unveiled at the Pantheon a tablet to the memory of the famous airman, Georges Guynemer. Ex-President Paul Deschanel died on 28 April of pneumonia. He had been forced to resign the presidency the previous September and subsequently became a member of the senate. A French financial commission, headed by Jean V. Parmentier, came to the United States in July to confer with the American War Debt Commission and to present detailed information in regard to the financial resources of France and to show that France was quite unable to meet her obligations for some time to come unless Germany paid her. The mission

was sent to America in response to a measure passed by the congress in February, inviting America's war debtors to repay capital and interest at 4½ per cent and within 25 years. At the time of departure of the mission several French experts declared that even if Germany were to pay 800,000,000 gold marks yearly, it would not cover France's annual indebtedness in interest to the United States and Great Britain on the basis proposed by the Congress of the United States. The debt of France to the United States amounts to \$3,340,857,593. In this connection it was stated that France is paying 50,000,000,000 francs to the devastated regions and the nation's resources taken all together were insufficient to meet war debt interest and amortization in 1922. The Premier was attacked in the chamber on 5 and 6 July on the ground of his alleged responsibility for the war. He was ably defended by a former Premier, M. Viviani, and received a vote of confidence from the chamber. The Washington treaties failed of ratification before the summer recess of the chamber on 8 July. In July it became known that the French Premier had drawn up and intended to present to the Allied Ministers at London a new plan for reparation based on Allied debt cancellation. This plan collapsed when a stern note was received from Great Britain on 1 August declaring that France would be held to payment of her debt to Great Britain at least to the degree that Britain would be held to payment of her debt to the United States. In her reply on 1 September France stated her inability to repay her war debts to her Allies until she had been paid the huge cost of reconstruction of her ruined northern departments. At the same time she favored the plan of a general cancellation of all war debts and to this end proposed a conference of all interested nations. The Premier was deeply chagrined at the failure of the mission to the United States and at a public meeting at Bar-le-Duc on 20 August he reiterated his demand that Germany should be made to pay in full for the damage she had wrought in France; that no moratorium would be granted with the consent of France without full German guarantees and France would exact these even if she had to act alone. On 10 September France reported to the League of Nations that her army strength on that date amounted to 690,000 men and that this force was necessary to her national security because of the spirit of revenge which was being fostered in Germany. On 26 August the battleship *France* was wrecked off Quiberon Bay and was a serious loss to the French navy. In the autumn the financial situation in France was impaired by the heavy cost of reconstruction, which was charged against Germany but which the French were unable to collect. The Finance Minister stated publicly that the 4,000,000,000 franc deficit represented interest on money borrowed to carry on reconstruction for which Germany was supposed to pay. Decreasing confidence in foreign countries that Germany would ever pay France's reparations was a contributing cause of the decline of the franc. On 8 November the quotation for the dollar was 16 francs, 6 centimes. Reconstruction in the devastated regions proceeded during the year; roads, railways and

canals have all been practically restored and factory and industrial plants are very near to complete restoration. Obstacles, shells, etc. have been cleared from the soil but there remain many houses to be rebuilt or definitely repaired. Last reports showed that out of 564,000 houses wholly or partly destroyed by the German invasion, 3,348 had been completely rebuilt; 180,417 had been provisionally repaired and 214,422 definitely repaired. The Turkish victories in the Near East again brought up for solution this age-old problem and the Lausanne Conference was arranged in an attempt to bring peace in that quarter. Meanwhile, an important international gathering was taking place in London in the hope of agreeing on German reparations payments. British and French views were at such complete divergence that the conference failed to reach a solution and to save the Entente an adjournment was taken to 2 Jan. 1923. This London conference opened on 9 December and was attended by the Premiers of Great Britain, France, Belgium and Italy. On behalf of France M. Poincaré offered acceptance of a two-year moratorium for Germany on condition that satisfactory guarantees were provided, including measures for the economic control of the Rhine provinces and occupation of the Ruhr district. The new British Premier, Bonar Law, agreed to consider the matter of the cancellation of debts and stated that he desired a settlement based on a moratorium sufficient for Germany to re-establish her finances and credit and to stabilize the mark, a reduction of the indemnity to between 30,000,000,000 and 40,000,000,000 gold marks and the abandonment by France of all proposals to take military action. The German proposal, prepared by Chancellor Cuno, was presented to Bonar Law on 9 December by Dr. Carl Bergmann. It was rejected as unsatisfactory the day following and its terms were not made public until April 1923. Premier Mussolini of Italy stated that he believed Germany stood in need of a further moratorium and an international loan and that the reparations question should be dealt with in connection with the interallied debts and in relation to the entire financial situation of Europe. The Italian Premier did not think that Europe's debt to the United States should be considered at the same time as it was entirely beside the question. Pressed as to the guarantees provided the Italian Premier replied that his proposals were purely economic and not military. The reduction of reparations as provided in the Italian plan was acceptable to the conference insofar as reparations were to be reduced in proportion to the writing off of the interallied debts. On 10 December Premier Poincaré stated that France was insistent on the occupation of the Ruhr as a guarantee for any moratorium and Bonar Law replied to the effect that Great Britain would not consent to the occupation of the Ruhr and the exploitation of the Rhineland, since she considered such measures as penalties and not economic guarantees. These divergent views could not be reconciled and the conference adjourned to 2 January. The policy of France in the Near East is dealt with elsewhere in this volume. (See NEAR EAST.) This policy as outlined in the chamber by the Premier

appeared to meet with little favor and it was evident that his hold on the country was weakening. The financial administration was attacked in the chamber on 15 November and a cabinet crisis seemed imminent. The Premier, however, rallied to his support majorities in both chamber and senate largely on his assurance of continuing his policy of holding Germany to a strict fulfillment of the terms of the Treaty of Versailles. On 4 December an effort was made to ratify the Washington Treaty for Naval Disarmament. However, considerable opposition developed though it was stated that France was in an economic position to construct capital ships before the time limit imposed by the treaty had expired anyway. On 21 November the senate rejected the women's suffrage bill by a vote of 156 to 134. On 12 November Georges Clemenceau, former Premier, sailed for the United States on what was alleged to be a self-appointed mission to appeal for American co-operation in Europe and to interpret the French point of view to America generally. He was well received in the chief cities of the United States and made several noteworthy addresses appealing for the active participation of America in the efforts to settle the international problems confronting most of the European countries. He returned to France just before Christmas. On 21 December, after Clemenceau had arrived home it was announced that his American visit had added \$20,000 to the American Field Service Fund Fellowships. It was explained that the former Premier was unwilling to accept financial assistance for his mission and his own means were inadequate so he accepted lecture and writing contracts to pay his way. He expressed the desire that any surplus be devoted to the Fellowships, which are intended, among other things, to stimulate friendship between France and America through the education in each country of young men from the other.

FRANKLIN AND MARSHALL COLLEGE, an educational institution for men of the Reformed Church in the United States, founded in 1787 and located at Lancaster, Pa. In 1922-23 it had a faculty of 24 members, 470 students, property valued at \$1,200,000, including an endowment of \$600,000, and an income of \$90,000. Henry Harbrough Apple, LL.D., is president.

FRANKLIN COLLEGE OF INDIANA, a co-educational institution, non-sectarian but affiliated with the Baptist Church. It was founded in 1834 and located at Franklin, Ind. In 1922-23 it had a faculty of 24 members, 423 students, property valued at \$395,000 and an income of \$105,000. Charles Elmer Goodell, A.M., LL.D., is president.

FREAR, William, American chemist and agriculturist: b. Reading, Pa., 24 May 1860; d. State College, Pa., 7 Jan. 1922. He was graduated from the University of Lewisburg (now Bucknell University) in 1881 and in 1883 received the degree of Ph.D. at Wesleyan University. In 1881-83, he was assistant in sciences at Bucknell University and in 1883 became chemist in the United States Department of Agriculture, Washington, D. C. He was professor of agricultural chemistry from 1885-1907 in Penn-

sylvania State College, and after 1907 was professor of experimental agricultural chemistry in the same institution. He was vice-director and chemist, Pennsylvania Agricultural Exposition after 1887; he was chemist to the Pennsylvania State Board of Agriculture from 1888 to 1919; chemist, Pennsylvania Department of Agriculture from 1895 to 1916; and after 1900, special agent of the United States Department of Agriculture. He was also chief chemist, Pennsylvania Bureau of Foods. Doctor Frear was a member of many chemical and agricultural societies; served as chairman of the executive committee of the National Pure Food and Drug Congress; was chairman, National Food Standards Commission, 1902-07, and a member of the Joint Committee on Food Definitions and Standards after 1914. He was editor and proprietor of *Agricultural Science* (1892-94). His writings consist exclusively of contributions to scientific periodicals and experiment station and State reports.

FREER GALLERY OF ART. See SMITHSONIAN INSTITUTION.

FRENCH-AMERICAN CHAMBER OF COMMERCE, Incorporated. This organization was formed to work as an international chamber of commerce for the benefit of manufacturers, merchants, importers and exporters, wholesale and retail, to and from France and her colonies, bankers and others interested in international relations. It has a large membership in both France and the United States and is affiliated with the French Institute in the United States (q.v.), having its headquarters in the same building, 599 Fifth Avenue, New York City. It, of course, will move with the institute to the latter's new building at 20-22 East 60th Street, New York, when that structure is completed. The Chamber follows the practice of active economic associations in the United States in the diffusion of information relative to commercial and industrial matters. Its officers for 1923 are John Aspegren, president; J. J. Larkin, vice-president; McDougall Hawkes, chairman of the board; Samuel W. Fairchild and John A. Penton, vice-chairmen of the board; Emile C. Juen, secretary and treasurer.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA, or FRENCH CONGO, a French colony on the west coast of Africa extending along the Atlantic coast between Cameroon and the Belgian Congo. Its hinterland boundaries are the Congo and Ubanghi rivers. The term as now employed includes Gabon, the Middle Congo, the Ubanghi-Shari, the Chad colonies and the Cameroon territories. The area is about 982,049 square miles with a population estimated at nine millions of negro and other races. Each division is under a Lieutenant-Governor, has separate financial and administrative autonomy and an administrative council. The governors are under the Governor-General of French Equatorial Africa. There is a general budget and also a separate budget for each colony. In 1921 the general budget was for 8,845,402 francs; the Gabon budget was 4,149,500 francs; Middle Congo, 4,325,000 francs; Ubanghi-Shari, 3,514,000 francs; Chad Colony, 3,850,-

000 francs. There are 45 mission schools in the colony with 3,000 boy pupils and 10 mission schools with 750 girl pupils; 95 public schools with 4,000 pupils. There are in the colony extensive forests with many species of commercial value. The resources of the region are undeveloped. Rubber, palm oil and coffee are the chief products. Stock-raising is suited to the Chad region, and development has begun there but facilities for export are lacking. Copper, zinc and lead are found. Total exports in 1920 amounted in value to 31,246,248 francs and imports to 18,370,512 francs. The chief ports of the region are Libreville and Port Gentil and Loango. Railway construction is under way to connect Brazzaville with the coast. There are about 2,500 miles of telegraph line in the colony. The Governor-General of Equatorial Africa in 1922 was M. Alfassa, who received his present appointment in 1921.

FRENCH GUIANA, a French colony and penal settlement on the continent of South America. The area is 32,000 square miles and the population 49,000. Cayenne, the capital and only seaport, has a population of 13,527. The annual budget of the colony amounts to 3,500,000 francs yearly. There are immense timber forests rich in woods of the commercial kind. The chief crops are rice, Indian corn, manioc, cocoa, coffee, sugar, tobacco, gutta percha and indigo. Gold mining is the most important industry. Silver, iron and phosphates are also found. Exports of the colony in 1920 were valued at 42,674,734 francs and the imports at 40,405,823 francs. The penal population in 1920 numbered 3,633. The colony is administered by a Governor assisted by a Privy Council of five members. There is also a Council-General of 16 members elected by the French citizens residing in the colony. The colony sends one deputy to the French Chamber at Paris.

FRENCH GUINEA. See FRENCH WEST AFRICA.

FRENCH INDIA, the French possessions or five separate dependencies with an aggregate area of 196 square miles. The population in 1921 was as follows: Pondichery, 170,846; Karikal, 53,027; Chandernaga, 25,423; Mahe, 11,199, and Yanam, 4,705; total, 265,200. The Indian colony is represented at Paris by one senator and one deputy. A Governor resides at Pondichery. He is assisted by a general council. There are about 10,000 school pupils in the colony. The chief crops are rice, cotton, sugar, manioc, cacao, coffee and nuts. There are cotton mills and oil factories at Pondichery. There is a large import and export trade. There are 43 miles of railways open in the colony.

FRENCH INDO-CHINA, a portion of southeastern Asia now under France. It has an area of 310,344 square miles and a population of 16,990,229. It consists of the five states of Cochin-China, the protectorates of Annam, Cambodia, Tonking and Laos and Kwang-Chau-Wan leased from China. The whole territory is under a Governor-General and each state has a resident-superior, except Cochin-China which is a direct French colony. There are 23,700 Europeans in the region, all of whom are subject to French law. There is a federal budget for the

five states and a separate one for each. The debt of the region in 1922 was 403,000,000 francs. There is a military force of about 25,000 men. Rice, fish, hides, coal, cotton, rubber and sugar are the chief articles of export and are valued at \$100,000,000 yearly. Textiles and tin are the chief imports. There are 1,265 miles of railways and 350 postoffices. See separate articles on the states and protectorates.

FRENCH INSTITUTE IN THE UNITED STATES. This organization was chartered by the Regents of the University of the State of New York in December 1911. The movement which resulted in its being founded was started in Paris, France, in the spring of that year. The promoters were French and American citizens of distinction in all callings of life, who believed that the interests of both countries would be advanced by the creation of an organization which would address itself in particular to citizens of the United States rather than to persons born in Europe and coming to the United States. The institute is non-political; it having been founded for educational purposes only. It is supported by residents of America who are interested in foreign relations and its endowment fund and its lecture and publication foundations are the gifts of Americans. All of its trustees are citizens of the United States. It is said to be the most influential French-American society in the United States and its ramifications extend throughout the country. It consists of three sections: 1. Arts—the "Museum of French Art," formed for the purpose of diffusing among the citizens of the United States a knowledge of the arts of France in their various manifestations, and of French literature and the French language, to permit understanding these manifestations. 2. Belles-Lettres—the "French Union,"—literature, history and philosophy association, chartered by the State Regents of New York in 1918, to diffuse a knowledge of French in the public and private schools and universities throughout the United States. It awards medals and prizes to students for proficiency in French. 3. Economics and Science—"Entente France-America,"—commerce, industry and science society, incorporated, with which is affiliated the French-American Chamber of Commerce, Incorporated (q.v.). This section deals with economic relations between the United States and France. The institute has approximately 1,000 annual members in New York City and 500 life members, perpetual fellows and patrons scattered throughout the United States. The administrative office, on 1 Jan. was located at 599 Fifth Avenue, New York City, but during the fall of 1922 the institute purchased lots Nos. 20-22 East 60th Street, New York, upon which it will erect a building 90 feet high, into which it expects to move before the close of 1923. This new building will be the centre of all French-American activities in America. The museum will occupy certain rooms in which will be housed the extensive collections of the institute and its large library of information relative to France. The officers of the institute for the year 1923 are McDougall Hawkes, president; Henry Alfred Todd, Samuel W. Fairchild, William A. Clark and John Aspegren, vice-presidents; Thomas Hastings, general secretary.

FRENCH IVORY COAST. See FRENCH WEST AFRICA.

FRENCH LANGUAGE AND LITERATURE. See LITERATURE; PHILOLOGY, MODERN.

FRENCH SOMALILAND, a colony of France in northeast Africa between the Italian colony of Eritrea and British Somaliland. It reaches inland to a distance of 56 miles from the coast, has an area of 5,790 square miles and a population of 65,000. It is ruled by a Governor and an administrative council. The capital of the colony is Djibouti, which has a population of 8,366, including 354 Europeans. The budget for 1921 called for 5,255,000 francs. There is a railway from the capital inland to Addis Abeba in Abyssinia, 485 miles. Salt mining and coast fishing are the chief industries. There is a large inland trade and much of the foreign trade of Abyssinia passes through the colony. Coffee, ivory, hides and skins are exported and cotton goods, coal, butter and sugar are the chief imports. The total imports in 1919 amounted to 106,301,216 francs and the exports to 66,816,294 francs. There is regular steamer communication between the capital and the British colony of Aden.

FRENCH SUDAN. See FRENCH WEST AFRICA.

FRENCH WEST AFRICA. The French possessions in this region include: Senegal, French Guinea, the Ivory Coast, Dahomey, Upper Senegal-Niger, also called French Sudan, Upper Volta, Mauritania and the Territory of the Niger. The approximate area and population of these possessions according to the census of 1921 are as follows:

COLONY	Area, square miles	Population
Senegal.....	74,112	1,225,523
Guinea.....	95,218	1,875,996
Ivory Coast.....	121,976	1,545,680
Dahomey.....	42,460	842,243
French Sudan.....	617,600	2,474,589
Upper Volta.....	154,400	2,974,142
Mauritania.....	347,400	261,746
Niger Territory.....	347,000	1,084,043
Total.....	1,800,565	12,283,962

There is a Governor-General over the whole of French West Africa, who maintains his seat at Dakar. Each colony has a Lieutenant-Governor at the head of its immediate administration. There is a general budget for the common interests of all the colonies. This budget in 1921 amounted to 64,604,240 francs. There is a military force of 18,000 men and a police force of 5,000 men.

Schools are relatively numerous; there being over 23,000 children who are receiving elementary instruction, of whom 3,000 are girls. The exports from these colonies are chiefly fruits, cotton, rubber, timber, cacao, oils and oil seeds. The chief imports are beverages, foodstuffs, implements, etc. Exports in 1920 were valued at 589,051,244 francs and the imports at 654,638,301 francs. The colonies have an aggregate railway

mileage of 1,658 and 12,000 miles of telegraph lines. There are 250 post offices. In the years immediately after the great war and in 1922 the French government made a great effort to increase the acreage of cotton in these colonies and as irrigation works are established success along this line is being achieved.

FREY, Emil, Swiss statesman: b. Arlesheim, Switzerland, 1838; d. there, 25 Dec. 1922. He represented Switzerland in Washington from 1882 to 1888, and was elected president of Switzerland in 1893. His mission to Washington was not his first visit to the United States, as he took an active part in the Civil War. While a captain in the 82d Illinois infantry, he was captured at Gettysburg, and sent to Libby prison where he was kept for six months. He was held as a hostage until President Lincoln consented to the exchange of a Captain Gordon, who had previously been sentenced to death. He had intended to spend the rest of his life in the United States in a business career, but his health had been so wrecked by the war that he returned to his home in Switzerland for a brief rest. Upon his departure from the United States he was breveted a major for bravery by President Johnson. He arrived in Basle during the election of officers of the canton. There was a dead-lock in the contest for secretary, and the mention of his name as a hero of the American war led to his immediate unanimous election to the office. As a result he never became an American business man. He served for 24 years as director of the International Cable and Telegraph Union and was one of the technical experts attached to the Swiss delegation at the Genoa Conference.

FRIENDS. See CHURCHES IN THE UNITED STATES, STATISTICS OF THE.

FRIENDS UNIVERSITY, a Friends co-educational institution, founded in 1898 and located at Wichita, Kan. In 1922-23 it has a faculty of 18 members, 295 students, property valued at \$825,000 including endowment and new pledges. The income is estimated at \$50,000. W. O. Mendenhall, Ph.D., is president.

FRUIT. See AGRICULTURE IN THE UNITED STATES; HORTICULTURE.

FUMASONI-BIONDI, Archbishop **Pietro**: Roman Catholic apostolic delegate to the United States: b. Rome, Italy, 4 Sept. 1872. He received his early education, as well as his theological education, in Rome. For several years after his ordination to the priesthood he was assigned to the Congregation of the Propaganda in a clerical capacity and also acted as private secretary to His Eminence Sebastian Cardinal Martinelli, who was apostolic delegate to the United States from 1896 to 1902. On 4 Nov. 1906 he was made titular archbishop of Dioclea and in 1916 was appointed apostolic delegate to India. In 1919 he was appointed apostolic delegate to Japan and here made a great reputation as an administrator and a diplomat in improving the relations between the Vatican and the Mikado. When Cardinal Laurenti was elected to the Sacred College, Archbishop Fumasoni was chosen to be his successor as secretary of the Sacred Congregation for the Propagation of the Faith in 1921. His duties included the post of consulor of the Sacred Congregation of Extraordinary

Ecclesiastical Affairs and of the Congregation for the Oriental Church. In November 1922 he was appointed apostolic delegate to the United States to succeed the former delegate Archbishop Bonzano, made cardinal.

FUR FARMS. About 500 fur farms, mainly for raising silver foxes, are established in the United States. See BIOLOGICAL SURVEY, UNITED STATES BUREAU OF; ENTOMOLOGY, UNITED STATES BUREAU OF.

Canadian Fur Farms.—While mink, raccoon, marten, skunk, beaver, muskrat, and karakul sheep are raised in small numbers, the principal animal raised on Canadian farms is the fox, which has been found more adaptable to domestication than any other wild animal and is also popular because of the high value of fox furs. In 1921 Canadian fur farmers realized \$1,270,000 on silver foxes alone. Contrary to the popular idea that fox furs come from the wilds of Canada, by far the greater number come from these fox farms. The entire number of fur farms in operation in Canada at the close of 1921 was 812, of which 775 were fox farms. Fifteen thousand animals were born on these farms in 1921, and 7,761 were killed for their pelts. The total amount received by the farmers for live animals and furs was \$1,498,105 in 1921 as compared with \$1,151,556 in 1920. Silver foxes sold numbered 2,920 and brought an average of \$289 each, the highest price registered being \$1,250 and the lowest \$75. Silver fox pelts sold at an average price of \$152 each. The value of animals remaining on the farms at the end of 1921 was placed at \$5,977,545, of which \$5,789,465 was in silver foxes.

FURMAN UNIVERSITY, a Baptist educational institution for men, founded in 1826 and located at Greenville, S. C. In 1922-23 it had a faculty of 21 members, 418 students, property valued at \$1,000,000 and an income of \$63,500. William Joseph McGlothlin, D.D., is president.

FURNACES, Electric. See METALLURGY.

FURNITURE INDUSTRY OF THE UNITED STATES. This industry, while not the largest manufacturing industry of the country is one of the most important, as it is a very important factor in the pleasure and happiness of the home. It has had a wonderful growth in the last 30 years from a total production in 1880 of \$75,000,000 to a production of \$575,000,000 in 1920. Until after the close of the Civil War the furniture factory, as we know of it to-day, was not to be found. Practically all the furniture produced in America previous to that time was made in small cabinet shops employing from one to six men and the most of the work was of necessity, hand work. The wood used at that time was very largely walnut and mahogany, of which we speak to-day as the most expensive woods we are able to obtain. As our population increased, the demand for furniture increased. To meet this demand and also to enable the manufacturers to reduce prices so as to satisfy the wants of all classes of people, modern machinery had to be obtained and cheaper woods had to be used. The laboring people of America used considerably more furniture than the laboring class of any other country. In most foreign countries the plebeian class use but very little furniture, while in

America, regardless of the home, furniture is in universal use. In a number of foreign countries the same small cabinet shop which was formerly so popular in this country may still be seen. For instance, all the furniture manufactured in Cuba is made in small cabinet shops. In Mexico there is not a modern furniture factory. There is, however, in that country one chair factory, which 20 years ago was a modern plant, and several small factories using a limited line of machinery and making rather a poor grade of furniture.

The designs used by the early cabinet makers in America were copied after the designs used in foreign countries and this copying of designs has been kept up until the present time. The colonial is the only design of furniture which may be spoken of as strictly American and there is but very little furniture of this design being produced to-day. The most popular design of furniture manufactured to-day is the Queen Anne and this design dates back to the reign of William and Mary. The Chippendale, the Italian Renaissance, the Sheraton, the Louis XV, the Louis XVI, the Empire, the Hipplewhite, and, in fact, every design being made to-day in the better classes of furniture is a modernized copy of the furniture made in the period, as indicated by the name, of the old designers. It is rather a reflection upon the furniture industry of our country that we have not developed designs which are strictly American, which would go down in history indicating the periods in which the designs came into prominence or the persons who brought the designs into prominence. There is, of course, a considerable amount of furniture produced that cannot be classed under any special design. Each factory producing this class of furniture usually produces it according to its own taste and in accordance with its own opinion as to what can be produced at the least cost to meet the demand for low-priced furniture.

While American manufacturers have always been copyists in designs, they have always produced, in the higher grades, as good furniture as is produced in the world. The construction of American furniture is better than that of any other country. The equipment to-day of the furniture factories of our country is better than that to be found in any other country and there is a constant effort being put forth by the American factory to utilize the advantages of its modern machinery for the betterment of the goods which it manufactures. A few articles of furniture are strictly American, such as the bureau, rocking chair, folding bed, chifforier, etc. Necessity has forced the American manufacturer to place these on the market to take care of the special needs of the American people.

The varieties of wood used in the manufacture of furniture have varied greatly. Early in the century walnut and mahogany were used very extensively; then maple, cherry and ash came into general use. About 1875 poplar began to be used for the cheaper grades of furniture. Oak came into general use about 1880 and it is in general use to-day, though for the past five years it has been losing its popularity. However, with our increasing population, the demand for furniture is becoming so great as to necessitate the use by factories of

lumber which can be obtained in large quantities. Hence, oak, having a wider range of growth than any other timber, the probabilities are that it will continue to be used in the manufacture of furniture for many years to come. Gum, the next most extensively grown timber, began to be used by the furniture manufacturers about 1910 and to-day nearly 60 per cent of the medium grade furniture is made of that wood, finished imitation walnut, the manufacturers having devised methods of curing and handling it which overcome the objectionable features that formerly made it unpopular. Gum, like oak, probably will be used for a great many years in the manufacture of furniture of the cheaper grades, for it and oak are the only suitable furniture woods growing in sufficient quantities to meet the increasing demand for furniture. Various finishes will be applied to these woods and the designs will change, but at the present time there does not seem to be any probability that either will be dispensed with for many years. Enameled furniture is coming into use each year and the demand is steadily increasing. The better class of furniture, which is veneered, is made and will continue to be made, as indicated above, of various kinds of wood, both domestic and imported. The finish applied to it, of course, is governed and will be governed by the demand. Outdoor furniture is being used more and more each year; maple and oak being the timber from which it is made. Rustic furniture, made from hickory, sassafras, willow, etc., is growing in popularity. Reed, rattan, and fibre furniture is now being used largely for porches, sun parlors and living rooms, fibre furniture being by far the most generally used. The breakfast room suite came into prominence about 1919 and to-day is being used extensively, not only in breakfast rooms, but in cottages, bungalows and apartments. Such furniture usually is finished in bright enamels with one or more colors and decorations.

In 1920 a concerted action was put forth by the furniture manufacturers and retail dealers of the country to create an increased demand for furniture and to educate the American people to the desirability of making the home more attractive. This movement has met with great success and with great favor in every section of the United States. "Better Homes Week" is being advocated by the larger newspapers and by the larger cities of our country. Advertising matter is furnished by the Better Homes Bureau, the expense being borne by the furniture dealers of the cities in which such advertising campaigns are put on. The principal object of the bureau is to educate the people to make their homes more attractive and to create a love for the home.

The largest producing centers of metal and upholstered furniture are the largest cities of the country. In the order of their importance from this standpoint they are: Chicago, New York, Philadelphia, Saint Louis and Cincinnati. The largest producing centers of furniture made from wood are, in the order of their importance: Grand Rapids, Mich.; High Point, N. C.; Jamestown, N. Y.; Rockford, Ill.; Evansville, Ind., and Gardner, Mass. For a number of

years, Grand Rapids has stood out very prominently as the furniture center of the United States, especially the center for fine furniture while High Point, N. C., for the last 15 years, has stood out very prominently as the center for cheap and medium grade furniture. For the last 15 years dealers have been insisting upon seeing and examining furniture before buying it because in no other way can they determine its real quality. So insistent has become this demand for a prepurchase examination that five distinct markets have been established, at each of which large buildings have been erected for the display of furniture. These centers are as follows: Grand Rapids, Mich.; Chicago, Ill.; New York City; Jamestown, N. Y.; High Point, N. C.

The exporting and importing of furniture from and to the United States is very limited. A small amount is exported to Cuba, Porto Rico, Mexico, South America and Canada but very little is being exported beyond the countries and islands adjoining the United States. The principal furniture imported is the bentwood chair from Austria and the number of these now being imported is very small. The most rapid strides in the furniture industry in the United States have been made in the last eight years. In 1914 there were 3,192 furniture establishments in the country with a production of \$265,705,763. In 1919, while the number of establishments had decreased to 3,154, the product was valued at \$571,356,333. It is safe to say that the year 1922 will show an increase in production over 1919 of about 18 per cent. Up to the present time it has been felt that the end to be attained did not warrant

STATE	Number of establishments	Capital invested	Value of products

the expenditure of time and money necessary to obtain the exact information relative to the production of furniture in the United States but the figures given above are as accurate as can be given under the circumstances. The States producing furniture are given in the order of their importance in the above table.

The figures given above include house furnishing goods such as comforts, piano covers, carpet-linings, mosquito canopies, portieres, draperies, furniture covers, serving trays, hassocks, pillows, carpet sweepers, quilts, etc., the value of which is about \$60,000,000. There is also a limited amount of furniture made in the smaller towns of the country and shipped to the larger cities in the white "knock-down" and this is listed as manufactured by the larger cities when it is only partially manufactured or rather assembled in them. It is impossible to obtain figures giving the exact amount of such furniture thus manufactured and shipped but the total would decrease the amounts by States as shown by but a very small amount. The next five years will see a greater tendency toward the buying of good furniture than in any period of the past. A desire has been created in the minds and hearts of the American people for better homes and this desire must be met by well-designed, well-manufactured, well-finished, honest furniture.

S. L. DAVIS,

Secretary, Treasurer and Manager, Southern Chair Company.

FURS. The centre of the world's fur trade is no longer London, having shifted across the Atlantic during the World War. Neither is it Saint Louis, which has been a gathering centre for furs and skins on the American continent for many years. It has moved to New York City, and seems likely to stay there, this being the market of the largest number of people who have the money to buy, and have also perhaps the greatest regard for fashions in furs. It is true that London still holds fur auctions, but the volume of trade is away below old-time figures, and the people who attend will not pay the prices that are easily had in New York. Saint Louis also has fur auctions, but they have dwindled so that the January, 1923, or "winter auction," was omitted, and Western buyers came to New York. Paris still holds place as a centre of design in garments, including fur garments and trimmings, but New York designers are equally successful, and make the styles in America quite as much as they are made in Paris. The total fur trade of the United States has to be partially estimated for 1922, but is close to \$75,000,000. As a whole the trade experienced marked prosperity. The official importations of furs and skins for the first nine months of the year were valued at \$46,430,357, as against \$28,675,884, during the same period of 1921. The other three months' importation is estimated at \$12,000,000, and the home production at \$16,500,000. It is believed that \$4,000,000 represents the increase in the value of dyed furs during the year, very many kinds of fur being dyed to imitate furs of higher

value. The caracal or Persian lynx was especially popular this last year, and over a 1,000,000 skins were sold in the American market against a bare 100,000 the year before. Muskrat furs sold to an even larger total, and marmot skins about half a million.

The fur-bearing animals of the United States have increased during recent years, owing to the wise policy of most of the States in passing closed-season laws, and development of fur farms as an industry. Still, the most of the furs in this market comes from abroad, in the raw state as skins. Canada sends us the most, some \$14,000,000 worth in 1922, followed by China, United Kingdom, Germany, Australia, France, Japan, Belgium, and the Argentine Republic. Dressed furs were brought in to the total of \$5,000,000 this last year, a gain of 28 per cent over 1921. The exports of furs from the United States totaled about \$25,000,000 in 1922, over 40 per cent going to the United Kingdom, 18 per cent to Canada, 13 per cent to Germany and 8 per cent to France.

The proportions in which the various raw furs come into the American market may be gathered from the following figures, taken from the announcement of the New York Auction Company's offerings in January, 1923: Number of skins — Muskrat, 270,400; Southern muskrat, 210,000; opossum, 175,400; Australian rabbit, 162,000 (lbs.); skunk, 143,700; mole, 143,000; squirrel, 109,000; fox, 80,000; raccoon, 63,000; marmot, 56,500; mink, 43,000; kid, 40,000, and so on in smaller quantities, the fewest being two mountain lion skins. It is very difficult to give an adequate idea of the prices of furs in the raw, variations being so great according to size and quality. January, 1923, prices, quoted in New York were: Skunk, 10c to \$1.45; mink, 10c to \$4.50; opossum, 3c to 65c; raccoon, 10c to \$1.65; black raccoon, \$3 to \$3.50; otter, \$6 to \$15; marten, \$2 to \$12; lynx, \$5 to \$10; wildcat, 8c to 80c; badger, 20c to \$1.50; wolverine, 25c to \$7; wolf, 50c to \$3.75; bear, 50c to \$8; black bear, \$13 to \$24, and cubs, \$3 up; fox, 50c to \$3; cross fox, \$5 to \$10; deer, 25c to \$4; black cat, 25c; house cat, 3c; mountain lion, \$1 to \$3.

Dyeing and substitution are a large part of the retail fur trade. How far it is carried on, only those in the business know with certainty. The census tells that in 1919 \$6,338,835 of fur materials were dressed into \$20,384,569 worth of finished furs, at wholesale valuation. Also that fur goods to the total of \$173,137,739, were made from \$105,596,605 of materials, these figures evidently being mainly of apparel fur-trimmed. Real sealskin is not as much in the market as it used to be, owing to the destruction of the Alaska herds. But government protection, in which the United States, Great Britain, Russia and Japan join, is resulting in the building up of the herd, which was reduced to about 132,000 animals in 1911. The policy of taking only surplus males over three years old, and of stopping open sea slaughter, is increasing the total, so that it is believed that by 1931, an average of 75,000 young males may be taken annually for fur.

G

GABUN. See FRENCH EQUATORIAL AFRICA.

GALICIA, formerly a province of Austria-Hungary lying to the south of Russian Poland, now a part of the Republic of Poland. It has a population of 8,257,505, of whom 3,731,569 are Roman Catholics, 3,379,613 Greek Catholics, and 871,895 Jews. The area of Galicia is 7,849,252 hectares, or about 19,000,000 acres. Petroleum and potassium salts are the chief products of the province. See POLAND.

GALLAUDET COLLEGE. See COLUMBIA INSTITUTION FOR THE DEAF.

GALLOWAY COLLEGE, a Methodist Episcopal, South, educational institution for women, founded in 1888 and located at Searcy, Ark. In 1922-23 it had a faculty of 24 members, 280 students, property valued at \$365,000 and an income of \$60,000. J. M. Williams is president.

GAMBIA, a British colony and protectorate at the mouth of the River Gambia in West Africa. It is administered by a governor assisted by an executive and a legislative council. The area of the colony proper is only four square miles. The protectorate has an area of 4,130 square miles and a population estimated at 240,000. Bathurst on the island of Saint Mary is the capital. There are eight government-aided schools, three are Roman Catholic, three Wesleyan, one Anglican, and one Mohammedan. The average attendance is 658 pupils. Imports in 1920 were valued at £2,711,880 and exports at £2,466,145. Revenue the same year amounted to £268,789 and expenditure to £171,160. There is no public debt. The chief imports are wearing apparel, boots and shoes, hardware, soap, wines, spirits and tobacco. The chief exports are hides, ground nuts, palm kernels and specie. There is a fortnightly mail service between Liverpool and Bathurst. The governor in 1922 was Capt. Cecil H. Armitage.

GANDHI, Mohandas Karamchand, Indian saint, politician and revolutionary: b. Probandar, near the industrial city of Ahmedabad, in the Presidency of Bombay, 2 Oct. 1869. His father was a man of independent temper from whom Gandhi inherited his spirit of "satyagraha" or adherence to truth. His early education was received in Ahmedabad, but after matriculation, he was sent to London to study law. He joined the Inner Temple and, in obedience to a promise made his mother, lived an austere life, not spending, it is said, more than \$5 a week. His recreation was a violin. In 1891, he was called to the bar and began to practice in Bombay. An important case required his presence in South Africa where he was immediately impressed with the humiliations, as he regarded them, which were heaped on Indian residents in that country. It was thus not with Britain herself but with a selfgoverning British dominion that Gandhi, as a vindicator of Oriental citizenship, first came into collision. South Africa no more wanted

Indian immigration than California wants the Japanese, and the Indians, here domiciled, were fingerprinted like criminals. With the humblest coolie, Gandhi went to prison for the rights and dignities of his race and he declined all preferential treatment. As between Britain and Boer, he was loyal to Britain.

The issue of race-equality in Africa spread to India whither, in due course, Gandhi returned. He settled in Ahmedabad and there lived as a Tolstoyan, taking up any grievance that was brought to him and accumulating around his person the reverence due to a Mahatma. In 1917, he was still loyal to the Government, with which he co-operated in the amelioration of agrarian grievances. The break came on 1 March 1919 when he issued his famous Passive Resistance or Salyagraha pledge in the following terms: "Being conscientiously of opinion that the Bill known as the Indian Criminal Law Amendment Bill No. 1 of 1919 and the Criminal Law Emergency Powers Bill No. 2 of 1919 are unjust, subversive of the principles of liberty and justice, and destructive of the elementary rights of an individual on which the safety of India as a whole and the State itself is based, we solemnly affirm that in the event of these Bills becoming law and until they are withdrawn, we shall refuse civilly to obey these laws and such other laws as the committee to be hereafter appointed may think fit and we further affirm that in the struggle we will faithfully follow truth and refrain from violence to life, person or property." Disclaiming all violence, Gandhi could not be said at this stage to have brought himself, even as a politician, within the grip of the law, but Mrs. Besant, whose sympathies were with the Nationalist movement, at once warned him that his action would release uncontrollable forces. The Rowlatt Acts were undoubtedly coercive and so calculated to inflame resentment. It is an ironic comment on them that they were not enforced. As propaganda, they did the maximum of harm to the British influence, yet were not, in fact, needed to sustain British authority.

In many respects, Gandhi's message was helpful to India. He proclaimed the dignity of man. He discounted the value of a merely material prosperity. He denounced caste and religious animosities. He was the first great teacher to bring Hindu and Moslem, for a time, into the same camp. But, to his personality, there was another side. All that he said against Western civilization was not true. His appeals were often to superstition. His reported miracles were a myth. And, in particular, his lack of sympathy with hospitals and other manifest benefits which the West had brought to India, was merely perverse. His mild words were translated by Hindus into ferocious placards, demanding the extermination of whites, men and women, and in April, 1919, disturbances in Amritsar led to grave and much resented reprisals by the British.

Moreover, events soon proved that Hindu-Moslem unity was only superficial. There was no real common factor between a gospel of non-resistance as preached by Gandhi and the religion of force, inflicted on Armenians by Turkey and — what touched India more closely — by fanatical Moplahs on the helpless and terror-stricken Hindus in their neighborhood. The Khilafat movement did not mean toleration. It was a demand for ultimate Mohammedan supremacy. As perplexities gathered around him, Gandhi's tone hardened. There were proclaimed *hartals* or periods of national mourning when all work ceased; schools, were to be boycotted; the new scheme of Indian Home Rule was to be killed by nonco-operation; a welcome must be refused the Prince of Wales; only *Swadeshi* goods must be used; for cotton goods, imported from Lancashire, handspun cloth must be substituted. The spinning wheel became the symbol of India's regeneration. The whole programme was vaguely summed up in the word *swaraj* which Gandhi was careful not too particularly to define.

In September, 1920, Gandhi carried the Indian National Congress for nonco-operation. He held out hopes which meant to his followers that within a year the British would be out of India. September, 1921 came and the prophecy was unfulfilled. It was extended to October — to December — then indefinitely. With that miscalculation, Gandhi's magic was shattered. On the one hand, non-resistance had disappointed those who believed in it. On the other hand, its failure brought the country face to face with a choice between civil war and an attempt to work out peaceful reforms. Responsible Indian opinion was not prepared to seek a solution in war. In May, 1921, there were several interviews between Gandhi and the Viceroy, Lord Reading. As a result, the Ali Brothers, who had led the Khilafat movement, apologised for their violent language. They were, however, arrested later for a similar offence, and it began to be clear that Gandhi himself was being driven by circumstances into association with the extremists who believe in physical force. On 10 March, 1922, he was arrested. There was no doubt that his writings had been seditious. As a lawyer, he knew it and pleaded guilty, even asking that the highest sentence be imposed upon him. He was sentenced to six years imprisonment but with the provision that, if politics permitted, there would be an earlier release. The disappearance of Gandhi was accepted by India with calm, in which there was an element of relief. He and his followers did not mean the same thing. The Hindus were not prepared, in practice, to surrender caste. The Moslems remained Moslems.

Word pictures of Gandhi are numerous and, from the western standpoint, not always flattering. Spare of figure, he sits, partially clad in *khaddar* or homespun, with a blanket thrown around him. His iron-gray hair is strong and close-clipped. He wears a moustache. His teeth are ill-kept; his eyes, dark and restless. Around him are gathered his worshippers, men and women. He is often silent. His English, when he speaks, is however perfect and no man living is better informed on modern literature. He

has been called "the Christ of India" and Rabindranath Tagore, the Indian poet, has hailed him as India's greatest man. Others will see a nearer parallel to him in Savonarola, the Florentine monk who also tried to reconcile statesmanship with spirituality. His imprisonment is hardly regarded as a martyrdom. Its rigors merely continue without accentuating Gandhi's own asceticism. And it has relieved him of a dilemma of which no one was more conscious than he himself when, on the eve of his arrest, which virtually he invited, he censured his followers for the Chauri Chaura riots.

PHILIP WHITWELL WILSON.

GARVIN, Lucius Fayette Clark, American physician and ex-governor: b. Knoxville, Tenn., 13 Nov. 1841; d. Lonsdale, R. I., 2 Oct. 1922. He was educated at the Newgarden Friends School at Greensboro, N. C., and at Amherst College, receiving the degree of A.B. in 1862. He was graduated at the Harvard Medical School in 1867, and practised in Pawtucket, R. I., before removing to Lonsdale. During the Civil War he served with the 51st Massachusetts regiment. He was elected to the Rhode Island legislature 16 times from 1883, and was the Democratic candidate for Congress in 1894, 1896, 1898, 1900 and 1906 from the second Rhode Island district. He was elected governor of Rhode Island in 1902 and became nationally known through his advocacy of labor legislation, including the nine-hour day. As a physician he was widely known throughout the State, and in all his years of practice Doctor Garvin had never owned a carriage or automobile, doing all his travelling by bicycle. In 1920 he was elected State senator. He advocated proportional representation, single tax, and also the constitutional initiative as a means to those ends.

GAS MACHINES AND GAS AND WATER METERS.

Manufacture of. Reports to the United States Census Bureau, made public in December 1922, show a considerable decrease between 1919 and 1921 in the activities of the establishments engaged primarily in the manufacture of gas machines and gas and water meters in this country. The total value of products reported for 1921 was \$21,956,000 as compared with \$26,267,000, reported for 1919, a decrease of 16.4 per cent. The figures for 1921 do not include establishments reporting products valued at less than \$5,000 each. The decrease in production was accompanied by decreases in the number of persons employed, in the total amount paid during the year in salaries and wages, in the amount expended for materials and by a large decrease in the number of establishments engaged in the industry. The average number of wage earners employed in this business in 1921 was 4,282, compared with 5,589 in 1919. Salary and wage payments amounted to \$7,434,000 in 1921 as against \$8,752,000 in 1919. In 1921 materials cost \$9,000,000; in 1919, \$10,647,000. There were 65 establishments engaged in the industry in 1921 as compared with 105 in 1919. The decrease, the Census Bureau's report states, was due in part to the fact that a number of the 1919 reporting concerns were out of business in 1921 while others had so changed

the character of their operations as to require classification in some other industry—that is gas machines and gas and water meters were no longer the products of chief value. Of the 65 establishments reporting products of over \$5,000 for 1921, 13 were located in Illinois; 9 each in New York and Pennsylvania; 7 in Ohio; 5 each in Indiana and New Jersey; 3 each in Massachusetts and Michigan; 2 each in Kansas, Maryland and Minnesota; and 1 each in Connecticut, Missouri, Oklahoma, Rhode Island and Wisconsin.

GATES, Merrill Edwards, American educator, lecturer and author: b. Warsaw, N. Y., 6 April 1848; d. Bethlehem, N. H., 17 Aug. 1922. His father was Seth M. Gates, member of Congress and anti-slavery leader. He received the degree of A.B. from the University of Rochester in 1870 and the degree of A.M. in 1873; the degree of Ph.D. from the University of the State of New York in 1880; that of LL.D. from Princeton and Rochester in 1882; from Columbia 1891 and from Williams College in 1893; and the degree of L.H.D. from Columbia in 1887. From 1870 to 1882 he was principal of the Albany Boys' Academy, and from 1882 to 1890 he was president of Rutgers College, leaving in 1890 to accept the presidency of Amherst College, where he remained nine years. He became a member of the United States Board of Indian Commissioners in 1884, and was its chairman from 1890 to 1899 and secretary from 1899 to 1912. A licensed preacher of the Congregational Church from 1899, he was active in State and national church affairs. He was president of the American Missionary Association (1892-98); president of the Lake Mohonk Indian Conference for eight years; member of the international committee of the Young Men's Christian Association (1882-1902); vice-president of the American Bible Society and of the American Tract Society, and a member of the American Philosophy Society, and of the Academy of Political Science. He was the author of: 'Land and Law as Agents in Educating the Indians' (1885); 'Sidney Lanier, Poet and Artist' (1887); 'International Arbitration' (1897); 'Highest Use of Wealth' (1901); 'Introduction to Pocket Edition of the Constitution of the United States' (1920).

GEMS AND PRECIOUS STONES. The value of the precious stones produced in the United States in 1921 was as follows: Andalusite, \$10; beryl, \$1,090; chlorastrolite, \$100; copper-ore gems, \$8,775; corundum (sapphire), \$482,745; feldspar, \$155; fossil coral, \$200; garnet, \$606; jet, \$460; obsidian, \$67; opal, \$336; quartz, \$11,114; rhodonite, \$275; thomsonite, \$10; tourmaline, \$1,450; turquoise, \$6,272; variscite, \$560. The value of the precious stones produced in the United States by States in 1921 was as follows: Montana, \$489,021; Arizona, \$8,805; Nevada, \$5,538; Colorado, \$3,848; other States, \$11,068; total, \$518,280.

The gems and precious stones imported and entered for consumption in the United States in 1917-21 were as follows: Pearls a non-mineral product are added in a separate column.

YEAR	Diamonds			
	Glazier's	Dust and bort	Rough or uncut	Cut but not set

GENEVA COLLEGE, a Reformed Presbyterian co-educational institution, founded in 1840 and located at Beaver Falls, Pa. In 1922-23 it had a faculty of 16 members (6 instructors), 1,050 students (including summer 1922), property valued at \$676,763, and an income of \$84,064.56. Archibald A. Johnston, A.M., B.D., is president.

GENOA CONFERENCE. See PEACE AND ARBITRATION, INTERNATIONAL; also REPARATIONS.

GEOGRAPHICAL SOCIETY, American. This organization was established in 1852 and occupies a handsome building in New York City at Broadway and 156th Street. Its activities lie primarily in the field of research and publication. In the course of 1922 notable progress was made in the prosecution of this work. The Society's outstanding publication of general interest is a quarterly, *The Geographical Review*, which has appeared regularly. Of more special interest are the volumes of the 'Research Series,' scientific monographs on a wide range of geographical subjects. Of these, three were published in 1922; a study of the legendary islands of the Atlantic as described and depicted on maps in the middle ages, a catalogue of geological maps of South America, and a determination, by a new method based upon the examination of clay deposits, of the duration of the recession of the last ice sheet in New England.

A department of the staff of the Society is devoted especially to carrying out a program of research in the geography of Hispanic America, the results of which are appearing in a series of maps and publications. The fundamental map, when finished, will be represented by some 100 sheets on a scale of 1:1,000,000 conforming in general to the 'International Millionth Map' of the world. Compiled critically from the examination of a wide range of sources, this map will serve as a base for regional studies; in 1922 the La Paz sheet was published; work upon several others was started and has made notable progress. It is expected that four sheets will be

completed in 1923. Handbooks on the geography of the area covered will accompany each sheet; that for the La Paz sheet, which bears the title 'Geography of the Central Andes' appeared at the close of the year. Another essential feature of the Society's activity is the maintenance of a geographical library and collection of maps, among the most complete in the United States. Their function is to serve the members of the staff of the Society in the work of research and editing and to provide a center where serious students of geography may carry on their studies. Notable additions were made to these collections during the year 1922.

In its elections to honorary and corresponding membership and in its presentations of medals, the Society has long made a practise of recognizing contributions to the advancement of geography. Three honorary and 15 corresponding members were elected in 1922. On 19 July 1922, the Charles P. Daly gold medal was presented by Ambassador Harvey at the American Embassy in London to Lieut-Col. Sir Francis Younghusband, president of the Royal Geographical Society, "for explorations in northern India and Tibet and for geographical publications on Asiatic and African borders of the Empire."

The officers of the Society for 1922 include the following: president, John Greenough; vice-presidents, James B. Ford, Philip W. Henry, Alexander Hamilton Rice, M.D.; foreign corresponding secretary, Prof. William Libbey; domestic corresponding secretary, W. Redmond Cross; recording secretary, Hamilton Fish Kean; treasurer, Henry Parish; director and editor, Isaiah Bowman, Ph.D.

GEOGRAPHIC SOCIETY, National, an educational organization founded for the increase and diffusion of geographical knowledge, with headquarters at Washington, D. C. It concentrated its activities in the field of exploration during 1922 in the Chaco Canyon (New Mexico) region, where its expedition, under the leadership of Neil M. Judd, of the National Museum, pursued its work of excavation in the Pueblo Bonito ruins—the mysterious communal settlement, which, when its riddles are read, it is believed will throw illuminating light on the history of pre-Columbian America. The Society will continue its investigations during the summer of 1923. The Society's notable achievements in the exploration and study of the Mount Katmai volcanic region, in Alaska, were consummated in December 1922, with the publication of 'The Valley of Ten Thousand Smokes,' a richly illustrated volume, giving a fascinatingly human account of the Society's five expeditions to this region, and at the same time supplying exact scientific data on the greatest volcanic explosion of modern times, and of the valley in the vicinity of Mount Katmai, where millions of fissures belching forth superheated steam and gases have caused it to be termed the "Eighth Wonder of the World." In addition to this volume by Dr. Robert F. Griggs, leader of the Society's expeditions, the first two of a series of important memoirs, dealing with the purely scientific findings of the expeditions, were published in 1922. They are entitled 'The Origin and Mode of Emplacement of the Great Tuff

Deposit of the Valley of Ten Thousand Smokes' and 'A Chemical Study of the Fumaroles of the Katmai Region'—the first by Clarence N. Fenner and the second by E. T. Allen and E. G. Zies, all of the geophysical laboratory of the Carnegie Institution, who accompanied the Society's 1919 expedition. Photographic surveys were made during the year by staff photographers of the Society in Italy, Portugal, Mexico, Wales, Holland, Spain, Norway, Sweden, Denmark, Germany, Hungary, and several sections of the United States. After consultation with General Pershing and the French government, it has been decided that the \$10,000 remaining in the society's war relief fund shall be expended in providing a model water supply system to Cantigny, France, to replace that destroyed in the World War. This is in the nature of a gift as a memorial to the American soldiers who fought for the first time as a unit in the World War at Cantigny. This gift recalls the fact that the Society not long ago granted \$25,000, and, in addition, \$75,000 was given by individual members, through the Society, to the Federal government, when the congressional appropriation for the purchase was insufficient, and the finest of the giant Sequoia trees of California were thereby saved for the American people, and incorporated into a national park. On 6 April 1922, the thirteenth anniversary of the discovery of the North Pole, the Society unveiled a monument over the grave of Rear Admiral Robert E. Peary, in Arlington National Cemetery. The Society's chief contribution in promoting the diffusion of geographic knowledge was carried on during 1922 by the monthly distribution of the *National Geographic Magazine* to its 750,000 members. It followed its map program of 1921, when large scale new maps of Europe, Asia, South America and the islands of the Pacific were issued as supplements with its magazine, by the issuance, in 1922, of maps of the countries of the Caribbean, of Africa, and of the world. In addition to the distribution of its official organ—*The Magazine*—the Society, during the past year, furnished to more than 500 of the leading daily newspapers in America a daily geographic news bulletin—each devoted to some topic or place of immediate news interest. The bulletin service, established at the beginning of the World War, has been carried on for eight years without service charge to the press. More recently, the Society established, along the same lines, a school service bulletin for teachers in public schools. These bulletins, containing geographic material of present-day interest in the schoolroom, are so written and illustrated as to be highly attractive to children. The Society also participated, through financial support, in an expedition to the islands off the west coast of Lower California, and in the improvement of roads and trails in Mount McKinley National Park.

Officers.—Dr. Gilbert Grosvenor, president and editor-in-chief; Henry White, vice-president; John Joy Edson, treasurer; John Oliver LaGorce, associate editor; O. P. Austin, secretary; George W. Hutchison, associate secretary; William Joseph Showalter, assistant editor; Ralph A. Graves, assistant editor.

Board of Trustees.—William Howard Taft;

John Joy Edson; David Fairchild; C. Hart Merriam; O. P. Austin; George R. Putnam; George Shiras, 3d; Grant Squires; Charles J. Bell; C. M. Chester; Frederick V. Coville; Stephen T. Mather; E. Lester Jones; T. L. MacDonald; S. N. D. North; Gilbert Grosvenor; Rudolph Kauffmann; J. Howard Gore; A. W. Greely; John Oliver LaGorce; George Otis Smith; O. H. Tittmann; Henry White. During 1922, the Society lost from its board of trustees, by death, Dr. Alexander Graham Bell, one of the founders and a former president of the Society.

GILBERT GROSVENOR,
President.

GEORGE, Sir Ernest, English architect: b. London, 13 June 1839; d. Kensington, London, 8 Dec. 1922. He was educated at Brighton and Reading, was articled to S. Hewitt and entered the Royal Academy Schools, where he took the gold medal for architecture in 1859. Two years later he began practice with Thomas Vaughan. After Vaughan's death he was joined by Harold Peto, and on Peto's retirement by A. B. Yeates. In 1896 he was given the queen's gold medal of the Royal Institute of British Architects. In 1908-09 he was president of the Royal Institute of British Architects and in 1910 was made an associate of the Royal Academy. In 1911 he was knighted and in 1917, in his 78th year, he was elected a full member of the Royal Academy. The greater part of his work consists of country mansions, some of them new and some of them remodelled. His chief works lie in Southern and Western England. He restored Berkeley Castle, Gloucestershire, and improved and partly rebuilt Welbeck Abbey after a bad fire. His houses are notably in harmony with their surroundings. They include: Rousden, Devonshire; Stoodleigh Court, Devonshire; Motcombe, Dorset; Batsford, Gloucestershire; Edgeworth Manor, Gloucestershire; Monk Frys-ton, Yorkshire; Poles, Herts; North Minns, Herts; Buchan Hill, Sussex; Dunley Hill, Surrey; Eynsham Hall, Oxford; Sedgwick Park, Sussex; Ruckley Grange, Salop; Foxcombe, Oxford; Busbridge Park, Surrey; and Crathorne Hall, Yorkshire. In London he not only built single houses, but whole streets; Harrington Gardens and Collingham Gardens, of brick and terra cotta, follow the style of Flemish country-houses of the 16th and 17th centuries. A north Italian Renaissance house was built in Berkeley Square for the late Mr. Salting. The shop, No. 36 Piccadilly, built for the bookseller, Sotheran, and a large building at the corner of Piccadilly and Albermarle Street, once known as the Albermarle Hotel, are his. In the city of London the Royal Exchange buildings are by him, and in Marylebone, the Royal Academy of Music. He was also architect for the Crematorium at Golders Green. Sir Ernest designed four churches only: one at Streatham; Saint Pancras at Rousden, Devonshire; and two English churches in the Engadine at Samaden and Tarasp. He built the Shirpur palace in India and a villa at Antibes, France. Sir Ernest was an accomplished etcher and published 'Etchings on the Loire'; 'Etchings in Belgium'; 'Etchings'; and 'Etchings in Venice.'

GEORGETOWN COLLEGE, a Baptist co-educational institution, founded in 1829 and

located at Georgetown, Ky. In 1922-23 it had a faculty of 24 members, 343 students (1st semester), property valued at \$232,700, and an estimated income of \$100,000. Maldon Browning Adams, D.D., LL.D., is president.

GEORGETOWN UNIVERSITY (legal title, "The President and Directors of Georgetown College in the District of Columbia"), a Roman Catholic educational institution for men, founded in 1789 and located at Washington, D. C. In 1922-23 it had a faculty of 226 members, and 2,626 students. Figures relating to value of property and income not available for publication. John B. Creeden, S.J., Ph.D., D.D., is president.

GEORGE WASHINGTON UNIVERSITY, a non-sectarian co-educational institution, founded in 1821 and located at Washington, D. C. In 1922-23 it had a faculty of 280 members, about 4,800 students, property valued at \$1,500,000, and an income of \$540,000. Howard L. Hodgkins, Ph.D., Sc.D., is president.

GEORGIA, a South Atlantic State of the United States, bounded on the north by Tennessee, North Carolina and South Carolina, on the east by the Atlantic Ocean, on the south by Florida and the west by Alabama. The area of the State is 59,265 square miles, which makes it the 20th State in order of size. In 1920, it ranked 12th in population with 2,895,832. Of this population 1,689,467 were whites, 1,206,365 negroes, 228 Asiatics and 125 Indians. In the same year there were in the State 16,186 foreign-born, of whom 1,936 were Germans, 1,593 English, 3,452 Russian and 1,112 Irish. The chief cities of the State are Atlanta, the capital, with a population of 200,600; Savannah, 83,252; Macon, 52,995; Augusta, 52,548, and Columbus, 31,125.

Religion.—The chief denominations are Baptists (721,140) and Methodists (387,775), the former having more than half of the entire religious membership of the State. There are 25,181 Presbyterians, 18,214 Roman Catholics and 11,098 Episcopalians.

Education.—Primary education is free and compulsory. There are in the State 8,359 primary schools with 16,409 teachers and 723,077 pupils; 132 high schools with 1,499 teachers and 47,860 pupils; three normal schools with 126 teachers and 2,514 students. In 1922, the State appropriation for common schools was \$4,250,000. For higher education the State maintains the University of Georgia at Athens, the Georgia School of Technology and the North Georgia Agricultural College.

Agriculture.—There are in the State 310,732 farms with an aggregate acreage of 25,437,072 acres, of which 13,154,010 acres are improved land. The total value of all farm property in 1920 was \$1,356,904,896. Negroes operate 41 per cent of the farms of the State, but of this 41 per cent, 86 per cent are rented farms. Cotton is the chief crop raised by the negro farmers. Cereals are important crops in the northern part of the State. Of late years sugarcane planting has been increasing. The chief crops, with their acreage, yield and value, for the year 1922 are: corn, 4,385,000 acres, 52,620,000 bushels, \$45,253,000; winter wheat, 190,000 acres, 1,520,-

000 bushels, \$2,280,000; oats, 474,000 acres, 8,532,000 bushels, \$6,399,000; rye, 18,000 acres, 171,000 bushels, \$231,000; tame hay, 728,000 acres, 670,000 tons, \$11,390,000; sorghum syrup, 30,000 acres, 2,490,000 gallons, \$1,370,000; rice, 3,000 acres, 72,000 bushels, \$84,000; potatoes, 25,000 acres, 1,700,000 bushels, \$2,380,000; sweet potatoes, 152,000 acres, 12,616,000 bushels, \$7,696,000; cotton, 3,466,000 acres, 725,000 bales, \$86,638,000; tobacco, 11,000 acres, 5,940,000 pounds, \$1,544,000; peanuts, 160,000 acres, 96,320,000 pounds, \$4,527,000; apples, 1,135,000 bushels; peaches, 4,900,000 bushels, and pears, 202,000 bushels. On 1 Jan. 1923, the live stock count of the United States Department of Agriculture showed on Georgia farms 95,000 horses, valued at \$7,885,000; 390,000 mules, valued at \$40,950,000; 509,000 milk cows, valued at \$14,252,000; 700,000 other cattle, valued at \$7,700,000; 66,000 sheep, valued at \$198,000, and 2,152,000 hogs, valued at \$16,786,000. The value of the fruit crop of 1922 was \$8,000,000. The watermelon crop netted \$1,800,000 to the growers and the canteloupe crop amounted to \$500,000.

Other Products.—Oyster and shad fishing are of some importance. The mineral resources of the State include gold, silver, coal, iron, manganese, bauxite and graphite, lime, ochre, natural cement, talc and soap stone, marble and mineral waters.

Manufacturing.—There are in the State 4,639 manufacturing establishments with an aggregate capital of \$258,325,811, and employing 118,000 hands. In 1920, the value of the industrial output of the State was \$693,237,000. The chief manufactured product is cotton, followed by oil and cake from cotton seed. The cotton mills of Georgia operate over 2,000,000 spindles. The percentage of child labor in Atlanta in 1920 was 17.2 per cent.

Transportation.—The transportation system of the State is highly developed. There are several rail lines traversing the State and Savannah is an ocean port, accommodating vessels up to 32 feet draft. The total railroad mileage is 7,326, and there are in addition 491 miles of electric railways.

Forest Products.—The lumbering industry furnishes about 500,000,000 board feet annually. By far the greater part of this cut is the celebrated Georgia pine.

Finances.—At the beginning of the fiscal year, 1922-23, the State had a balance in hand of \$1,727,866.35. During the fiscal year receipts aggregated \$12,889,801.22. Disbursements for the same period aggregated \$12,984,534.82, leaving a balance on hand at the beginning of the fiscal year, 1923-24, of \$1,633,132.75. The estimated expenditures of the fiscal year, 1923-24, amount to \$12,889,801.22. The bonded debt of the State on 31 Dec. 1922 was \$5,485,202. The assessed value of real property was \$719,868,211; of personal property, \$307,926,510.

Government.—The legislative power is vested in the General Assembly of two chambers—a senate of 51 members and a house of representatives of 193 members. The members of both houses are elected for two years. The legislature meets annually on the fourth Wednesday in June and its sessions are limited to 50 days. The State sends two senators and 12

representatives to the Federal Congress. The governor in 1922 was Hon. Thomas W. Hardwick, who was elected for the term 1 July 1921 to 30 June 1923. The secretary of state is S. G. McLendon; attorney general, George M. Napier; comptroller, W. A. Wright; treasurer, W. J. Speer; superintendent of education, M. M. Parks; assistant treasurer, J. O. Anderson.

Judiciary.—Members of Supreme Court: S. C. Atkinson, M. W. Beck, James K. Hines, S. P. Gilbert, H. W. Hill and R. B. Russell. Members of court of appeals: N. R. Broyles, W. F. Jenkins, R. A. Bell, O. H. B. Bloodworth, A. W. Stephens and Roscoe Luke.

GEORGIA (Sakartvelo), a republic formerly a part of the Russian empire, situated in Transcaucasia between the Black and Caspian seas. The area of the republic is 74,577 square miles with a population of 3,053,345. The chief towns with their populations are: Tiflis, the capital, 346,766; Kutais, 85,151; Sukhum, 61,974; and Poti, 20,731. The population is made up of the following tribal groups: Georgians proper, Mingrelians, Osietines, Abhasians, Hevsurs, and Emertines. Elementary education is in charge of the rural and municipal councils under the general supervision of the ministry of education, the secondary schools are controlled directly by the ministry and higher education is provided for by the University of Tiflis, which has 50 professors and 1,500 students. The Georgian language relegated to peasant use under the Russian regime has been declared the official language of the republic. Agriculture is the chief occupation of the inhabitants, about 90 per cent being engaged in its pursuit. Corn is the principal crop. Wine is made in large quantities and fruit growing, bee-keeping and sericulture are flourishing. Cattle raising is also an important industry, the country being well adapted thereto. Of the minerals the chief product is manganese. Copper, iron, coal and lead are found but are not worked to any great extent. In the last year for which there are official statistics the exports of Georgia were valued at 257,559,000 roubles and the imports at 366,897,167 roubles. There are 970 miles of railways, the main line being from Batum through Tiflis to Baku on the Caspian. There are several narrow gauge lines connecting up the mining districts with the main line. All lines in the territory of the republic are the property of the state. At present the country is governed by a revolutionary committee after the manner of Soviet Russia.

GEORGIA SCHOOL OF TECHNOLOGY, a State educational institution for men, founded in 1888 and located at Atlanta, Ga. In 1922-23 it had a faculty of 120 members, 3,035 students, property valued at \$1,250,000 and an income of \$367,000. Marion Luther Brittain, A.B., LL.D., is president.

GEORGIA, University of, State co-educational institution, chartered in 1784, opened in 1801 and located at Athens, Ga. In 1922-23 it had a faculty of 93 members, 1,436 students, property valued at \$3,000,000, and an income of about \$300,000. David C. Barrow, LL.D., is chancellor.

GERMAN COLONIES. The overseas possessions of the former German Empire had a total area of 1,140,117 square miles and a population estimated at \$13,258,000. In Africa, Germany ruled German East Africa, German Southwest Africa, Cameroon, Togoland; in the Pacific, the colonies of Germany included New Guinea, the Bismarck Archipelago, the Caroline Islands, German Solomon Islands, Marshall Islands, the Pelew Islands, the Ladrone Islands, Nauru and German Samoa. On the Asiatic mainland, Germany held Kiaochow. Under the terms of the Treaty of Versailles these colonies were turned over to the principal Allied and Associated powers under mandates. Great Britain received most of the African colonies, the rest being mandated to France and Belgium. The Pacific island colonies were placed under mandate to Australia, New Zealand and Japan. See articles on the several former colonies.

GERMAN NEW GUINEA, the name of former territories of Germany in the western Pacific and including Kaiser Wilhelm's Land, the Bismarck Archipelago, the German Solomon Islands, the Caroline Islands, the Marshall Islands, the Ladrone Islands and the small island of Nauru. These islands were occupied by Australian forces in 1914 and after the war the islands north of the Equator—the Marshalls, Caroline, Pelew, and Ladrone—were placed under mandate to Japan, while those to the south of the equator—the Bismarck Archipelago, German Solomon Islands, German New Guinea, were assigned to Australia. German Samoa was assigned to New Zealand, Nauru was assigned to the British Empire. The territory now called the Territory of New Guinea, under mandate to Australia, is divided into 10 administrative districts. New Guinea proper, or Kaiser Wilhelm's Land, is dealt with in this volume under its own head. Bismarck Archipelago comprises the islands, New Pommern, now called New Britain, area, 10,000 square miles; New Ireland, the former Neu Mecklenburg, area, 4,600 square miles; the Duke of York Islands, formerly Neu Hannover and Neu Lauenburg, 530 and 22 square miles respectively; and the Admiralty Islands, area 600 square miles. Lesser island groups of this archipelago are the Gardner Islands, Fead Islands, the French Islands, Rook Islands, Commerson Islands, Anchorite Islands, Abgarris Islands, Nissan and Saint Matthias Islands. The native population of the Archipelago is estimated at 188,000, of whom 50,000 dwell on the island of New Britain; 28,000 on New Ireland. The Solomon Islands have an area of about 4,000 square miles and a population of 18,000. In 1920-21 the import duties amounted to £61,697 and the export duties to £31,736. The chief exports that year were copra, shell, birds of paradise, and cocoa. The value of the exports was £673,992 and the value of the imports the same year was £661,441. Imports consisted chiefly of groceries, hardware, tobacco, boots and shoes,

oils and wines, spirits and beer. See also NEW GUINEA.

GERMANY, or THE GERMAN REPUBLIC (still officially *Deutsches Reich*). On 9 Nov. 1918 Emperor William II abdicated and took up his residence in Holland. The government was taken over by the council of people's commissioners in Berlin; the reigning princes of the component states either abdicated or were deposed; the provisional authorities declared the Imperial Parliament dissolved, and arrangements were begun for establishing the republic. A national assembly, chosen at elections held in January 1919 at which the suffrage was extended to all German men and women over 20 years of age, consisted of 423 members (165 Majority Socialists, 90 Clericals, 75 Democrats, 42 Conservatives, 22 Independent Socialists, an equal number belonging to the German People's party, and 7 representatives of minor parties). It met at Weimar on 6 February; five days later Friedrich Ebert was chosen as the first president; and on 31 July the assembly adopted a constitution which was promulgated 11 August and under which, 21 August, President Ebert was formally installed.

Constitution.—Provisions of that document are: The commonwealth is a republic and the power of the state is derived from the people; all Germans are equal before the law; men and women have fundamentally the same civil rights and duties; public advantages or disadvantages of birth or rank are suspended; titles of nobility shall be accepted only as part of a name and are not to be conferred in future, and other titles, academic degrees excepted, may be conferred only when they designate an office or profession; orders and their insignia may not be conferred by the state and no citizen shall accept a title or order from a foreign government; no state church is recognized; religious freedom, freedom of speech and of the press are guaranteed; all citizens, women as well as men, over 20 years of age have the right of equal suffrage; the government, though accepting the principles of the law of nations as binding upon Germany, shall have the exclusive right of legislation in regard to foreign relations, colonial matters, state property, immigration and emigration, extradition, military organization, coinage, customs, posts, telegraphs and telephones; the national government has similar legislative control in the fields of civil and criminal law, poor laws, judicial proceedings, passports, health, labor, industrial pursuits, insurance, mining, weights and measures, highways, theatres, navigation, railways, taxes and other sources of income in so far as they may be claimed for its purposes; every component state is required to have a republican constitution and its officials must be chosen by universal, equal, direct and secret vote of all citizens; both men and women, on the basis of proportional representation; laws of

the national government transcend those of the component states, but in so far as the central government makes no use of its right of legislation the confederated states are permitted to legislate for themselves, except as to matters reserved for the central government's exclusive legislation. There are two legislative bodies: the Reichstag and the Reichsrat. The former chooses its own president and secretary. Its delegates serve for four years, and are chosen, on the basis of proportional representation, by universal, equal, direct and secret vote of all German men and women over 20 years of age. The elections must be held either on a Sunday or other day of public rest. This body, in 1922, had 469 members, divided as follows: Majority Socialists, 108; Independent Socialists, 61; Centre (Clerical) party, 72; German National People's party, 71; German People's party, 65; German Democratic party, 40; the Bavarian People's party, 20; other parties, 7. Projects of legislation must be introduced by the government (with the Reichsrat's assent), or by the Reichstag. The Reichsrat may veto measures approved by the Reichstag. The principle of referendum is provided for. The president of the republic is to be chosen by direct vote as described above; the term of office is seven years, and to be eligible a candidate must have completed his 35th year. An incumbent is eligible for re-election. The president may be deposed by a referendum requested by a two-thirds majority of the Reichstag.

The president is authorized to conclude, subject to the Reichstag's approval, alliances and treaties with foreign powers. He receives and appoints ambassadors, is supreme commander of the nation's military forces, appoints the chancellor and, upon the latter's recommendation, the ministers of government; but the cabinet thus appointed must enjoy the Reichstag's confidence. Arrangements and dispositions of the president, including those concerning the army, must (to become valid) be countersigned by the chancellor or a qualified government minister. The president's salary is 100,000 marks a year, with an additional allowance of 100,000 marks. The new judiciary system does not differ very materially from the old. Justice is administered through national and state courts; judges may be permanently or temporarily removed from office, transferred to other offices, or retired against their will only by virtue of judicial decisions and upon the grounds and in the forms provided by law. One section of the constitution establishes a national budget system; another provides for compulsory education (see below, — SCHOOL REFORM); still another annuls the constitution of 1871, while providing that other laws and regulations shall remain in force in so far as they do not conflict with the new constitution.

Area and Population.—The 'Statesman's Year Book' of 1922, page 940, has the following totals: Area, English square miles, 250,471, and population, 59,857,283. The area and number of inhabitants of each state are given, thus: Prussia, including the Saar, 181,698, with 36,684,717 inhabitants; Bavaria, including Coburg, 29,501, with 7,140,333; Württemberg, 7,629, with 2,518,773; Baden, 5,817, with 2,208,503; Saxony, 5,789, with 4,663,298; Mecklenburg-Schwerin,

5,068, with 657,330; Thuringia (the seven Thuringian states in combination), 4,546, with 1,508,025; Hesse, 2,966, with 1,290,988; Oldenburg, 2,482, with 517,765; Brunswick, 1,418, with 480,599; Mecklenburg-Strelitz, 1,131, with 106,394; Anhalt, 888, with 331,258; Lippe, 469, with 154,318; Waldeck 443, with 66,432; Schaumburg-Lippe, 131, with 46,357; Hamburg, 160, with 1,050,359; Lübeck, 115, with 120,568. Bremen, 99, with 311,266. Under the Treaty of Versailles, 28 June 1919, Alsace-Lorraine has been ceded to France; the greater part of West Prussia and a part of Eastern Silesia to Poland; a part of Upper Silesia to Czechoslovakia; Memel and Danzig to the Allies; Eupen and Malmédy to Belgium. All told, Germany lost approximately 27,275 square miles of territory with a population of 6,471,581. Plebiscites for determining the fate of other areas were provided for in the treaty as follows: The Saar Basin, after 15 years; Schleswig, in two zones; districts in southern East Prussia, in West Prussia, and in Upper Silesia. Upper Schleswig voted, in March 1920, for union with Denmark; Lower Schleswig, to remain German. In July of the same year, the East and West Prussian districts voted to remain in Germany. The Upper Silesian plebiscite occurred in March of the following year, and the vote favored Germany; but Polish residents rebelled, and, after there had been fighting in the open and wrangling in council, eventually 1,255 square miles, with 891,669 inhabitants were transferred to Poland.

Cities Having More than 100,000 Inhabitants.—Greater Berlin, 3,801,325; Hamburg, 985,779; Cologne, 633,904; Munich, 630,711; Leipzig, 604,380; Dresden, 529,326; Breslau, 528,260; Essen, 439,257; Frankfurt-on-Main, 433,002; Düsseldorf, 407,338; Nürnberg, 352,675; Hanover, 310,431; Stuttgart, 309,197; Chemnitz, 303,775; Dortmund, 295,026; Magdeburg, 285,856; Königsberg, 260,895; Bremen, 257,923; Duisburg, 244,302; Stettin, 232,726; Mannheim, 229,576; Kiel, 205,330; Halle-on-Saale, 182,326; Altona, 168,729; Gelsenkirchen, 168,557; Cassel, 162,391; Elberfeld, 157,218; Barmen, 156,326; Augsburg, 154,555; Aachen, 145,748; Bochum, 142,760; Brunswick, 139,539; Karlsruhe, 135,952; Erfurt, 129,646; Mülheim-on-Ruhr, 127,027; Crefeld, 124,325; Lübeck, 113,071; Hamborn, 110,102; Mainz, 107,930; Plauen, 104,918; Münster, 100,452.

Army.—The maximum strength of the army permitted by the Treaty of Versailles was 100,000 men, including not more than 4,000 officers. The demobilization was completed on 1 May 1919, and the *Reichswehr*, voluntarily recruited, and by 1 August numbering 500,000, came into being. Germany ratified the treaty 10 Jan. 1920, and one year later the reduction of the *Reichswehr* to the authorized maximum was completed. But other organizations that had come into existence during 1919 were: *Sicherheitspolizei*, 150,000; *Zeitfreiwilligen*, also 150,000, and *Einwohnerwehr*, 350,000. Under pressure in 1921 the second and third of these organizations were disbanded, while the first was deprived of its artillery equipment.

Navy.—By the terms of the armistice Germany was required to surrender or dismantle all effective fighting ships. The Treaty of Ver-

sailles forbids her to have submarines, and stipulates that the fleet shall consist of not more than six battleships of the pre-dreadnought type (vessels displacing about 13,000 tons), six light cruisers, 12 destroyers, 12 torpedo-boats; the personnel being limited to 15,000 men, including not more than 1,500 officers of all grades; and this small force must be secured through voluntary enlistment for periods of 25 consecutive years, or 12 consecutive years—the longer periods applicable to the more important officers, the shorter to the petty officers and men.

Fortifications and Air Forces.—Provisions of the treaty required the disarming of fortifications west of a line to be drawn 50 kilometers east of the Rhine, but sanctioned the maintenance of those on the eastern and southern frontiers. Coast defences of Kiel and Heligoland were razed, and the equipment of other fortresses had been surrendered promptly enough, albeit the Disarmament Commission had notice of many field guns and machine guns neither surrendered nor destroyed. Airplanes, seaplanes, airships, balloons, engines, sheds, hangars, bombs—all of these appeared to be sacrificial, and 14,741 airplanes and seaplanes and 231,086 bombs, with other aeronautical material in proportion, were actually sacrificed; the treaty provides that the armed forces of Germany must not include any military or naval air forces.

School Reform.—Germany is undergoing a thorough test of its school system and planning a reconstruction of its school policies. To this effect Reinhold Lehmann, Leipzig, writes in *School Life* (Washington, Bureau of Education, Department of the Interior, September 1922). The Constitution contains, in the section 'Education and the School,' nine paragraphs in which appear the establishment of a definite forward movement which puts an end to the domination or despotism ascribed to the *Standeschule* (class-distinction school), the Denominational School, and the *Lernschule*. The unconditional establishment of the Unity School, the Secular-Instruction School, and the Creative School does not necessarily follow. "In the main, the Constitution [in this field] makes promises only; but one cannot easily disturb this foundation." The first intimation of the eventual fulfillment of such promises is the law which guarantees a common primary school for the sixth to the tenth year of each child's life. It orders the suspension, not later than 1930, of all public and private preparatory schools and preparatory classes. In such schools, up to this time, the sons of the well-to-do class have been prepared for the secondary schools. At six years of age they were carefully separated from the children of the working people. The new primary school law was opposed by the wealthy and privileged classes. Its justification, Leipzig expositor claims, is that it may uphold until the tenth year of the child's life the democratic principle that the children of one people belong in one school and that the educational possibilities of all must be equal.

The next national school law, about which there has been the bitterest contest in parliament and press, in public assemblies, and in parents' and teachers' associations, puts the control on

the basis of ethics rather than of denominational religion. In spite of the efforts of the body of German teachers, a breaking up of the common schools on account of religious belief appeared inevitable. The constitution provides that the character of the schools in each community with respect to religious instruction shall be determined by the parents and guardians of the pupils. On account of this a perpetual school fight is engendered which threatens to disrupt every family. Some would establish schools for children of all denominations, but others (probably the majority) would have Protestant schools, Catholic schools, Jewish schools, Monistic schools, Secular-Instruction schools, etc. Germany has 529 sects, all jealous of their rights, and they are plunging the school system into chaos of small offshoots. Special cause for conflict lies in the question, Does the state alone have the right to supervise the religious instruction in the common schools? In small communities until 1918 the local clergy performed the entire school inspection. Large groups of orthodox churches would not willingly relinquish this function; but, as opposed to these, the majority of teachers in the common schools object to allowing the clergy again to participate in the school inspection. Many teachers make use of their constitutional right by declining to impart religious instruction. Then, often there arises in the village a demonstration against the godless teacher; or a school strike of the children may be started, so that the local authorities may obtain from the state a teacher more to their liking. On the other hand, children of the radical Socialists take part in street demonstrations, displaying red placards. "Everywhere orthodox and atheist are equally guilty; and with the momentary inner dismemberment of the German people, no beautiful oration, no reasoning exhortation by the pedagogical leaders will avail."

The training of teachers in its national aspect was recognized as the most vital problem in the field of education by the National School Conference which brought together 600 school men of every rank. Since all professional educators, from the elementary schools to the universities, have to fulfill in educating humanity a duty that is fundamentally the same, these educators should represent in the new state a single profession and receive accordingly a uniform preparation. This should be until about the nineteenth year in the general training schools leading to the university and then in the university itself. Here, in addition to the required subject of pedagogy, including psychology, the elementary-school teacher must carry at least one special subject of scientific, humanistic, or technical nature. Civics should be especially emphasized in the curriculum, and sociology might also be added.

In Saxony the university attendance is already fixed at three years. Other states will probably establish teachers' colleges, in close connection with the universities. In any case a movement is already in progress to do away with the special state normal schools; and the professors of education in the universities are becoming at last more numerous and more independent, even if the followers of tradition do struggle against recognizing pedagogy as a science and against

the best possible scientific foundation for their life's work. Since the Constitution expressly mentions civics and craftsmanship as subjects to be taught, the teaching profession is now doubly concerned in their associations and journals with these problems of teaching practice. Civics is offered as a subject of study, yet one would exempt, if possible, the elementary school pupil from it. The Constitution, of which every pupil receives a copy at the end of his compulsory school attendance, is made the central point of consideration. But the spirit of civic responsibility is to permeate the entire school life. The chief means toward this end appears to be pupil self-government, which is constantly increasing in favor.

The mechanical and inactive *Lernschulen*, with their lifeless "discipline" and external "authority," give way slowly to the vital and active creative schools. Progressive teachers make constructive exercises with material things the foundation of education. In all grades and all branches of instruction the "school of deeds" will independently, through play, constructive work, and action, reach the inner-life values of knowledge and understanding. "Self-development and the cultivation of all powers, both physical and spiritual, is the aim; together with prerequisites of a professional life, subjectively and objectively as correct as possible. Ethics and true religion will also grow out of the active community life which naturally cannot be bound to a rigid plan of instruction and of studies. Free, devoted work of the pupils and teachers in companionable groups is to establish an experiential morality and to prepare for fitness as members of the public community." The teachers have united in Hamburg, Frankfurt, Dresden, and Leipzig in order to conduct their individual experiments in the new field as a more unified, comprehensive, and reliable collective effort. Thoroughly progressive staffs meet, and have at their disposal standard experimental schools which are at the same time observation and training places for the entire body of progressive teachers. Educational authorities gravely disputed whether emphasis should be placed more on the intellectual self-activity of the pupil (the view of Professor Gaudig), or whether the hand also should be taken into consideration as much as possible (according to Professor Kerschensteiner). The ultimate development will, Dr. Lehmann thinks, move along a middle line, especially in the higher schools. "It might be impossible for our society of to-day to reach the alluring but difficult goal demanded by the radical school reformers, namely, that of making the school community fit into the whole economic plan by sharing in the production of commodities and of the necessities of the daily life."

The Band of Resolute School Reformers is conducting, under the leadership of Prof. Paul Oestreich, a well-founded agitation to create with the help of a new education, a new race for the development of a new culture, the constructive element of which shall be mutual helpfulness, solidity of character, and native creative energy of the individual and of the group. The fundamental principles and individual proposals of Oestreich and his energetic co-workers

are characterized by defenders of the old methods as a foretaste of Bolshevism; and yet the reformers merely desire to realize at last educational development in the spirit of Pestalozzi and Fichte. And the zeal of reformers is indispensable in view of the fact that definite promises of the Constitution have not yet been fulfilled. The informant of *School Life* writes: "The Commonwealth has permanency only through the intelligence and fitness of all its members. It must release all powers and make them serviceable to all. However, many a politician to whom every advancement in the direction of the education of the people is thoroughly hateful, skilfully conceals his real feelings behind financial considerations. Therefore, the hind financial considerations of the constitution are laws for the execution of the constitution are continually delayed and crossed. Only Saxony has for both boys and girls, after the eight years of elementary schooling, a three years' continuation school. The number of obligatory weekly study hours varies, according to the measure of self sacrifice of the community, from 3 to 12. Saxony also grants to the teachers the widest self-government. The old masters the power of the board of directors has been broken. The teaching staff of every school deliberate and decide matters concerning the school regulations, programs, courses of study, time schedule, the execution of the orders of the authorities, etc. Schools with more than 10 teachers choose a teachers' council of not less than three members. This council in co-operation with the school leader regulates all urgent school affairs. For the office of school leader the body of teachers makes recommendations, and the final appointment for three years is made by the local school board. The school leader receives no additional compensation, and does not have the right to inspect the instruction of the teacher and give directions as to methods; that right belongs now only to the learned specialist appointed as superintendent by the state. This right of sharing in the decisions secures for each individual teacher free development."

The parents' councils which have been legally established in different states have undertaken to further the work of the schools in the fields of child protection—of the care, education, and development of the young people in confidential co-operation with the teachers; to awaken and keep alive the feeling of responsibility for the care of the schools and their adjustment to the community; to secure the means which will aid the schools in the fulfillment of their aims. Parents' councils can make proposals to the school authorities, but are not permitted to control the internal and external school management, nor are they allowed to exercise the right of supervision. They are chosen annually by secret ballot. Unfortunately, in the choice of candidates, especially in the larger cities, the point of view of party politics prevails. About every three months there are "parents' evenings," which mobilize the educational possibilities of the family.

Universities.—There are in the republic 23 universities and seven lyceums, with approximately 88,000 teachers and students. The largest are those of Berlin (nearly 12,000 teachers

and students) and of Munich (just under 10,000). The other universities are given in alphabetical order, with dates of foundation: Bonn, 1818; Breslau, 1506-1811; Cologne, 1488-1919; Erlangen, 1743; Frankfurt, 1914; Freiburg, 1457; Giessen, 1607; Göttingen, 1737; Griefswald, 1456; Halle, 1694-1817; Hamburg, 1919; Heidelberg, 1386; Jena, 1558; Kiel, 1665; Königsberg, 1544; Leipzig, 1409; Marburg, 1527; Münster, 1786-1818; Rostock, 1419; Tübingen, 1477; Würzburg, 1402-1582.

Finance and the Mark.—The 1923-24 budget estimate, as made public toward the end of 1922, showed a total deficit of 359,200,000,000 marks, against 445,100,000,000 in 1922. That includes contribution (reparations) deficit 238,800,000,000 marks, against 316,400,000,000 in 1922; postal deficit 69,950,000,000, against 45,380,000,000; railroad deficit 43,230,000,000, against 26,990,000,000; state administration deficit 7,220,000,000 against 56,300,000,000 in 1922. Taxes and duties will bring in, according to this estimate, 653,800,000,000 marks, against 324,900,000,000 in 1922. Army expenditures total 26,000,000,000, against 4,100,000,000; navy 5,410,000,000, against 1,510,000,000; postal department 185,900,000,000, against 106,700,000,000; railroad 997,500,000,000, against 473,900,000,000; contribution 262,700,000,000, against 362,300,000,000. (In this connection, see the article entitled REPARATIONS.) Total receipts will be 1,786,010,000,000 marks, against 893,500,000,000, and expenditures 2,145,300,000,000, against 1,338,600,000,000 marks. The note circulation of the Reichsbank, at the end of December, 1922, amounted to 1,200,000,000,000 marks, compared with 754,000,000,000 marks at the beginning of December and 469,000,000,000 at the beginning of November. Private discounts at the Reichsbank amounted to 422,235,000,000 marks on 30 December as compared with 247,000,000,000 a month before and 101,000,000,000 two months before. At the end of July the private discount figure had stood at 3,000,000,000 marks. The floating debt in treasury bills, which was stated to be 1,166,000,000,000 on 30 November amounted at the last of December to 1,495,000,000,000 marks. Practically no wage agreements were fixed for January, 1923, because employers generally awaited political developments before assuming wage obligations. The circumstance that few strikes of any kind occurred toward the end of the year was attributed by the employers' association to the fact that the unions were no longer able financially to support strikes. The only large strike during December was at the Ludwigshafen plant of the Badische aniline and soda factory; the strikers won, gaining wages considerably above the average. The cost of living, as indicated by the government index, showed a 55 per cent increase from November to December as compared with 102 per cent increase from October to November. Rents in Berlin averaged on 1 January 1923 about 40 times the pre-war figure as compared with 30 times at the beginning of December. The advance was due to an increase in the supplementary payments under the maximum rent law. The amount of bullion in the principal German banks 19 January 1922: Gold, £49,769,850; silver, £611,500. And, when

the year had passed, the amounts were: Gold, £50,110,580; silver, £7,259,150.

At the beginning of 1922, the value of marks was given as 182 to the dollar; on 1 October, 1,815 to the dollar; on 7 November, as 8,392, and very soon after the beginning of 1923, as 20,850 to the dollar; by 31 Jan. 1923 the price had dropped to 48,700 to the dollar. Commenting on the causes and effects of the German mark collapse, *Commerce Reports*, 20 Nov. 1922, observed (basing the statements on a cable from Commercial Attaché Herring, Berlin, 11 November, to the Department at Washington) that the new collapse, together with the expectation of a further decline, resulted in popular apprehension, greater uncertainty in all business, increased price confusion, panic buying of goods, and all other incidents of previous drops in the mark. The beginning of the decline of 12 October was generally attributed to the cabinet crisis in England; since then basic factors which made a further mark collapse inevitable were in operation. These basic factors bringing about currency depreciation (the valued comments proceed) may be listed as follows: The continuing adverse balance of payments, as aggravated by reparation payments; the complete loss of confidence abroad in any mark recovery, with the resulting refusal to purchase and the unloading of previous holdings; the invoicing of 60 per cent or more of German exports in high-exchange currency, thus greatly diminishing the legitimate commercial demand for mark exchange; anticipatory purchase of foreign exchange by German industry and, of less importance, speculation by individuals; and lastly, although this is an effect rather than a cause, continued inflation. The theory that internal speculation in foreign values was largely responsible for the collapse of the mark seems somewhat invalidated by the violent depreciation since the passage of the law providing for the control of foreign exchange transactions. This measure was in fact not so much a practical expedient as a gesture to quiet public apprehension over the new mark depreciation; it was aimed chiefly at the prevention of smaller private speculation and had no effect on legitimate purchase of foreign exchange by industry which must obviously cover raw-material purchases when contracts are made. This law, which went into effect about the middle of October caused much protest from trade and industry.

The German note circulation at the end of October amounted to 469,000,000,000 Reichsbank notes and 14,000,000,000 Government Loan Office notes. The Reichsbank circulation advanced during the month from 316,000,000,000, but the amount of the loan office notes was practically unchanged. The rate of inflation increased month by month, the additional circulation having been in round numbers 12,000,000,000 in March, 17,000,000,000 in June, 20,000,000,000 in July, 48,000,000,000 in August, 78,000,000,000 in September, and 153,000,000,000 in October.

The floating debt of the German government was given as 721,000,000,000 marks on 31 October, of which 604,000,000,000 consisted of discounted treasury bills. Of these discounted bills

the money market had absorbed only 127,000,000,000 marks, leaving an excessive amount in the Reichsbank. Private discounts at the Reichsbank amounted to 101,000,000,000 marks on 31 October, of which 25,000,000,000 had been added during the last week in the month. On 30 September the private discount figure was 50,000,000,000 marks; on 31 August, 21,000,000,000; on 31 July, 8,000,000,000. The Finance Ministry reports the revenue of the German government from April to September (first six months of fiscal year) as 343,000,000,000 marks, 218,000,000,000 of this being derived from the floating debt and 123,000,000,000 marks from taxation, but the forced loan receipts came to only 2,450,000,000 marks.

The stock market experienced a strong bull movement. The extent of turnover and the work involved made necessary the closing of the exchange for two days a week. Nevertheless, the market level did not react in proportion to the fall of the currency. The *Frankfurter Zeitung* stock index on 3 November stood at 318,145, compared with 98,880 on 6 October. Domestic loans went from 1,345 to 2,133 during the period, and foreign loans from 46,115 to 77,660. The remarkable appreciation of securities is to be attributed in part to the discouraging effect of the anti-speculation measures on small investors who formerly speculated in foreign currencies. The gold value of the share capitalization of German industry, estimated in July by the *Berliner Tageblatt* at 6,800,000,000 marks (against 31,000,000,000 at the end of 1913), was considered to be undoubtedly less in November than in July.

The various difficulties due to the shortage of capital were becoming more pronounced. Conditions tended to bring about the elimination of smaller concerns which were unable to obtain adequate bank credit to meet the new price levels or proportionately increase their capitalization. This elimination took the form of absorption by large corporations rather than of bankruptcies. The larger concerns were forced to draw upon their foreign high-exchange reserves. Actual currency was also still scarce; municipal and other corporations were issuing emergency currency. The *Frankfurter Zeitung* gave October capital increases as 3,798,900,000 marks, largely in the metals and machinery industries, mines and smelters, public utilities, and banks. New incorporations amounted to 1,078,600,000 marks, chiefly in metals, machinery, food-stuffs, and banks. The capital increases in September were 3,748,400,000 marks, and the new incorporations came to 905,700,000; capital absorption apparently was lagging far behind currency depreciation and price levels. During October, six corporations issued 2,309,500,000 marks in fixed interest securities, as against 3,283,200,000 marks by 21 corporations in September. Coal prices were increased on 1 November by approximately 60 per cent, and textile raw materials were advancing so rapidly as to affect both the cotton and woolen textile industries severely. Inland potash prices effective 3 November showed an advance over those of 1 October of about 250 per cent, while pig-iron prices jumped four times during the month. The *Frankfurter Zeitung* wholesale price index for

98 commodities showed an increase from 43,233 at the end of September to 94,492 at the end of October, a much closer response to currency depreciation than was noted in retail indexes. It must be considered, however, in comparing wholesale and retail price movements for the month that the controlled and artificially low rent prices were included in the retail index, and also that end-of-the-month prices were given in the wholesale index as against average prices in the retail.

The cost of renewing stocks was out of proportion to the purchase price of stocks on hand, and much confusion resulted from attempts to arrive at a proper selling price. Sales at renewal prices were prohibited by the government, although a greater percentage of profit than usual was allowed to offset partially the currency depreciation. A great variety of prices was often found in the same locality and even in the same establishment, according to the time of purchase and the extent of profit necessary for duplication. All domestic trade was on a shifting price basis. Although internal payments in foreign currencies were prohibited except in special cases, yet the practice of calculating on a dollar basis was increasing. In export trade probably 60 per cent of the transactions were in high-exchange currencies. The labor market was probably less favorable during October than it had been in September (although official unemployment figures did not reflect this), but the slump in production predicted some time ago had not yet set in. Part-time employment was on the increase, but the eventual industrial crisis apparently was postponed. All proposals to introduce part-time work had to be approved by a government commission which refused such applications in a large number of cases. The weekly changes in the prices of iron and steel and certain other standard goods and the very frequent wage changes (often weekly) were resulting in many negotiations and much paper work, and, of course, brought about great economic waste. Likewise the government control of foreign trade and other activities, together with the shifting basis of all economic life, resulted in enormous unproductive employment among the "white collar" class; production costs were increased, and the effect of the lower gold value of wages was partially nullified. Labor unions reported that 52,349 of their membership were unemployed on 1 October. This was 8 per cent, against an unemployment of 7 per cent in September. The response of retail prices to the new currency depreciation was greatly retarded. Currency depreciated between 1 October and 31 October about 450 per cent, while the government cost-of-living index showed an increase up to 25 October of only 92 per cent over the September average. Doctor Kuczynski's minimum living-expense index for Berlin showed a 98 per cent increase for the second half of October. The government cost-of-living average for October showed 22,066, a 65 per cent increase over the September average. On 25 October the index stood at 24,702, showing that the increase was mainly toward the end of the month. Doctor Kuczynski estimated the minimum weekly living cost for a family of four

in Berlin to be 6,136 marks during the first half of October and 8,871 during the second half. Effective on 13 November, the price of rationed bread was set at 112 marks for a 1,900 gram loaf. The average weekly wage paid in Berlin during the second half of October, 5,200 to 6,000 marks, indicates that wages were not keeping pace with the greatly advancing living costs. [This condition was said to prevail in Germany as a whole.] The internal purchasing power of the mark, an average gold value for October, was estimated by Kuczynski at \$0.001, while the foreign exchange value (based on an average mark-to-dollar rate of 3,308) was given at \$0.0003. During the second half of the month the averages above were \$0.0008 and \$0.00028, respectively.

Shipping.—Lloyd's 'Register of Shipping' states that, while practically every other maritime country showed a decrease in shipbuilding during 1922, as compared with 1921, Germany continued to forge ahead, her production being second only to that of British yards. Launchings in Germany during 1922 were 525,829 gross tons as against 509,064 tons in 1921. The output for both years was above the pre-war figure of 465,000 tons. A striking comment was made by the Department of Commerce, Washington, 30 December 1922, substantially in the following terms: German ship-owners and ship operators stress the effect of the Versailles treaty on German shipping; yet, says Consul J. K. Huddle, Hamburg, in a report to the Department of Commerce, the large companies at Hamburg and Bremen are launching new vessels, and the modern shipbuilding works at North Sea and Baltic ports continue to lay down new keels, while hundreds of thousands of tons under other flags are lying idle. In the 12 months ended June 1922, German merchant shipping increased 1,170,000 gross tons; while the combined merchant fleets of the United States, the British empire, France, Japan, Italy, Greece, Belgium, and Portugal increased only 735,000 gross tons. With a gross registered tonnage of about 5,500,000 in 1914, and losses of 2,700,000 tons as the result of war-time operations and of about 2,900,000 tons as the result of the provisions of the treaty of Versailles, Germany's tonnage immediately after the war registered the small total of 400,000. Of this total the greater part was composed of old vessels, due for scrapping, and of small coastal vessels plying local North Sea and Baltic ports. There was not one ship expressly designed for overseas traffic. But a report just published leads to the belief that on 30 Sept. 1922, the German merchant marine amounted to a total of 2,013,500 gross tons. The additions for September alone (included in these figures) cover six vessels launched, aggregating 33,700 tons, and 11 vessels completed that aggregate 60,700 tons.

Another authoritative statement issued by the *Boston News Bureau* and which seems indispensable at this point shows that the number of vessels using Hamburg harbor in October increased, although traffic generally declined elsewhere. The tonnage of cleared ships totaled 1,238,331, compared with 1,281,230 in October 1913, while the tonnage of incoming vessels to-

taled 1,271,787, compared with 1,291,623. In 10 months ended October 1922, 11,167,973 tons cleared Hamburg, compared with 12,123,629 tons in the corresponding period of 1913. Incoming tonnage for same period totaled 10,918,446 and 11,891,076 tons. A shipping strike in July made figures lower than they otherwise would have been. It is intended to enlarge Hamburg harbor. Since May, Bremen sea traffic has surpassed that of 1913. Below is a comparison of the tonnage of vessels using Hamburg and Bremen harbors:

	Hamburg		Bremen	
	Entered	Cleared	Entered	Cleared
September, 1913	1,247,000	1,223,000	369,000	229,000
July, 1921.....	888,000	808,000	232,000	229,000
August.....	955,000	920,000	291,000	316,000
September.....	1,018,000	1,014,000	288,000	285,000
October.....	1,047,000	1,072,000	325,000	296,000
December.....	873,000	878,000	274,000	246,000
July.....	1,065,000	948,000	305,000	218,000
August.....	1,171,000	1,420,000	437,000	546,000
September.....	1,208,000	1,266,000
October.....	1,267,767	1,238,331

A total of 26 per cent of Hamburg tonnage in September carried the German flag and 34 per cent of the Bremen. The following table shows tonnage using ports of Hamburg, Rotterdam and Antwerp:

	Hamburg	Rotterdam	Antwerp
Third quarter, 1922...	3,445,000	3,187,000	3,201,000
Second quarter, 1922...	3,642,000	3,288,000	3,191,000
First quarter, 1922.....	2,560,000	2,502,000	2,803,000
First nine months, 1922	9,647,000	8,977,000	9,196,000
First nine months, 1921	6,772,000	8,288,000	8,197,000

Sea traffic in all German harbors in 1920 reached only 35.5 per cent of 1913 and just equaled traffic of 1890. In 1920, 52.8 per cent of incoming tonnage carried the German flag, compared with 61.1 per cent in 1913. Following table shows year's tonnage:

	Entered	Cleared
1920.....	12,544,881	12,360,486
1919.....	7,719,786	7,808,964
1913.....	34,772,177	34,921,806
1910.....	29,930,553	30,203,756
1905.....	24,135,754	24,269,989
1900.....	18,585,757	18,669,061

Traffic through Kaiser Wilhelm Canal increased monthly as shown in table below:

	Entered	Cleared
June, 1921.....	2,424,000	632,000
January, 1922.....	2,032,000	664,000
February, 1922.....	360,000	194,000
March, 1922.....	3,073,000	809,000
April, 1922.....	3,292,000	979,000
May, 1922.....	3,852,000	1,016,000
June, 1922.....	3,908,000	1,279,000

In June, 37.5 per cent of this tonnage carried the German flag, compared with 41.7 per cent in May 1922, and 53.3 per cent in June 1921.

Imports and Exports.—During the fiscal year ended 30 June, Germany imported from the United States: Copper (238,330,000 pounds, valued at \$31,517,000); wheat (21,782,679 bushels, valued at \$31,507,603); flour (1,516,362 barrels, at a cost of \$19,076,205); cotton (103,631,453 bales, costing \$130,841,050); lubricating oil, valued at \$12,056,160; milk-preparations, valued at \$4,774,050; bacon, at a cost of \$5,959,577.

For the foregoing seven products, the total was about \$235,700,000; while \$350,442,438 represented the sum of all Germany's imports from the United States in the same period of 12 months. In the fiscal year before the war, the total value of German imports of the same seven products from the United States was given as \$394,000,000. The Department of Commerce's summary for July and the first seven months of 1922 shows:

GERMANY'S IMPORTS FROM THE UNITED STATES.

	Seven months ended July	
	1921	1922
Meats.....	\$5,200,683	\$3,742,819
Milk and cream.....	3,809,607	2,198,689
Edible oils and fats.....	22,567,643	15,802,670
Grain.....	48,275,460	27,764,111
Flour.....	8,972,002	5,008,062
Total food (except sugar).....	\$88,825,395	\$54,516,351
Copper.....	17,395,097	17,063,112
Cotton.....	55,322,960	69,375,804
Mineral oils.....	9,485,830	17,421,644
Tobacco.....	2,398,111	1,862,524
Sugar.....		3,962,407
Starch.....		1,504,064
Miscellaneous.....	3,625,267	3,522,593
Total.....	\$177,052,660	\$169,228,499

GERMANY'S EXPORTS TO THE UNITED STATES.

	Seven months ended July	
	1921	1922
Coal tar products.....	\$822,702	\$992,964
Cotton manufactures.....	41,391	70,703
Lace articles.....	380,848	545,077
China, etc.....	1,002,242	784,195
Crockery.....		103,355
Furs and fur skins.....	1,527,063	3,277,703
Upper leather, dressed.....		187,892
Gloves.....	1,279,792	945,580
Grass seed.....		535,790
Total.....	\$5,054,038	\$7,443,259

A cable from Commercial Attaché Herring, at Berlin, gave the following particulars in regard to German foreign trade for September: German imports for September amounted to 4,830,000 metric tons with an estimated value of 421,000,000 gold marks. Exports amounted to 1,590,000 metric tons and had an estimated value of 280,000,000 gold marks. A new method is being used in the computation of the gold-mark value of imports which takes into account the ratio of the paper mark to the dollar for the preceding month and the world market price. Such fictitious import valuations are misleading, as the world price is often not ascertainable; and the balance of trade figures are consequently meaningless. The gold value of exports is less inaccurate as some 60 per cent of total exports are invoiced in high exchange currencies. The exact gold value of exports invoiced in paper marks or other low-value currency is undeterminable. In comparison with August figures by weight the following percentages of decrease are noted in certain commodities: Machinery, 27; paper, 4; and coal, coke, and other

mineral fuels, except oils, 5. Increases were as follows: Pottery, 5; glass, 8; rubber, 25; cotton textiles, 23; woolen textiles, 32; electrical goods, 12; musical instruments, 16; toys, 9; iron and steel goods, 23; heavy chemicals, 22; dyestuffs, 7; and leather and leather goods, 25. The large increase, particularly in textiles, leather, and some electrotechnical lines, apparently reflect the partial saturation of the domestic market and increased pressure on export markets.

Germany's exports to Japan have been increasing, and are now greater in volume than before the war. For the year ended May 1922 such exports amounted to 83,310,000 yen (1 yen = \$0.4985)—an increase of 22,150,000 yen over the 1913 figures. For the first five months of 1922, the amount of exports from Germany to Japan exceeded by 35,000,000 yen, approximately, the amount for the corresponding period of 1921—Japan buying from Germany: strings, ropes and materials therefor; dyestuffs, paints and colors; metals and manufactures of metal; clocks, watches and scientific instruments; chemicals, explosives; and, in smaller amounts, many other varieties of merchandise. Passing on now to the end of the year, we find that German exports, in the iron and steel industry, were increasingly hampered during December by production costs, by foreign competition, and prohibitive foreign tariffs. Foreign competition was also having a more noticeable effect on the chemical industry. Exporters of paper were resenting the high export tax. Exports of cotton textiles were decreasing, supposedly on account of American and Japanese competition.

Railways.—According to *The Guaranty Survey* (New York, 28 Aug. 1922), such developments had been made in the construction of railway equipment in Germany that the 150,000 freight trucks and the 5,000 locomotives delivered to France by Germany, after the armistice, were replaced by new material; and the rolling-stock of German railways was not only in quantity equal but in quality superior to that in use at the outbreak of the war. On 1 July railway rates were increased by 25 per cent. Even before that increase they were officially estimated to be on an average 72½ times those of 1914. The total length of railway lines on 31 Dec. 1919 was 35,919 miles, of which total 34,689 miles were state roads; but all the various state railways were transferred to the national government 1 April 1920. Freight rates were increased 133 per cent 1 October, bringing them to 370 times pre-war rates, and again raised 60 per cent 15 October. Passenger rates had reached 45 times pre-war rates, and were to be advanced 100 per cent 1 November. In April 1922 expenses for the fiscal year ending 31 March 1923 were estimated at about 100,000,000,000 marks, and in June at 153,000,000,000. In July this estimate was raised to 195,000,000,000, in August to 235,000,000,000 and in September to 395,000,000,000 marks. Wages paid to rail workers were adapted to the scale used in private industries, so that there was an increase of 45,000,000,000 marks in expenses from September 1922 to March 1923. In September monthly expenses of state railroads increased 26,600,000,000 marks, of which 10,200,000,000 was for wages and 16,400,-

000,000 for materials. The following table shows the rise in prices of most important materials during August and September (in marks a metric ton):

Coal.....	from 2,200 to 5,500, or 175 per cent
Rails.....	from 20,600 to 50,000, or 243 per cent
Iron sleepers.....	from 20,900 to 51,000, or 244 per cent
Bar pipe.....	from 19,470 to 46,000, or 240 per cent
Pine.....	from 8,000 to 25,000, or 239 per cent

About 25 per cent of total expenses were for coal. Authorities decreased amount of coal used to 16 metric tons for 1,000 locomotive kilometers, compared with 17.7 in April. During the first quarter of the 1922 fiscal year ordinary expenditures of state railroads totaled 30,400,000,000 marks, and incomes 32,900,000,000, leaving surplus of 2,500,000,000 marks.

Radio Development.—The Department of Commerce at Washington observes that Germany, deprived of all overseas possessions, has been building up within her own borders a system of radiotelegraph and radiotelephone stations that is second to none in the world. The loss to Germany of her ocean cable system, built up at great cost during the 15 years preceding the war, made her dependent on neighboring countries for all her international communication except the portion that she could handle by radio. The logical result has been the increased use of high-power radio stations for overseas communications, especially to the United States. At the end of 1922 and beginning of 1923 the central office of the Gesellschaft für drahtlose Telegraphie, located in Berlin, controlled the two great transmitting stations, Nauen and Eilvese, and the two receiving stations Gelton and Hagen. Both the transmitting stations work on schedule—Nauen with New York, Moscow, Madrid, Rome and Bucharest; Eilvese with Rome and Madrid. Both have transatlantic press schedules as well.

Public wireless telephony was inaugurated 1 Sept. 1922.

Crops.—Harvests of 1922 were as follows: Wheat, 1,957,000 tons; rye, 5,283,000 tons; potatoes, 40,655,000 tons. In 1921, the yield was: Wheat, 2,934,000 tons; rye, 6,799,000 tons; potatoes, 26,157,000 tons. In 1913, on the basis of the same area, the harvests were: Wheat, 4,043,000 tons; rye, 10,132,000 tons; potatoes, 44,023,000 tons. The sugar-beet crop amounted to 10,791,000 tons, as compared with 7,999,000 in 1921, the acreage under sugar-beet cultivation having been about 894,140, as compared with 802,750 in 1921 and 1,359,000 acres in 1914. The Department of Commerce, under date 14 Oct. 1922, stated: Germany for years before the war was the leading beet-sugar producer of the world. But within the territory turned over to Poland by Germany under the terms of the peace settlement were 296,400 acres of beet-sugar land. Furthermore, some of the best beet-sugar soil of the old empire was in the Posen region and the Danzig corridor. With the territory there passed also to Polish control two sugar refineries and 30 or more sugar factories. Experts estimate that 450,000 tons of sugar production have been lost to Germany by territorial cession out of the 2,700,000 tons of pre-war capacity. Aside from territorial losses, beet growing has been further curtailed in the area now included in Germany,

the acreage having fallen in the post-war period about 21 per cent, while yields per acre have fallen off approximately 30 per cent, chiefly on account of labor difficulties and soil deterioration.

Live Stock.—A livestock census taken in December 1922 shows in Germany 16,309,474 cattle, 5,556,086 sheep; 14,135,950 pigs and 4,135,950 goats. All of these figures show a decrease from the year before.

Lumber.—Assistant Trade Commissioner Zwickel, Berlin, states in *Commerce Reports*, 7 Aug. 1922, that approximately 26 per cent of the total area of Germany was, before the war, covered with forests representing 14,223,200 hectares (1 hectare equals 2.471 acres), and that the present area of the forests is estimated at 12,783,000 hectares, 1,440,000 hectares having been surrendered by terms of the peace treaty. The low purchasing power of the mark makes it impossible for Germany to meet its own demands for woods by purchase in foreign markets, as in pre-war years. For this reason the Prussian state forestry administration plans to increase the domestic supply by felling more trees; and this may be done without impairing the condition of the forests, which in the past have been cared for wisely. The control of Germany's foreign trade in lumber is intrusted to a semi-official organization which has the authority to grant export and import licenses. It also checks the sales price made by the exporter, to prevent disparity between the selling price and the world market. During the early part of the year there was much speculative buying. The point was reached, however, where almost all stocks of seasoned logs, rough timber, and other lumber were absorbed and rumors were afloat that there was a decided shortage, which tended to increase the prices. The high prices, together with a stringent money market, caused a decided slump in orders beginning in April 1922. It was claimed that the price of German lumber had reached the world market level and in some cases even surpassed it. The nonactivity of the building trade and the officially enforced low rents which retarded building, brought about an acute shortage of houses, apartments, stores, and other buildings throughout Germany. The increase of rents permitted by the government brought about a change in building circles, thereby increasing the demand for building lumber. The other uses of wood and lumber products in Germany are very similar to those in the United States. The furniture and veneering industries have experienced a very busy period in spite of the high costs of lumber. The use of wicker and reed furniture has developed rapidly in the past eight years, since the average German can no longer purchase the better quality of furniture. The German federal railways have placed large orders for ties and telegraph poles. Large orders have also been placed by England, Belgium and France. The demand for ship-building lumber was heavy. The shutting off of former sources of pulp wood, coupled with a heavy demand, played an effective part in taxing the German supplies.

Coal.—Vice-Consul Davis, Berlin, stated in a report to the Department of Commerce that the increasing importation of English coal into Germany was due primarily to the decrease in

German production which had been going on steadily since March 1922, when the peak of post-war production was reached. In March, with 27 working days, 9,014,278 tons were produced, a daily average of 333,862 tons. At the same time, statistical reports showed fuel exports from Germany to be greater than before the war. The suggestion had been made, both in the Reichstag and in the press, that all exports of coal should be forbidden, in order that the needs of German industry might be met without having recourse to imported fuel. The most serious difficulty in the way of increasing production was the circumstance that miners were turning to other and more profitable employment. The building trades in particular were drawing away the miners by offering higher wages,—about 264 marks per day for unskilled labor, as against 230 marks per day earned by pickmen in the mines. . . . The estimated coal production for 1922 was 115,000,000 tons. The Ruhr area produced 94,115,000 tons in 1921.

Taxation of Business.—Commercial and industrial firms doing business in Germany are, or may become subject to the income tax, corporation tax, tax on capital—income, property tax, and turnover tax, beside numerous minor taxes. To this effect the United States Consul at Hamburg wrote in September 1922. As a rule foreigners are subject to German taxation if they have their residence in Germany, or if they have their "ordinary" residence in Germany for the purpose of doing business, or if they have their "ordinary" residence in Germany for more than six months. The consul adds that "the liability to pay taxes is retroactive" and that "any American business man or concern doing business in Germany even for a short time is liable to German taxation." For his statement in full, see *Commerce Reports*, 25 Sept. 1922, pages 842 and 843.

Government Assistance to Unemployed.—From the office of the American commercial attaché, Berlin, came a study of this subject, dealing with conditions up to 21 June 1922. First, we are reminded that straightway after the revolution the workers demanded that their right to work should be recognized and that the new government should provide unemployment allowances when the aforesaid just claim could not be met. The new government announced that both demands would be fulfilled; a method was devised to absorb unemployment by creating emergency jobs, and a system of allowances was introduced. Under the system of emergency work the government arranged to pay a part of the production cost to any employer who should initiate an enterprise providing work for the otherwise unemployed. Cities and local governments undertook such activities, which comprised the repair of streets, railways and waterways. The central government contributed about 25 per cent of the cost of these emergency works. By August 1921 workers employed in these activities numbered 200,000, and a further 267,108 were receiving government unemployment allowances. Official figures indicating the number of persons who received these allowances in the spring of 1922 are: On 1 March, 212,572; 1 April, 116,302; 1 May, 69,017. In preparation for a time when labor's needs may become more acute, the gov-

ernment was postponing all repairs and new building, in connection with public works, which could possibly wait, and was holding such things as a reserve, or provision for anticipated crises of unemployment. All free states of the republic were asked to do likewise, and the central government made an investigation to determine the character of future emergency works. . . . According to the regulation of February 1920, it is illegal for an employer to discharge a worker on the ground that economic conditions no longer require so large a force. As a first step toward reducing his force, the employer is required by law to distribute the work among a larger number of employees by shortening the day. Whether or not economic conditions finally warrant discharge is decided upon by an arbitration committee in co-operation with the factory council of the plant, which includes representatives of the workers. No official or union statistics are published showing to what extent part-time employment was actually practiced. The unemployment expert at the ministry of labor stated that practically no part-time work was being done, but the publication, *Gewerkschaftshaus*, estimated that about 20 per cent of German industry was running on a part-time basis. To judge from general conditions, the statement of the *Gewerkschaftshaus* would seem to be correct. The approach to world market prices caused a falling off of inland as well as foreign orders in a number of industries; the coal shortage preventing others from producing to capacity. In a number of industries work was limited to the filling of orders placed months before, and in many cases new orders steadily decreased.

History.—Although a separate article is devoted to reparations, it is impossible to omit emphatic references to that subject while reviewing, however briefly, the course of events in 1922. It seems reasonable, indeed, or natural, that our restatement of the outstanding dates and events should include—yes, and begin with—such a memorable item as the following: On 8 January, the Cannes conference assembled; in due time its program for the year was agreed on; January and February payments by Germany (reparation for damage done) were reduced. Without intentional neglect of any class of subjects, let us take up the happenings in chronological order—noting, for example, that on 14 January, the day after the moratorium was granted, a chemist at Frankfurt was sentenced to nine months' imprisonment and fined 50,000 marks, for attempted betrayal and sale of laboratory secrets to an American dye company. . . . On 20 January, at Tempelhof, near Berlin, a fire occurred which injured 800 factory workmen. . . . On 2 February a general railway strike, beginning at Berlin, spread to Cassel and Chemnitz, and on 5 February 57,000 Berlin public utility employees struck, stopping the light, water, and trolley services. The railway strike ended 7 February. . . . On 21 March the Reparations Commission announced the details of the conditional partial moratorium for 1922, namely, 720 millions of gold marks in cash and 1,450 millions in kind to be paid for the year. (A note which Secretary Hughes had sent the day before to the principal Allied Powers asserted the right of the United

States to priority of payment, out of such reparations, of the actual cost of the American army of occupation on the Rhine). . . . On 29 March 1,000 American soldiers from the Rhine, and 1,065 bodies of those who had fallen over there—the last to be brought home of our incalculable "actual" sacrifices in the war—reached New York on a transport. . . . Less than one week later, at Mons, Belgium, the betrayer of Edith Cavell to the Germans was sentenced to death. (The sentence was commuted in July to imprisonment for life). . . . Germany and Russia entered into a trade and economic treaty at Rapallo, Italy, 16 April; and on the 18th, at Genoa, representatives of the Powers in convention and of the Little Entente adopted a resolution censuring Germany for that separately made compact. Again an interval of two days. Then, Germany's representatives agreeing to take no part in the Russian negotiations at Genoa, the separateness just referred to appears to have been rather stressed than otherwise. . . . At Berlin, 22 April, A. B. Houghton presented his credentials as American Ambassador to Germany. . . .

At Genoa, 9 May, German and Polish representatives at the conference accepted the Silesian frontier line, as drawn by the League of Nations; and on the same day, at Oberammergau, the Passion Play was presented, for the first time since 1910. . . . The first German Ambassador to the United States since the war Otto L. Wiedfeldt, arrived in New York, from Bremen, 13 May. . . . On 23 May, in a collision of the German battleship *Hannover* and the torpedo boat T-18, ten sailors were killed. . . . On the following day, 24 May, a committee of experts, international bankers, held a first meeting in Paris to consider the subject of a loan to Germany,—ultimately (i. e., before adjournment of the conference, 10 June) finding the loan impossible under the schedule of payments then in force; and to that effect advising, it is understood, the Reparation Commission. . . .

Near Wilhelmshöhe, an attempt was made 5 June to kill the German Socialist leader Philip Scheidemann. . . . At Hamburg, the new steamship *Avare* upset at the dock, and more than 20 lives were lost, 16 June. . . . The German foreign Minister, Walter Rathenau, was assassinated at Berlin, 24 June. . . . It was reported, 30 June, that the Berlin police had discovered a plot to kill all leading Jews in Germany. . . .

An attempt was made, 3 July, to assassinate a leading editor, Maximilian Harden. . . . On 4 July, the Rapallo Treaty with Russia (mentioned above, as of 16 April) was ratified by the German government. . . .

Workmen's demonstrations against monarchists led to conditions resembling those of civil war at Singen, Voelpe, Zwickau and Zittau, 5 July. . . . One week later, 12 July, Germany presented a formal request for a two and one-half years' moratorium. (Compare the statement in regard to loan and payments, under date of 24 May, above.) . . .

In Saaleck Castle, Saxony, 17 July, Fischer and Kern, the assassins of Rathenau, committed suicide. . . . On 5 August, the liquidation of individual German claims against France was suspended; and sub-

sequently, at the third London conference, which extended from 7 August to 14 August, France refused to grant a moratorium without further guarantees. . . . The United States and Germany agreed, 10 August, on a commission to adjust the claims of the former against the latter. . . . On 12 August began the expulsion of 1,500 Germans from Alsace by French authorities. . . . On 31 August the Reparation Commission granted to Germany a six-months' moratorium—payment to be in treasury bills, guaranteed in a manner satisfactory to the Belgian government. . . . The Majority and Independent Socialists decided at Berlin, 24 September, to form a working alliance. This was characterized as the beginning of a fusion of the two German Social Democracy parties, and of the reunion of German labor—that restoration of unity which the masses of German labor have constantly desired. An immediate result was, that in the Reichstag 70 Independent and 110 Majority Socialist deputies could be relied upon to act as one party, forming a bloc of 169 or perhaps even 180 in a legislating body with but 469 members. Moreover, this union of the two Socialist parties was a natural thing, to which only the quite artificial alliance of Volkspartei, Centre, and Democrats could be opposed. The fundamental differences between the three bourgeois parties could not be ignored. The footing of the Socialist union was relatively secure; that of the opposing alliance, positively insecure. Reunion of the German Social Democratic groups was ascribed to the pressure of events which were the outcome of the post-war economic and political situation—of intolerable conditions, prompting leaders of both factions to establish Social Democracy once more as a firmly co-ordinated unit so that it might, with trade-union prestige regained, resume its dominant influence in affairs of the national government also.

On 14 October, at Leipzig, nine young men were sentenced to terms of penal servitude, ranging from two months to fifteen years, for complicity in the murder of foreign Minister Rathenau. (See notes, above, 24 June—3 July). . . .

The following day, 15 October, riots in which two policemen and two Communists were killed, took place at Berlin. . . . On 24 October the Reichstag prolonged President Ebert's tenure of office by adopting a constitutional amendment declaring that the provisional president elected by the National Assembly at Weimar should be the lawful first President of the German Republic until 30 June 1925. (See constitution, above.) Notification of the amendment thus secured was then conveyed by the President of the Reichstag, the Chancellor, and the Minister of the Interior to President Ebert, whose acceptance was not in doubt—the vote for the amendment having been about four to one. The Reichstag at that time voted pension provisions for the first President and his successors. . . . Ex-Kaiser Wilhelm married, 5 November, at Doorn, Holland, the Princess Herminie of Reuss. . . . The United Socialists (see the note with date of 24 September, above) voted 14 November, not to participate in a Coalition ministry which included members

of the German People's Party, That night the cabinet of Chancellor Wirth resigned. . . . In the afternoon of 16 November, Wilhelm Cuno, director-general of the Hamburg-American Steamship Line, was commissioned by President Ebert to form a new cabinet and immediately consulted party leaders for the purpose of ascertaining their attitude toward supporting a cabinet which should include members of the Centre and Socialist parties — a cabinet of work, truly representative, not partisan. . . . On

21 November the new cabinet was constituted as follows: Chancellor, Wilhelm Cuno; Vice-Chancellor and Minister of Justice, Dr. Carl Heinze; Minister of Foreign Affairs, Herr von Rosenberg; Minister of the Interior, Rudolph Oeser; Minister of Finance, Andreas Hermes; Minister of Economics, Johannes Becker; Minister of the Treasury, Dr. Heinrich Albert; Minister of Transportation, Gen. Wilhelm Groener; Minister of Posts and Telegraphs, Herr Stingl; Minister of Food, Herman Mueller; Minister of Defense, Dr. O. Gessler; Minister of Labor, Dr. Heinrich Brauns. . . .

On 25 November Chancellor Cuno, when opening the session of the Reichsrat, announced his intention to call a meeting of the premiers of the federal states in order to secure their co-operation in solving the problems confronting the nation. . . . On 28 November began the

strike of the people employed in the Baden Aniline works at Ludwigshafen. (This was settled 18 December and all the workers except the strike leaders were reinstated. The strike was occasioned by the dismissal of three members of the workmen's factory council. Two days before the settlement the strikers received a telegram from Moscow, to the effect that Communists were sending 3,500,000 marks in token of solidarity.) . . . At London, 9 December, a conference on reparations opened, Premier Bonar Law presiding. Two days later, 11 December, this conference, dividing on the matter of the contemplated invasion of the Ruhr, adjourned to 2 Jan. 1923, at Paris. Premier Poincaré, the reports ran, demanded then a French occupation of the Ruhr as the price of a German moratorium. . . . At Washington,

14 December, it was disclosed that the flotation of a \$1,500,000,000 loan to ward off German disintegration had been suggested to American banking interests. . . . On the same day, at Berlin, two men who had (3 July) assaulted and wounded Maximilian Harden, editor of *Die Zukunft*, were sentenced. . . . At Paris, also the same day, the Allied Council of Ambassadors decided not to accept the German government's offer to pay 1,000,000 gold marks. Bavaria's penalty for attacks on Allied military-control officers at Passau and Ingolstadt, unless the Bavarian government should agree to carry out other imposed penalties. Strained relations between those officers and the populace were, of course, fairly matched by strained relations between Munich and Berlin; but that is to be a theme, rather, of unwritten passion plays in 1923.

MARRION WILCOX.

GETTYSBURG COLLEGE, a non-sectarian co-educational institution, founded in 1832 and located at Gettysburg, Pa. Until 14 Nov.

1921 its corporate name was Pennsylvania College of Gettysburg. In 1922-23 it had a faculty of 40 members, 600 students, property valued at \$1,200,000 and an income of \$135,000. William A. Granville, Ph.D., LL.D., is president.

GIBBS, Alfred Wolcott, American mechanical engineer: b. Fort Fillmore, N. M., 27 Oct. 1856; d. Wayne, Pa., 19 May 1922. He was a student at Rutgers College, New Brunswick, N. J., 1873-74, and was graduated at Stevens Institute, Hoboken, N. J., in 1878. He entered the service of the Pennsylvania Railroad as an apprentice in the Altoona shops in 1879. From 1881 to 1893 he was connected with railroads in the South, successively as draftsman and then master mechanic of the Richmond and Danville Railroad, and superintendent of motive power of the Central Railroad of Georgia. From 1902 to 1903 he was assistant mechanical engineer of the Pennsylvania Railroad and superintendent of motive power of the Philadelphia, Wilmington and Baltimore Railroad. From 1903 to 1911 he was general superintendent of motive power of the Pennsylvania road and on 1 July 1911 he was made chief mechanical engineer, which position he held until his death. He was a member of the American Society for Testing Materials (president in 1915), American Railway Engineering Association, American Railway Association, American Society of Mechanical Engineers, Society of Naval Engineers, the Eastern Railroad Association (president), and a member of the board of managers of Franklin Institute, Philadelphia.

GIBRALTAR, a British colony in the province of Andalusia, Spain, commanding the entrance of the Mediterranean. The governor, who is also commander-in-chief of the garrison, exercises all functions of government and legislation. The area of the colony is $1\frac{1}{8}$ square miles with a maximum elevation of 1,396 feet. The fixed civil population in 1921 was 17,690, of whom 9,205 were females. In addition there were 1,700 aliens. The military population averages about 6,000. The fixed population are mostly the descendants of Italian and Spanish settlers and are adherents of the Roman Catholic faith. There are four Roman Catholic churches and one Protestant cathedral. Each denomination receives an annual subsidy from the government of £500. There are 16 elementary schools of which 12 are Roman Catholic. The pupil enrolment in 1921 was 2,604. The revenue of the colony in 1920 was \$1,435,255 and the expenditure \$1,864,970. Revenue is derived chiefly from customs, postal receipts, port and harbor dues, licenses, etc. The chief expenditures are for the maintenance of existing establishments, public works, pensions and ecclesiastical subsidies. There is no public debt. The industries of the colony are negligible. There is a large transit trade and the colony is an important coaling station for steam vessels. There is ample means of communication with England and the Continent. There are four private banks and one government savings bank. The legal currency is that of Great Britain but Spanish currency is in circulation. The governor in 1922 was Gen. Sir Horace L. Smith-Dorrien and the colonial secretary, Major C. W. J. Orr.

GIBSON, Joseph Thompson, American clergyman: b. Jefferson County, Pa., 13 Feb. 1844; d. 17 July 1922. He received the degree of A.B. from Washington and Jefferson College, Pennsylvania, in 1869 and was graduated from the Western Theological Seminary, Pennsylvania, in 1872. He received the degree of D.D. from Grove City College, Pennsylvania in 1893 and from Washington and Jefferson College in 1895. He was a sergeant in the 78th Pennsylvania infantry, 1861-64, and fought in the battles of Missionary Ridge, Stone River, Chickamauga and Lookout Mountain, etc.; and was wounded at the battle of New Hope Church, near Atlanta, Ga. He was superintendent of public schools of Indiana County, Pa., from 1869 to 1871, and was ordained to the Presbyterian ministry in 1872. He was pastor at Govanstown, Md. (1872-80) and at Sharpsburg, Pa. (1880-87). He served as secretary of the Synodical Sustentation Presbyterian Church (1887-90) and secretary and treasurer of the board of missions for Freedmen (1884-94). He was editor of the *Presbyterian Messenger* (1894-98); associate editor of the *Presbyterian Banner* (1898-99), and editor of the same from 1917 to the time of his death. He was also president of the Presbyterian Banner Publishing Company. He was acting pastor of the East Liberty Church, Pennsylvania (1901), trustee of the Western Theological Seminary, of Grove City College and of the Presbyterian Hospital, Pittsburg, and a member of the Chickamauga National Military Park commissioners for Pennsylvania (1894-99). He was also chaplain-in-chief of the Union Veteran Legion of the United States. He was the author of 'Biographical History'; 'Official History of the 78th Regiment, Pennsylvania Volunteer Infantry'; 'Jesus Christ the Unique Revealer of God'; and the 'Origin and History of the English Bible.'

GIFTS AND BENEFACTIONS. Among the principal gifts and benefactions announced during 1922 were the following: Anonymous gift of \$500,000 to Northern Baptist Fund; William P. Armstrong left by will to Wesleyan University at Middletown, Conn., \$100,000 in cash and residue of his estate of over \$1,000,000 to the New York Conference of the Methodist Episcopal Church, \$100,000 each to Home for Missions and Church Expansion of the same church; George F. Baker, \$1,000,000 as an endowment fund to the Metropolitan Museum of Art, \$250,000 to the American Museum of Natural History, \$500,000 to the New York Hospital and \$700,000 to Columbia University for the purchase of 46 acre tract for a stadium in the Dyckman section of the city of New York; Ball Brothers, of Muncie, Ind., gave \$1,000,000 to charitable and educational institutions; Mrs. Beatrice Boeke bequeathed 28,000 shares valued at \$1,000,000 in Cadburys Limited to the employees of that firm; Frederick Bertuch left by will to Columbia University \$100,000, and numerous minor benefactions to various charities; Miss Emily Howland Bourne left by will \$300,000 to the New York Association for Improving the Condition of the Poor; William Jennings Bryan gave his \$100,000 home near Lincoln, Neb., to the Methodist Episcopal Hospital Association; the Carnegie Corporation between 1 Oct. 1921 and 1 Oct. 1922 donated \$3,816,510 to

various colleges and organizations, including \$300,000 to New York University, \$200,000 to the University of Cincinnati, \$150,000 to the California Institute of Technology, \$150,000 to the Georgia School of Technology, and \$100,000 to the Stevens Institute of Technology; the Carnegie Corporation of New York set aside \$1,600,000 for the establishment and maintenance of an Institute of Economics at the national capital; Mrs. Lydia C. Chamberlain left by will to Columbia University \$500,000 for the establishment of fellowship; Mrs. Helen T. Cole left by will \$150,000 to the Presbyterian Hospital, New York; Senator James Couzens of Michigan donated \$1,000,000 to the Children's Hospital of Detroit; Charles R. Cross left by will to Harvard University \$100,000; Mrs. A. Gertrude Cutter bequeathed \$796,000 to the Hospital for Deformities and Joint Diseases; Robert W. De Forest and Emily Johnston De Forest donated \$2,000,000 for an American wing to the Metropolitan Museum of Art, New York; Cleveland H. Dodge gave \$165,000 to American colleges in the Near East; George Doheny of Syracuse, N. Y., left by will to Saint Joseph's Hospital of that city \$250,000, and \$150,000 each to Memorial Hospital, House of Providence, Onondaga Orphans' Home, Homeopathic Hospital, Saint Vincents Orphan Asylum, Syracuse Home Association, Syracuse Free Dispensary, and Saint Mary's Maternity Hospital; J. B. Duke gave \$1,125,000 to Trinity College, Durham, N. C.; the Educational Commission of the Commission for Relief in Belgium donated 15,000,000 francs to the University of Brussels; Amos F. Eno left by will \$272,000 to the American Museum of Natural History; Stanley Field of Chicago gave \$200,000 to clear off the building deficit of the Field Museum of Natural History, Chicago; John H. Flagler left by will to Saint Lukes, the New York and Presbyterian Hospitals \$1,000,000 to be shared equally also \$70,000 to the Saint Cecilia Club; Henry Ford bought the farm of the late John Burroughs and presented it to the Burroughs Memorial Association; Mrs. Stephen Harkness gave \$750,000 to the Fifth Avenue Presbyterian Church for a parish house; and \$3,000,000 to Yale University to increase the salaries of the faculty; August Hecksher gave 10,000,000 marks to Munich, Bavaria, for a hospital for shell-shocked soldiers; A. Barton Hepburn left by will \$750,000 to Hepburn Hospital at Ogdensburg, N. Y., \$200,000 to Middlebury College, Vermont, \$150,000 to Columbia University, and \$100,000 to Saint Lawrence University at Canton, N. Y.; the Mount Sinai Hospital, New York received \$150,000 through the will of Alfred S. Heidebach; Mrs. Sarah L. Holden of Newburgh left by will \$100,000 to Saint Luke's Maternity Hospital, and \$100,000 to the Holden Home for Aged Women; Margaret Howard of New York left by will \$400,000 for the establishment of the Howard Home for Indigent Needlewomen and the residue of her estate for its maintenance; Mrs. H. B. Hyde bequeathed \$100,000 to four hospitals; Mrs. Alice Tobey Jones left by will \$3,000,000 to the Bide-a-Wee Home Association for the prevention of cruelty to animals; Colonel and Mrs. Anthony B. Keuser left to the State of New Jersey their High Point estate of over 10,000 acres for park purposes; Samuel Mather of Cleveland gave

\$2,500,000 to Western Reserve University for construction of buildings for its medical school; Mrs. Calista S. Mayhew of South Orange, N. J., left the bulk of her estate of \$3,000,000 to various schools and charities; Miss Phoebe Mills left \$500,000 to the Presbyterian Church, its hospitals and charitable institutions; Frank Munsey gave \$100,000 to Bowdoin College, Me.; Miss Mary Oakley left her estate of \$300,000 to numerous charities; Baroness Solomon de Rothchild bequeathed her estate of 10,000,000 francs to the city of Paris; Jacob H. Schiff left by will \$1,350,000 to various charities and institutions and 2,000,000 marks to the city of Frankfurt, Germany for municipal purposes; Mrs. Mary Scranton of New Haven, Conn., bequeathed \$850,000 to charities; Herman Sielcken, a German-American, bequeathed \$600,000 to Baden-Baden for a Maternity Home for Poor Mothers; William Sloane donated \$100,000 to the Y. M. C. A., \$100,000 to the Presbyterian Hospital, \$100,000 to Yale University, and numerous minor bequests; Delavan Smith, of Indianapolis, bequeathed \$100,000 to the Methodist Episcopal Hospital, \$150,000 to the Indiana Historical Society and \$100,000 to the Lake Forest Hospital Association; Mrs. Dexter Smith bequeathed \$100,000 to Wesleyan University; the same institution received \$170,000 through the will of Mrs. Harriet A. Smith, who also left \$120,000 to the Springfield (Mass.) Hospital; Mrs. Anna M. Swift left \$500,000 in charitable bequests; Mrs. J. T. S. Wells donated \$300,000 to the City and Suburban Homes Company and the Open Air Tenement Company; Dr. I. C. White, left to the University of West Virginia and the city of Morgantown 1,900 acres of coal lands estimated to produce a total revenue of \$3,000,000; the Samuel Clark Williams estate estimated at from \$200,000 to \$1,000,000 was left to the Salvation Army to be known as the Hiram Williams Foundation; John D. Rockefeller, Jr., gave \$1,000,000 to the American Museum of Natural History. The Rockefeller Foundation gave a total approximating \$12,500,000 during the year, of which \$6,000,000 was to the Johns Hopkins School of Hygiene and Public Health, \$2,000,000 to the London School of Hygiene, \$2,500,000 for the relief and control of hookworm, tuberculosis and yellow fever and \$1,510,000 for medical schools and hospitals in China. The total appropriations of the General Education Board in 1922 totaled \$8,221,900. See also PAINTING AND SCULPTURE.

GIPSY MOTH. See ENTOMOLOGY, UNITED STATES BUREAU OF.

GIRL SCOUTS, Inc., a national, non-sectarian, non-partisan movement, which has for its object the development of wholesome happy girlhood prepared for effective citizenship through participation in small, self-governing groups. Patterned after the British Girl Guides, it was founded here by Mrs. Juliette Low of Savannah, in 1912. In 10 years it has spread to every State, and is now in 2,500 communities, with a total membership of 130,000, of which 10,000 are officers. It is affiliated with scouting organizations in more than 30 countries throughout the world. The governing body, the national council, composed of delegates from local councils, meets annually. The national executive board,

through its New York City headquarters (189 Lexington Avenue), carries on the work of recruiting and training leaders, distributing supplies and equipment, issuing literature, and aiding in local development. Activities center about home, health and citizenship, as adapted to the interests and capacities of girls from 10 to 18 years of age. Eight girls with an elected leader make up a patrol. Two or more patrols constitute a troop. The troop, the administrative unit, usually has about 32 girls, and is headed by a captain, at least 21 years of age, whose character and competence as a leader of younger girls have been attested to before she is commissioned. The captain may have several lieutenants. To become a scout, a girl must pass a "Tenderfoot" test, and subscribe to the "Scout Promise" of duty to God and country, and "Laws" of honor, loyalty, helpfulness, friendliness, courtesy, humanity, obedience, cheerfulness, thrift and cleanliness. These laws are the rules of the scout game, and all the activities of troop and patrol are subject to them. As scouts, girls learn cooking, sewing, home nursing, child care, self help and resourcefulness in many lines, as well as first aid and life saving, and other forms of community service. Proficiency is rewarded by badges in over 50 subjects. The distinctive method of scouting is the patrol system, which places responsibility and authority upon the individual girls through their chosen leaders. Captains and lieutenants act as elder companions and guides, rather than as teachers or supervising officers. Troop business and discipline by patrols are carried on through the court of honor, made up of leaders and the captain. This gives a practical experience in democratic and representative government on a comprehensible scale. The weekly troop meetings are taken up with games that involve specific knowledge of various sorts, acquired in the natural way of education by play. Singing and dancing, especially folk dancing, story telling, spontaneous expression through dramatizations and cheer making, are all used. Business-like keeping of records and accounts is encouraged by inter-patrol competition. Hiking and camping and outdoor activities generally are preferred. More than 100 Girl Scout camps were maintained in 1922, of which 61 were permanent.

Standards of achievement and general morale, particularly in the choice and training of the young captains, upon whose qualities of leadership so much depends, are the special concern of local councils, now numbering 298. The grade of young women attracted to scouting is shown by the fact that over 60 per cent of the captains have had more than high school training, nearly 40 per cent having graduated from college, and the rest from normal or other professional schools. Training courses for leaders have been established in more than 80 colleges and other institutions of higher learning, and are called for in many more. The Girl Scout program has been endorsed by the following national organizations: The American Association of University Women, the Girls' Friendly Society, the American Red Cross and the National Board of Social Agencies. Publications include: 'Scouting for Girls,' (the official handbook, 576 pp., illustrated); 'Campward Ho!' (a manual for camp directors); 'The

Blue Book of Rules for Girl Scout Captains,' miscellaneous pamphlets on community service, council organization, training courses, and special programs for younger and older girls, and a monthly magazine, *The American Girl*. The officers for 1922 follow: Founder, Mrs. Juliette Low; president, Mrs. Herbert Hoover; vice-presidents, first, Mrs. James J. Storrow; second, Mrs. Arthur O. Choate; third, Mrs. Julius Rosenwald; fourth, Mrs. William F. Sims; fifth, Mrs. E. M. Swift; chairman, executive board, Mrs. V. Everit Macy; counsel, Mr. Douglas Campbell; treasurer, Mrs. Nicholas F. Brady; National Director, Mrs. Jane Deeter Rippin. Executive Board, Miss Sarah Louise Arnold, Mrs. Leo Arnstein, Mrs. Selden Bacon, Mrs. Nicholas F. Brady, Mrs. Frederick H. Brooke, Mrs. Francis K. Carey, Mrs. Arthur W. Hartt, Miss E. Gwen Martin, Mrs. William G. McAdoo, Mrs. Robert G. Mead, Miss Llewellyn Parsons, Mrs. Harold I. Pratt, Mrs. Theodore H. Price, Mrs. W. N. Rothchild, Mrs. A. Clifford Shinkle, Mrs. Charles Welch, Mrs. Percy H. Williams. Permanent Committee: secretaries, education and publications, Dr. Louise Stevens Bryant and Dr. Elizabeth Kemper Adams; field and standards, Miss Sybil M. Gordon; camp, Miss Louise Price. The work is supported by membership fees, sales of literature and equipment, and contributions.

LOUISE STEVENS BRYANT,
Educational Secretary.

GLASGOW, Robert, Canadian editor: b. Canada, 1876; d. New York, N. Y., 5 April 1922. Until 1916 he had carried on a publishing business in Toronto, Canada, and had published 'The Chronicles of Canada.' He later edited 'The Chronicles of America,' a 50-volume historical work that gained him the honorary degree of M.A. from Yale University in 1919. He was a member of the Canadian and Yale clubs. The Yale University Press has created at Yale the Theodore Glasgow Foundation in memory of a son, an aviator in the Canadian army, who was killed over the German lines in Flanders during the World War. Mr. Glasgow had incorporated his recent publishing activities under the name of the United States Publishers' Association.

GLASS INDUSTRY. The glass industry is recovering rapidly from the depression of 1921. Window glass suffered largely from the depression in building, but the recovery of that industry in 1922 brought back this trade. Bottle glass suffered from the diminution of the liquor traffic, but trade began to revive early in 1922, and were it not for wage disputes, the two branches of the industry would be classed as normal. The importation of glassware tends to reduce slightly, and also the export. The great development of machinery for glass-making in America has more than offset the lower cost of labor abroad. In no European country is the glass business back on a satisfactory basis. In Belgium it is down fully one-half; the French industry makes an even poorer showing, and in Great Britain glass manufacturers complain that the German glass is finding its way in, at prices with which they cannot compete. That the German glass industry is doing better than any other on the continent is shown by the fact that that country is paying part of its indemnity to Italy in glass, much to the disgust of Italian glass

workers. The Germans are using some American bottle-machines, and the other countries named use a very few, and would buy more if they had the credit to buy them. Canada bought a good deal of American glass during and since the World War, and Mexico, Belgium, Cuba and Argentina bought, but all of this trade appears declining, while the home demand is enough to keep American factories busy. The satisfactory condition of the glass trade seems largely due to willingness to moderate prices to the consumer. In April, 1921, the American Window Glass Company cut prices 21 per cent, and in January 1922, followed with another cut of 23 per cent. Two-thirds of the window glass is now made in 27 factories by machine methods. Of the bottle glass, 50 per cent is wholly machine-made and about 33 per cent is produced by semi-automatic machinery. In 1921 the glass industry of the United States included 328 establishments, which gave occupation to 59,705 people. With \$86,883,000 of materials they produced \$212,593,000 worth of goods. We continue to import high-grade glass, at an average duty of 28 per cent. The following table shows the details.

IMPORTATIONS OF GLASS AND GLASSWARE

	1920	1921	1922 (Est.)
Bottles, ordinary.....	\$335,000	\$317,000	\$295,000
Bottles, cut, etc.....	1,462,000	1,564,000	2,220,000
Optical.....	1,045,000	999,000	1,371,000
Window glass.....	1,527,000	2,378,000	2,640,000
Plate glass.....	2,913,000	2,090,000	3,752,000
Other.....	3,466,000	2,698,000
	<u>\$10,648,000</u>	<u>\$10,036,000</u>	<u>.....</u>

Of more than ordinary interest was the announcement made in 1922 that at one of the oldest of the glass factories in Bohemia, after many years of experiments, a glass had been produced which, it was claimed, is absolutely unbreakable. Receptacles made from the material, it was said, can be thrown about, made red hot and then put into cold water and yet do not break. It was claimed that hammers made from the material can be used for ordinary purposes. The glass is difficult to cut, even with a diamond, while the ordinary carborundum stones are useless for the purpose. Another new and interesting discovery of considerable importance to the glass trade was reported by two Czech engineers. The manufacture of glass and glassware is one of the leading and oldest-established industries of Czechoslovakia, Bohemian glass having enjoyed a reputation in all parts of the world for several centuries. The new discovery is that of a silica which is suitable for the production of raw glass without the aid of other ingredients. The mineral is of volcanic origin, somewhat resembling lava, and the deposits are said to be very extensive.

GLEICHEN, Lady Feodora, English sculptress: b. London, England, 20 Dec. 1861; d. there, 22 Feb. 1922. She was a daughter of the late Admiral Prince Victor of Hohenlohe-Langenbourg, son of Queen Victoria's half-sister, for whom Lady Feodora was named. When the Prince was born, Queen Victoria asserted that he should be brought up as an Englishman, which was done. He went into the navy and distinguished himself in the Crimea,

the Baltic and China. He married Laura Wilhamina, a daughter of Admiral of the Fleet Sir George Seymour, and sister of the fifth Marquess of Hertford. He was himself a sculptor of considerable ability. Prior to 1917 Lady Feodora was known as the Countess Feodora Gleichen, her brother, Maj.-Gen. Lord Edward Gleichen, who distinguished himself in the Boer War and also in the World War, as Count Gleichen, and her sister, Lady Helena Gleichen, the artist, who lived with her in Saint James' Palace, where she died, as Countess Helena Gleichen. Lady Feodora studied art at the Slade School, the University College under the late Professor Legros, and also in Rome. After 1893 she was a regular exhibitor at the Royal Academy. Among the best-known of her works are the life-size figure of Queen Victoria, executed for the Victoria Hospital in Canada in 1895; a bust of Queen Alexandra, belonging in 1922 to the Constitutional Club; fountain in Hyde Park, executed in 1902; the external decoration of the Foundling Hospital in Cairo; the Edward VII Memorial at Windsor; the Florence Nightingale Memorial at Derby, two busts of Queen Victoria; panel for the exterior of the National Art Gallery; a fountain in Paris; memorial (unveiled October 1921), at Monchy-le-Preux to the fallen of the 37th British division, which was formed and at first commanded by her brother, Lord Edward Gleichen, and a bas-relief of her nephew, Roger Machell, as a baby. She was an accomplished modeler, and in her work manifested a breadth and simplicity, attributable, undoubtedly, to the teachings of Legros. She was also a very good water-color artist and draughtsman and was an honorary member of the Royal Institute of Painters in Water-Colors and of the Royal Society of Painter-Etchers.

GLENNEY, Charles, English actor: b. Glasgow, Scotland, in 1857; d. Worthing, Sussex, 1 Oct. 1922. The son of an actor, he made his first appearance in London in 1878 as Thuerdier in 'The Barricade' at the old Duke's Theatre, Holborn. He then played at the Criterion, Globe and Royalty theatres, London, and in 1880 was engaged by Henry Irving. He appeared at the Lyceum as Tybalt in 'Romeo and Juliet,' Don Juan in 'Much ado about Nothing,' etc. In 1881 he came to New York and joined Lester Wallack and played in 'Moths,' 'An American Wife,' 'Deception,' 'Lady Clancarty' and other dramas. Returning to England in 1885 he appeared at the Adelphi in 'The Last Chance,' and, rejoining Irving appeared as Gratiano in 'The Merchant of Venice,' Valentine in 'Faust' and Strahlenheim in 'Werner' as well as in various Shakesperian plays in 1887. In 1888 he was at the old Princess' Theatre as Jack Manley in 'The Still Alarm.' After a period at Drury Lane, he became associated with Martin Harvey, the well-known actor-manager and played leading parts with him in 'Richard III' and 'The Only Way to Pay Old Debts.' He attracted some attention as Christopher Sly in a production of 'The Taming of the Shrew' at the Prince of Wales Theatre. He also played in 'The Aristocrat' with Sir George Alexander. Other roles in which he achieved success were

Colonna in 'The Corsican Brothers'; Count von der Trenk in 'Armageddon'; Colonel Hungerford in 'The Breed of the Treshams'; and Maurice Morris in 'The Faun.' He also played in variety with Miss Kate Cutler.

GLIDERS. See AERONAUTICS.

GODDARD, Arabella, English pianist: b. Saint Malo, Brittany, France, 12 Jan. 1836; d. Boulogne, France, 20 April 1922. She came of an old Salisbury family and early displayed a talent for the piano and at the age of seven played for Chopin and was caressed by Georges Sand, who heard her on this occasion. At the age of eight she studied with Kalkbrenner in Paris. Afterwards she had lessons with Mrs. Andersen, Thalberg and J. W. Davison in England. The latter, who was musical critic of the *London Times*, she married in 1860. Her real début took place at a grand national concert at Her Majesty's Theatre in 1850, Balfe conducting. In 1854-55 she traveled in Germany and Italy giving concerts. At a Gewandhaus concert in Leipzig, in 1855 she had an enthusiastic reception. In 1856 she won a gold medal at a Philharmonic concert in London. From this time forward she played frequently in London and other English cities and towns and in 1873-76 made a long tour around the world, visiting the United States, Australia, China, Java and India. She won a medal at the Paris Exposition in 1878 and retired in that year from public life. Madame Goddard played in Sims Reeves's benefit concert, London, March 1882 and her own benefit concert 9 March 1890.

GOLD. According to a report issued by the Bureau of the Mint, in co-operation with the Geological Survey, the refinery production of gold in the United States in 1922 was 2,375,019 ounces valued at \$49,096,000, a decrease in value from the production of 1921 of \$971,000. The country's record production occurred in 1915 when the output was valued at \$101,035,700. California, as usual, led in production in 1922 with a total output of 717,358 ounces, valued at \$14,829,100. Alaskan production amounted to 380,769 ounces valued at \$7,871,200. In 1921 California produced 716,477 ounces and Alaska produced 412,915 ounces. The total production for the United States by years from 1917 to 1921 inclusive was as follows: 1917, 4,051,440 ounces; 1918, 3,320,784 ounces; 1919, 2,918,628 ounces; 1920, 2,476,166 ounces; 1921, 2,422,006 ounces. The table on page 359, prepared by the Bureau of the Mint and the Geological Survey, shows the production by States in 1922.

South Africa is to-day the great gold producing section of the world. According to the United States Department of Commerce in 1922 its production amounted to 7,020,110 fine ounces, valued at £29,835,467, against 8,114,516 ounces valued at £42,529,596 in 1921. These figures are based on the standard price of 85 shillings an ounce to which the price was reduced from 88 shillings and 6 pence in November. The falling off in production during 1922 was due to the disastrous strike in the Rand in March. The management of the great mines in that locality felt that cost had to be reduced and one method of reduction proposed was to reduce the proportion of white labor and replace with black

REFINERY PRODUCTION OF GOLD IN THE UNITED STATES IN 1922.

STATE OR TERRITORY	Gold	
	Ounces	Value

Kaffirs. The custom had been to use 10 per cent of white labor, mostly in directive positions. The company not only undertook to reduce wages but also to reduce the proportion of white labor to 8 per cent and to advance a sufficient number of the more competent blacks to better positions. The strike that followed led in March to pitched battles in which 217 men were reported to have been killed and 591 wounded. It ended in a victory for the mine owners.

The tendency in South Africa is to improve machinery and reduce hand labor. The most forward movement has been made by the New States Areas Company, on the Witwatersrand, which has built enormous new works, with a capacity of 50,000 tons of ore a month, in which the ore is crushed entirely without gravity stamps and without amalgamation. Crushers and tube-mills are used instead; great jaw crushers reduce the lumps of ore to a size not over 2½ ins. This product is further reduced by disk crushers to one-inch diameter balls that can be handled in the tube-mills. Conveyors carry these inch lumps to 13 extremely large tube mills. Here they are comminuted and then pumped to slime collectors; then to agitator tanks. Cyaniding begins at the tube mills. The agitator tanks are among the largest ever made—22 by 45 feet. Then the product goes to storage tanks and filter plant. Classification follows in the usual way. The plant will handle 600,000 tons of ore annually.

World Production.—Statistics showing the world production of gold in 1922 were not available at the time this article was written, but the production in 1921 was estimated at 15,644,812 fine ounces as compared with the 1920 production of 16,205,029 fine ounces. The value of the gold produced in 1921 was placed at 65,886,925 pounds sterling or approximately \$329,000,000. The 1920 production had a value of \$334,987,610, and the 1919 production 17,695,037 fine ounces a value of \$365,788,796. Production in 1921 showed a decrease of 7,029,756 ounces compared with the output in 1915 when the high-water mark of 22,675,568 ounces was reached.

Generally gold is shipped from one country to another in the shape of bars which come in all sizes. Those withdrawn from the United States Assay Office are uniform and worth about

\$7,000 each. English gold generally is shipped in boxes which average \$30,000 or \$35,000 per box. South America, on the other hand sometimes ships gold in bars no larger than a pencil and often smaller.

According to the 'Statistical Abstract of the United States' issued by the Department of Commerce, the gold produced in the world since the discovery of America up to and including the year 1920 totaled 875,629,722 fine ounces valued at \$18,100,874,536. Of this amount about \$8,000,000,000 it was stated, was in circulation as money in the banks and public treasuries of the world—about \$2,000,000,000 of the \$8,000,000,000 being in the United States Treasury. The other \$10,000,000,000 worth, has been used up in the industrial arts or has disappeared in the 430 years which have elapsed since the keeping of gold statistics began.

Imports and Exports.—According to the Department of Commerce, the gold imported into the United States in 1922 totaled \$275,169,785 as compared with imports in 1921 of \$691,248,297 and imports in 1920 of \$417,068,273. Exports of gold in 1922 amounted to \$36,874,894 as compared with exports of \$23,891,377 in 1921 and exports of \$322,091,208 in 1920.

During the full year 1922, Great Britain imported gold from more than 17 separate countries. Out of the total imports of £34,543,591, the Transvaal sent £30,382,102; West Africa, £1,113,500; the United States, £472,360, and British India, £122,974. Importations from all other countries were considerably less than £100,000.

Exports of gold were made during the year to more than twelve separate countries. Out of the total shipments of £44,851,917, the United States took £26,632,645; British India, £12,949,424; France, £3,666,052; the Straits Settlements, £531,339, and Switzerland, £329,000.

GOLD COAST, a British west African colony situated on the Gulf of Guinea between the French Ivory Coast and Togoland. It has a coast line of 334 miles. With Ashanti and the protectorate it has an area of 80,000 square miles and a population in 1921 of 2,029,750. The chief towns are Accra (20,000); Secondee (8,000); and Cape Coast Castle (11,000). The Europeans in the colony number 2,345. In 1920 there were 19 government schools and 198 assisted schools under the control of various religious denominations. The attendance was 23,162 out of an enrollment of 28,580. The government expenditure on education in 1920 was \$247,426. The colony produces cocoa, palm oil, kola nuts, rubber, palm kernels, manganese and timber. The coast fisheries are increasing in importance, the dried product being sent to the interior. Gold is found in quartz and in alluvium. In 1920 the revenue of the colony amounted to \$18,608,860 and the expenditure to \$14,231,735. The revenue is derived from customs, railways, licenses, etc., and the chief expenditures are for public works, debt charges and the railways. The public debt in 1921 was \$36,720,590. The colony imports cotton goods, machinery, foodstuffs, building materials and fuel oil. Cocoa is the chief export, the value of this item in 1920 being \$50,281,490.

There is a government railway from Secondee to Coomassie, the capital of Ashanti, 168 miles, with branch lines aggregating 23 miles.

A line 85 miles in length has been constructed from Accra to Anyinam and in 1922 a line was constructed from Coomassie to Accra. The colony has 320 miles of improved roads and 2,100 miles of secondary roads. There are 60 telegraph offices and 2,762 miles of telegraph line. Since 1901 Ashanti has been under the governor of the Gold Coast, although the laws and ordinances of the latter do not apply in Ashanti. Ashanti has a population of 420,000. Cocoa and rubber are the chief products of the soil. Gold is found also, the output in 1920 being 70,719 ounces. There are thousands of acres of valuable forest lands. The governor of the Gold Coast in 1922 was Brig.-Gen. Sir F. G. Guggisberg and the colonial secretary was A. R. Slater.

GONORRHEA. See PUBLIC HEALTH SERVICE, UNITED STATES.

GONZAGA UNIVERSITY, a Catholic educational institution for men, founded in 1887 and located at Spokane, Wash. In 1922-23 it had a faculty of 51 members, 725 students, and property valued at \$2,000,000. Rev. W. J. Fitzgerald, S.J., is president.

GOODING COLLEGE, a Methodist-Episcopal co-educational institution, founded in 1913 and located at Gooding, Idaho. In 1922-23 it had a faculty of 16 members, 140 students, property valued at \$150,000, and an income of \$38,000. Charles Wesley Tenney, is president.

GOSHEN COLLEGE, a Mennonite co-educational institution, founded in 1895 and located at Goshen, Ind. In 1922-23 it had a faculty of 13 members, 189 students, and property valued at \$136,800. Income figures not given for 1922-23 but for 1921-22 they were \$47,700. Daniel Kauffman, is president.

GOUCHER, John Franklin, American educator: b. Waynesburg, Pa., 7 June 1845; d. near Baltimore, Md., 19 July 1922. He received the degree of A.B. from Dickinson College in 1868, the degree of A.M. in 1872, the degree of D.D. in 1885 and the degree of LL.D. in 1899. In 1869 he entered the Methodist Episcopal ministry in the Baltimore Conference and was pastor of various Baltimore churches before he founded the Woman's College, of Baltimore (now Goucher College) in 1885, of which he was president until 1908 when he became president emeritus. He projected and built Harlem Park, Strawbridge and the new first churches in Baltimore; was president of the board of trustees of Centenary Bible Institute (now Morgan College) after 1883; was projector and benefactor of Princess Anne Training School; lifted the debt of Martin Missionary Institute, Frankfort-on-the-Main, Germany; projected and directed the organization of the Anglo-Japanese College, Tokyo, Japan, in 1882; founded the West China Mission and Korean Mission of the Methodist Episcopal Church; inspected the missions of the Methodist Episcopal Church in Italy in 1886, in Mexico in 1892, in India in 1897-98; in India, Java, China, Korea and

Japan, 1906-07; projected and supported a system of over 120 primary and secondary vernacular schools in India, 1883-1908; was member of the Board of Foreign Missions of the Methodist Episcopal Church (chairman, committee on education) after 1884; was a trustee of the University of Peking, China; president of the board of governors of West China Union University, Chentu; was delegate to general conferences of the Methodist Episcopal Church after 1888; fraternal delegate to the Methodist Episcopal Church, South, in 1894. He was a member of the business committee of the World Missionary Conference, Edin-Mission Field 1910-20; inspected educational institutions in Japan, Korea and China in 1910-11, 1913-15, 1919-21. He was a founder in 1902 and a member of the executive committee from that date until 1909 of the Young Peoples Missionary Movement; he founded the Pai Chai (the first Christian school in Korea), Seoul, in 1883. He was a member of the Joint Commission on Unification of American Methodism, 1912-20; president of the Maryland Bible Society, 1909. He was a trustee of Fukien Christian University, Foochow, China; of Chosen Christian College, Seoul, Korea; of Union Methodist Episcopal Theological Seminary, Seoul; a member of the Archaeological Institute of America; of the American Academy of Political and Social Science, the Anthropological Society; the American Association for the Advancement of Science, and various other organizations. He was decorated by the Emperor of Japan with the Order of the Rising Sun, third class, in 1920 and was awarded the Chia-ho Decoration, third class, by the President of China in 1921. Doctor Goucher was a life member of the Asiatic Society of Japan, an honorary life member of the Maryland Academy of Science, and president of the American Methodist Historical Society. He published 'Young People and the World's Evangelization,' 'The Sunday School and Missions,' 'Christianity and the United States' (1908), 'Growth in the Missionary Concept,' and 'Principles of Stewardship.'

GOUCHER COLLEGE, a non-sectarian educational institution for women, located in Baltimore, Md. It was founded as the Woman's College of Baltimore in 1885, by the late Dr. John F. Goucher, in honor of whom the name was changed about the time he retired as active president. In 1922-23 had a faculty of 90 members and a student enrollment of 986. For the same year, the value of the institution's property was placed at \$3,102,500, and its income at \$370,000. Its president is William W. Guth, Ph.D., LL.D.

GOULD, Sir Alfred Pearce, English surgeon: b. Norwich, England, 2 Jan. 1852; d. Ashburton, Devonshire, England, April 1922. He was educated at Amersham Hall School, at University College, London, at University College Medical School, and at the University of London. He was admitted to membership in the Royal College of Surgeons, England, in 1873, elected a fellow thereof in 1877, served on the council from 1900-16, and as acting vice-president 1908-10. He had an equally dis-

tinguished career at the University of London, where he obtained his degree of Master of Surgery in 1876, served as a member of the senate in 1900, was dean of the Faculty of Medicine from 1912 to 1916, and acted as vice-chancellor for the years 1916-17. He began his professional life in 1877 as assistant surgeon and lecturer on anatomy at the Westminster Hospital, posts which he resigned in 1882, on his election as assistant surgeon at the Middlesex Hospital. He remained attached to this hospital for the rest of his life, becoming surgeon, lecturer on surgery, and consulting surgeon. At the Royal Society of Medicine he served as treasurer, and was president of the clinical section. He also served as president of the Medical Society of London in 1902, and he was president of the Röntgen Society. In 1911 he was created a Knight Commander of the Royal Victorian Order and in 1919 was made a Commander of the Order of the British Empire. During the World War he acted as officer-in-command of the Third London General Hospital at Wandsworth with the rank of lieutenant-colonel in the Royal Army Medical Corps (Territorial forces). He published 'The Elements of Surgical Diagnosis'; 'The Evolution of Surgery'; 'Bradshaw Lecture on Surgery, Royal College of Surgeons of England' (1910); and was joint editor with Dr. Collins Warren of the 'International Text-Book of Surgery.' A large part of his professional career was devoted to a study of cancer.

GOULD, George Milbry, American physician, author and lecturer: b. Auburn, Me., 8 Nov. 1848; d. Atlantic City, N. J., 8 August 1922. He served as a drummer boy in the 63d Ohio volunteers, 1861-62, and enlisted in the 141st Ohio volunteers in 1864. He was educated at Ohio Wesleyan University, receiving the degree of A. B. in 1873 and the degree of A.M. in 1892 and at the Harvard Divinity School, 1873. He was graduated from the Jefferson Medical College, Philadelphia, in 1888, beginning his practice in that city in the same year as an eye specialist. From 1892 to 1894 he was ophthalmologist of the Philadelphia almshouse. He edited the *Medical News* from 1891 to 1895, the *Philadelphia Medical Journal* from 1898 to 1900 and *American Medicine* from 1901 to 1906. He was fellow of the College of Physicians of Philadelphia, and a member of the American Ophthalmological Society and of the American Academy of Medicine (president in 1895). He was one of the speakers at the Congress of Arts and Sciences at the Saint Louis Exposition in 1904. He received the first Doyné medal at the Ophthalmological Congress at Oxford, England. He was a member of the Phi Beta Kappa fraternity. He published: 'The Meaning and the Method of Life' (1893); 'Borderland Studies,' (2 vols. 1896-1905); 'An Autumn Singer' (poems) (1897); 'History of Jefferson College,' (2 vols. 1904); 'The Infinite Presence' (1910); 'Life and Letters of Edmund Clarence Stedman' (in collaboration), (2 vols. 1910); and many books on diseases of the eye as well as medical dictionaries.

GOVERNMENT, Cost of. The total cost of government in the United States in 1921

was \$8,460,011,596, according to statistics compiled by the National Budget Committee and published early in 1923. On the basis of 40,000,000 workers, whose gross income is \$60,000,000,000 a year, this means that the burden of government on every man and woman in business or professional life, including the 2,000,000 persons on the public pay rolls in nation, states, cities and counties, would be about \$220 annually. If they should contribute labor instead of dollars, every worker would give as his or her share more than seven weeks' labor every year.

As to the cost of the various forms of governmental activity, here is a summary for the calendar year 1921:

Cost of maintaining the Federal government	\$4,666,671,594
Cost of maintaining 48 State governments	1,008,540,232
Cost of maintaining 253 municipal governments in cities of more than 30,000 inhabitants	1,638,296,052
Cost of maintaining the municipal governments of all towns and cities of from 2500 to 30,000 population	431,287,059
Cost of maintaining municipal governments in 12,905 incorporated communities of less than 2500 population	123,147,687
Cost of maintaining county governments in the 48 States	592,068,972
Total cost of American government in 1921.	\$8,460,011,596

GOVERNMENT RESEARCH, Institute for. The Institute for Government Research is an organization with headquarters at Washington, D. C., created by a number of public-spirited men who believed that there should be some body whose duty it should be as a non-partisan, independent institution, to submit the problems of public administration, and particularly those of the national government, to scientific study for the purpose of making known those principles, practices and conditions which, if followed, would lead to a more efficient and economical conduct of public affairs. Its articles of incorporation thus state its purpose to be: "To conduct scientific investigations into the theory and practice of governmental administration, including inquiries into the form of organization and the manner of operations of Federal, State and local governmental bodies and offices in the United States of America; the powers, duties, limitations and qualifications of officers; the methods of administration employed; the character and cost of results obtained and the conditions affecting the efficiency and welfare of governmental officers and employees; to carry on such inquiries, directly or with the co-operation of governments, learned societies, institutions of learning, or other agencies and individuals, and to make public the results of its investigations; to maintain a library for the use of the society or its members and officers and those affiliated with its work; and to prosecute such other inquiries and perform such other services as may tend to the development and application of the principles of efficiency in governmental administration."

The institute was incorporated under the laws of the District of Columbia on 16 March 1916 and began active operations on 1 October of that year. Its board of trustees has been carefully selected with a view to securing repre-

sentation on it of those persons who stand highest in the public estimation for their active interest and work in the cause of promoting good government in this country. The present chairman of the board is Robert S. Brookings. Since its organization the work of the institute has been under the immediate direction of W. F. Willoughby. The institute is wholly supported by private donations. The activities of the institute fall into two general fields: (1) the prosecution of scientific investigations in the field of public administration; and (2) the direct assistance of governments, and particularly the national government, in working out and installing improved methods of administration.

The results of the scientific investigation work of the institute are given to the public in three series of publications: 'Principles of Public Administration,' 'Studies in Public Administration,' and 'Service Monographs of the United States Government.' The first series embraces volumes setting forth the principles that should be employed in handling the several branches of public administration, such as accounting and reporting, personnel administration, purchasing, and the like. The second includes volumes giving studies of particular administrative problems and systems such for example as 'The System of Financial Administration of Great Britain,' 'The Movement for Budgetary Reform in the States,' etc. The third series has for its purpose to give a detailed account of the history, activities and organization of each of the four score or more separate administrative services of the national government. Each service is handled in a separate volume, the method of treatment being uniform for all the services. The preparation of these monographs has been undertaken since the first essential of efficient administration is that full information shall be readily available regarding the activities engaged in, the organization and personnel employed in performing these activities, and all other pertinent facts regarding such services. These monographs thus furnish what may be termed a necessary tool of administration through the use of which members of the Congress may more intelligently perform their duties of legislating regarding and voting funds for the support of these services, administrators may more effectively perform their duties and the general public may keep itself informed regarding the work of governmental agencies.

In the second field of its activities the institute places at the disposal of members of the Congress, and administrative officers, the services of its director, and its highly expert staff in working out both the general and the more technical problems of administration. This assistance has been welcomed by these officers. In particular, it has been able to contribute to the promotion of such fundamental reforms as the introduction by the national government of a budget system, the reform of the methods of accounting and reporting, the establishment of a more satisfactory personnel system and the reorganization of the administrative departments and to the working out of the problems involved in putting these reforms into practical application. Following is a list of the publications of the insti-

tute to date, including those in press as well as those which have actually appeared:

Principles of Public Administration: (1) 'Principles of Government Accounting and Reporting,' by Francis Oakey; (2) 'Principles of Government Purchasing,' by A. G. Thomas; (3) 'Principles Governing the Retirement of Public Employees,' by Lewis Meriam; (4) 'Principles of Public Personnel Administration,' by A. W. Procter.

Studies in Public Administration: (1) 'The System of Financial Administration of Great Britain,' by W. F. Willoughby, W. W. Willoughby and S. M. Lindsay; (2) 'The Budget,' by Rene Stourm; (3) 'The Canadian Budgetary System,' by H. G. Villard and W. W. Willoughby; (4) 'The Problem of a National Budget,' by W. F. Willoughby; (5) 'The Movement for Budgetary Reform in the States,' by W. F. Willoughby; (6) 'Organized Efforts for the Improvement of Methods of Administration in the United States,' by G. A. Weber; (7) 'Teachers' Pension Systems in the United States,' by Paul Studensky; (8) 'The Federal Service: A Study of the System of Personnel Administration of the United States Government,' by Lewis Mayers; 'The Reorganization of the Administrative Branch of the National Government,' by W. F. Willoughby.

Service Monographs of the United States Government: 'Geological Survey,' 'Reclamation Service,' 'Bureau of Mines,' 'Alaskan Engineering Commission,' 'Tariff Commission,' 'Federal Board of Vocational Education,' 'Federal Trade Commission,' 'Steamboat Inspection Service,' 'Weather Bureau,' 'Public Health Service,' 'National Park Service,' 'Employees' Compensation Commission,' 'General Land Office,' 'Bureau of Education,' 'Bureau of Navigation,' 'Coast and Geodetic Survey,' 'Federal Power Commission,' 'Interstate Commerce Commission,' 'Railroad Labor Board,' 'Division of Conciliation,' 'Children's Bureau,' 'Women's Bureau,' 'Office of Supervising Architect,' 'Bureau of Pensions.'

W. F. WILLOUGHBY,

Director.

GRAECO-TURKISH WAR OF 1921-22.

GRAIN, Artificial Culture of. Early in January 1923 the announcement was made that experiments carried on in the plant laboratories of the University of Minnesota, had demonstrated that grain crops can be brought to maturity and made to produce seeds of good quality entirely by cultivation under artificial light. In the experiments conducted at the institution referred to, electricity was substituted for sunlight. It was asserted that by the use of artificial illumination the germination of seeds can be speeded up two times over. Satisfactory experiments were carried on with wheat, oats, barley, rye, potatoes, lettuce, beans, peas, radishes, clover and various other seeds including the seeds of several ordinary weeds. Spring wheats were made to produce ripe seeds in 90 days of continuous lighting. The experiments were carried out in unheated basement rooms in the college buildings. Tungsten filament nitro-

gen filled lamps which burned for 24 hours each day were used. The experiments were conducted by Dr. R. B. Harvey, associate professor of plant pathology and botany in the university mentioned. See also **CHEMISTRY**, subsection, **ORGANIC AND BIOLOGICAL**.

GRAIN FUTURES ACT. See **AGRICULTURE IN THE UNITED STATES**, subsection **AGRICULTURAL LEGISLATION**.

GRAND ISLAND COLLEGE, a Baptist co-educational institution, founded in 1892 and located at Grand Island, Neb. In 1922–23 it had a faculty of 10 members, 227 students, property valued at \$121,624.14 and an income of \$58,944.01. John Mason Wells, A. M., is president.

GRANT, Nellie (MRS. FRANKLIN HATCH JONES), daughter of Gen. Ulysses S. Grant: b. Wistonwisch, Mo., 4 July 1853; d. Chicago, Ill., 30 Aug. 1922. She was born at the home of her grandfather, Colonel Dent, and spent the first years of her life in a log cabin built by her father. She went to live with her parents in the White House, where she immediately became a favorite and shared the national popularity of the President. In 1874 she was married to Algernon Sartoris, a member of the British diplomatic corps. Nellie Grant was one of the few "White House brides" and her wedding attracted great attention. Mr. and Mrs. Sartoris went to England and made their home at Cadogan. After the death of her husband, Mrs. Sartoris returned to the United States and joined her mother in Washington, D. C. By special act of Congress she was made a citizen of the United States, since by her marriage to a Britisher she had forfeited her American rights. On 4 July 1912, she became the wife of Franklin Hatch Jones, a Chicago lawyer and banker. Three months after her marriage she was attacked by an illness which made her an invalid and caused her to withdraw from all social activities. She left two children, Algernon Sartoris and Mrs. Frederick R. Scovel (Virginia Sartoris).

GRAPEFRUIT. See **PLANT INDUSTRY**, **BUREAU OF**.

GRAPES. The 1922 commercial grape crop of the United States, as determined by shipments, totaled 52,000 carloads, or 13,000 more cars than were moved during any preceding year. Allowing an average of 15 short tons to the car, the 1922 crop amounted to 1,560,000,000 pounds. California, with a total output of approximately 37,000 cars, not only led all States in the production of grapes by producing about two-thirds of the country's supply, but exceeded its 1921 crop by 4,000 cars and its 1917 crop by 24,000 cars. There was also a large gain in Eastern grapes during 1922, compared with the 1921 crop and with the average crop for the five years, 1917–21. New York, Michigan and Pennsylvania—the three leading grape-growing States of the East—about doubled their average shipments. New York's 1922 crop totaled 7,384 cars and exceeded its previous highest crop—that of 1920—by 1,305 cars. The crop of Michigan, which established a high record of 4,607 cars in 1920, amounted to 5,833 cars in 1922. The car shortage is said to have caused

rather serious losses to some growers in California. Many Western grapes were sent to large terminal markets in box cars and arrived in bad condition. Growers and shippers agree that it is hard to compute an average price per ton to cover both table and wine grapes but it is agreed that \$50 a ton is a fair estimate. That was the general price at New York loading points for Concords at the end of October. Earlier the same variety brought \$95 a ton, f. o. b. in New York and from \$70 to \$75 in Michigan. See also **HORTICULTURE**.

GRAPHITE. See under **UNITED STATES** subsection **MINERAL PRODUCTION**.

GRAY, George Buchanan, English Biblical scholar: b. Blandford, Dorset, England, 13 Jan. 1865; d. Oxford, England, 9 Nov. 1922. He was the son of the Rev. Benjamin Gray and was educated in private schools and at New College and University College, London, and afterwards studied at Mansfield College, Oxford and at Marburg. He took his London B. A. in 1886. At Oxford, where he was a non-collegiate student, he distinguished himself by obtaining a first class in the School of Semitic Studies, in 1891, and by winning the Pusey and Ellerton theological scholarship, the Junior Septuagint Prize and the junior and senior Kennicott scholarships. On taking his degree he joined the teaching staff at Mansfield and was in due course admitted to the Independent ministry. During this period he was examined in Oriental languages in the university. He was speaker's lecturer in Biblical studies from 1914 to 1919 and Grinfield lecturer on the Septuagint from 1919 to 1921. Oxford gave him the degree of D. Litt. and Aberdeen that of D. D. In 1898 he was elected a fellow of the German Oriental Society. To Doctor Gray the late Prof. S. R. Driver entrusted the completion of his great edition of the 'Book of Job.' This work, which was published in the summer of 1921, completed Doctor Gray's reputation as critic, commentator and philologist. His publications include articles in the 'Encyclopedia Biblica,' contributions on Semitic philology and Old Testament criticism to religious publications, as well as to the *Jewish Quarterly Review*, and the following books: 'Studies in Hebrew Proper Names' (1896); 'The Divine Discipline of Israel' (1900); 'Numbers' (1902); 'Numbers' (1903); 'Isaiah' (1911); 'A Critical Introduction to the Old Testament' (1913); and 'The Forms of Hebrew Poetry' (1915).

GREAT BRITAIN, or the United Kingdom of Great Britain and Ireland, a constitutional monarchy comprising the islands off western Europe commonly referred to as the British Isles. Strictly employed the term Great Britain denotes the larger island which comprises England, Scotland and Wales, but it is frequently used to include Ireland, the Isle of Man and the Channel Islands. Together with its overseas possessions and dependencies Great Britain forms the British empire. See also articles on England, Wales, Scotland, Ireland, Canada, Australia, New Zealand, South Africa and the minor possessions of Great Britain.

Area and Population.—According to the census of 19 June 1921 the population of the

several divisions of Great Britain was as follows:

DIVISIONS	Area, square miles	Population
England.....	50,874	35,678,530
Wales.....	7,466	2,206,712
Scotland.....	30,405	4,882,288
Ireland.....	32,586	*4,496,000
Isle of Man.....	227	60,238
Channel Islands.....	75	89,614
Total.....	121,633	47,307,601

* Estimate. No census taken in 1921.

The total number of births in England and Wales in 1920 was 957,994, or 25.5 per 1,000, and the very highest on record. The total number of births in 1921 was 849,045, of which 37,928 were illegitimate. Deaths the same year numbered 458,710. The proportion of male to female births in 1921 was 1,051 male to 1,000 female. In Scotland in 1921 there were 123,196 births of which 8,757 were illegitimate, and 66,311 deaths. The latest figures for Ireland (1920) show a total of 99,536 births of which 3,313 were illegitimate, 66,538 deaths and 26,826 marriages. In 1920, 352,429 British subjects departed for non-European countries and 84,355 aliens left Britain in the same year. British subjects to the number of 180,064 returned, as did also 103,641 aliens, leaving a balance outward from Great Britain of 153,079. Of these emigrants in 1920, 90,429 left Britain for the United States, 134,079 for British North America, 49,357 for Australia, 29,019 for British South Africa, 19,326 for India and Ceylon. Of the aliens, 61,224 traveled to the United States.

Religion.—The Protestant Episcopal is the established church of England. The King is the supreme governor of the church in England and nominates to archbishoprics and bishoprics and to other offices specified as the gift of the crown. The church in Wales was disestablished as from 31 March 1920. The Church of England has three archbishops, 39 bishops, and 36 suffragan bishops. This church claims 2,291,000 full members. The second largest body of Christians in England is the Roman Catholic with 1,900,000 adherents, one cardinal, four archbishops, and 17 bishops and 3,900 clergy. The third largest body is the Wesleyan Methodist with 484,000 full members closely followed by the Congregationalists with 451,000 members. Next in order come the Baptists with 380,000, the Primitive Methodists with 206,000, the Calvinistic Methodists with 187,000, and the United Methodists. In the Church of Scotland the ministers are all of equal rank, the church being Presbyterian. There are 84 presbyteries formed of parish groups and these are gathered in 16 synods. At the head of the church is the general assembly of 750 members partly clerical and partly lay. The Scottish church has 739,000 communicants, 1,800 ministers and 241,600 Sunday school pupils. The Roman Catholic church has in Scotland two archbishops, five bishops and 600 clergymen and 546,000 commu-

nicants. In Ireland the Roman Catholic faith has 3,242,670 communicants under four archbishops, 24 bishops and 3,830 clergymen. The second religious body in point of numbers is the Protestant Episcopalian with 576,611 communicants. The Presbyterians number 440,525, the Methodists 62,382 and the minor sects aggregate 68,031. The Church of Ireland (Episcopal) has two archbishops, 11 bishops and 1,500 clergymen.

Education.—In England and Wales there are 21,501 elementary schools with accommodation for 7,100,000 pupils. The total enrollment in 1922 was 5,917,854. The number of teachers the same year was 170,000. There are 59 schools for the blind, 50 for the deaf, 197 for mental defectives, 166 for physical defectives, six schools for epileptics, 50 so-called "certified efficient" schools, 60 poor law schools, 29 nursery schools and over 340 play centres. For the training of elementary teachers there are in England and Wales 88 training schools with accommodations for 13,578 students. Elementary education is free and compulsory between the ages of five and 14. In Scotland education is compulsory to the age of 15. In 1921 there were 3,123 primary schools in operation with an enrollment of 769,000 and an average attendance of 675,000. About 13,000 children are in intermediate schools. In the primary schools there are 24,604 teachers. Ireland has

Total (Ireland).....	379	4,645
Total (United Kingdom).....	4,247	49,943

8,002 primary schools with an average enrollment of 688,955 and an average attendance of 488,031. There are 7,590 principal teachers, 5,770 assistant teachers, and 2,380 junior assistant teachers in the Irish elementary schools system. There are seven training schools with accommodations for 1,195 students. The partition of the country under the government of Ireland Act of 1920 gave the Northern Irish

government its own Department of Education. In England and Wales there are at present 1,140 recognized secondary schools, with 308,000 full-time pupils, of whom 149,000 are girls. In addition to these there are 206 other schools of secondary grade recognized as efficient by the Board of Education but not included in the grant list. Scotland has 148 secondary schools in receipt of grants with an average student attendance of 45,965. Ireland's secondary schools are under the direction and management of the Intermediate Education Board. In 1921, 12,419 students presented themselves at the examinations conducted by the board. Higher education in the United Kingdom is provided for by the universities listed in the preceding table and by a number of technical and special schools.

As noted above, there are several special schools of higher instruction the chief of which are the university colleges at Nottingham, Exeter, Reading and Southampton; the agricultural colleges at Carlisle, Cirencester, Glasgow, Kingston, Wye, Ripley and Uckfield. The expenditure of the United Kingdom on education in 1919 was 53,102,000 pounds sterling, of which 43,674,000 represented the amount expended by England and Wales and 6,649,000 the amount expended by Scotland.

Agriculture.—The number of farms in England and Wales entirely or mainly owned by the people living on them increased from 48,665 in 1919 to 70,469 in 1921, according to agricultural statistics for 1921 published by the British Ministry of Agriculture and Fisheries. This is an increase of nearly 45 per cent in two years and gives some idea of the extent to which farms and holdings have been bought for occupation by those who were formerly either tenants or were not engaged in agriculture. The following table shows the number of holdings in England and Wales owned or mainly owned by the occupiers in 1919 and 1921 and the per cent of increase:

SIZE OF HOLDINGS	NUMBER		Per cent increase 1921 over 1919
	1919	1921	
1-5 acres.....	10,453	12,028	15.1
5-20 acres.....	13,786	18,635	35.2
20-50 acres.....	8,346	13,069	56.6
50-100 acres.....	6,380	10,769	68.8
100-150 acres.....	3,463	5,844	68.8
150-300 acres.....	4,216	7,170	70.1
Over 300 acres.....	2,021	2,954	46.2
Total.....	48,665	70,469	44.8

The total area under crops and grass in 1913 amounted to 27,129,000 acres of which 2,891,000 acres were owned by the occupiers. In 1921 the total area was 26,144,000 acres of which 5,232,000 were owned by the occupiers. Thus, while the proportion of the total area in England and Wales under crops and grass owned by occupiers in 1913 was only 10.7 per cent it was just 20 per cent in 1921, a change of considerable economic interest. In 1921 the cultivated area

included 8,902,301 acres planted to wheat, barley, oats, rye, beans and peas, 3,779,958 acres under green crops such as potatoes, turnips, cabbage, vetches, etc., 48,097 acres under flax, 100,751 acres under small fruits and 512,910 acres fallow. In the same year the number of horses was 2,137,200, 11,887,000 cattle, 23,749,500 sheep, and 3,116,500 swine. The yield of wheat in the United Kingdom in 1921 was 9,225,000 quarters, of barley 6,762,000 quarters, of oats 20,583,000 quarters, of potatoes 6,554,000 tons, of hay 9,383,000 tons. Thus the yield of the chief crops per acre was: of wheat 35.4 bushels, of barley 30.4 bushels, of oats 37.3 bushels, of potatoes 5.1 tons, of hay 1.7 tons.

Fisheries.—In 1921 the quantity of the fish caught and landed in the United Kingdom was 839,161 tons exclusive of salmon, and the value of the catch was 21,217,260 pounds sterling. The value of the shell-fish caught was 684,257 pounds sterling. There are 23,089 fishing boats registered of a total net tonnage of 336,234, of which 15,672 are sail vessels and 7,417 are steam vessels. About 66,801 men and boys are employed in the fishing industry and about 19,897 others are connected with it.

Mining.—The following table shows the mineral output of the United Kingdom for the year 1920, the last for which complete returns are available:

MINERAL	Quantity (tons)	Value at mines (pounds sterling)
Alum shale.....	5,539	623
Arsenical pyrites.....	1,178	7,212
Arsenic.....	1,997	110,873
Barium.....	64,150	207,218
Bauxite.....	11,020	3,443
Bog ore.....	2,179	1,127

* 95,000 feet of natural gas.

In all mines there were employed in 1920, 1,270,000 workers. There were 3,349 mines in

operation and 1,003,000 persons worked underground and 258,000 males and 9,000 females worked above ground. A total of 68,000 persons were employed in quarries of which 5,479 were in operation. In 1921 there were mined 163,000,000 tons of coal, of which nearly 20 per cent was exported or sent out of the country as bunker coal.

Textiles.—From statistics published in the *Manchester Guardian* it appears that the textile mills of England consumed in the two-year period, 1921–22, the following amounts of raw material: 1,305,000,000 pounds of cotton, 711,000,000 pounds of wool, 63,000,000 pounds of flax, a total of 2,079,000,000 pounds of raw material used in the textile industry. The value of the textiles exported was: 290,200,000 pounds sterling of cotton goods, 95,050,000 pounds sterling of woollen goods and 17,000,000 pounds worth of linen, making a total of 402,350,000 pounds sterling. The wool clip of 1921 was 102,000,000 pounds and the flax crop 22,000,000 pounds.

Commerce.—The various commodities making up the principal articles of export and import for 1921 and 1922 are as follows:

IMPORTS		
	1921	1922
Food, drink and tobacco:		
Grain and flour.....	£77,299,902	£58,837,083
Feeding-stuffs for animals.....	3,686,090	2,812,330
Meat.....	85,180,151	61,241,333
Animals, living, for food.....	1,639,916	1,246,745
Other food and drink, non-dutiable.....	103,960,027	82,129,221
Other food and drink, dutiable.....	57,626,336	56,028,244
Tobacco.....	14,677,884	10,789,645
Total, Class 1.....	£344,070,306	£273,084,601
Raw materials and articles mainly unmanufactured:		
Coal.....	£11,463,366	£20
Other non-metallic mining and quarry products, etc.	4,349,150	3,021,241
Iron ore and scrap.....	3,730,615	2,657,161
Non-ferrous metaliferous ore and scrap.....	4,954,339	3,708,989
Wood and timber.....	15,310,990	16,311,192
Raw cotton and cotton waste.....	36,184,709	45,760,419
Wool, raw, and waste and woollen rags.....	26,931,248	40,969,968
Silk, raw, knubs and noils.....	442,900	1,131,869
Other textile materials.....	6,451,332	5,649,151
Oil seeds, nuts, oils, fats, resins, gums.....	19,511,526	22,150,347
Hides and skins, undressed.....	4,969,662	8,141,192
Papermaking materials.....	6,508,794	4,778,814
Rubber.....	7,365,334	3,991,934
Miscellaneous raw materials and articles mainly unmanufactured.....	3,947,485	4,853,872
Total, Class 2.....	£152,127,450	£163,121,169
Articles wholly or mainly manufactured:		
Coke and manufactured fuel.....	210,976	16,817
Earthenware, glass, abrasives, etc.....	4,182,887	3,939,126
Iron and steel and manufactures thereof.....	11,289,570	5,798,549
Non-ferrous metals, manufactures thereof.....	11,289,570	9,980,733
Cutlery, hardware, implements and instruments.....	4,166,591	3,506,622
Electrical goods and apparatus.....	1,353,522	725,477
Machinery.....	7,851,672	4,652,127
Manufactures of wood and timber.....	3,360,068	2,226,812
Cotton yarns and manufactures.....	3,210,870	3,888,231

IMPORTS — (Continued)		
	1921	1922
Woolen and worsted yarns and manufactures.....	£5,347,222	£5,110,341
Silk and silk manufactures.....	11,830,713	12,392,424
Manufactures of other textile materials.....	4,767,079	5,995,545
Apparel.....	5,165,773	8,006,647
Chemicals, drugs, dyes and colors.....	8,239,803	6,186,112
Oils, fats and resins, manufactured.....	38,623,562	25,504,794
Leather and manufactures thereof.....	4,160,535	6,205,192
Paper and cardboard.....	6,707,342	6,469,270
Vehicles (including locomotives, ships and aircraft).....	4,754,440	8,965,310
Rubber manufactures.....	2,403,152	3,469,733
Miscellaneous articles, mainly or wholly manufactured.....	11,206,167	13,068,395
Total, Class 3.....	£154,051,667	£131,198,257
Animals, not for food.....	£216,293	£198,424
Parcel post, non-dutiable articles.....	1,811,152	1,367,708
Total.....	£652,276,868	£568,970,159

EXPORTS		
	1921	1922
Food, drink and tobacco:		
Grain and flour.....	£2,140,347	£1,865,061
Feeding stuffs for animals.....	672,746	1,104,348

Animals, not for food.....	£2,152,818	£856,579
Parcel post.....	5,531,374	6,317,392
Total.....	£412,067,426	£412,180,431

The trade for the calendar year ended 31 Dec. 1922 compares as follows with the same period in 1921 and 1920:

	1922	1921	1920
Exports, British products— £720,493,394	£703,196,282	£1,334,469,269	
Re-exports, foreign goods— 103,768,805	107,052,072	222,753,331	
Total exports— £824,262,199	£810,248,354	£1,557,222,600	
Imports— 1,003,941,435	1,086,687,213	1,932,648,881	
Excess of imports— £179,679,236	£276,438,859	£375,426,281	

Finance.—The chief sources of revenue are the customs, dues, the excise, motor vehicle duties, estate and inheritance taxes, stamps, the land and house taxes, property and income tax and the super-tax, the postal, telegraph and telephone services, and crown lands. The chief sources of expenditure are the several debt services, the post-office, army and navy, and the civil services. A statement of the British treasury at the beginning of the fiscal year 1922–23 showed that the external debt of the British government had been reduced from 1,364,850,000 pounds at that date in 1919 to 1,278,714,000 in 1920, to 1,161,563,000 in 1921, and to 1,087,150,915 (at par \$5,294,424,965) in 1922. Twenty-eight separate loans of various dates and to various countries, most of them issued during the war, are scheduled as having already been repaid in full. The war debt to the United States treasury, which was scheduled, including interest, at £865,652,000 on 1 March 1920, had been subsequently reduced to 856,093,000 at the end of March 1922. The British treasury return, made public 9 Nov. 1922, puts Great Britain's total debt on 1 April 1922 at £7,742,526,147 (roughly \$34,067,115,058). The lowest figures since 1875, when the debt was £767,268,559 (\$3,365,081,648) was in 1899, when it was £635,393,734 (\$2,795,732,429). The debt in 1914 was £707,654,110 (\$8,113,678,184). The highest figure was in 1920, when it was £7,878,607,166 (\$34,555,871,519).

On war pensions and allowances, the annual expenditure exceeds £100,000,000 (half a billion dollars). Despite this heavy outlay, Great Britain has balanced her budget. In the financial year, ending 31 March 1922,

The receipts were.....	£1,124,880,000
And the expenditures.....	1,079,187,000
Showing a surplus.....	£45,693,000

The actual reduction of debt was:

By surplus.....	£45,693,000
By sinking fund.....	25,000,000
By saving on civil contingencies.....	17,773,000
Total.....	£88,466,000

The estimates for the current year, 1922–23, are:

Revenue.....	£910,775,000
Expenditure.....	910,069,000
Surplus.....	£706,000

This means that, according to estimates, the budget would merely balance, leaving nothing for reduction of debt. For the nine months ending 31 December, the accounts showed:

Revenue.....	£585,562,730
Expenditure.....	572,634,460
Surplus.....	£12,928,270

This result shows an improvement over the estimates. In sterling exchange, there has been a great improvement. On 1 Jan. 1922, it stood at 4.21 dollars to the £ compared with 4.85 dollars normal. On 31 December, the quotation was 4.63.

The budget introduced in the House of Commons, 15 April 1923, showed a surplus of £101,515,848 for the fiscal year ended 31 March 1923. Revenues for the year totaled £914,012,452; expenditures, £812,496,604. The budget estimates for the year 1923–24 were: Revenue, £818,500,000; expenditures, £816,616,000; estimated surplus, £1,884,000.

Communications.—At the beginning of 1921 there were 23,734 miles of railways open for traffic in the United Kingdom. Of this mileage, England, Scotland and Wales possessed 20,292 miles, and Ireland 3,442 miles. In the year named the total paid-up capital of all lines amounted to 1,327,500,000 pounds sterling, the number of passengers carried exclusive of season ticket holders was 1,604,500,000, amount of freight carried was 324,000,000 tons, gross receipts amounted to 314,766,000, operating expenses totalled 261,755,000 pounds, leaving a net income of 53,011,000 pounds. The proportion of operating expenditures to gross receipts was 98 per cent. In the same year there were in the United Kingdom 2,729 miles of light railways and tramways in operation, of which 2,647 miles were operated by electricity. The total number of passengers carried in 1920 was 4,987,526,000.

As a result of experience during the World War when all railroads were taken over by the government the principal railroad managers of Great Britain decided that an amalgamation of the country's railroads was desirable. War-time experience showed that there were too many roads in certain places, involving a great deal of duplication and wasteful competition,

which, by exhausting the resources, hindered much-needed improvements. The Ministry of Transport prepared an amalgamation scheme which, with but two important changes, passed through Parliament in 1921. One modification of the plan was the exclusion of the London local lines and the other the division of the Scottish lines between eastern and western groups instead of a single group by themselves. The amalgamation, which went into effect 1 Jan. 1923, eliminates the old familiar names, except the Great Western, and establishes four big systems. On 29 Dec. 1922 the *New York Times* outlined the amalgamation plan as follows: The four groups are known as the Southern Railway, the Great Western Railway, the London, Midland and Northern Railway and the London and Northeastern Railway. The Southern Railway includes the old London and Southwestern, the London, Brighton and South Coast and the Southeastern and Chatham. The Great Western adds to its original lines all the Cambrian railways in Wales. The London, Midland and Northern represents the old North-western, the Midland, the Lancashire and Yorkshire, the North Staffordshire, the Furness, the Caledonian, the Highland and the Glasgow and Southwestern Railway Companies. The London and Northeastern includes the former Great Central, the Great Eastern, the Great Northern, the Hull and Barnsley, the North British and the Great North of Scotland lines. In this way there is one great system for each of the four quarters of Great Britain, although, as the properties held by the present companies are not redistributed, the lines of the new amalgamations in some places invade the territory of rivals. Thus, although theoretically speaking, the London and Northeastern is to occupy itself entirely with the eastern districts, one of its branches runs clear across England from Sheffield to Manchester and Liverpool, and another cuts across Scotland from Edinburgh to Glasgow and goes up the northwest coast to Mallaig and Arisaig. The size of the new units may be judged from the fact that the London and Northeastern will operate 7,000 miles and 2,500 stations and freight depots and is expected to carry 300,000,000 passengers and 183,000,000 tons of freight, including minerals, per annum. To regulate tariffs of the new group railroads a rates tribunal has been set up. It consists of three men, all experienced in railroad and shipping matters, Sir Francis Gore Browne, K.C., president; W. A. Jepson and George Cooper Lockett. The new companies must submit their schedules to this board and it has power to lay down general principles the companies must observe and to order changes.

Under the old system railroad rates in the United Kingdom were subject to maxima laid down by statute. The companies were at liberty to charge whatever they pleased within these maxima. But now a different principle is to prevail. The companies are to aim at earning as much money as the old concerns cleared in 1913, the last normal year before the war, together with 5 per cent on capital expenditure while under government control and an additional allowance upon any capital expenditure made before 1913 which can be shown not to

have reached its full, fair earning power in 1913. This is styled the railroads' "standard revenue." Consequently the companies know what burdens their railroads are to bear, and they are to portion it out among different classes of merchandise so that each supports its reasonable share. Rate schedules are to be subject to periodical review by the rates tribunal, and it is also provided that, as it is impossible to consider existing conditions as stable, there is to be an annual revision for the next three years. There would, of course, be a risk, if the "standard revenue" were determined absolutely, that the companies would lose all spur to initiative and would do nothing to increase their efficiency. It therefore is arranged that if the rates yield more than the standard revenue the companies shall be permitted to retain 20 per cent of the excess, and only the other 80 per cent shall be used to reduce rates. This principle, it has been stated officially, has been accepted as satisfactory both by the railroad companies and by the Federation of British Industries and other representative bodies of commercial men. There was, of course, nothing to prevent the old railways forming these new groupings on their own initiative, but it could have been done only by long, complicated negotiations and so the government decided to seek Parliamentary power to make such amalgamations compulsory. The details, however, were left as far as possible to the old managements to work out, though they had to be submitted for approval to a special amalgamation tribunal consisting of Sir Henry Babington Smith, G.B.E., president; Sir William Plender G.B.E., and George John Talbot, K.C.

One of the principal tasks which came before this tribunal was the exchange of securities of the old companies for those of the new group companies. This was extremely complicated, as the capitalization of the old companies not only was divided into securities of several different ranks, but also included stock and debentures of one-time small railroads which already had been absorbed into the old systems. Generally the conversion of securities was so devised as to give to stockholders amounts of capital in the new concerns, which will bring them in the same annual incomes that they have been enjoying. Thus, for every 6 per cent £100 preference share of the old Great Central Railway, £150 of 4 per cent second guaranteed stock in the new London and Northeastern Company has been given. To facilitate this the conversion act provides that if there is any difficulty found in winding up any of the old railway companies the amalgamation tribunal may give permission for its being carried on for five years, or even longer, merely as a holding company under its old name, but without any of the privileges or duties of a railroad corporation. The declared object of this amalgamation act is to promote co-operation and to limit uneconomic competition. Larger groups, it is contended, will provide more efficient services than the old individual lines and will be able to effect great economies in the overhead expenses of management. They will be able, because of the large areas they cover, to offer to the public much greater facilities for travel and carriage of

freight and shippers will get important advantages through reduction in the number of times their consignments have to be handled. Moreover, the amalgamation has been so devised as to hold out to the new groups strong inducements to develop the territories they serve.

In the United Kingdom there are 4,673 miles of canals, of which 3,641 miles are in England, 848 in Ireland and 184 in Scotland. The total tonnages originating in the chief canals of the United Kingdom in 1921 was 11,780,000 tons. In addition there are the tonnages of the Thames above Teddington and that of the Caledonian canal aggregating about 85,000 tons. In the United Kingdom there were in 1922, 23,650 post-offices staffed by 227,308 persons. In 1922 the postal system carried 3,350,000,000 letters, 500,000,000 post cards, 1,150,000,000 printed papers, and 190,000,000 newspapers, 137,000,000 parcels and 80,000,000 telegrams. In 1921 a total of 16,846,000 money orders was issued in the amount of 118,843,000 pounds. In the same year the postal orders issued totaled 101,617,000 the value of which was 37,368,000 pounds sterling. At the beginning of the fiscal year 1922-23 the telegram mileage of the United Kingdom was 283,461, with 4,065,780 miles of wire, of which 2,997,992 miles are underground and 1,046,379 are aerial and 21,409 are subaqueous. The post-office operates 16 wireless stations. There are 1,188 telephone exchanges with 7,197 circuits containing 472,400 miles of wire in the trunk-line service while London had 82 exchanges in 1922 with 1,320,300 miles of wire and 324,721 instruments. The provincial exchanges are 3,180 in number with 1,730,664 miles of wire and 637,280 instruments.

Army.—In the United Kingdom the land forces consist of the regular army, the territorial army and the reserve forces. The regular army serve both at home and in the overseas dominions. At present time service in the regular army is for 12 years, of which from three to nine years are spent with the colors and the remainder in the army reserve. The land forces are under an Army Council over which presides the Secretary of State for War and composed of the Chief of the Imperial Staff, the Deputy Chief, the Adjutant-General, the Quartermaster-General, the Master-General of Ordnance, the Parliament Under-Secretary of State, who is Vice President of the Council, and the two permanent Secretaries of the War Office. The chief military educational establishments are the Royal Military Academy, the Royal Military College, and the Staff College. The expenditure for the military establishment for the year 1922 was 106,315,000 pounds sterling. The total personnel in 1922 was 341,000, of whom 277,023 were British troops and 84,200 were Indian and colonial troops. These men were distributed as follows: In India, 75,896; home garrison, 134,769; in Constantinople, Egypt, Palestine and Mesopotamia, 105,250, including some Indian troops; on the Rhine and in the plebiscite areas, 14,500.

Navy.—Eight of the early ships of the dreadnought class and all pre-dreadnoughts have been removed from the lists and all other classes have been reduced both in the interest of economy and because of the Washington Conference

on Disarmament. The class of armored cruisers no longer exists. Capital ships are no longer classed as either dreadnought or pre-dreadnought but as pre-Jutland and post-Jutland. The *Hood* is the only vessel of the latter type. The strength of the British navy prior to the carrying out of the provisions of the Washington Conference is indicated by the following summary:

Dreadnoughts.....	24
Pre-dreadnoughts.....	
Armored cruisers.....	
Light cruisers.....	68
Destroyers.....	205
Torpedo boats.....	47
Submarines.....	70

There are in addition several depot ships, store ships, repair ships, mine layers and sweepers and several seaplane carriers. The personnel of the navy totalled 121,600 in 1922-23. In December 1922 it was announced that two 35,000-ton battleships would be built and their keels laid before the close of the year in accord with the terms of the Washington treaty.

History.—In Great Britain, the year 1922 was marked by the collapse of the Coalition over which, for six years, David Lloyd George had presided as Prime Minister. A straight Conservative government, under Andrew Bonar Law, was called to power. When the year opened, anyone who studied Mr. Lloyd George's special organ, *The Daily Chronicle*, and other newspapers could gather that it was his desire to dissolve Parliament in February and appeal to the country as himself, the head of the government in power. Indeed, Lloyd George, early in January, discussed this strategy with Austen Chamberlain, his most responsible Conservative colleague. Had such a general election then occurred—that is, in the early spring—there is hardly a doubt that Lloyd George would have secured a further lease of office. The Coalition would have been perpetuated as a National party, representing middle opinion and strong enough to resist Toryism on the extreme right and Labor on the extreme left. In such a plan for an immediate election Lloyd George would have been able to count upon the more or less willing support of Austen Chamberlain, Viscount Birkenhead (the Lord Chancellor), Earl Balfour (formerly Prime Minister), and Sir Robert Horne (the Chancellor of the Exchequer). But, from the first, Sir George Younger, the chief whip of the Conservative party, openly protested against the foreshadowed strategy. He declared that the Conservative party must retain its separate existence and that the Coalition, before appealing to the country, must reform the House of Lords. What Sir George Younger meant by House of Lords' Reform was a repeal of the Parliament Act, passed in the year 1911, whereby the veto of the peers was severely restricted. To a restoration of that veto, David Lloyd George and the Coalition Liberals would not agree. With the Conservative caucus against him, Lloyd George dared not risk an election in February and the dissolution was thus postponed until the autumn. To outward appearances, Lloyd George was still strongly entrenched in the con-

fidence of the House of Commons. On 3 April the majority that endorsed his policy at Genoa was 372 to 94. It is true that on 16 May the government was defeated by 151 votes to 148 over a small question of taxing teachers' pensions, but on the 25th a vote of confidence was carried by 233 to 26. There was, however, a certain restlessness in the country which was reflected in by elections, many of them resulting adversely to the government. Behind the scenes, the Conservative Die-Hards, led by Sir George Younger, only awaited their opportunity to break the Coalition, drive out Lloyd George and his Liberal friends and instal a Conservative of their own choice as Prime Minister. Of the Big Four, who negotiated the Treaty of Versailles—Woodrow Wilson, Clemenceau, Orlando and Lloyd George—only Lloyd George remained in power. While it was agreed that he did much to win the war, that war was now over, except as a source of bitter recriminations, in which generals and editors, correspondents and diarists spilt ink against one another as freely as blood had been shed, only a year or two before. The Asquith Liberals could not forgive Lloyd George for betraying—as they regarded it—their leader, their party and their cause. They alleged that he had squandered British lives and British money in futile campaigns against Russia and in the Mesopotamian adventure. They attacked the Safeguarding of Industries Act as a surrender of free trade. They enlarged upon what they considered to be the inconsistent policy of the government in Ireland, where the reprisals, inflicted by the Black-and-Tans were so quickly followed by the grant of a Free State. While in terms, they did not alter their opinion of the justice and inevitability of the war, they joined with labor, including pacifist labor, in deploring the terms of peace, which was, in fact, no peace at all, and they accused Lloyd George of a lukewarm feeling towards the League of Nations. During the summer, criticisms of every kind accumulated, some of them justified, others merely emotional.

What brought things to a head was the defeat of the Greeks by the Kemalists Turks, with threat to Constantinople. On 16 September a manifesto, the authorship of which was attributed to Winston Churchill, appeared in the press. By this manifesto, it appeared that war against Turkey was contemplated—a war in which Great Britain would fight alone. The country was already taxed to the limit and any idea of such a commitment caused the gravest alarm. Labor made it clear that, if hostilities were attempted, there would be trouble among the workers and the more extreme organization of that party passed a resolution denouncing Lloyd George "as a public danger to the peace of the world." Lord Curzon was sent to Paris in order to negotiate with M. Poincaré a line of common action in the Near East. Powerful sections of the press, including the Northcliffe newspapers, clamored for a change of administration. The decisive word lay with the Conservatives in the House of Commons. On 9 October the party met at the historic Carlton Club. By 186 votes to 89, a resolution was carried, declaring that the party "while willing to co-

operate with Coalition Liberals, fights the election as an independent party with its own leader and its own program." It was Bonar Law's speech in support of this resolution that carried the day. What ultimately determined the verdict was a by-election at Newport, Wales, in which—the day before—the Conservative had headed the poll against a split Liberal and Labor vote. It seemed possible to the Conservatives to carry the country without Liberal assistance. On the afternoon of that party meeting, David Lloyd George resigned. With resignations by his colleagues filling his letter-box, he had no choice. The King sent for Andrew Bonar Law (q.v.), who undertook to form a government. The cabinet was as follows:

Office	Old	New
Prime Minister and First Lord of Treasury	D. Lloyd George	A. Bonar Law
Lord Privy Seal	Austen Chamberlain	Vacant
Lord President of Council	Earl Balfour	Marquis of Salisbury
Lord Chancellor	Viscount Birkenhead	Viscount Cave
Chancellor of Exchequer	Sir R. Horne	Stanley Baldwin
Home Secretary	Edward Shortt	W. C. Bridgeman
Foreign Secretary	Marquis Curzon	Marquis Curzon
Colonial Secretary	Winston Churchill	Duke of Devonshire
Secretary for India	Viscount Peel	Viscount Peel
Secretary for War	Sir L. Worthington Evans	Earl of Derby
First Lord of Admiralty	Lord Lee of Fareham	L. C. M. S. Amery
Secretary for Scotland	Vacant	Viscount Novar
President Board of Trade	Stanley Baldwin	Sir Philip Lloyd-Graeme
Minister of Health	Sir A. Mond	Sir Arthur Griffith Boscawen
Minister of Agriculture	Sir A. Griffith Boscawen	Sir Robert Sanders
President Board of Education	H. A. L. Fisher	E. F. L. Wood
Minister of Labor	Dr. J. T. Macnamara	Sir Montagu Barlow

On 15 Nov. 1922 the general election was held. With the Irish Free State no longer represented in the Imperial Parliament, the House of Commons was reduced to 615 members, of whom 602 represented Great Britain. Of these, 47 obtained their seats without opposition, namely, 32 Conservatives, four Labor, five Asquith or Independent Liberals, five Lloyd George or National Liberals, and one Independent. Of the 555 contested seats, the Conservatives won 305, Labor 140, Independent Liberals 55, National Liberals 50 and Independents five. The final result was thus:

Conservatives	337
Other parties:	
Labor	144
Independent Liberals	60
National Liberals	55
Independents	6
	<hr/> 265
Conservative majority in Great Britain over all other parties	<hr/> 72

In the 13 Ulster constituencies, the Conservatives won 11 seats against one National and one Sinn Féin. This brought up the Conservative majority to 81. On 23 November, in a te-

division, the figures were: Ministerial, 239; Opposition, 135; majority, 104. The votes recorded in Great Britain were:

Conservative.....	5,474,533
Labor.....	4,312,030
Independent Liberal.....	2,651,187
National Liberal.....	1,428,478
Independents.....	302,244
	<hr/> 14,178,472 <hr/>

These statistics created a deep impression. First, it was clear that the Conservatives, despite their majority, had polled few more than one-third of the votes recorded. Secondly, the enormous poll of Labor came as a startling surprise. And, thirdly, the feud within Liberalism, between "Independents" and "Nationals," was displayed in all its folly. Owing to split votes in three-corner contests, it was calculated that while on the average it took 17,900 votes to elect a Conservative, it took 28,500 votes to elect a National Liberal; 30,800 to elect a Labor member, and 48,000 to elect an Independent Liberal. The new Parliament, therefore, could not be regarded as accurately representative of parties in the country, and a demand immediately arose—voiced by Lloyd George himself—for some kind of second ballot or proportional representation.

The total number of candidates was 1,419; and 176 members, including Bonar Law himself, were returned by a minority vote. They were: Conservatives, 95; Labor, 54; Independent Liberals, 17; and National Liberals, 10. Among the candidates were 32 women, as follows: Conservatives, 5; Labor, 9; Independent Liberals, 13; National Liberals, 3; Independents, 20. Many of these women were well known throughout the country. Not one of them was returned, save the two members already in the House, namely, Lady Astor and Mrs. Wintringham, whose poll was as follows:

Plymouth: Sutton (Electorate, 37,696):	
Lady Astor (Conservative).....	13,924
Capt. G. W. Brennan (Labor).....	10,831
Dr. H. W. Bayly (Independent Conservative).....	4,643
Majority.....	<hr/> 3,093 <hr/>
Lincolnshire, South (Electorate, 28,468):	
Mrs. Wintringham (Independent Liberal).....	11,609
Sir Alan Hutchings (Conservative).....	10,726
Majority.....	<hr/> 883 <hr/>

The reason why an independent Conservative was put up against Lady Astor, appears to have been a dissatisfaction with her outspoken advocacy of temperance. While she is not herself urging so drastic a policy as Prohibition for Great Britain, her personal abstinence from alcoholic liquor is well known, and her general attitude on the subject is not approved in the Conservative Party, of which the chief whip, Sir George Younger is a brewer. The success of the party at the polls was largely due to the support of 100,000 public houses. In fighting the election, Bonar Law did not pretend to put forward any program. He quietly set aside a positive Conservative policy, which would have included tariffs and a new fight for the House of Lords. His "slogan" recalled the famous word

"normalcy," coined by President Harding in 1920. Bonar Law promised "tranquility." He suggested a withdrawal from too active responsibilities in Mesopotamia and the Near East. His whole attitude favored *laissez faire*. As Prime Minister, he would not himself interfere, as Lloyd George had done with the departments. Lord Curzon should manage foreign policy, and the unemployed—when they called on him—were told that they must be content with interviewing Sir Montague Barlow, the Minister of Labor.

But on one matter of capital importance, the government was compelled to take an immediate decision. As long ago as 22 May 1922, Bonar Law, then speaking as a private member out of office, had warned France against any weakening of the Entente, adding that if she acted independently in attempting to carry out the Treaty of Versailles, she would be playing into the hands of Germany. In January 1923, Bonar Law, as Prime Minister, visited Paris and conferred with Poincaré over reparations. The differences between the two statesmen were irreconcilable. Bonar Law wished to give Germany time to build up her economic strength and so to enable her to pay something, at any rate, of her liabilities under the Treaty of Versailles. Poincaré was for declaring an immediate default, to be followed by the military occupation of the Ruhr valley. The negotiations between the Prime Ministers were brief and friendly, but final. The new year had scarcely opened before Bonar Law bade Poincaré a courteous farewell and the British Entente with France, developed 20 years before by Lord Lansdowne, came to an end.

The new House of Commons presented many interesting changes. The absence of the Irish Nationalists was confirmed. And Labor, having the largest party, other than the Conservatives, became the official Opposition. This meant that the historic Liberal Party, led by Palmerston, Gladstone, Rosebery, Bannerman and Asquith was relegated to a third place in the landscape, and that in the event of a Ministerial defeat, it would be for the Labor leader and not for the Liberal leader that the King would send to form an alternative government. Lloyd George recognized the position by taking his seat "below the gangway"—the same familiar corner seat which he occupied before 1905, as a private member who had yet to taste the sweets of office. Asquith was a somewhat pathetic figure. His majority at Paisley had been reduced to 316 in an electorate of 38,000 and undoubtedly a contributory cause was the irresponsible reminiscences published and lectures delivered by "Margot." Without formally deposing their veteran leader, the Independent Liberals chose Sir John Simon, perhaps the most successful lawyer of the day, to be their spokesman. The Labor Party is not perhaps so formidable in fact as it is in name. It contains many intellectuals like Sidney Webb and also a number of Liberals, usually with private means, who have become impatient over the negative prospects of that party under the Asquith leadership. The only Communist in the House is J. T. W. Newbold who sits for the Motherwell division of Lancashire where the mining vote predominates.

The declared policy of the Labor Party may be summarized: Free Trade, an avoidance of diplomatic and military commitments abroad, housing, the national ownership of mines and railways, and a levy on capital.

The party includes many members who, like Philip Snowden, opposed the war. Their return from the political wilderness may be interpreted as meaning that public opinion among the workers is gravely dissatisfied with the Treaty of Versailles and the failure to establish a real reconciliation in Europe. How complete has been the change of sentiment towards Germany may be estimated by the choice of a leader on the part of labor. The previous leader was J. R. Clynes, a trade unionist and cotton worker, who had supported the war, served in the Coalition as food controller and been created a Privy Councillor. At a party meeting, Clynes was, however, defeated 61 votes to 56, 21 November, his chosen successor being James Ramsay MacDonald, a determined pacifist and intellectual. The decision was doubtless due in a measure to MacDonald's conspicuous parliamentary gifts but it was regarded, none the less, as sensational. The most dramatic incident of the election was the defeat of Winston Churchill. It was unfortunate for him that he was just recovering from an operation for appendicitis but, had he enjoyed good health, it is doubtful whether the result would have been materially different. His constituency was Dundee in Scotland. Two members represent the city and the voting was:

Dundee (Electorate, 78,007):	
E. Scrymgeour (Prohibition).....	32, 078
E. D. Morel (Labor).....	30, 292
D. J. Macdonald (National Liberal).....	22, 244
Winston Churchill (National Liberal).....	20, 466
R. R. Pilkington (Independent Liberal).....	6, 681
W. Gallacher (Communist).....	5, 906

That Scrymgeour, the only Prohibitionist in the House, should have beaten a powerful Minister like Churchill by more than 12,000 votes, showed how far the pendulum had swung against "a spirited" policy abroad. During the year under review, the chief event was the marriage of Princess Mary, only daughter of King George V, to Viscount Lascelles, heir to the Earl of Harewood. The ceremony took place on 26 February in Westminster Abbey, and was an occasion of immense public rejoicing. In June, the Prince of Wales returned from a tour that included India, Japan,—where his game of golf with Prince Hirohito became at once historic— and Egypt. Defying precedent, he acted as best man for his cousin and aide-de-camp, Lord Louis Mountbatten, who—also in Westminster Abbey—married (July) Edwina Cynthia Annette Ashley, the wealthy heiress of the late Sir Ernest Cassel—the pair spending their honeymoon in the United States. During the year the Prince was twice thrown from his horse on the hunting field.

Over his matrimonial prospects, rumor has been busy. On his return from travel, he was greeted at Buckingham Palace by a company that included the Princess Yolanda of Italy, whose religion would have to be changed, of course, if she were to be included in the Protestant Succession of Great Britain. Another

rumor associated the name of the Prince with that of Lady Elizabeth Bowes Lyon, daughter of the Earl of Strathmore whose castle of Glamis is mentioned in Shakespeare's 'Macbeth.' In January 1923, however, the King announced that it was the Duke of York who had sought and won this lady, to which betrothal he gave his consent. While the Prince of Wales is heir apparent to the throne, the Duke of York is heir presumptive, and his engagement to a lady of British birth and non-royal status marks a great change in the policy of the court. The throne is thus rendered dependent on national affiliations rather than on international alliances, which, indeed, had become difficult, if not impossible, owing to the failure of royalty in Germany, Russia and Greece. During the year, there have been certain determining social factors. On 11 Dec. 1922, the number of unemployed, though reduced, was still 1,388,600. Depression in the shipping business and in foreign trade generally accounts for this large proportion—about 16 per cent—of idleness, to relieve which distress there are heavy charges on the community. The sums paid in unemployment benefit were 1920, £2,420,000; 1921, £58,500,000; 1922 (to 2 December) £44,000,000. To this expenditure, contributions are made by the employers, employed and the state, the figures for 11 months of 1922 being: employers, 16,750,000; employed, 14,500,000; state, 11,350,000. total, 42,600,000.

It will be noticed that while Great Britain has reduced her imports, her exports have slightly increased. Her purchasing power is restricted and she has to meet foreign obligations which tend to swell her export figures. Despite the strain of war, the virility of the British people is well maintained. According to the registrar general's report, published in 1922, the number of births in 1920 was 957,782, and of deaths, 466,130, showing a net increase of population of no less than 491,652, or nearly half a million. For the year 1922, a rough estimate suggests that the increase of population will work out at—say—300,000. Under these circumstances emigration is inevitable and schemes for assisting settlers to reach the Dominions are in progress.

PHILIP WHITWELL WILSON.

GREECE, a country of southeastern Europe and a constitutional monarchy since 1830. In 1922, the throne was occupied to 27 September by Constantine and after that date by his son George. For details of the abdication of Constantine and the accession of George see section on History in this article.

Area and Population.—The territory of old Greece (before 1912) comprised so-called continental Greece in the extreme of the Balkan Peninsula, the Peloponnesus to the south of the Gulf of Corinth, Euboea, the Cyclades including Naxos, Syra, Andros, Mikonos, Tenos, Paros and other islands about 220 in number, the Sporades, and the islands in the Ionian Sea, including Corfu, Xante, Santa Maura, and Cephalonia. As the result of the Balkan war of 1912-13 Greece added 16,919 square miles to her territory, including Macedonia, Epirus, Crete, and the other Aegean Islands, all of which

is termed new Greece. After the World War the powers permitted Greece to retain all those Aegean Islands which she occupied during the war except Imbros, Tenedos and Castellorizzo, which were to be restored to Turkey. Also with the consent of the allied and associated powers Greece, after the war, occupied part of the Bulgarian province of western Thrace and the greater part of the province of Aidin in Asia Minor. From the last named she was ousted in the early autumn of 1922 by the Turkish Nationalist forces under the command of Mustafa Kemal Pasha. The Turkish victory also resulted in a readjustment of the boundaries between Turkey and Greece in Thrace. The population of the nomes or departments of Greece is as follows:

Names	Census, 1920
Old Greece:	
Attica and Boeotia.....	581,829
Phthiotis and Phocis.....	119,215
Acarnania and Aetolia.....	195,571
Achaia and Elis.....	271,672
Argolis and Corinthia.....	158,528
Arcadia.....	155,833
Laconia.....	137,456
Messenia.....	226,066
Euboea.....	127,876
Cyclades.....	120,292
Corfu.....	123,371
Cephalonia.....	64,775
Xante.....	39,078
Larissa.....	239,528
Trichkala.....	186,476
Arta.....	52,578
Total (Old Greece).....	2,800,164
New Greece:	
(Macedonia):	
Salonica.....	398,240
Pellis.....	94,117
Serres.....	113,620
Drama.....	161,890
Kosani.....	175,577
Florina.....	200,866
	1,144,310
(Epirus):	
Janina.....	167,644
Preveza.....	45,632
	213,276
(Aegean Islands):	
Mytilene.....	146,852
Chios.....	61,873
Samos.....	65,756
	274,481
Canea.....	97,175
Candia.....	118,101
Lasithion.....	61,158
Rethymnos.....	68,715
	345,149
(Thrace*).....	669,697
Grand total.....	5,447,077

* Boundary settlement in Thrace will reduce the total for this division.

The chief cities and their populations are the following: Athens, 300,701; Salonica, 170,195; Piraeus, 133,482; Patras, 52,133; Volo, 30,056. Athens is the capital.

Religion.—The religion of the state is the Greek Orthodox but complete freedom of worship is guaranteed to all other sects. The great majority of the inhabitants are members of the Greek Orthodox faith. The National Church is governed by a permanent council called the Holy Synod, which consists of the Primate of Athens and four archbishops and bishops. There

are three archbishops and 29 bishops in the territory of Old Greece and 59 archbishops and bishops in the territories acquired since the Balkan Wars. The Roman Catholic Church has three archbishops and three bishops in Greece.

Education.—Primary education is free and compulsory between the ages of 6 and 12 but the attendance law is poorly enforced and the percentage of illiteracy is very high, being 30 among the army recruits. According to latest returns there are in the kingdom 6,799 primary schools with a teaching staff of 8,641, of whom about one-half are females. In these schools there were 476,695 pupils, including 174,805 females. Secondary education is provided for by 76 high schools and 425 middle schools with 55,408 pupils, including 5,311 girls. In addition there are two agricultural schools with 150 students, a trade and industrial academy and government commercial schools at Athens, Volo, Salonica and Patras. In these commercial schools there are about 350 students. There are two universities at Athens with about 165 professors and 3,300 students. There is a polytechnic institute with 180 students. Primary education costs the state about 10,000,000 drachmai yearly. The Ministry of Education also maintains an archaeological department which has charge of the conservation and repair of the ancient monuments which abound in the country. There are also several schools of archaeology maintained by foreigners, such as the American School at Athens, etc.

Production.—Agriculture is the chief occupation of the inhabitants but only 20 per cent of the total area is arable. Great efforts are being made at reafforestation, the country having been denuded of its trees. Irrigation and drainage works are being constructed and road building is proceeding as rapidly as the financial state of the country permits. The land is largely in the hands of small proprietors. The currant crop is the chief industry and has its centre about Patras. In 1922 the yield of this crop was 103,307 tons. To help maintain prices there is a recent law limiting the production of currants. In 1921, wheat was grown to the extent of 261,565 metric tons, barley 125,112 tons, corn (maize) 200,818 tons, oats 65,500 tons, wine 51,415,685 gallons and olive oil 13,801,000 gallons, nuts 6,376,590 pounds, citrus fruits about 6,000,000 cases and cheese 14,812,875 pounds. The breeds of cattle and other live stock are being greatly improved by the introduction of pure-bred stock. The last live stock census showed in Greece 5,467,828 sheep, 365,074 swine, 527,173 cattle, 131,436 horses, 111,979 mules, and 242,700 asses. Mining is becoming increasingly prominent, the chief ores worked are those of iron, copper, zinc, lead, tin, silver, antimony, manganese, cobalt, lignite and sulphur ochre. The output of lead in 1921 was 24,313 tons, of magnesite 65,015 tons, of iron 45,718 tons and of salt 58,050 tons. Lignite production declined from the record productions set in 1918, 1919 and 1920, being only 144,480 tons. The manufacture of olive oil, wine, leather, soap and textiles are the chief industries of the kingdom. The last industrial census reported 2,213 factories, employing 36,100 operatives and capitalized at 260,363,000 drachmai.

Commerce and Trade.—The value of the imports of Greece in the year 1921 was 66,944,700 English pounds sterling and that of the exports 32,679,600 pounds sterling. Yarns and textiles, agricultural products, medical supplies, metals and metal manufactures, leather, hides, confectionery and forest products formed the chief articles on the import list while the same articles also figured largely in the exports. In 1920 Great Britain furnished the largest quota of the imports and also took more of the exports than any other nation. The United States was second on the list of nations in the foreign trade of Greece. Exports during the first six months of 1922 were valued at \$32,319,519; imports at \$45,322,815.

Finance.—The revenue in 1921 was 1,033,579,740 drachmai and the total expenditure the same year was 1,298,759,754, leaving a deficit of 265,180,014 drachmai. No budget for the year 1921-22 was submitted to the National Assembly and not even provisional estimates of revenue and expenditure were available. During 1922 the expenses of administration and of the war with Turkey were met by monthly credits passed by royal decree and without parliamentary control. The public debt of Greece is mostly under the control of an international commission to which are assigned certain revenues and duties. In 1921 the commission reported an income of 149,185,600 drachmai. The external debt of Greece at the beginning of 1922 was \$204,401,300. According to the agreement of 10 Feb. 1918, Great Britain, France and the United States agreed to advance credits to the Greek government in stated sums, of which there have actually been paid 7,000,000 pounds by Great Britain, 15,000,000 dollars by the United States and 30,000,000 francs by France.

Army and Navy.—Military service is compulsory and well high universal from the 20th year to the 51st year. Active service is two years with the infantry and three years in the cavalry and artillery followed by 21 years in the first reserve and the remainder of eight years in the second reserve. During the year 1922 the Greek army was on a war footing as it had been for nearly 10 years. In 1922 Greece had in Asia Minor 11 divisions and a number of detached regiments until the debacle before Smyrna in September. All men liable to service up to the age of 40 were mobilized. The average number of men in a division is 12,000. For details of the military operations during the year see section on History at the end of this article. The navy consists of seven cruisers, three of which are virtually obsolete, 13 destroyers, six modern torpedo boats, two submarines and a number of auxiliary craft. At the close of the war Greece received the Austrian destroyer *Uluu* and seven torpedo boats.

Communications.—Greece has a total railway mileage of 1,470 miles. The principal rail routes are the Piraeus-Athens-Peloponnesus, the Hellenic, the Salonica-Monastir and the North Western. Most of the lines are state-owned. There are 10,565 miles of telegraph lines served by 350 offices and 7,750 miles of telephone lines mostly confined to six urban systems. There are 940 post-offices. The merchant marine of the Greek nation at the beginning of 1922 con-

sisted of 1,192 sailing vessels of 113,726 tons and 408 steam vessels of 402,221 tons.

Government.—Since 1911 the legislative power is vested in two chambers. The lower chamber is called the Boule; has 316 members who must be at least 25 years of age. It meets yearly in October for a period of three months. The second chamber is really a council of state and passes on the constitutionality of the laws acted on by the lower chamber, and annuls decrees found to be contrary to the constitution. The executive power is vested in the sovereign who attains his majority upon the completion of his 18th year.

History.—The Ministry of Finance announced on 1 January that the British government had withdrawn its objections to a private banking credit to Greece in the sum of \$75,000,000. The government projected a great port at Dede-Agatch, on the Aegean, which is to be renamed Alexandroupolis. The quarrel with Turkey continued to absorb most serious attention. On 20 January, Mustapha Kemal, the Turkish National leader, ordered all the Greek residents of Konieh, in Anatolia, to be deported to Erzerum. The Turkish authorities in Samsun arrested 300 Greek civilians on 30 January and put them to death. There were several hangings in various parts of Turkey and feeling ran high among the Greeks at home and in Asia Minor. Large quantities of Greek stores were confiscated by the Turks in Constantinople early in February and a clash with Greek consular officers and Turkish police was only averted by the intervention of the British police. Desultory fighting continued between the forces of Kemal and the Greeks. A Kemalist conspiracy was discovered by the Greeks in Smyrna and the Greek government ordered the harbor closed from sunset to sunrise. The Gounaris cabinet fell 10 March but after the failure of Stratos to form a cabinet M. Gounaris was recalled. Greek naval forces seized the French steamer *Espoir* on 14 February; the vessel carried coal and oil whose destination the Greeks alleged to be the Kemalist government at Mersina. A long controversy ensued with France, the upshot of which was that the boat was released by the Greeks, who kept the cargo and referred the whole matter to an international prize court. A month later the Greeks seized the Italian steamers *Umbria* and *Abbazia*, retaining the latter. This incident caused friction with Italy. On 23 March the three great powers forwarded to Athens their decision about an armistice between the Greek and Turkish forces in Asia Minor. The text of this document is as follows:

"The Foreign Ministers of the three great powers, having met together in Paris for the purpose of restoring peace in the Near East, and in order to try to formulate some suggestions for the evacuation of Asia Minor without further bloodshed and other material losses, have considered it their duty to advise very earnestly the interested Governments to accept an immediate cessation of hostilities."

This preamble is followed by the text of the proposed armistice as follows:

Article 1. The hostilities will cease at midnight of the night of ———, 1922.

Article 2. While maintaining their general lines now occupied by their main forces, the belligerent parties must withdraw to the rear their advanced elements in such a way as to suppress any contact, and they must also open a space free from troops, which space must not be less than ten kilometers between the two fronts, in conformity with the decisions to be taken by different local commissions.

made up of the representatives of the Greek and Turkish commands, and also of a number of Allied officers.

Article 3. During the armistice no reinforcements, whether in personnel or in material, shall be operated by either of the opposing armies, and no transfer of any units constituting the front will be permitted.

Article 4. A number of Allied commissions under a common Allied direction shall be attached to each belligerent army.

Their duty shall be to control in each of the armies the execution of the clauses of the armistice, and to settle the incidents that may arise in this connection. These Allied commissions shall also have the right to intervene in the activities of the authorities occupying their respective territories, in order to assure the protection of the minorities resident in those localities.

Article 5. The Hellenic High Command and the Ottoman High Command assume the obligation of accepting and of loyally complying with the arbitration of the Allied commissions.

Article 6. The hostilities will be suspended for a period of three months, which period may be automatically renewed until the time when the belligerents will have accepted the conditions of the preliminaries of peace. Should one of the belligerents desire not to renew the present convention, he shall have to notify the other party and also the representatives of Great Britain, France and Italy, at least fifteen days before the expiration of the armistice then in force.

"CURZON"
"SCHANZER"
"POINCARÉ."

The Greek government agreed to this armistice conditional on certain reservations of a strictly military character. However, it declined though unofficially to the clause involving the evacuation of Asia Minor which for Greece would involve the abandonment to the tender mercies of the Turks of the entire Greek population of Asia Minor. The Turkish nationalists notified the great powers that their acceptance of the armistice was conditional on the withdrawal of the Greek forces in specified areas within two weeks and on the complete evacuation of Asia Minor by the Greeks within four months. In April the National Assembly enacted a law for a forced internal loan of 1,600,000,000 drachmai (the equivalent of \$75,000,000 at the present rate of exchange). This loan and the method of its execution caused somewhat of a sensation. It declared one-half of the paper currency of the kingdom void for any monetary transaction and good only as a bond bearing 6 per cent interest, and redeemable in 20 years. Under the terms of the act, all bank notes in Greece were cut in two, one-half of which was to be used thereafter as currency, and the other half becoming automatically a 6 per cent 20-year bond. Certain adjustments were permitted for a period not to exceed three months. Three times a year certain of the bonds will be drawn for redemption at par. The cutting of the notes is a temporary measure; the government being prepared to replace the bond side of the notes with a regular bond of a given denomination and the currency side with new paper currency. The depletion of the treasury funds resulted from the effects of the two-year financial blockade which prevented the government from obtaining a loan abroad and also from the great cost of the operations and maintenance of the Greek armies in Asia Minor.

An adverse vote in the National Assembly on 11 May resulted in the resignation of the Gounaris cabinet, which was at once succeeded by the administration of Mr. Stratos. The latter appeared before the Assembly on the 17th and asked for a vote of confidence on the policy he had just outlined. The vote was denied him

and he resigned the following day. Mr. Gounaris now co-operated with Stratos in forming a Coalition ministry which was completed on 23 May under the presidency of Mr. Protopapadakis, who had been Minister of Finance in the Gounaris ministry. On the following day this cabinet received the endorsement of the National Assembly by a vote of 218 to 30.

On 25 May General Papoulas, commander of the Greek forces in Asia Minor, resigned his command on the ground that he had reached the age limit. He was succeeded by General Hadjanestis, who thereupon made a tour of the entire front and on 28 June submitted his report advising a continuation of the war with Turkey. A great council of war was held the following day at the summer palace at Tatoi, at which the King and most of the Cabinet members assisted. It was decided not to evacuate Asia Minor and to bend all efforts to force a decision on the Near East question. The Greeks determined at length to end the long and costly war by a sudden advance on Constantinople but were frustrated by the attitude of the Allied forces on the Straits. For the moment the advance on the Turkish capital was abandoned but Greece issued a decree declaring Smyrna and the surrounding territory in Asia Minor an autonomous state. The Allies massed troops along the Chatalja front to forestall any Greek advance in that quarter. Greece frequently protested that the Allies were limiting her forces as a belligerent. The situation was suddenly changed the last week in August when the Turkish forces drove the Greek armies into precipitate retreat along the entire front in Asia Minor. About 100,000 Greeks were captured or killed and great supplies fell into the hands of the Turks. The rout of the Greeks was accompanied by the flight of hundreds of thousands of Greek civilian refugees, who fled to the coast to escape massacre at the hands of the advancing Turks. Efforts to arrange an armistice proved fruitless and Smyrna was taken by the Turks on 9 September. Throngs of civilian and soldier refugees packed the quays of Smyrna and Greek and allied vessels aided in the gigantic task of evacuation. Typhus and other epidemic diseases added to the horror and demoralization. With the entrance of the Turks into Smyrna, the burning of the city a few days later and the massacre of many of its Christian inhabitants on 13 September the Greek occupation of Asia Minor came to an end and the nation turned its eyes on Thrace, the new focus of Turkish activity against Greece. King Constantine advised the people to remain calm in face of the national disaster and a new cabinet was formed under the premiership of Mr. Triantafyllakos. The broken remnants of the army of Asia Minor were transferred first to the islands of Chios and Mytilene and later to the mainland. There were symptoms of mutiny during the transfer as the troops learned of the extent of the disaster and felt that they had been betrayed. On 20 September it was announced that Greece had an army of 100,000 men on the Thracian front. At the same time the Greek government learned of the Allied offer to the Turkish Nationalists of eastern Thrace, together with the restitution of Adrianople and Constantinople. While the government at Athens

was discussing these happenings a military revolution broke out in Mytilene under the lead of Colonel Gonatas. The troops destined for Thrace demanded to be transported to Athens and, under the escort of the navy, several transports reached Laurium on 26 September. Here a revolutionary committee was formed led by Colonels Gonatas and Plastiras and Captain Phokas of the mutinous navy. With civil war imminent, King Constantine abdicated in favor of his son, Crown Prince George, on 27 September. The latter took the oath before the Triantafyllakos ministry and the revolutionary committee and the ministry then resigned. A ministry was then formed by the revolutionary committee with Mr. Krokidas as Premier. One of the first acts of the revolutionary ministry was to order the arrest of the former premiers Gounaris, Stratos, Protopapadakis and the ministers Goudas and Theotokis to be tried on charges of high treason. The avowed purpose of the revolution in Greece was to save Thrace, nevertheless Thrace had to be sacrificed at the Mudania conference, where the armistice between Turkey and the Allies was signed on 10 October. The revolutionary committee explained the failure to save Thrace by stating that the revolution came too late to accomplish its purpose. Martial law was proclaimed throughout Greece on 11 October and on the same day Mr. Venizelos was appointed official delegate of Greece at the Allied capitals. Greece began the evacuation of Thrace on 15 October and the revolutionary committee turned its attention to the pressing internal problems. On 22 October a great popular demonstration took place at Athens expressing the people's confidence in the revolutionary committee. On the 26th, Prince Andrew, brother of the deposed King Constantine, was arrested on the charge that he was responsible for the disaster in Asia Minor. The revolutionary investigating committee published a report on 8 November in which it placed the responsibility for the disaster to Greek arms in Asia Minor. It accused all the anti-Venizelist governments from 1915 to 1922 of alienating the sympathies of the Allies, of recalling Constantine in 1920 and of various breaches of the constitutional law of the kingdom. The report was a form of indictment in that it demanded the establishment of a special court-martial for the trial on a charge of treason of Messrs. Gounaris, Stratos, Protopapadakis, Theotokis, Baltagis, Hadjanestis, Goudas and Stratigos. Mr. Zaimis declared his willingness to assume the premiership on 9 November on the retirement of Mr. Krokidas. The trial of the former ministers began on 13 November when the jurisdiction of the revolutionary court was questioned. In the days that followed General Papoulas stated to the court that the advance on Angora in August 1921 was ill-advised and undertaken without his consent. Coming to the campaign of 1922 General Papoulas stated that the contemplated advance on Constantinople in July 1922 so weakened the Asiatic front that its collapse became at once imminent and inevitable. Practically all the accused ministers took the stand in their own defense and defended their every action. Gounaris offered to present official proof that he had received assurances of support from Great

Britain but these proofs were excluded from the record. On 22 November General Metaxas, leader of the anti-Venizelist opposition, pleaded with the Premier to ask that any sentence passed on the accused by the revolutionary court be appealed to the new National Assembly. The court refused the plea as transmitted by the Premier and the latter thereupon resigned. Zaimis, who had some time before signified his willingness to form a ministry, refused to subordinate the ministry to the leaders of the revolution and refused to form a cabinet. Colonel Gonatas took the premiership himself on 25 November, formed a cabinet and with it assumed office on 27 November. On the 27th the final arguments were made in the state trials, the court retiring at midnight and returning at 2 A. M. on the 28th with a death sentence for the five former ministers and General Hadjanestis and a decree of life imprisonment for the other two prisoners. The sentence was carried out at 11 o'clock in the morning.

An official announcement issued after the executions reads: "The sentence of the court martial was delivered this morning. Messrs. Gounaris, Baltazis, Theotokis, Protopapadakis and Stratos and General Hadjanestis were condemned to death and were executed this morning. General Stratigos and Mr. Goudas were sentenced to penal servitude for life. The military defendants were also sentenced to degradation, and the following fines were inflicted: Gounaris, 200,000 drachmas; Stratos, 355,000 drachmas; Protopapadakis, 500,000; Baltazis, 1,000,000; Theotokis, 1,000,000; Goudas, 200,000 drachmas."

A statement by the court martial, giving the reasons for imposing the sentence of death, says in effect that the defendants knowingly concealed from the people the danger involved in King Constantine's return to the throne, and that, although Greece was breaking away from her alliances, they did their utmost to consolidate Constantine's throne in order to enjoy office under him. "By terroristic methods," the statement adds, "they stifled all public opinion contrary to them, arranged with General Hadjanestis a pretended offensive against Constantinople, and thereby brought about the enemy's offensive and the collapse of the Greek front in Asia Minor, thus deliberately delivering a large part of the army into the enemy's hands. They therefore were convicted, in accordance with several articles of the military and penal codes, of conspiring to commit high treason."

On the day following the executions Great Britain severed relations with the Greek government and on 1 December the Greek Minister at Washington, Mr. Lambros Coromilas, resigned in protest against the execution of the former ministers. On 3 December Prince Andrew was tried on a charge of treason and sentenced to life banishment from Greece and to suffer degradation and deprivation of his army rank. See also NEAR EAST.

GREENLAND, the second largest island in the world and the only colony of Denmark, has an estimated area of 845,000 square miles, of which the greater part is uninhabited. The inhabited portion has an area of 46,470 square

miles and in 1911 had a population of 13,449. The largest settlement is Sydproven, which had 789 inhabitants in 1911; the smallest is Skansen with 46 inhabitants. Imports from Greenland to Denmark were valued at 4,020,000 kroner in 1920 and exports from Denmark to Greenland the same year were valued at 3,229,000 kroner. The trade of Greenland is a state monopoly. Seals and sealskins, fox skins, fish and oil are the chief products of the colony. See also DENMARK.

GREENSBORO COLLEGE, an educational institution for women of the Methodist Episcopal Church, South, chartered in 1838 and located at Greensboro, N. C. In 1922-23 it had a faculty of 25 members, 324 students, property valued at \$756,000, and a total income of \$77,000. Samuel Bryant Turrentine, D.D., is president.

GREENVILLE COLLEGE, a Free Methodist co-educational institution, founded in 1892 and located at Greenville, Ill. In 1922-23 it had a faculty of 23 members, 409 students, property valued at \$250,000 and an income of \$40,000. Eldon Grant Burritt, A.M., is president.

GREENVILLE WOMAN'S COLLEGE, a Baptist educational institution, founded in 1854 and located at Greenville, S. C. In 1922-23 it had a staff of 39 teachers, property valued at about \$627,800, and an income of approximately \$110,000. Number of students enrolled for the year 1922-23 not given. David Marshall Ramsay, D.D., is president.

GREENWOOD, Elizabeth Ward, American evangelist; b. Brooklyn, N. Y., 1850; d. there 28 Nov. 1922. She was the daughter of Joseph M. Greenwood, a Brooklyn lawyer. For nearly 40 years she was a preacher of the Gospel in churches, jails and asylums throughout the United States and in many other countries of the world. For 20 summers she filled the pulpit of the Congregational Church at Chapinville, Conn., and for seven years she served as pastor of the famous Mayflower Mission of Plymouth Church in Brooklyn. From 1887 to 1912 she was superintendent of the evangelistic work of the World's Woman's Christian Temperance Union, and of the National Woman's Christian Temperance Union, and for 34 years was president of the Woman's Christian Temperance Union in Brooklyn.

GREINER, Fred, American political leader; b. 1854; d. Buffalo, N. Y., 25 Dec. 1922. After graduation from the public schools, he took up the study of law in a local office and was admitted to the bar in 1876, when he was 22 years old. Soon afterward he began to make himself felt as an influence in Buffalo politics. From the start he made it his rule to take no middle ground on any important question. "I make up my mind on an issue, and then I am a partisan," he often said. He wrested control of the Republican Party in Erie County from William C. Warren in a memorable primary contest in 1906. He supported President Roosevelt and Governor Higgins in opposition to the efforts of Benjamin Odell, former Governor, to direct the State politics of the party. The result was a sweeping victory for Greiner, and from that day until his death he reigned supreme, defeating

three attempts to overthrow him. In 1908 he and Herbert Parsons of New York led the fight for the renomination of Governor Hughes. In 1910 he was a factor in the successful fight to make Roosevelt presiding officer of the Republican State Convention. Again he combined with Roosevelt in 1910 in support of Governor Hughes's efforts to pass the Hughes direct primary bills. In 1916 Greiner was successful in persuading Roosevelt to take the stump for Hughes, who was a candidate for President. Mr. Greiner held only two offices during his political career,—one was a minor clerkship in the Municipal Court and the other, the Post-mastership of Buffalo, which he held for 12 years.

GRENADA, an island of the Windward group in the Antilles belonging to Great Britain. It has an area of 133 square miles and a population of 75,663 in 1920. The capital is Saint George. There are 11 government and 48 aided schools with 9,437 pupils and one secondary school for boys and two for girls. The revenue in 1920 was 134,128 pounds sterling and the expenditure 148,175 pounds. Imports the same year were valued at 630,803 pounds and exports at 603,697 pounds. Cocoa, nutmegs, mace, limejuice, raw cotton, and cotton seed are the chief products and exports. The United States was the largest importer in 1920, but took less of the exports that year than Great Britain. The island is part of the administration of the Windward Islands. The Governor and Commander-in-Chief in 1922 was Sir G. B. Haddon-Smith. The seat of the government is at Saint George.

GRENADA COLLEGE, an educational institution for women under the auspices of the Methodist-Episcopal Church, South, founded in 1852 and located at Grenada, Miss. In 1922-23 it had a faculty of 18 members, 200 students, property valued at \$300,000 and an income of \$70,000. J. R. Countiss, A.B., D.D., is president.

GRIFFITH, Arthur, Irish journalist and statesman, founder of the Sinn Fein party; b. Dublin, 1872; d. there, 12 Aug. 1922. He was educated at a Christian Brothers school. Like his father, he became a compositor and soon advanced to copy reader on a Dublin journal. After a time he went to South Africa where he was employed as a surface miner on the Rand. The native Kafir miners called him "Cuguan," that is, "The Gentle One," "The Dove," and, on returning to Ireland, he adopted "Cuguan" as his pen-name. On his way back to Ireland he visited the Continent and made a close study of the constitutional system of Austria-Hungary. He reached Ireland with a very definite idea as to the form Irish national development should take and in 1899 founded a paper called *The United Irishman*, his articles in which soon attracted attention. His political master was Thomas Davis, and he was steeped in the literature of the American Revolution and of the Civil War, in the Nationalist verse of the Young Irelanders, and in English literature. Griffith wrote in a convincing and interesting way on economic subjects, industrial development and finance. The official Nationalist Party looked

on him with suspicion. Griffith became widely known by his book on 'The Resurrection of Hungary,' in which he set forth the advantages which had accrued to Hungary from the policy of self-help advocated by Deak, and Ireland's salvation, he argued, lay not through violence, but through practical and systematic work. About 1902, Griffith and a handful of disciples launched the Sinn Fein movement. His policy was one of Irish self-reliance (Sinn Fein means "Our-selves"), and he persisted, despite many discouragements, in his efforts to bring about the self-government of Ireland by peaceful means. Armed revolt was no part of his program. In contrast with the constitutional home rule policy of Parnell, Redmond and other Irish leaders, he urged abstention by the Irish members from the British House of Commons, and argued that for the Irish people to send representation to the British Parliament was an admission of its right to legislate for Ireland. Restoration of the independent Irish Parliament which existed before the British Act of Union of 1800 was advocated by Griffith. He and his associates worked for the development of Irish industries, the revival of the national games, the national music and the Irish language. The full program of the Sinn Fein was propounded by Griffith at a great gathering in the Rotunda, Dublin, in November 1905. However, it met with little favor for several years. A Sinn Fein candidate stood for the Longford parliamentary seat and was hopelessly beaten and Sinn Fein appeared to be dead. Griffith continued to issue weekly a four-page sheet called *Sinn Fein*. The apparent success of the Nationalist Party at Westminster militated against the growth of the Sinn Fein until 1914 when a division developed in the Irish Volunteer organization, one section following Redmond and the Nationalists and the other allying itself with the Sinn Fein. Griffith was drawn into taking an active part in the organization, which gave him a new journal, *Nationality*, which soon became the official organ of the Sinn Fein. The rebellion of Easter of 1916 burst upon Griffith like a bombshell. He saw in it the destruction of all his hopes. In due course he was arrested and lodged in Reading Gaol with the less dangerous of the extremists. As the "physical force" party had been crushed and its leaders executed or in prison, the peaceful business of working out the old Sinn Fein policy was resumed and the movement grew by leaps and bounds. When Griffith was released he found himself president of the most powerful political society in Ireland. Election after election was won by the Sinn Fein and then came the release of the extremists, headed by De Valera, who ejected Griffith from the party leadership, his views being far too moderate to suit them. During the Peace Conference at Paris in 1919 Griffith was chosen to present the Irish case, but failure to secure a safe conduct from the British Government prevented his attendance. In July 1919, he was elected acting president of the Irish National Assembly, in the absence of De Valera, who was in the United States. In October of the same year, Griffith was elected one of the permanent vice-presidents of the Sinn Fein organization. Griffith was arrested in November 1920 and spent seven months in Mountjoy

Prison, Dublin. During his imprisonment he issued a message to the people as to the conduct of the Sinn Fein. Early in June 1921, there were reports that a conference would be held in London at which Irish leaders would be invited to consult with members of the British Cabinet. Griffith was mentioned as one of the probable delegates. His release from prison followed later in the month. He accompanied De Valera to London in July 1921, when the series of conferences opened. Later he was appointed chairman of the Sinn Fein Mission to London and was the principal factor on the Irish side in carrying on the negotiations, which culminated with the signing of the treaty between Great Britain and Ireland establishing the Irish Free State. Griffith at once set about the formation of the Irish Provisional Government. The statesman in him gave effect to what the educator had taught. His action had three stages: first, in the London debates, where he forced acceptance on a wavering Irish Cabinet; second, in the debates where he had to prevent the Dail from going back on what the delegates had done; thirdly, in the Ministry, when he had to decide that attempts to defeat by force the country's declared acceptance must be put down by force. He lived to see those who in opposition to him preached an irreconcilable policy render their own ideal furiously unpopular by the courses they pursued.

GRINNELL COLLEGE (legal title, The Trustees of Iowa College) a non-sectarian, co-educational institution, founded in 1847 and located at Grinnell, Iowa. Statistics for 1922-23 show a faculty of 89 members, 880 students, property valued at \$2,864,000, and an income of \$307,000. John Hanson Thomas Main, Ph.D., LL.D., is president.

GRISMER, Joseph Rhode, American theatrical manager, actor and playwright: b. Albany, N. Y., 4 Nov. 1849; d. New York City, 3 March 1922. He was educated at the Albany Academy and made his first appearance on the stage in the city of his birth in 1870. Three years later he went to Cincinnati, Ohio, as the leading man at the Grand Opera House. In 1877 and later he appeared at the Grand Opera House, Baldwin and California theatres in San Francisco. For several years he and his first wife, who was Phoebe Davis, toured the country as joint stars. He dramatized 'Monte Cristo' and 'Called Back.' On 2 Jan. 1893 his first original play, 'The New South,' written in collaboration with Clay M. Greene, was produced at the Broadway Theatre, New York. In it he played the part of Captain Henry Ford. Mr. Grismer appeared as Lieut. Bevis Cranbourne in 'Humanity' in 1895 at the 14th Street Theatre, New York, and on tour. In 1898 he rewrote 'Way Down East,' and, under a partnership arrangement, became joint proprietor with William A. Brady of it, 'The Man of the Hour,' 'As Ye Sow' and other plays. In 1899 he adapted 'The Manicure' from the French and wrote 'Sky Farm,' produced in 1902. He was elected Shepherd of the Lambs Club in 1910 and again in 1917.

GRISWOLD, Annie Robe, Anglo-American actress: b. London, England, 1862; d. Lenox, Mass., 26 July 1922. She was the daughter of

Eliza Rugg, a Shakespearean actress in England 50 years ago. Her father was a scene painter. She went on the stage as a child under the name of Annie Robie, and early began to play in Shakespeare. Lester Wallack brought her to New York, and she succeeded Rose Coghlan as leading woman in his theatre. On her marriage to Daniel P. Griswold in 1888, she retired from the stage, though occasionally appearing in private entertainments.

GRONNA, Asle J., United States Senator: b. Elkader, Iowa, 10 Dec. 1858; d. Lakota, N. D., 4 May 1922. He was reared on a farm and educated in the schools of Houston County, Minn., and at Caledonia Academy. He removed to South Dakota in 1879, where he was extensively engaged in farming and banking. He was a member of the Territorial Legislature (1889), and the president of the board of trustees and board of education of Lakota, N. D., for several terms. He was chairman of the county central committee of Nelson County, N. D. (1902-06) and a member-at-large from North Dakota to the 59th to 61st Congresses (1905-11). He was elected United States Senator in January, 1911, for the unexpired term of Martin N. Johnson, deceased, and was re-elected for the term of 1915-21. He had always been a Republican. Senator Gronna was one of "the little group of wilful men," so characterized by President Wilson in March, 1917, because of their opposition to arming American merchant vessels for defense against German submarines. Later, however, in the Spring of 1918, he called for a "peace with victory and honor."

GROVE CITY COLLEGE, a non-sectarian co-educational institution founded in 1876, chartered in 1884, and located at Grove City, Pa. In 1922-23 it had a teaching faculty of 28, 450 students, property valued at \$750,000, and an income of \$130,000. Weir C. Ketler, LL.D., is president.

GUADELOUPE, a French colony in the Lesser Antilles, consisting of the two islands, Basse-Terre and Grande-Terre, separated one from the other by the narrow channel called Riviere Salee. The area is 532 square miles. The colony has five dependencies consisting of the smaller islands, Marie Galante, Les Saintes, Desirade, St. Barthelemy and St. Martin, the total area of which is 688 square miles. The population in 1921 was 229,822. The colony is governed by an official styled Governor and an elected Council. The seat of the government is at Pointe-a-Pitre, which has a population of 27,679. In 1921, the revenue and expenditure balanced at 16,954,562 francs. The colony produces coffee, cocoa, rum and sugar for export while bananas, sweet potatoes, tobacco, maize, and manioc are grown for home consumption. The imports in 1920 were valued at 117,858,064 francs and the exports at 146,389,180 francs. In the year mentioned there were exported over 16,000,000 litres of rum, 14,265 tons of sugar, 1,100 tons of coffee, and 26,000 tons of vanilla. There is direct steam communication with France and a new wireless station was opened at Destrellan in 1918.

GUAM, an island possession of the United States in the Pacific Ocean in Lat. 13° 26' N.

Long, 144° 43' E., and the largest of the Mariana Archipelago. It is under the jurisdiction of the Navy Department of the United States and has been designated a naval station for purposes of government and protection. It has an area of 225 square miles. Agaña is the seat of the government. In 1920 there were 13,698 inhabitants classed as natives, who speak the native language called Chamorro. Elementary education is compulsory. There are 2,240 pupils of school age in the island. The products of the island are copra, rice, sweet potatoes, cocoa, coffee and sugar. Imports in 1922 were valued at \$418,613 and exports at \$35,650. The Governor in 1922 was Capt. Ivan C. Wettengel, U. S. N.

GUATEMALA, a republic of Central America, bounded north by Mexico, south by the Pacific Ocean and El Salvador, east by British Honduras, Honduras and the Gulf of Honduras, and west by Mexico. The area of the republic is 48,290 square miles with an estimated population of 2,124,101 in 1918. Of this population over 60 per cent are of pure Indian blood and most of the remainder are half-castes, there being very few whites. The republic is divided for administrative purposes into 23 departments. The capital and seat of the government is Guatemala City, which has a population of 125,000. An earthquake destroyed the capital in 1917 but its reconstruction has been largely completed on more stable lines than before. Other large cities are: Quezaltenango (28,940); Coban (30,770), and Totonicapan (28,310).

In 1922 Gen. Jose Maria Orellana was Provisional President till March, when he assumed the office of President for the term 1922-28.

Education.—Primary education is free and compulsory between the ages of six and 14. There are in the republic 1,334 government schools with 55,234 pupils in 1921. A national university was established in 1918 and is now known as the Universidad Estrada Cabrera. There are also several special schools. The annual expenditure on education is about 12,500,000 pesos.

Religion.—The prevailing religion of the inhabitants is the Roman Catholic but there is full freedom for all denominations. There is an archbishop of the Roman Catholic Church in the capital, who has suffragans in the neighboring republics of Costa Rica, Salvador, Honduras and Nicaragua.

Production.—The Cordilleras divide the country into two regions or drainage areas, of which the Pacific area is the smaller but by far the most important economically. This western area is well watered and is very fertile between the altitudes of 1,000 and 5,000 feet. This section of the republic is also the more densely populated. On the eastern or Atlantic area the population is sparse, but coffee is grown in the Coban region, bananas are raised in the Motagua Valley and the timber industries of the Peten District are important. The forest area of the republic is about 1,316,400 acres. The most important crop of the country is coffee, of which there are 1,519 plantations covering about 600,000 acres and containing some 450,000,000 trees. An average coffee crop is between 900,000 and 1,000,000 quintals of 101.43 pounds each. About 50,000 quintals are produced in the Varapaz re-

gion on the Atlantic side and are exported through the port of Livingston; 15,000 quintals (hard bean variety) are grown in the district of Antigua, the ancient capital, 25 miles from Guatemala City; and the remainder is produced on the Pacific slope. The 1921 crop was considerably below the average, amounting approximately to 750,000 quintals, or 500,000 bags of 150 pounds each. The 1920 crop was about 850,000 quintals. Before the war Germany took over one-half the coffee crop, but during the war period most of the crop was shipped to the United States. Two-thirds of the crop of 1920 went to the United States. In 1921, 60 per cent of the crop went to Europe, chiefly to Holland, Germany, England and Scandinavia, the remaining 40 per cent to the United States. The following table furnished by the United States Department of Commerce shows the quantity of coffee shipped, and unwashed, the average annual coffee price per quintal, f.o.b. Guatemalan port, and the total annual value of exports for several years, according to the Guatemalan customs statistics:

YEAR	Coffee, clean	Coffee, unwashed	Price per quintal	Total value
	<i>Quintals</i>	<i>Quintals</i>		
1898	334,461	491,571	\$11 54	\$8,397,863
1900	323,663	406,163	10 84	7,030,752
1905	507,639	378,970	9 91	8,035,177
1910	507,178	196,717	10 18	6,765,135
1913	707,491	209,807	15 03	13,156,309
1914	711,368	149,996	13 58	11,289,934
1915	696,495	98,920	11 50	8,919,756
1916	850,570	30,158	8 30	7,259,927
1917	892,829	14,102	9 75	8,815,078
1918	778,428	5,115	9 00	7,042,680
1919	892,829	4,801	23 00	20,623,405
1920	929,472	12,583	15 50	14,562,845
1921	922,083	16,472	10 00	9,352,608

The coffee plantations of the republic are mostly owned by Germans. Sugar is the second crop and in 1920 was planted to 54,270 acres. The yield of the sugar crop was 40,000,000 pounds. Bananas come next with an annual yield of about 9,500,000 bunches. Indian corn is also grown on about 800,000 acres, but the consumption is domestic. Beans, wheat, rice and potatoes are the other crops of importance. In the department of Peten there are forests of mahogany and valuable dye woods. Chicle gum is also an important product of this department. Cattle raising and swine herding are of increasing importance on the slopes of the Cordilleras. Silver, gold, copper, iron and lead are worked on a small scale due chiefly to the difficulties of transport in the interior. In 1920 the ferrochromium mines of Jalapa produced 2,241,300 kilos.

Commerce.—The foreign trade of Guatemala in 1921 totaled \$22,836,915 against \$32,652,776 in 1920, \$33,748,306 in 1919 and \$22,407,228 in 1913, according to customs statistics. Guatemala has usually had a very favorable balance of trade, but in 1921, due to the decline in value of its exports, especially coffee, this favorable balance was reduced to \$1,444,737. Guatemalan imports, however, increased from 57,051,387 kilos in 1920 to 70,410,005 kilos in 1921, and exports increased from 397,346,633 pounds in 1920 to

437,683,575 pounds in 1921. In 1913, 50 per cent of the imports were from the United States; in 1920, 65 per cent; and in 1921, 63 per cent. The United States took 83 per cent of the exports in 1920 and only 57 per cent in 1921. The trade with Germany increased materially in 1921 over 1920, that country taking 14 per cent of the exports and supplying 9 per cent of the imports. The chief imports and their values in 1921 were: Cotton goods, \$2,915,879; iron manufactures, \$1,289,259; railway material, \$1,229,890; machinery, \$536,812; alcoholic beverages, \$504,195; foodstuffs, \$463,173; drugs and medicines, \$375,751; paper goods, \$398,555; linen, hemp and jute goods, \$294,432; glassware, crockery and earthenware, \$193,519; silk goods, \$151,441; leather goods, \$139,713 and petroleum, \$128,967. In 1921 the chief exports were: Clean coffee, \$9,220,833; bananas, \$1,196,672; lumber, \$526,442; sugar, \$290,378; chicle, \$252,045; hides, \$183,130; shell coffee, \$131,775, and honey, \$48,906.

Currency and Finance.—The currency of the republic has been depreciating constantly for the last 50 years, due to the lowered price of silver and to the issuance of paper money without a backing of silver, the monetary standard. The average value of the peso in 1921 was 2.003 cents. According to the average 1921 value of silver, the intrinsic value of the Guatemalan silver peso would be \$0.5257. Thus it is practically impossible to attempt to state the relationship of the current value of the Guatemalan paper peso to any par value.

Government receipts were 168,482,214 pesos in 1920 and 241,759,790 pesos in 1921. Governmental expenditures amounted to 169,766,083 pesos in 1920 and to 295,923,386 pesos in 1921. These figures are only approximations to the actual value, because the receipts and expenditures, which are made in dollars, are converted at the arbitrary rate of 40 to 1, and the fluctuation in value of the peso must also be taken into consideration. At the beginning of 1922 Guatemala had a floating debt of about \$140,000 and an external debt to Great Britain of £1,940,643, the amortization during the previous year being £323,340.

Communications.—The republic has 512 miles of railways, all of which are consolidated into the International Railway of Central America. The main line runs from Puerto Barrios on the Atlantic Coast to Guatemala City (194.5 miles) and thence to San Jose de Guatemala on the Pacific (74 miles). The company receives subsidies from both Guatemala and El Salvador, but the Salvador division of 40 miles is operated separately. The capital is also connected with Ayutla on the Mexican border by a branch from the main line at Las Cruces to Ayutla (45 miles). Good roads are few, but in recent years several bridges have been built. In the interior most of the traffic is by mule pack. On the Atlantic, Guatemala has the ports of Puerto Barrios and Livingston and on the Pacific side those of San Jose, Ocos and Champerico. There are 423 postoffices, 4,512 miles of telegraph lines and 416 miles of telephone lines. There are 262 telegraph offices and 252 telephone stations.

Constitution and Government.—The constitution now in force was proclaimed in 1879 but has undergone several modifications. The

legislative power is vested in a National Assembly of representatives (one for every 20,000 inhabitants) chosen by universal suffrage for terms of four years and a Council of State of 13, partly chosen by the Assembly and partly by the President of the Republic. The latter is elected for a term of six years and wields the executive power. The President is assisted by the heads of six departments—Government and Justice, Foreign Affairs, Hacienda and Public Credit, Education, War and Fomento.

Defense.—All males between the ages of 18 and 50 are subject to military service. The military establishment numbers 85,535 officers and men upon mobilization. The reserve numbers 40,575 men divided into 81 battalions.

History.—On 29 March 1922, the *Guatemalteco* (official gazette) printed a decree, issued in accordance with the Hague Convention of 23 Jan. 1912, to regulate the trade in opium, morphine, heroin, cocaine and related products, while forbidding the use or possession of opium for smoking. On 18 June two groups of modern houses for laborers were opened by the Workmen's Co-operative and Savings Association of Guatemala City. On 6 July, in that city, coffee planters held a meeting to consider the questions of labor and the non-fulfillment of labor contracts which had prevented harvesting of part of the crops in 1921. It was announced in July that the California-Guatemala Fruit Corporation had been granted a concession to construct the port of Alvarado with the requisite buildings, including a lighthouse—all improvements to pass into the government's hands at the end of a five-year period. On 28 July the Guatemalan Minister of Foreign Relations and the Minister of France signed a commercial convention, by the terms of which the products of Guatemala, carried to French

markets, have the benefit of a 75 per cent reduction of customs duties, and French products, reciprocally, a reduction of 10 to 30 per cent when imported for sale in Guatemala. On 25 September the *Guatemalteco* gave the complete text of changes in the hydrocarbon law, said changes affecting especially contracts for exploitation of mining property. On 27 October, in the building of the Association of University Students, Guatemala City, the new Federal Council of the Federation of University Students of Central America took office, its membership comprising delegates from the universities of Salvador, Honduras, and Nicaragua, as well as Guatemala. In October, mention was made of the formation of a Bureau of Archaeology, Ethnology, and History, for the purpose of preserving national archaeological treasures and carrying on explorations in parts of the republic where such remains of ancient semi-civilizations may be found. See also CENTRAL AMERICAN CONFERENCE.

GUIANA, British. See BRITISH GUIANA.

GUILFORD COLLEGE, a Friends co-educational institution, founded in 1837 and located at Guilford College, N. C. In 1922-23 it had a faculty of 20 members, 240 students, property valued at \$545,000 and an income of \$55,000. Raymond Binford, Ph.D., is president.

GUN STEEL. See METALLURGY.

GUSTAVUS ADOLPHUS COLLEGE, a Lutheran co-educational institution, founded in 1862 and located at Saint Peter, Minn. In 1922-23 it had a faculty of 19 members, 400 students, property valued at \$321,320, endowment of \$257,500 and an income of \$76,701.58. O. J. Johnson, D.D., is president.

GYPSUM. See under UNITED STATES, subsection MINERAL PRODUCTION.

HAGUE COURT. See PEACE AND ARBITRATION, INTERNATIONAL.

HAIGAZIAN, A. H., Armenian professor and educator: d. Harpoot, Asia Minor, 25 May 1922. He was graduated from Columbia University and Union Theological Seminary and received the degree of Doctor of Philosophy from Yale University. He was president of the American College at Konia, Asia Minor, and was the most prominent Armenian educator in the Near East. While being deported with a group of influential Armenians and Greeks into the interior of the country, he contracted typhus and died in the American Hospital in Harpoot.

HAITI, a republic of the Antilles occupying the western part of the Island of Santo Domingo, the eastern part forming the territory of the Dominican Republic. The area of the Republic is estimated at 10,204 square miles with a population of 2,500,000. The majority of the population are negroes but there are great numbers of mulattoes, the descendants of former French settlers, the Republic being at one time a French colony. The capital is Port-au-Prince, with a population of 120,000. Other large cities are Cape Haiti (15,000); Jacmel (20,000); Aux Cayes (15,000); Gonaives (8,000); and Port de Paix (5,000). French is the official language of the country but the spoken tongue is a debased dialect called Creole French.

Education.—Primary education is free and compulsory but instruction is still in a backward state especially in the rural districts. There were in 1922, 982 primary schools of all classes with 53,379 pupils. Of these, 11 were national primary schools in charge of friars, with 3,260 pupils, 32 in charge of nuns with 4,782 pupils, 15 rural primary schools with 530 pupils, 38 private city primary schools with 2,951 pupils, 563 national rural primary schools with 18,187 pupils, 105 religious schools with 5,857 pupils, 118 girls' primary schools with 10,481 pupils, 100 boys' schools with 8,331 pupils, and 10 part-time schools with 965 pupils.

There are six national lycees with 655 pupils and 10 private secondary schools with 2,800 pupils. A national university was instituted in 1921.

Religion.—The religion of the nation is Roman Catholicism. There is an archbishop and four bishops. The clergy are French.

Production.—The chief industries of the republic are those connected with agriculture. Coffee is the chief crop, followed by cocoa and cotton and tobacco. Sugar is also grown and there are now four sugar mills in operation. Rum and other spirits are manufactured for domestic consumption. Logwood and other valuable woods are exported in ever increasing

quantities. The mineral resources of the republic are undeveloped. Concessions for the working of coal, iron and copper have been granted in recent years. Silver, tin, antimony, sulphur, kaolin, nickel, gypsum and porphyry are also known to exist in workable quantities.

Commerce.—The imports of the republic in 1920 were valued at \$27,398,411 and the exports at \$18,990,032. Coffee, logwood and cotton were the chief items among the exports. In the year named the United States furnished 83.12 per cent of the imports and took 52.15 per cent of the exports. France took 34.39 per cent of the exports the same year.

Finance.—The revenue of the republic is derived from the customs almost exclusively and most of the expenditure is for the national debt. In 1920, the revenue was \$5,608,414 gold dollars and 5,011,703 currency gourdes; the expenses, \$3,748,498 gold dollars and 4,602,494 currency gourdes. At the beginning of 1921 the national debt consisted of gold loans aggregating 92,263,260 francs. The internal debt was \$2,263,226; the floating debt, \$3,734,005 and 2,068,988 gourdes.

Communications.—There is good steamer service between the ports of Haiti and New York and other ports of the United States. There are about 200 miles of improved roads radiating from the capital. There is a light railway connecting the capital with Lake Assuei and Leogane. There is also a line under construction from Cape Haiti to the capital. There are cable lines to South America and to Cuba and 124 miles of telegraph lines. Post offices number 31.

Government.—At the head of the state is a President, who is elected by the chambers in joint session for a term of four years, and in whom is vested the executive power.

The legislative power is vested in the Chamber of Deputies, the members of which are chosen for two years by direct popular vote (one member to each 60,000 inhabitants), and in a Senate of 15 members chosen by direct popular vote for terms of six years. The franchise is possessed by all citizens over the age of 21. Five secretaries of state assist the President in the discharge of his executive duties. Since 1915, the republic of Haiti has been virtually a protectorate of the United States. For details of the American occupation see following section on the current history of the republic.

History.—On 10 April 1922, Louis Borno, member of the Hague Permanent Court of Arbitration, was elected President of Haiti for a term of four years beginning 15 May; and he appointed the following Cabinet: Léon Dejean, Secretary of Foreign Relations and Worship; L. A. Guillaume, Secretary of Public Instruction; A. C. Sansaricq, Secretary of the Interior and Public Works; L. Ethéart, Secretary of Finance and Commerce; A. D. Rameau, Secretary of Justice and Agriculture. That

government appointed, as delegate to the Pan-American Conference of Women at Baltimore, Md. (see CUBA; History), a professor at the Normal School of Port-au-Prince. On 7 and 8 May, a national agricultural exposition took place, in Thor, Port-au-Prince. On 9 May a presidential decree made obligatory the use of the metric system of weights and measures in all transactions after 1 July. On 18 May the University of Haiti celebrated the 119th anniversary of the creation of the national flag; in honor of which occasion and emblem the ceremonial exercises (held in a Port-au-Prince theatre) were attended by delegations from primary and secondary schools. On 26 June, at Washington, the indefinite continuance of the American military occupation of Haiti, though with a reduction of the marine force, was recommended unanimously in a report of the Special Senate Committee that had been appointed to investigate the American administrations in Haiti and the Dominican Republic. The next following month, in Haiti, the sum of \$134,737.42 was appropriated for supplementary credits in connection with the budget; and, commendably, the largest item, \$66,467, was allotted to public roads. On 9 July Normil Charles's bust of Toussaint l'Ouverture was unveiled in the square at Port-au-Prince which bears the name of that extraordinary Haitian slave, liberator, patriot. On 26 July a law was passed requiring the registration of foreigners. On 7 August the government's sanction was given to a contract, dated 18 July, between the Secretary of Finance and Commerce of Haiti and the National City Company of New York, by which the government concession made 21 Oct. 1910 to the Banque de l'Union Parisienne, granting it participation in the organization of the Banque Nationale de la Republique d'Haiti, was transferred to the National City Company. On 1 September a presidential decree created, in the Department of Foreign Affairs, a diplomatic council charged with the following duties: To execute the acts of the Pan-American Conferences, to furnish useful information to the Pan-American Union, and to study national questions in order to assure the best course of action on the part of the Department of Foreign Affairs. On 13 October the budget of expenditure was fixed for the first three months of the fiscal year 1922-23. The largest items were: Public Instruction, 442,674.06 gourdes (gourde, \$0.20) and \$17,116.98; Interior, 144,306.44 gourdes and \$358,493.57; Justice, 267,802.38 gourdes and \$7,539; Public Works, 59,835.72 gourdes and \$167,930; Finance and Commerce, 192,560.65 gourdes and \$1,440.64; service of the Receiver General, 34,832.89 gourdes and \$45,258.99. That month, the National City Company of New York placed on the market an issue of \$16,000,000 Republic of Haiti external gold bonds,—the proceeds of said bonds ("Series A," as part of a total authorized loan of \$40,000,000) to be used for refunding two Haitian loans outstanding in France to the amount of 85,838,500 francs, approximately, and to provide funds to pay the internal floating debt and for other governmental purposes, including public works. The total public debt was estimated at \$17,871,471.75. On 30 Octo-

ber the powers of the Claims Commission (established by article 2 of the protocol of 3 Oct. 1919) were prescribed by law, and an account of \$50,000 was opened for payment of salaries and expenses of the Commission, a body having jurisdiction over all financial claims of Haitian or foreign societies, companies, or individuals pending against the Republic. At the end of 1922 the receipts from all taxes, duties, and similar sources to be used for governmental expenditures in the fiscal year 1922-23 were estimated at 4,737,547 gourdes and \$3,721,544. As another year's end theme, we mention the visit beginning in December, of an imported representative of Tuskegee Institute, invited by President Borno to go to Haiti for the closer study of conditions which may not preclude the possibility of establishing vocational schools there, according to the Tuskegee model.

MARRION WILCOX.

HALIDEH EDIB HANOUM, Turkish soldier, educator and writer: b. about 1875. Her father was treasurer to Sultan Abdul Hamid, and was one of the few progressive Moslems of his generation, although he had several wives. He gave his daughter a Western education notwithstanding national prejudices. Her mother is the daughter of the sixth wife of a great pasha and her grandmother was a Circassian slave. Halideh was one of the first Turkish girls to attend Constantinople College, the American College for girls on the Bosphorus. Her professor of mathematics, Salih Bey, fell in love with her, and after her graduation in 1901, married her. Their union was not happy, although she had two sons, and when Salih Bey announced that he was bringing home a second wife, Halideh got a divorce. Her entrance into public life dates from the fall of Abdul Hamid, when more liberty was granted to women. She began to write political articles and essays on education and reorganized the Turkish Normal School for Girls. During the World War Djemal Pasha put her in charge of all the schools in Syria, and her influence with the government prevented taking over the buildings of Constantinople College when the United States declared war on Germany. In 1917 she was married to Dr. Adnan Bey, a physician in Constantinople, who became vice-president of the Parliament at Angora. When the Nationalist Movement started she entered into it with such ardor that she was marked for deportation. While soldiers were searching for her in Stamboul, she and her husband escaped by boat to Asia Minor and traveled on donkeys to Angora, the capital of the Nationalists. Mustapha Kemal welcomed them gladly and made Halideh his Minister of Education and, therefore, a member of his Cabinet. She had the rank of sergeant until 14 Oct. 1922, when she was made a colonel in the National Army. She has often served in the front line trenches, and when not soldiering, or attending to official duties, she spends much time among the Turkish women, teaching them some of the elements of hygiene sadly needed in the Turkish villages. She frequently wears the green turban of the pilgrims to Mecca, but her usual head gear is the *tcharshaf*. Her stimulating presence in the battle line has caused her to be known as

the "Turkish Joan of Arc." She is tall and dark, with almond-shaped eyes of wonderful brilliancy, a voice of musical quality, and a charming manner. While apparently feminine and a product of the Turkish harem when she addresses an audience she is described as a "fire-brand." She has written six novels, prose works, short stories and poems, many of which compositions have been translated into Russian, French and German. Halideh Edib Hanoum is not only one of the most romantic personalities of the day, but she is one of the most potent influences in the New Turkey. An intimate view of this extraordinary Turkish woman is contained in a letter signed "Aghavnic Yeghenian": "She saw her chance for fame and power, as every typical Turk instinctively does, with the beginning of the Armenian persecution, and she began her famous career during some two years she spent in and around Damascus. It was these two years in Damascus that put Halideh Edib Hanoum on her road to Angora and to her present heights of fame as being acclaimed the Turkish Joan of Arc. During this time she became, because of her political opinions and of her stand on the Armenian massacres, the sole close associate of the triumvirate of directors, Enver, Talaat and Djemal. Djemal Pasha, as Director of Syria and as the Supervisor General of the Armenian deportations, was alleged to be the cruellest member of the triumvirate. Halideh Edib Hanoum during this period became the official and chief aid of Djemal Pasha. She lived in the harem of Djemal Pasha during those two years in Aleppo and had charge of the vast members of Armenian orphans who were gathered from the Syrian deserts to Aleppo. This little woman, who so often boasts of her American ideals of womanhood and of which her Western friends make so much, undertook the task of making Moslems of these orphaned children. At the close of the war she was allowed to return to Constantinople, but eventually, because of her past political history she was exiled to Malta. From Malta she escaped to Angora and there married her present husband. Halideh, herself, despite her renowned feminism, is the most typical of harem products.

HALSTED, William Stewart, American surgeon: b. New York City, 23 Sept. 1852; d. Baltimore, Md., 7 Sept. 1922. He was graduated A.B. from Yale University in 1874; M.D. from the College of Physicians and Surgeons of Columbia University in 1877, and studied at the universities of Vienna, Leipzig and Würzburg, 1878-80. In New York City he served as attending physician at the Charity Hospital, 1881-83; as surgeon-in-chief at the Emigrant Hospital, 1881-84; as associate surgeon and surgeon-in-chief of the out-patient department of Roosevelt Hospital, 1881-87, and as attending surgeon at Bellevue and the Presbyterian hospitals, 1885-87. When the Johns Hopkins Hospital was opened in Baltimore in 1889 he was called there as surgeon-in-chief and as professor of surgery in the Johns Hopkins University Medical School. The late Sir William Osler and Dr. Howard Atwood Kelly were called to the institution at the same time. Of the three, Dr. Halsted was the last to continue in active

service. Dr. Osler, who was chosen to head the medical department of Hopkins, resigned in 1904, following his appointment as regius professor of medicine in the University of Oxford, England, where he died in 1919. Dr. Kelly, who was placed in charge of the department of gynecology, retired in 1919. Dr. Halsted's skill as a surgeon was recognized throughout the medical world while to him surgery is indebted for many of its advances. He invented the Halsted forceps, introduced many antiseptic methods in the operating room, including the use of rubber gloves by surgeons; devised various operations which bear his name, was the first surgeon to use the knife in the treatment of goiter and developed neuro-regional or "block" anaesthesia whereby painless dentistry, without complete anaesthesia, was made possible. In 1913, when the General Educational Board gave \$1,500,000 to Hopkins on condition that the heads of the various departments of the Medical School devote their entire time to the institution, Dr. Halsted promptly abandoned private practice and accepted a salary of \$10,000 a year, saying that the opportunity afforded was one he had longed for almost from the beginning of his professional career. The degree of LL.D. was conferred on Dr. Halsted by Yale University in 1904 and by the University of Edinburgh in 1905. Columbia University conferred the degree of Sc.D. upon him in 1904. He was an honorary fellow of the Royal College of Surgeons, England, and also of the Royal College of Surgeons of Edinburgh; member of the National Academy of Sciences; associate fellow of the American Academy of Arts and Sciences; fellow of the American Surgical Association, the American Association for the Advancement of Science, the American Society of Experimental Pathology; foreign corresponding member of the Harveian Society of London, de la Société de Chirurgie, Paris; honorary member of the Deutsche Gesellschaft für Chirurgie; honorary fellow of the American College of Surgeons; member de l'Association Française de Chirurgie; member of the Society for Experimental Biology and Medicine; member of the American Association of Pathologists and Bacteriologists, the American Association of Anatomists; foreign member of the Royal Swedish Academy of Science; honorary member of the Societas Medicorum Sverana, Stockholm. He published numerous papers on surgery, pathology and physiology.

HAMILTON COLLEGE, a non-sectarian educational institution for men, founded in 1812 and located at Clinton, N. Y. Statistics for 1922-23 show a faculty of 30 members, 318 students, property valued at \$1,053,720.90 and an income of \$196,766.71. Frederick C. Ferry, Ph.D., Sc.D., LL.D., is president.

HAMLINE UNIVERSITY, a Methodist Episcopal co-educational institution, founded in 1854 and located at Saint Paul, Minn. In 1922-23 it had a faculty of 37 members, an estimated student enrollment of 600, property valued at approximately \$500,000, an endowment of \$1,015,000, and an estimated income of \$170,000. Samuel F. Kerfoot, D.D., is president.

HAMPDEN-SIDNEY COLLEGE, an educational institution for men, supported by the Presbyterian church but nevertheless, non-sectarian, founded in 1776 and located at Hampden Sidney, Va. In 1922-23 it had a faculty of 13 members including 2 assistants, 217 students, property valued at \$675,000, and an income of approximately \$75,000. Joseph D. Eggleston, LL.D., is president.

HANIHARA, Masanao, Japanese diplomat: b. Japan, 1876. From 1902-11 he was attached to the Japanese Embassy at Washington, becoming known to everyone from Presidents Roosevelt and Taft down to the clerks in the State Department as a congenial, natural person with a keen sense of humor and possessing real ability. In 1916-17 he was Consul General at San Francisco. Later he was made Director of the Bureau of Commerce of the Japanese Foreign Office. Shortly thereafter he again came to the United States, this time as a member of the Ishii Mission which negotiated the Ishii-Lansing agreement. He was next appointed Director of the Bureau of Political Affairs and in 1919 he succeeded Baron Shidehara as Vice Minister of Foreign Affairs. He was one of Japan's representatives at the Washington Conference on the Limitation of Armaments, other members of the commission being Prince Tokugawa, Baron Shidehara and Baron Kato. From the foregoing it will be seen that much of Mr. Hanihara's time has been spent in the United States, and it was no doubt due to his understanding the American ways and American people that he was appointed Ambassador to the United States in December 1922, the youngest Ambassador ever accredited from Japan to this country.

HANOVER COLLEGE, a Presbyterian co-educational institution, founded in 1827 and located at Hanover, Ind. In 1922-23 it had a faculty of 18 members, 605 students, property valued at \$850,000, and an income of \$45,000. William A. Millis, LL.D., is president.

HARBORD, James Guthrie, American Army officer: b. Bloomington, Ill., 21 March 1866. After graduation at the Kansas State Agricultural College, Manhattan, Kan., in 1886, he enlisted as a private in the United States Army at the age of 20. He served in Cuba as a Rough Rider in the Spanish-American War. From 18 Aug. 1903 to 1 Jan. 1914 he was assistant chief of the Philippine Constabulary with rank of colonel. From 14 May 1917 to 5 May 1918, he was Chief of Staff, American Expeditionary Forces in France; commanded the Marine Brigade near Château-Thierry June-July 1918; commanded 2nd Division in Soissons offensive July, 1918; commanded Service of Supply 29 July 1918 to 26 May 1919, and was re-appointed Chief-of-Staff, American Expeditionary Forces, 26 May 1919 and served in this capacity until President Wilson sent him to the Near East as Chief of the Military Mission to Armenia in November 1919. He was awarded the Distinguished Service Medal. In June 1921, Gen. Harbord was made Deputy Chief of Staff, from which he retired 29 Dec. 1922, to become president of the Radio Corporation of America. Following his entrance into business, an effort was

made by the House of Representatives to cut off his pay as a retired Army officer but the Senate refused to concur in the House's action.

HARDING ADMINISTRATION. See UNITED STATES, subsection HISTORY.

HARE, Sir John, English actor and theatrical manager: b. London, England, 16 May 1844; d. there, 28 Dec. 1921. His real name was John Fairs. He was educated at Giggleswick Grammar School, Yorkshire, and made his first appearance on the stage at the Prince of Wales Theatre, Liverpool, 28 Sept. 1864. On 25 Sept. 1865 he went to London where he appeared in the entire series of Robertson comedies, as Sir Peter Teazel in 'The School for Scandal,' and in various other parts. He became manager of the Court Theatre 13 March 1875, produced 'Olivia' and other plays. In 1879 he and Kendal took over the management of the Saint James Theatre. Ten years later he became manager of the Garrick Theatre, built for him by Sir W. S. Gilbert. This management he surrendered in 1894. The next few years were spent in touring the provinces and in more than one successful trip to America. In 1898 he returned to London and produced 'The Gay Lord Quex' at the Globe Theatre. He then again went on tour, but in 1903 produced Barrie's 'Little Mary' at the New Theatre. In 1905 he began a long succession of "farewell" tours through the provinces, and in the Spring of 1908, shortly after he had been knighted, gave revivals of 'The Gay Lord Quex' and 'A Pair of Spectacles' as a farewell to the London stage. His last appearances were in 1917 in revivals of 'A Pair of Spectacles.'

HARNES RACES. See SPORTS.

HARRIS, George, American educator: b. East Machias, Me., 1 April 1844; d. New York City, 1 March 1922. He was graduated with the degree of A.B. from Amherst College in 1866 and in 1869 was graduated from Andover Theological Seminary. In the latter year he was ordained to the Congregational ministry and became pastor of the High Street Church, Auburn, Me., holding the pastorate until 1872 when he became pastor of Central Church, Providence, R. I. This latter pastorate he held until 1883 when he became professor of Christian theology at Andover Theological Seminary, remaining there until 1899 when he was elected president of Amherst College. He resigned the presidency of Amherst in 1912 and was made president emeritus. He received the degree of D.D. from Amherst, Harvard and Yale, and LL.D. from Dartmouth, Williams and Wesleyan. He wrote 'Moral Evolution' (1896); 'Inequality and Progress' (1897); 'A Century's Change in Religion' (1914), and was one of the editors of the Andover Review from 1884-93.

HARVARD BUREAU OF BUSINESS RESEARCH. The Harvard Bureau of Business Research was established in 1911 to gather reliable, up-to-date information regarding every-

day business methods and problems. While sought primarily for teaching purposes in the Graduate School of Business Administration, Harvard University, this information has proved to be of immediate value and practical application for business men. The results of this research are published in bulletins that are furnished without charge to each merchant who sends in a report on his business. Because of the interest that has been shown, the bulletins are also sold at the stated prices, the receipts being used solely to cover a portion of the expense of collecting and publishing the data. Many manufacturers, merchants and other business men already have utilized the results of this research to advantage. Each of the bulletins on operating accounts explains how to make out an accurate profit and loss statement for a firm in the trade for which it has been prepared. The accounts are arranged so as to show clearly the gross profit, the various items of expense, and the net profit of the business. This method of keeping accounts may be used with a variety of book-keeping systems. Some merchants have double-entry books; other retailers simply use record sheets, such as are described in the bulletins. In the bulletins on operating expenses the reports that have been received confidentially from groups of representative firms throughout the country are summarized. The tables show average figures for the various items for expense and profit. The bulletins contain also numerous suggestions regarding problems on store management, and in some cases, as with the methods of stock-keeping in retail shoe stores, special bulletins have been published covering the subject. In the bulletins on operating expenses in 1920 and 1921 detailed analyses are made showing the relation of stock-turn to expenses. Operating expenses summarized according to the geographical districts in which the firms are located, as well as according to the volume of sales, also are given in the latest bulletins. The research conducted by the Bureau up to the present time has covered retail shoe, grocery, hardware, drug, jewelry, and department stores, and the wholesale grocery business. The bulletin on labor terminology is a dictionary of terms in common use in labor relations, as defined from the labor standpoint. Such terms as open shop, closed shop, preferential shop, boycott, differential piece-rate system, and standard time are defined. Examples are given of the organization of the American Federation of Labor, national and international unions, district councils, allied trade councils, local unions, industrial councils, and shop committees. The bulletin on International Comparisons of Prices of Cotton Cloth, January 1919-March 1920, gives the weekly prices of cloth in the United States, England, India, and China with a full explanation of the method by which these comparisons were worked out. For the last year and a half the Harvard Bureau of Business Research has been engaged actively in the collection of problems for teaching purposes in the Graduate School of Business Administration. The problems, or cases, collected are those that come before executives for decision. They have been obtained in such subjects as advertising, marketing, retail store management, industrial accounting, industrial man-

agement, labor, commercial banking, investment banking, foreign trade, lumber, statistics, and sales management. As a result of this work several problem books already have been published by members of the faculty of the Business School. Melvin T. Copeland, professor of marketing in the Harvard Business School, is director of the Bureau; Richard Lennihan, assistant director; M. P. McNair, in charge of cost research, and Mary E. Osgood, secretary.

MELVIN T. COPELAND,
Director.

HARVARD COLLEGE, a non-sectarian institution of higher learning for men, though co-educational in the Graduate School of Education. It was founded in 1636 and is the oldest educational institution in the United States. It is located at Cambridge, Mass. In 1922-23 the teaching staff numbered 1,009 members, while the number of students enrolled was 6,357. No information was available as to the value of the college's property and its income. A. Lawrence Lowell, Ph.D., LL.D., is president. For information as to Harvard School of Public Health, see ROCKEFELLER FOUNDATION.

HASA, Emirate of. See ARABIA.

HASTINGS COLLEGE, a Presbyterian co-educational institution, founded in 1882 and located at Hastings, Neb. In 1922-23 it had a faculty of 28 members (college 16, special and academy 6, conservatory 6), 595 students (college 395, others 200), property valued at \$525,000 and an income of \$98,500. Rev. Calvin H. French, D.D., LL.D., is president.

HAUSEN, BARON Max von, German military officer: b. Dresden, Germany, 12 Dec. 1846; d. there, 20 March 1922. He inherited his title from his father who died in 1879. As a cadet he fought in the Saxon army against Prussia in 1866. From 1871 to 1874 he taught in the military academy at Berlin and from 1875-87 he was attached to the general staff of the German army. In 1902 he held the portfolios of State and War in the Saxon Cabinet. When the World War started he was in command of the German 12th Army Corps with headquarters at Dresden. He commanded the Third Saxon army at the battle of the Marne and spent the latter years of his life in an effort to clear himself of the accusation of having ordered the bombardment which almost destroyed the Rheims cathedral. In the attempt to reach Paris the Third army, with General von Buelow's Second army on its right, reached Rheims 3 Sept. 1914 and captured several of the forts without opposition. On that day, according to von Hausen, who had been promoted to lieutenant-general, the Prussian guard under von Buelow, began to bombard the city and "on 4 September the guard bombarded Rheims for two hours, damaging the cathedral. After the bombardment von Buelow sent word that he had imposed a fine of fifty million francs which would be increased to one hundred million if the courier were not released in two days." According to von Hausen, the missing courier had not reached Rheims which meanwhile had been firmly held by the Saxons. Von Buelow and his friends maintained that as soon as he took Rheims von Hausen should have so informed the commander of the Second army, in

which case there would have been no bombardment.

HAVERFORD COLLEGE, an educational institution for men under the control of the Society of Friends, founded in 1833 and located at Haverford, Pa. In 1922-23 it had a faculty of 25 members, 210 students, real property valued at \$3,000,000 and \$3,250,000 in funds, and an income of \$260,000. William Wistar Comfort, Ph.D., LL.D., is president.

HAWAII, Territory of, a group of 20 islands, of which nine are inhabited, lying in the North Pacific Ocean, 2,089 miles west of San Francisco. The area of the group is 6,449 square miles, of which the island of Hawaii has 4,016; Oahu, 598; Maui, 728; Kauai, 547; Molokai, 261; Lanai, 140; Niihau, 73; Kahoolawe, 44, and Molokai, 217 square miles. The population of the Territory on 1 Jan. 1920 was 255,912, as compared with a population of 191,909 in 1910. On 20 June 1922, the population was estimated by the board of health to be 284,538. The population of the islands by races is as follows: Hawaiian, 23,723; Asiatic Hawaiian, 6,955; Caucasian Hawaiian, 11,072; Portuguese, 2,702; Porto Ricans, 5,602; Spaniards, 2,430; other Caucasians, 19,708; Chinese, 23,507; Japanese, 109,274; Filipinos, 21,031; Koreans, 4,950; negroes, 348, all others, 310. The total number of steerage arrivals during the year ending 30 June 1922 was 15,756, and the number of departures, 10,464. The laborers on the sugar plantations in May 1922 by nationalities were as follows: Americans, 932; Hawaiians, 966; Porto Ricans, 1,715; Portuguese, 2,533; Spaniards, 172; Filipinos, 18,189; Japanese, 16,992; Chinese, 1,487; Koreans, 1,170; Russians, 10, and all others, 236.

Religion.—Practically all the natives are Christians. At Honolulu there are an Anglican bishop and a Roman Catholic bishop.

Education.—Primary education is free and English is the language in general use in the schools, of which there are in the Territory 173, with 1,431 teachers and 44,393 pupils. There are 63 private schools, with 436 teachers and 8,068 pupils. Of the pupils in public schools in 1922, 43,160 were born under the United States flag, while 1,233 were foreign born. In addition, there are a normal and training school, two reformatory industrial schools, the McKinley high school, several junior high schools, a Territorial trade school and a school for the deaf and blind. For higher education there is a Territorial university.

Finances.—Local governments in Hawaii were first established 1 July 1905, when the Territory was divided into four counties. On 1 Jan. 1909 the county comprising the island of Oahu was converted into a city and county known as the city and county of Honolulu, with a mayor. The other counties are Hawaii, including the island of that name; Maui, including the islands of Maui, Kahoolawe, Lanai and all of Molokai except the leper settlement; and Kauai, including the islands of Kauai and Niihau. The leper settlement on Molokai constitutes a fifth county, Kalawao, but is under the control of the Territorial board of health. In 1922 the income of the various counties aggregated \$6,399,177.46. The assessment of property, real and personal,

in the Territory aggregated \$271,662,484. The total revenue collected by the Territory aggregated \$11,353,811.30 and the total disbursements aggregated \$13,157,109.24. The net cash balance on 30 June 1922 was \$1,333,285. The total bonded debt on 30 June 1921 was \$12,600,000, which was increased by the sale of \$739,000, the balance of the 1920 4½ per cent Public Improvement bond issue of \$2,400,000, and \$1,350,000 of the 1 June 1922 issue of 4½ per cent Public Improvement bonds. The debt was decreased during the year by the payment of \$40,000 of the 1919 issue of 5 per cent Memorial Park bonds, leaving the bonded debt as of 30 June 1922 at \$14,649,000.

Banking.—At the close of the year 1922 there were 28 banks in operation. Two are national banks, one bank is solely a savings bank, one is solely commercial and the remainder are both commercial and savings banks. Bank deposits at the end of the year amounted to \$46,243,481.36, of which \$28,379,489.19 were commercial deposits and the remainder, \$17,863,992.17, were savings deposits. The savings accounts by races were as follows: Japanese, 15.73 per cent; Chinese, 12.70 per cent; Hawaiian, 7.31 per cent; Portuguese, 12.48 per cent, and all others, 51.78 per cent.

Production.—While the islands are to a very great extent mountainous and volcanic, the soil is very fertile. The census of 1920 reported 5,284 farms with an aggregate acreage of 2,702,245, of which 435,242 acres were improved land. The value of all farm property was \$151,129,085. Sugar and pineapples are the staple crops, but coffee, bananas, rice, tobacco and cotton are also grown. The yield of sugar for the calendar year 1922 is estimated at 546,844 tons, and the yield of pineapples at 5,000,000 cases. During the year, agricultural labor conditions continued serious. There was a great shortage of field labor, which was partially compensated for by abandoning land formerly under cultivation. A resolution known as the Hawaii Emergency Labor Resolution was introduced into Congress. This provides that if in the opinion of the President and the Secretary of Labor there shall exist a labor emergency in Hawaii, additional laborers may be allowed to enter the Territory for a limited period of time, under special restriction, and such admission does not carry the privilege of passing from Hawaii to the mainland of the United States. Sugar plantations of the Territory are supplied by numerous irrigation canals. There are 47 forest reservations in the Territory. The second industry of the Territory is the canning of pineapples, practically no fresh pineapples being shipped. About 120,000 acres are planted to sugarcane and about 45,000 acres to pineapples. In addition to the field crops mentioned above, hides, sisal and honey are among the exports of the islands.

Commerce.—The importance of the Hawaii Islands as a centre of trans-Pacific business is evidenced by the steady increase in tonnage entering the island ports. The gross tonnage of all vessels entering the Territory in the fiscal year ending 30 June 1922 was 6,090,145 tons, the greatest in the history of the Territory. Passenger service was rapidly enlarging during the year and direct service between Los Angeles and

Honolulu with fortnightly sailings was inaugurated. Imports for the year ending 31 March 1922 amounted to \$64,042,740, including \$56,223,067 from the mainland of the United States and \$7,819,673 from foreign countries. Exports totaled \$72,748,243, of which \$71,615,805 were to the mainland of the United States and \$1,132,438 to foreign countries. Sugar, pineapples, coffee and rice made up the bulk of the exports. The imports were chiefly iron and steel manufactures, petroleum and its derivatives, breadstuffs, dairy and meat products, lumber, textiles, rubber goods, paper, automobiles, leather and fertilizers.

Communications.—On the Island of Hawaii there is an excellent system of roads. In the entire territory there are 354 miles of steam railways, not including about 650 miles of private railways on the sugar plantations. Honolulu, the capital (population 83,327) has a fine harbor, which has been enlarged and dredged to a depth sufficient to admit the largest steamships afloat. Hilo, the second city of the territory, has a population of 10,431, and a breakwater has been constructed on one side of its bay. Hilo is an important sugar shipping port. Within the last decade, several lighthouses and other aids to navigation have been set up about the islands. There is steamship communication with the United States, Australia, Canada, the Philippines, China and Japan. Twelve small steamers owned by one company provide communication between the several islands. Honolulu has an electric tramway system, and much concrete construction is used in its streets. The city is lighted by electricity. There are telephone systems on all principal islands and wireless stations are in operation between the islands for commercial purposes and for communication with the mainland of the United States. The territory is connected by cable with both shores of the Pacific Ocean.

Leprosy.—On 30 June 1921 there were 481 leper patients at Kalaupapa. One patient was admitted there during the year and there were 43 deaths, leaving 439 patients. On the same date, Kalihi Hospital had a total of 142 patients. There were 106 admissions, while 41 were discharged or died, leaving 207 patients at the close of the year. There were 26 patients paroled from Kalihi Hospital. The Kalihi Boys' Home for the children of leprosy parents had in 1922, 43 boys of from two to 18 years of age. The Kapiolani Girls' Home for children of leprosy parents had a total of 65 girls.

Government.—Hawaii is a territory of the United States. The executive power is vested in a Governor, appointed by the President for four years, with the approval of the Senate. The appointee must be a resident of the territory in order to qualify for appointment. The Secretary of the Territory is appointed in the same manner, but the heads of departments are appointed by the Governor with the approval of Territorial Senate. The territorial legislature consists of two houses, a Senate of 15 members, elected for four years, and a House of Representatives of 30 members, elected for two years. Sessions of the legislature are held biennially and are limited to 60 days. In the Federal Congress the Territory is represented by a delegate elected for two years, who enjoys the privileges of the House

of Representatives, but may not vote. The Territorial judiciary is composed of a Supreme Court, four circuit courts and several district courts. The justices of the Supreme Court and circuit courts are appointed by the President of the United States with the consent of the Senate. During the fiscal year, ending 30 June 1922, Hawaii paid into the United States Treasury a total of \$16,597,017.10 in Federal taxes. Of this amount, \$15,520,853.98 was collected through the United States Bureau of Internal Revenue, and \$1,076,163.12 was collected in customs duties at the ports of the territory. The Governor of the territory is W. R. Farrington, who was appointed in 1921 for a term of four years. The Territorial Secretary is Raymond C. Brown.

HAWAII, University of, a non-sectarian co-educational institution, founded in 1907 and located at Honolulu, Hawaii. In 1922-23 it had a faculty of 44 members, 539 students, property valued at \$973,591 and an income of \$174,000. Arthur L. Dean, Ph.D., is president.

HAY. According to the final estimate of the Department of Agriculture, the 1922 hay crop of the United States totaled 112,791,000 tons—96,687,000 tons of tame hay and 16,104,000 tons of wild hay. These figures compare with 82,379,000 tons of tame and 15,391,000 tons of wild hay produced in 1921; 87,855,000 tons of tame and 17,460,000 tons of wild hay produced in 1920. The tame hay crop of 1922 was valued at \$1,217,044,000, compared with \$997,527,000 in 1921 and \$1,560,235,000 in 1920. The wild hay crop of 1922 was valued at \$114,635,000, compared with \$101,991,000 in 1921 and \$198,115,000 in 1920. The acreage for the three years was as follows: Tame, 1922, 61,208,000; 1921, 58,769,000; 1920, 58,101,000—Wild, 1922, 15,842,000; 1921, 15,632,000; 1920, 15,787,000. The average yield per acre of tame hay in 1922 was 1.58 tons, compared with 1.40 tons in 1921 and 1.51 tons in 1920. The average yield per acre of wild hay during the same years was 1.02, .98 and 1.11 tons respectively. New York leads the States in production of tame hay with a total yield of 6,818,000 tons, compared with 4,895,000 tons in 1921 and 6,119,000 tons in 1920. Wisconsin came second with 5,553,000 tons, compared with 4,136,000 tons in 1921 and 5,209,000 tons in 1920. Illinois was third with 5,285,000 tons in 1922, compared with 3,743,000 tons in 1921 and 3,850,000 tons in 1920. California was fourth with 5,059,000 tons compared with 5,003,000 tons in 1921 and 4,945,000 tons in 1920. The average price of tame hay on the 1 December was given as \$12.59 per ton, compared with \$12.11 and \$17.76 on the corresponding dates of 1921 and 1920. South Dakota led in the production of wild hay in 1922 with a total of 3,308,000 tons, compared with 2,800,000 tons in 1921 and 4,049,000 tons in 1920. North Dakota was second with 2,592,000 in 1922, compared with 2,308,000 tons in 1921 and 2,193,000 tons in 1920. Minnesota was third with 2,505,000 tons in 1922, compared with 2,602,000 tons in 1921 and 2,674,000 tons in 1920. The average price per ton of wild hay on 1 December was given as \$7.12, compared with \$6.63 on the same date of 1921 and \$11.35 on 1 Dec. 1920. On 6 Jan. 1923 the Department of Agriculture issued a statement in which it said

Copyright, Underwood & Underwood, N. Y.

TIMOTHY M. HEALY
First Governor-General of the Irish Free State

that although the total production of hay in 1922 was estimated at about 15,000,000 tons more than in 1921, the increase was principally in timothy. At that time it was said the marketable surplus of alfalfa was being rapidly consumed. Drought in the Southwest curtailed the production of alfalfa, and also created an unusually large demand which was reflected in the price trend. At the beginning of the crop year, about 15 Sept. 1922, number 1 alfalfa was quoted at the principal markets at an average of \$21.50 per ton. On 15 December the average price was \$23.75 per ton. This was \$1 per ton higher than the average price of number 1 alfalfa on 15 Dec. 1921. Timothy prices on the other hand experienced a downward trend and the average price of number 1 timothy at the principal markets on 15 Dec. 1922 was \$21.50 per ton, compared with \$22.50 per ton on 15 Dec. 1921. The car situation was an important factor in the movement of hay during the last crop year. Shippers in most of the surplus hay producing States reported that cars had been very scarce and that, generally speaking, sufficient cars had not been available to move the hay as rapidly as desired. The car shortage was not as pronounced in the Southwest as in certain other sections and this, together with the special rate from the Western alfalfa producing States into the Southwest, no doubt was the principal contributing factor in the heavy movement of alfalfa hay.

HEALTH BOARD, International. See ROCKEFELLER FOUNDATION.

HEALTH SERVICE, United States Public. See PUBLIC HEALTH SERVICE, UNITED STATES.

HEALY, Timothy Michael, first Governor-General of the Irish Free State: b. 1855. He is the son of Maurice Healy guardian of the poorhouse at Bantry, Cork, and is one of three brothers, all lawyers and all members, at one time or another, of the British House of Commons. "Tim" Healy himself represented Wexford, from 1880 to 1883; County Monaghan from 1883 to 1885; South Londonderry, 1885-86; North Longford, 1887-92; North Louth 1892-1910 and Northeast Cork, 1910-18. He began his career as a Home Ruler and Nationalist, who followed Parnell, but when Parnell's divorce was declared in 1889, he was included among the majority of Nationalists who, under pressure of Gladstone and their own Catholic bishops, repudiated that leader. Redmond still stood by Parnell and was ultimately reconciled with Dillon, with whom and Joseph Devlin of Belfast he led the Nationalists during the fateful years when the Asquith home rule act was placed on the statute book—not however to come into effect, owing to the World War and the resistance of Ulster. Healy never joined Redmond, but led a small party of his own which included William O'Brien. In debate he was bitter of tongue, though kindly and gentle in private life; and his many witticisms, chiefly at the expense of his "friends" from Ireland, won for him a world wide fame as dialectician. "I have no desire to head a party," he would say. "My temper is too short, and I have not the talents of intrigue necessary." Again, "the English are notoriously deaf, unless stirred by

concussion." For calling Kitty O'Shea, who became Mrs. Parnell, "an English prostitute," he was knocked down in the Four Courts of Dublin and horsewhipped by Parnell's nephew. Apart from politics, Healy's career may fairly be described as English. At the age of 17, he went to Newcastle-on-Tyne, where his knowledge of shorthand enabled him to serve as railway clerk. It was here that he earned the somewhat inaccurate soubriquet of "the ticket nipper." In 1874, he heard from the strangers' gallery, his first debate in the House of Commons. About the year 1877, when he was 22 years old, he reported Parliament for his uncle's Dublin paper, *The Nation*, and acted as its correspondent at Westminster. In the mornings he read law, and in 1884, he was called to the Irish bar, "taking silk," there or becoming Queen's counsel in 1899. In 1903, like many another Irish barrister—Lord Carson, for instance, and the late Lord Russell of Killowen—he tried his luck by joining the English bar. In 1910, he there became King's counsel and a bencher of Grays Inn. His practice was by no means phenomenal but he achieved a sufficient success.

While his mordant irony weakened the influence of Redmond and the Nationalists, Healy was never himself a Sinn Féiner. Educated as a boy by the Christian Brothers, he has been throughout life, a devout Roman Catholic and on many occasions, it was understood that his attitude represented the views of the hierarchy. For church schools, he has been particularly zealous. In London, he belongs, not only to the National Liberal Club, but to the more exclusive Reform Club. In 1882, he married Erina, daughter of the late T. D. Sullivan, M.P., by whom he has had a family of three sons and three daughters. His official residence in Dublin is the Viceregal Lodge in Phoenix Park, where he enjoys a salary of £10,000 (\$50,000) a year. As governor general, he has refused any of the titles usual to such an office, under the British Crown. "I hope," said he, "the people will continue to call me Tim Healy, but if any one addresses me as 'your excellency,' I will consider it a matter of courtesy and overlook it." He was not asked to kiss the King's hand, on which omission, perhaps, the most delightful comment was made by the Irishman who remarked, "Twas afraid, was King George, that if he gave Tim his hand to kiss, Tim wud bite it." Such anecdotes possess a certain historical significance as illustrating the revolution suggested by the presence of Tim Healy in the halls where dukes, marquises and earls reigned as viceroys. Neither the practice of law nor his political activities have prevented Mr. Healy from at times turning his hand to literature. He has published 'Stolen Waters,' 'A Word for Ireland,' 'Loyalty Plus Murder,' 'Why Ireland Is Not Free,' 'The Great Land of Ulster,' and 'The Planters Progress.'

PHILIP WHITWELL WILSON.

HEIDELBERG UNIVERSITY, a co-educational institution under the auspices of the Reformed Church in United States, founded in 1850 and located at Tiffin, Ohio. In 1922-23

it had a faculty of 31 members, 396 students, property valued at \$956,624, and an income of \$92,000. Charles Erwin Miller, LL.D., is president.

HEJAZ, Kingdom of. See ARABIA.

HELIGOLAND, an island in the North Sea ceded by England to Germany in 1890 and strongly fortified by the latter. Under the terms of the Treaty of Versailles of 1919 the fortifications were ordered dismantled and the work was carried out under Allied supervision. It was alleged in April 1923 that the constant explosion of dynamite incident to the destruction of the fortifications was causing a rapid disintegration of the red and white sandstone of the island.

HEMORRHAGIC SEPTICEMIA, an infectious disease, attended with a very high mortality, which attacks various species of animals, especially cattle, sheep, and swine. It is caused according to the United States Bureau of Animal Industry, by an organism (*Bacillus bipolaris septicus*) belonging to the group in which the bacilli of chicken cholera, swine plague, and rabbit septicemia are to be found. This group is known also by the name of Pasteurella. Bacilli which resemble closely the organism of hemorrhagic septicemia are widely distributed in nature. They have been found in the soil, upon various plants, in stagnant water, and upon the moist nasal membranes of normal calves and hogs. In several instances these seemingly harmless organisms have been so increased in virulence by passing through animals that they finally proved to be fatal when injected into pigs, and in those instances the tissue changes, which were found at the autopsy of the pig, were similar to those found in swine that had died from swine plague. The losses occasioned by hemorrhagic septicemia are greatest among young animals, especially those that are thin in flesh and poorly nourished. The disease is a septicemia or poisoning of the blood, wherefore it often runs a short course and the animal dies quickly. In cattle the disease is sometimes termed stockyards fever. In hogs it is known as swine plague, and the acute form usually is fatal a few hours after the appearance of the first symptoms. In sheep the disease frequently manifests itself in the acute form, with marked depression, high temperature, labored breathing, muscular trembling, and colicky pains. Fowl cholera represents the avian or bird form of hemorrhagic septicemia, pigeons and geese being quite as susceptible as other species of poultry. No form of treatment has time to become effective for any animals that may be affected. The apparently healthy animals should be separated from the diseased and placed in clean, uninfected quarters, where they should have the best of feed and water. Bacterial vaccines have proved to be effective in many instances in checking the spread of an outbreak and in protecting the unaffected portion of the herd or flock. The advisability of using these products should be left to the discretion of a competent veterinarian. Consult Farmers' Bulletin 1018 of the United States Department of Agriculture.

HENDERSON-BROWN COLLEGE, a Methodist co-educational institution, founded in

1890 and located at Arkadelphia, Ark. In 1922-23 it had a faculty of 24 members, 328 students, property valued at \$336,000 and an income of \$90,000. J. M. Workman, A. B., LL.D., is president.

HEPBURN, A(lonzo) Barton, American lawyer, banker, philanthropist and author: b. on a farm near Colton, N. Y., 24 July 1846; d. New York City, 25 Jan. 1922. Following his graduation from Middlebury College in 1871 with the degree of A.B., Mr. Barton, for a time, was instructor in mathematics at Saint Lawrence Academy and thereafter was principal of the Ogdensburg (N. Y.) Educational Institute. In the meantime he studied law and, upon his admission to the bar, began practice at Colton. Entering the political arena in 1875, he was elected to the Assembly of New York that year and continued to serve as a member thereof until 1880 when he was appointed superintendent of the State banking department which position he held until 1883. He next engaged in the lumber business, having several years before acquired an extensive tract of timber land. In 1888 he was appointed a national bank examiner for the State of New York and served in that capacity until 1892 when he was called to the Treasury Department as Comptroller of Currency. He relinquished the latter position in 1893 when he was elected president of the Third National Bank of New York City. From that time until his death Mr. Barton devoted his time and energies almost exclusively to the banking business, developing into not only one of the leading financiers of his day but also into one of the country's real authorities on finance whose books on financial matters soon won recognition as standard publications. Mr. Barton left the Third National Bank in 1897 to become vice-president of the National City Bank of New York City. Two years later he was chosen president of the Chase National Bank of New York, thereby establishing a connection which continued until his death. He served as president of the Chase National Bank until 1911 when he was made chairman of the bank's board of directors. In 1918 he became chairman of the bank's advisory board and held that position until his death. Mr. Hepburn was also a director of the Columbia Trust Company, the New York Life Insurance Company, the American Agricultural Chemical Company, the American Car and Foundry Company, the Safety Car Heating and Lighting Company, Sears, Roebuck and Company of Chicago; the Studebaker Corporation, the Texas Company, F. W. Woolworth Company, and the Great Northern Railway Company. He was also a trustee of Middlebury College, the Rockefeller Foundation, Columbia University and the New York Zoological Society. He was a member, and at one time was president, of the New York Chamber of Commerce, a member and former president of the New England Society, member of the Saint Andrews Society, The Pilgrims and the Burns Society. He was chairman of the currency committee of the American Bankers' Association from its creation in 1896. In 1912 he was made an officer of the Legion of Honor of France. At various times he served as president of the Academy of Political Science, the New York Clearing House

Association and the National Currency Association. In 1907 and 1913 he served as chairman of commissions appointed for the purpose of revising the banking laws of the State of New York. In 1918 he was appointed a member of the advisory council of the Federal Reserve Board. The following year he was made a member of the governor's commission to study necessary legislation for the protection of the public in the purchase of securities. In 1919, also, he served as a member of the International Trade Conference, being a member of the committee on finance and credits.

He was a member of the Delta Kappa Epsilon and Phi Beta Kappa Greek-letter fraternities and of the following clubs: University, Columbia University, Union League, Bankers', France-America, Economic, Camp Fire, Recess, Saint Andrews Golf, National Golf Club of America, the Links, Authors, Japan Society and the Century. The degree of LL.D. was conferred upon him by Middlebury College (1894), Columbia University (1911), Williams College (1911), University of Vermont (1915) and New York University (1919). Saint Lawrence University conferred the degree of D.C.L. upon him in 1906. Despite his numerous business activities, Mr. Hepburn found time to write a number of books. His published works include: 'History of Coinage and Currency' (1903), 'Artificial Waterways and Commercial Development' (1909), 'Story of an Outing' (1913), and 'A History of Currency in the United States' (1915). He also contributed to magazines and reviews. Mr. Hepburn's benefactions, largely contributions to educational institutions, totaled several millions of dollars. Those made during his lifetime included \$600,000 to the A. Barton Hepburn Hospital, Ogdensburg, N. Y.; \$60,000 to the Imperial University of Tokio, Japan, to found a chair of American history and government; \$500,000 to libraries in various towns in Saint Lawrence County, N. Y.; \$5,000 to the Tuskegee Institute; \$150,000 to Princeton University; \$650,000 to Middlebury College; \$130,000 to Wellesley College; \$130,000 to Williams College; \$50,000 to New York University School of Commerce; \$75,000 to Saint Lawrence University; \$350,000 to Columbia University School of Business and \$225,000 to the New York State Chamber of Commerce.

HESSE, one of the states of the German Republic and a former grand duchy. Area, 2,968 square miles; population, 1,291,249. Capital, Darmstadt with a population of 82,368. Mainz (pop. 107,930) is the largest city. There is an executive ministry of four and a Landtag or Diet of 70 members. See GERMANY.

HESSIAN FLY. See ENTOMOLOGY, UNITED STATES BUREAU OF.

HIDES AND LEATHER. Secretary of Commerce Hoover, writing in January 1923, of the leather industry, stated that the total leather production of the country in 1922 was slightly under the 1921 figure. This indicates a very depressed condition of the tanning, currying and

finishing of leather factories. Their 1921 production was only \$383,365,000, falling 58.7 per cent below the total of \$928,592,000 in 1919. There appears to have been over-production especially of sole leather, in 1919, and it has taken two years of depression to work off this stock. In no other way can one account for the singular fact that upper leather production in 1922 exceeded sole leather production by 30 per cent. Ordinarily, a man ought to wear out two pair of soles to one pair of uppers. Leather exports increased in 1922, especially in shoe uppers, but the outgo was far from sensational.

The *Leather Manufacturer* makes the following estimate of the number of raw hides in the United States during recent years:

On 31 Dec. 1919, 7,300,000; on 28 Feb. 1921 (peak), 7,940,000; on 30 June 1922, 5,347,000; on 31 Oct. 1922, 5,480,000.

The average monthly import of hides in the same years was: 1919, 910,000; 1921, 313,000; 1922, 508,000. The stocks of leather in the hands of tanners, curriers, dealers, manufacturers, etc., is much greater than the raw stock. The estimates are:

Leather Stocks in United States.

DATE	Number of hides
31 Dec. 1920.....	15,939,000
30 June 1921 (peak).....	16,951,000
31 Dec. 1921.....	15,837,000
30 June 1922.....	15,576,000
30 Oct. 1922.....	14,425,000

The rate of leather production during the months of August, September and October, 1922, as measured in hides, was per month: Sole leather, 758,000; belting leather, 93,000; upper leather, 950,000; total monthly hide consumption, 1,801,000.

From the foregoing it is evident that leather manufacturers are carrying eight months supply of raw material, and that dealers in raw hides carry three months supply ahead of this. That this production is "back to normalcy" is suggested by the fact that prices of leather have stiffened and are stiffening, following a rise in the price of hides in the latter part of 1922.

HIDE AND LEATHER EXPORTS FROM UNITED STATES

	1921 Pounds	1922 Pounds
Hides and skins.....	30,577,000	28,700,000
Leather.....	\$4,067,000	\$4,019,000
Leather manufactures (mostly shoes).....	31,787,000	45,473,000
	29,418,000	16,711,000

Massachusetts still leads as the foremost State in leather production, followed closely by Pennsylvania, New York and New Jersey. There is also moderate production in Illinois, Wisconsin, Michigan, California and Ohio. There are 680 establishments in the country, giving employment to about 65,000 people.

HIGHLAND COLLEGE, a non-sectarian co-educational institution, founded in 1857 and located at Highland, Kan. In 1922-23 it had a faculty of five members, 35 students, property valued at \$150,000 and an income of \$12,000. James L. Howe, Ph.D., LL.D., is president.

HILLSDALE COLLEGE, a co-educational institution—Baptist in origin and affiliation—founded in 1844 and located at Hillsdale, Mich. Statistics for 1922-23 show a faculty of 27 members, 513 students and property valued at \$212,489.42. Income for the year ending April 1922 was \$89,432.27. William Gear Spencer, M.A., is president.

HIRAM COLLEGE, a co-educational institution, fostered by Disciples of Christ, founded in 1850 and located at Hiram, Ohio. In 1922-23 it had a faculty of 28 members, 364 students, property valued at \$460,000 and an income of \$120,000. Miner Lee Bates, LL.D., is president.

HISTORICAL ASSOCIATION, American. Membership in 1922 totaled 2,500. The president is Charles H. Haskins of Harvard University and the secretary, John Spencer Bassett of Smith College, Northampton, Mass. Headquarters of the Association are in the Woodward Building, Washington, D. C.

HOBART COLLEGE, an Episcopal educational institution for men and women (women's department called William Smith College), founded in 1822 and located at Geneva, N. Y. In 1922-23 it had a faculty of 26 members, 375 students, and property valued at \$1,214,000. Income figures not given. Murray Bartlett, D.D., LL.D., is president.

HOLLINS COLLEGE, a non-sectarian educational institution for women, founded in 1842 and located at Hollins, Va. In 1922-23 it had a faculty of 33 members, plus 10 other officers, 334 students, and property valued at \$625,000. Income figures not given. Matty L. Cooke, Litt.D., is president.

HOLY CROSS COLLEGE, a Roman Catholic educational institution for men, founded in 1843 and located at Worcester, Mass. In 1922-23 it had a faculty of 45 members, 876 students, property valued at \$687,400 and an income of \$90,000. Rev. James J. Carlin, S. J., is president.

HOME ECONOMICS, Bureau of. See AGRICULTURE, UNITED STATES DEPARTMENT OF.

HOMES, M. Goode, American educator: b. Boynton, Va.; d. Columbia, S. C., 6 May 1922. He was educated at the University of Virginia and the United States Military Academy at West Point. He was widely known as an engineering authority, and was assistant engineer for the republic of Cuba more than 20 years ago. He was special agent for the United States Bureau of Public Roads from 1911 to 1913, and in the World War was with the engineering corps of the United States army in the Big Bend district of Texas. From 1909 until his death he had been a member of the faculty of the School of Engineering of the University of South Carolina. On 6 May 1922 he was shot and killed by Benjamin Haile, university marshal. The shooting occurred in the university treasurer's office. Haile had first threatened to

shoot President W. S. Currel, and had then fired a shot over the head of Dean Leonard T. Baker. The shooting was the result of the bitter feeling that existed between Professor Homes and Marshal Haile, growing out of their conflicting duties at the university.

HOMES, Co-operative. See CO-OPERATIVE MOVEMENT.

HONDURAS, a Latin-American republic of Central America bounded north and northeast by the Caribbean Sea, east and south by Nicaragua, south by the Pacific Ocean and the republic of El Salvador, and west by the republic of Guatemala. It has an area of 44,275 square miles with a population on 1 January 1921 of 637,114. The inhabitants are mostly of Indian blood but there is a large admixture of Spanish blood. On the northern coast there are large negro settlements. Honduras is the third largest of the countries of Central America. The territory of the republic is mountainous throughout and resembles that of Costa Rica with a diversity of soil, climate and products. Its large and fertile plateaux and valleys produce all the tropical crops and offer excellent pasturage for numerous herds of cattle. The forests contain several varieties of cabinet and other woods, of which mahogany is the most important. Bananas are the principal article of export, while sugar, coffee, cocoanuts, rubber, indigo, cattle, hides, together with the precious metals and other mineral products, are shipped. Honduras is the country of the sarsaparilla, of which considerable quantities are annually exported to the United States. The republic is divided into 17 departments and one territory. The latter (La Mosquitia) is mostly unexplored, being covered with dense, impenetrable forests, and inhabited by native races who speak no Spanish. The capital is Tegucigalpa, with 38,950 inhabitants. Other centres are: Pespire, 7,132; La Esperanza, 11,453; Santa Rosa, 10,574; Choluteca, 8,065; and Nacaome, 8,152. Main ports on the Atlantic, are Puerto Cortez, Omoa, Ulua, La Ceiba, Trujillo, Roatan and Tela; on the Pacific Amapala.

Education.—Primary education is provided for by the municipalities, with the help of funds from the Federal government. By law it is free and compulsory for children between the ages of seven and 15 years, but it is almost impossible to enforce school attendance, especially in the rural districts. In 1922, there were in operation 871 primary schools with 1,124 teachers and 45,311 pupils, out of a school population of 93,314. The expenditure on education was about 400,000 pesos. The secondary schools have a five-year course comprising the study of Spanish, French, English, mathematics, book-keeping, natural sciences, etc. Besides the National Institute and the School of Commerce at the capital there are four other secondary schools in the republic. These institutions had 74 teachers and 217 students in 1922. Normal training is provided in schools for boys and girls at the capital, two others at Santa Rosa and La Esperanza, and in normal departments connected with two of the secondary schools. There are about 470 normal students. Higher education is provided by the central University of Honduras at Tegucigalpa, which has faculties of law, medicine, and an

engineering school. There is also a school of jurisprudence at Comayagua.

Religion.—The Roman Catholic is the prevailing religion but freedom is guaranteed to all denominations by the constitution. No state funds are contributed to any sect.

Defence.—Every citizen belongs to the regular army from his 21st year to his 35th and thereafter in the reserve until he reaches his 40th year. The total force is about 77,600 men, of whom 46,100 are in the regular ranks. There are five military zones in the republic.

Products and Industries.—The agricultural possibilities of the country are extensive. Cacao, cotton, sugar cane, coffee, tobacco and other tropical and subtropical products can be grown in immense quantities and of the finest quality, while the forests supply abundant timber, pitch pine and dyewoods. The chief culture crop is bananas which are grown in largest quantities on or near the Atlantic coast. The exports in 1921 amounted to 10,618,624 bunches. About an equal number of coconuts was exported the same year. Coffee and tobacco culture are on the increase, but the rubber industry has been decreasing of late. Henequen and the castor-oil plant are also being planted and the government is offering subsidies to these infant industries. On the temperate table lands, cereals, fruits and vegetables of the more northern latitudes are grown. Cattle raising and dairy farming are practised extensively and there are now 1,561 cattle ranches in the republic.

Gold, silver, copper, lead, iron, antimony and zinc are among the mineral resources of the country, together with some deposits of brown coal. Nearly 2,000,000 ounces of silver and 9,000 ounces of gold were produced in 1921. Of the manufacturing industries those connected with the making of straw hats and cigars are important and their products figure in the exports. There are also factories engaged in the manufacture of ice, shoes, candles, soap, etc., for domestic consumption. Indian corn takes first place in the diet of the people, in which it figures largely on account of the comparatively small quantity of wheat produced in the country.

Commerce.—In 1921-22, the foreign trade of the republic amounted to \$23,113,178, of which \$14,319,882 represented imports. Banana exports represented \$2,788,177; coconuts, \$260,100; cattle and hides, \$195,250; sugar, \$1,000,000, and coffee, \$30,150. The United States took 94 per cent of the exports and furnished almost all of the imports. The banana trade with the United States is facilitated by special steamers which are built for this trade and deliver their cargoes with despatch on the eastern seaboard of the United States.

Communications.—Transportation is the great desideratum in the republic and in recent years there have been made extensive improvements in the roadways, but much remains to be done. There are about 200 miles of improved highways, over which there is an efficient automobile mail service. There are five short railways in the republic, one of which is owned and operated by the state. The others are owned by the great banana corporations and fruit companies. The total length of railways is 475 miles. There are 877 miles of telephone

lines and 4,663 miles of telegraph lines, 277 telegraph offices and 664 telephone stations.

Finance.—The state has the monopolies of alcoholic spirits, tobacco and explosives and also derives a great part of its revenue from customs. The revenue for the fiscal year 1921-22 amounted to \$5,977,188 and the expenditures to \$5,888,978. Of the revenue, \$3,500,000 was derived from customs and about \$2,000,000 from the various monopolies, the remainder from the cattle tax, stamps, telegraphs, cables, etc. The cost of collection was nearly 10 per cent of this total. The external debt of the republic amounts to \$107,644,450, over 80 per cent being accrued interest on old loans. The internal debt amounts to \$16,500,000. The monetary unit is the silver peso or dollar of 100 centavos. The real of 12½ centavos is also in popular use. The value of the peso is legally fixed at one-half the value of the United States dollar. United States currency is being introduced under the Convention of 1920 and about \$3,000,000 of this currency is now in circulation. The metric system of weights and measures is in legal use, but the old Spanish system is still found in general use.

Government.—The legislative power is vested in a Congress of 42 members chosen for terms of four years by direct popular vote. The executive power is in the hands of a President who is elected by popular vote for a term of four years. He is assisted by a council of five ministers with the usual portfolios. The President in 1922 was Gen. Rafael Lopez Gutierrez, whose term of office runs from 1920 to 1924.

History.—On 1 March work was begun by the municipality of San Pedro Sula at Palmar on a section of the Santa Rosa de Copán road,—part of an indispensable system connecting the towns of the west with the "Atlantic" (strictly, Caribbean) coast. In April, plans were announced for equipment of the first Honduran school of aviation. On 25 July there was published in the *Gaceta* the order governing the Banco de la República, an institution starting with a capital of 2,000,000 silver pesos,—its founders being the Banco de Honduras and the National Government, the latter subscribing 20 per cent of the capital. During October the Third Central American Labor Congress was held at Tegucigalpa, where the delegates (two from each Central American country) framed a constitution, a feature of which was the contemplated founding of a Department of Labor to adjust difficulties between capitalist and workman. In the same month it was made known that the fruit companies operating in the northern part of Honduras would assume the cost of various works of sanitation amounting to \$500,000, approximately, in return for exemption from certain taxes. On 1 November occurred the death of José Antonio López Gutiérrez, who for more than four years represented Honduras in the United States. He was a brother of the Honduran President, and was a diplomat of marked ability who had, in his own country, occupied positions of the first importance in three successive administrations. President Harding, in his telegram of condolence, said: "Mr. López Gutiérrez during his residence here has rendered his

country signal service." See also NICARAGUA, HISTORY, 19 and 20 August; CENTRAL AMERICAN CONFERENCE.

HONGKONG, a British crown colony off the mouth of the Canton and about 89 miles distant from the city of that name, and the great centre of British trade with China and Japan. The island is about 11 miles in length and from two to five miles in breadth with an area of 32 square miles. It is separated from the mainland by the Lyeemoon Pass, about half-a-mile in width. The peninsula of Kowloon facing the island also forms part of the colony since 1861. The area of Old Kowloon is about three square miles. Great Britain also leased in 1898 an agricultural area of 356 square miles along the southern shore of the bay and the island of Lan-Tao. The total area of the colony is therefore 391 square miles. The colony is a military and naval station of the first rank. The administration is through a Governor, assisted by an Executive Council consisting of the Commanding Officer of the Troops, the Colonial Secretary, Attorney-General, Treasurer, Secretary for Chinese Affairs, Director of Public Works and three unofficial members. There is also a Legislative Council, mostly composed of the above officials, together with six unofficial members. The Governor in 1922 was Sir R. E. Stubbs. The population of the Colony was in 1921: Non-Chinese, 12,856; Chinese, 612,310; total, 625,166.

There are about 29,000 pupils in all schools. Education is not compulsory, but schools are held to a certain standard of efficiency and are inspected by the state. There are 13 secondary schools, of which 10 are for Chinese (one for girls) and three for children of British parentage. The examinations for the university serve the purpose of a graduation examination from the secondary schools. Higher education is provided by the University of Hongkong, which has about 245 students, mostly Chinese.

The revenue of the colony for 1921 was \$15,336,350 with expenditures of \$17,349,150. The revenue is derived from the opium monopoly, liquor and tobacco duties, land taxes, licenses, etc. The expenditure is largely for the maintenance of a strong police force. The public debt is \$9,200,000.

Sugar refining, ship building, tin refining, making of cement and tobacco and knit goods are the chief industries of the colony. The fisheries are also important. The trade of the colony in 1921 showed the effect of the general world depression, as well as the disturbed conditions of its principal market in South China. In the quantity of goods imported and exported, the year 1921 compared favorably with 1920, which was the record year in the trade of the colony. The value of the 1921 trade, however, computed on a sterling basis, was only about 64 per cent of the 1920 value, but was about equal to the trade in 1918 and 1919. Imports into Hongkong in 1921 were valued at £81,940,154, while the exports amounted in value to £85,673,234, the total foreign trade of the colony, therefore, being valued at £167,613,388, as compared with a total value of £289,340,518 in 1920. The largest item imported in 1921 was raw sugar, of which 365,919 tons,

valued at £8,771,351, were imported. The second largest item imported in 1921 was white rice, imports of which amounted to 523,295 tons, valued at £6,694,037. In the same year the imports of cotton yarn were 33,378 tons, valued at £5,565,578. Broken rice was imported to the extent of 273,694 tons, valued at £2,506,638. Other important items were: Kerosene, £2,362,143; coal, £2,320,398; heavy cotton fancies, £1,952,830; fish and fishery products, £1,930,135; wheat flour, £1,675,042; silk, £1,522,547; tin slabs and ingots, £1,224,576, and cargo rice, £1,119,896. The three principal items exported from Hongkong in 1921 were refined sugar, white rice and cotton yarn. Exports of refined sugar totaled 236,908 tons, valued at £7,774,824; white rice exports amounted to 398,529 tons, valued at £5,278,244, and cotton yarn exports were valued at £5,257,802. Other important exports were: Heavy cotton fancies, £2,936,784; raw sugar, £2,774,115; kerosene, £2,390,041; broken rice, £2,202,620; fish and fishery products, £2,050,162; tobacco, £2,028,065, and silk, £1,537,596. The bulk of the foreign trade of the colony is with the United States, the United Kingdom and Japan. In 1921 the United States lead in furnishing miscellaneous food stuffs, iron and steel angles and tees, joists and rivets, machine belting and clocks and watches; the United Kingdom led in aniline dyes, jams, confectioneries, copper wire, cutlery, tin and zinc plates and sheets, railway materials, electrical accessories, soap, hosiery and automatic musical instruments. Japan led with canned meat and fish, printing and lithographic material and toys and games, unbleached cottons and sewing cotton. Declared exports to the United States in 1921 totaled \$8,805,352, as compared with \$5,203,980 in 1913 and with \$69,922,951 in 1920. The total tonnage at the port of Hongkong in 1921 was the largest in the history of the colony. The total, including vessels in local as well as foreign trade, was 672,681 vessels of 43,420,970 tons. There were no developments in railway transportation in the colony during the year. Local road improvement continued. The most important project of its kind in progress—the motor road to the peak—was completed to the top of the hills and across the crest, thus making it possible to use trucks to this district, heretofore, accessible only by cable tramway and sedan chairs.

HOOPER, Horace Everett, American publisher: b Worcester, Mass. 3 Dec. 1859; d. Bedford Hills, N. Y., 13 June 1922. He first attended the Worcester public schools and there-

after Princeton preparatory school. In 1893 he organized the Western Book and Stationery Company and opened a place of business in Denver, Colo. A few years afterward he organized a company for the sale of the 'Century Dictionary' and other reference works. After having had many years of experience in the book business, especially in connection with the sale of reference books in this country, Mr. Hooper decided to go to England and unite with a book-selling company in that country. Prior to 1900 he and Walter M. Jackson, with whom he had formed a partnership, were associated with James and George Clarke in the sale of subscription books under the firm name of Clarke Company, Ltd. In March 1900 Hooper and Jackson bought out the Clarkes. Plans were then developed for an expansion of their business. One of their first acts was to acquire the copyrights and the trade name of the 'Encyclopaedia Britannica' with a view of selling that reference work in all parts of the world. In 1902 it was deemed advisable by them to organize separate English and American companies. In England, the business was carried on under the name of Hooper & Jackson, Ltd.; in the United States under the name of the Encyclopaedia Britannica Company, a New York corporation. The 10th edition of the 'Encyclopaedia Britannica' was published under the auspices of *The London Times*, and for many years the business relations between *The Times* and Mr. Hooper had been intimate. In January 1908 an announcement of a contemplated change in the control of *The London Times* was regarded by Mr. Hooper and his partner as likely to impair the value of the contract they had for the publication of the 11th edition of the 'Britannica.' They had invested a large amount of money, and to assure protection of their interest, Mr. Hooper proposed that he and his partner purchase the controlling interest in *The Times* and combine it in an immense publishing business with the 'Encyclopaedia Britannica' and other noted English publications. Mr. Jackson objected to Mr. Hooper's plans on the ground that it was a hazardous business venture, likely to result in a large loss. Mr. Hooper's alternative proposal was that he and his partner raise \$1,500,000 on their joint assets for bringing out the 11th edition of the 'Britannica,' a plan to which Mr. Jackson likewise objected. As a result, however, of the negotiations of Hooper and Jackson, *The London Times* in March 1908 passed to the control of a limited liability company with Arthur Walter, G. E. Buckle and the late Moberly Bell as chief managers and directors. At that time it was reported that Sir Arthur Pearson also was desirous of purchasing *The Times*, which, however, because of internal differences among the members of the management, passed to the control of the late Lord Northcliffe on 27 June 1908. The differences referred to, together with others relative to the management of their business resulted in long litigation between Mr. Hooper and Mr. Jackson, which was eventually decided in Mr. Hooper's favor. The full story of the alliance between *The London Times* and the 'Encyclopaedia Britannica' and the plans of Mr. Hooper to purchase *The Times* was brought out in papers filed in the New Jersey Court of Chan-

cery in 1909 in a suit asking for the appointment of a receiver of the joint assets of the two partners. For the last 14 years of his life Mr. Hooper had made his home in this country, and as president of the Encyclopaedia Britannica, Inc., directed his affairs from an office in New York City.

HOPE COLLEGE, a co-educational institution founded in 1854, incorporated 1866 and located at Holland, Mich. It belongs to the Reformed Church but is nevertheless non-sectarian. In 1922-23 it had a faculty of 21 members, 568 students, property valued at \$2,250,000 and an income of \$85,000. Edward D. Dimment, L.H.D., is president.

HOPS. Practically all of the commercial hops grown in the United States are produced in the States of Washington, Oregon and California. At least, these are the only States taken into consideration by the Department of Agriculture in making up its estimates of production. The hop yield for 1922 was 25,910,000 pounds, compared with 29,340,000 pounds in 1921 and 34,280,000 pounds in 1920. The 1922 crop was valued at \$2,200,000, compared with \$7,080,000 in 1921 and \$12,236,000 in 1920. California, which has led in the production of hops for the last three years, produced 14,760,000 pounds in 1922, 15,000,000 pounds in 1921 and 18,900,000 pounds in 1920. Oregon produced 9,600,000 pounds in 1922, 9,240,000 pounds in 1921 and 8,700,000 pounds in 1920. Washington dropped to 1,550,000 pounds in 1922 from 5,100,000 pounds in 1921 and 5,730,000 pounds in 1920. New York, which produced 950,000 pounds in 1920, dropped out of the production list entirely in 1921 and 1922, as shown by the Department of Agriculture's report.

The consumption and movement of hops in 1922 was given by the Department of Agriculture as follows: Consumed by brewers, 4,452,676 pounds; exported, 19,521,877 pounds of domestic, 487,633 pounds of foreign, making a total of brewers' consumption and export of 24,462,186 pounds. In 1914 brewers consumed 43,987,623 pounds, while exports for the year amounted to 24,262,896 pounds. Imports for 1922 amounted to 893,324 pounds as compared with 11,651,332 pounds imported in 1915.

HORTICULTURE. General Crop Conditions.—The year 1922 was characterized by uniformly good growing conditions, increased yields in most commodities, corresponding lower prices and an acute car shortage at the time of shipment of perishable fruits. Scab was prevalent in New York and Michigan, codling moth injury was quite severe in the Pacific Northwest, scale was reported on the increase in the Middle West and a spring freeze caused damage in California, but aside from these minor local problems there were no such general disturbances as the severe spring frosts and freezes of 1921.

The carlot shipments of pears, peaches and grapes were record-breaking. Nineteen thousand cars of pears were shipped, compared with 13,000 last season and a previous high record the season before of 15,000. Peach shipments

were 36,000 cars, or 9,000 more than last year and 10,000 above the average for the five-year period, 1917-21. Shipments of grapes were 13,000 cars more than were moved any previous year—52,000 cars in all, of which California, despite the car shortage, supplied 37,000 or 4,000 more than in 1921. New York, Michigan and Pennsylvania doubled their average shipments, yet grape prices held up fairly well until near the end of the season. Early apples being plentiful, brought low prices, but the fall and winter apple market steadied, though it did not reach the level of 1921. Early peaches, on the other hand, commanded good prices, due to the short crop in Georgia, but the heavy mid and late-season supply from New York and Michigan resulted in severe declines and considerable loss later in the season.

Most horticultural crops showed increases for 1922. Estimates of the United States Department of Agriculture for the year give the following comparisons: White potatoes, 451,185,000 bushels with a value of \$262,608,000 in 1922, and 361,659,000 bushels valued at \$398,362,000 in 1921; sweet potatoes, 109,534,000 bushels in 1922 and 98,654,000 in 1921; cabbage, 1,097,600 tons valued at \$14,301,000, compared with 673,900 tons valued at \$16,612,000 the previous year; commercial apples, 31,090,000 barrels with a value of \$91,534,000, compared with 21,557,000 barrels in 1921 with a value of \$99,131,000, and oranges, 24,900,000 boxes in 1922 and 20,300,000 boxes in 1921. The commercial production of vegetable seeds increased; commercial lettuce registered 27,612 cars or 25 per cent more than in 1921; and certified seed potatoes increased from 1,505,970 bushels to 2,255,360 bushels. Carlot shipments of strawberries showed a 75 per cent increase from 10,681 cars in 1921 to 18,500 cars in 1922, exceeding the seven-year average by 6,000 cars and marking a return from the growing of the more essential crops characteristic of the years of the war. Canning crop acreages approached more nearly the normal maintained before curtailment of plantings immediately following the war. The total acreage increased 27 per cent, while the tomato acreage more than doubled, jumping from 88,000 to 217,000 acres.

Foreign Commerce.—Exports of horticultural products from 1 January to 1 November showed a slight loss in value from those for the same period in 1921; imports gained. The total value of exports of fruits, nuts and vegetables for this period of 1921 was \$72,198,529, as compared with a value for 1922 of \$69,105,363. Fruits were valued at \$53,315,161 in 1921 and \$52,638,163 in 1922; vegetables at \$17,434,840 in 1921 and \$15,333,404 in 1922; and nuts at \$1,448,528 in 1921 and \$1,133,796 in 1922. Some of the conspicuous differences were: Oranges, which dropped from \$7,063,422 in 1921 to \$5,561,064 in 1922; raisins, which more than doubled, increasing from \$3,105,954 in 1921 to \$7,005,264 in 1922; and canned fruits, which increased from \$11,280,045 in 1921 to \$17,272,231 in 1922. A large share of these gains was due to increased exportations to the United Kingdom, the value of raisins for example, increasing from \$836,436 in 1921 to \$3,683,971 in 1922, and canned fruits, from \$8,060,722 in 1921 to \$14,391,322 in 1922. Exports of vege-

table and flower seeds were given a total valuation of \$808,718 and nursery and greenhouse stock of \$268,554.

Imports into the United States from 1 January to 22 September, the date of the enforcement of the Tariff Act of 1922, more commonly known as the Fordney-McCumber Tariff Bill, were as follows: Fruits \$30,541,473, vegetables \$14,837,728, nuts \$24,947,027, with a total value of \$70,326,228. The value of similar products imported in the first nine months of 1921 was \$58,408,172. Nursery stock increased slightly from \$4,102,442 for a like period in 1921 to \$4,717,281 in 1922. Nut and tropical imports gained decidedly in value, as evidenced by increases in lemons from \$1,044,872 to \$1,990,199, olives from \$1,939,150 to \$3,053,481, shelled almonds from \$2,953,161 to \$4,634,702 and shelled walnuts from \$3,119,520 to \$5,350,399.

One of the outstanding features of the season was the interest shown in the fruit industry in the South Temperate Zone. New Zealand, South Africa, Australia and Chile became increasingly active exporters of fresh fruits. Chile, especially, has commanded attention because of a climate and geography similar to that of California which permits her to produce a wide range of fruits and at a season which places them upon the markets of the United States during the months of January, February, March and April. Imports of fresh fruits from Chile for the first six months of 1922 were 35,594 cases with a total value of \$63,642, compared with 1,562 cases valuing \$4,404 for the entire 12 months of 1921. Cherries from South Africa were placed on sale in England a week or two before Christmas.

Commercial Progress.—The coal and railroad strikes were felt keenly in handling of perishable products. Eastern growers were not so seriously handicapped in this respect as the more distant shippers from California and other Pacific Coast States. In Colorado 500 carloads of peaches rotted for lack of cars, in California grapes were shipped bulk in box cars and in Oregon only 15 per cent of the necessary box cars and 40 per cent of the refrigerator cars were available. Because of this shortage, more than 150,000 boxes of apples were shipped, mostly from Oregon, by boat, and prices of boxed apples were maintained relatively high though orchards and shipping points were burdened with fruit. There was, nevertheless, a renewal of the tendency to ship long distances and under refrigeration. Strawberries and red raspberries grown in the Puget Sound region of the Northwest were shipped in special express refrigerator trains and served in Chicago 80 hours after picking. The trend towards better packing and marketing methods and the success of co-operative marketing was also evidenced. Arkansas shipped peaches packed in California-style boxes to Chicago, where they were well received. The branding of individual fruits with a trade-mark or brand, as was done with the Blue Goose brand of grapefruit, was received enthusiastically by the trade. The Satsuma growers of western Florida organized a co-operative association; peach-growers of the Yakima Valley in Washington did likewise; and the apple and peach-growers of southern Cali-

fornia, not to be outdone by the citrus, raisin and nut-growers, organized the Deciduous Fruit Distributors of Southern California. In the East the several local packing associations of the Hudson Valley formed the Hudson Valley Fruit Growers' Co-operative Association, Inc., patterned after the successful western New York association formed but a few years ago.

The most important single event, however, was the formation of a national co-operative sales agency, the Federated Fruit and Vegetable Growers, Inc., as the result of the work of the National Fruit Committee of Twenty-one appointed by the American Farm Bureau Federation. The new organization is organized on a non-stock, non-profit plan, and is intended to be grower-owned and controlled, with a national scope. By absorbing the North American Fruit Exchange, which has been marketing for co-operative organizations since 1911, the lapse of time necessary to build up a working organization has been materially lessened and the new organization began operation 1 Jan. 1923. Only co-operative organizations and large growers prevented from joining a co-operative organization by geographical circumstances will be permitted to become members of the concern. Further progressive efforts to improve the marketing situation were shown by the increase in joint State-Federal shipping point inspection service and by the growth of market inspections by the Food Products Inspection Service of the United States Department of Agriculture, which made 31,207 inspections during the fiscal year ending 30 June 1922, as compared with slightly less than 24,000 in 1920-21. In New York and Michigan the bushel-basket and hamper were largely retained as fruit packages following their adoption in 1920 upon the exorbitant charges made for barrels. The canning associations in these and other eastern States began activities towards the production of yellow-flesh, clingstone peaches suitable for canning, with the idea of competing with California for the canned peach market.

Regulatory and Control Work.—In May 1922 the Secretary of Agriculture called a conference to discuss from all angles Quarantine 37, an act which regulates the importation of horticultural plants and seeds for propagation purposes and which has been most vigorously attacked by interests both in this country and abroad ever since its adoption. Evidence of the need of the quarantine was shown by the report that during the last fiscal year 500 different species of insect pests were intercepted at points of entry into the United States. The conference succeeded in clearing up many disputed points and in securing the endorsement of many formerly hostile interests. The Federal Horticultural Board reported that the Japanese beetle was present in alarming numbers in the region of its original infestation and that it was spreading about five miles a year from the quarantined area. The Parlatoria date scale was noted as still infesting some 14 of the 200 date plantations in the United States, and the intensive measures for its eradication were therefore continued, for it is conceded that the new date industry cannot succeed unless the scale is eradicated. Activities to keep in check the brown-tail and gypsy moths met with some success in

the case of the former and resulted in a marked reduction in the area quarantined. The gypsy moth, however, made its appearance in two places on Long Island but was promptly met by vigorous measures on the part of both State and Federal authorities.

New Fruits.—New fruits are a constant source of interest and were no less so during 1922. The esteem in which a relatively new fruit, the Delicious apple, is held by some was evidenced by the dedication of a monument at Winterset, Iowa, on 16 Aug. 1922, commemorating the origin of the tree. A new old apple, Rainier, introduced by the Washington Nursery Company of Toppenish, Wash., was awarded a Wilder silver medal of merit by the fruit committee of the American Pomological Society. The Cortland apple, introduced by the New York Agricultural Experiment Station at Geneva, N. Y., rose to increased prominence. A new strawberry of the ever-bearing type, "Rock-hill," was reported purchased by a Michigan nursery company for a fabulous sum, and a new canning pear, resistant to pear-blight, was introduced by the Plant Introduction Board. Two other interesting novelties were the "peach-mond," reported from Mexico as a hybrid between the peach and almond; and the Andes berry, introduced into America as a vigorous growing plant resembling the raspberry in plant and the blackberry in fruit.

Research.—Scientific effort in horticulture has more recently followed in the channels of fundamentals. The New Hampshire station reported that shaded horticultural plants were higher in moisture and total nitrogen content than unshaded, with free reducing sugars and starches lower. In a similar vein, it was found at the Wisconsin station that the length of day affected the fruiting of plants by virtue of an affect upon the carbohydrate-nitrogen ratio. Several stations reported upon bud selection work. The New York (Geneva) station stated that young trees budded from both high and low yielding parents showed no corresponding differences in yield; the East Malling research station, England, reported a similar conclusion from similar investigations; and the Maine station stated that differences in yield in apples were due to external conditions, even continuing so far as to suggest that closer biometric studies of bud variations in citrus might reveal less variation than has previously been held. Orchard fertilization studies with the apple at the Pennsylvania State College when subjected to biometric study indicated that in a clean cultivated orchard of normal fertility in which a cover crop system of orchard management is employed, the addition of fertilizers is rarely profitable. Reports from several stations on spraying and dusting indicated the increasing use of forms of nicotine for insect control and of finely divided sulphur for the control of fungi. There was a noticeable disposition to reserve judgment on the benefits of calcium caseinate and other spreaders. Confidence in the study of the Massachusetts station on leaf characters of apple varieties was expressed by the Massachusetts Fruit Growers' Association, which adopted a nursery certification plan based on this work. Better accommodations were provided for the study of horticulture. In New York a field sta-

tion for the study of vegetable problems was established on Long Island; in Florida a citrus sub-station was located at Lake Alfred, and in Louisiana a substation was established especially for vegetable work. At Cornell University a new pomology storehouse and cold-storage plant were erected and at the University of Illinois the new horticultural building was completed. The latter, erected at a cost of over a quarter of a million dollars and complete in every detail including cold-storage plant, canning factory, cider and vinegar plant, by-product and preserving laboratories, and spraying and machinery laboratories, represents an entirely new plan in building design and illustrates perhaps the most important need in the handling of horticultural products, namely, refrigeration. In the centre of the building is the cold-storage; this is surrounded by a corridor, from which open the class-rooms and laboratories.

Necrology.—The year of 1922 took more than its share of men prominent in horticulture, notably, S. A. Beach, chief of the department of horticulture at the Iowa Agricultural College since 1905, occupant of a similar position at the New York Agricultural Experiment Station at Geneva from 1891 to 1905, author of 'The Apples of New York,' and one of the most successful American fruit breeders, died 2 November; G. Harold Powell, general manager of the California Fruit Growers' Exchange since 1912, author of numerous publications upon storage and handling of perishable products, and widely known as an authority on co-operative marketing, died 18 February; Dr. John P. Stewart, professor of experimental pomology at the Pennsylvania State College from 1907 to 1918 and noted for his work in fertilization of apple orchards and the preparation and use of lime-sulphur, died 21 January; Dr. William W. Tracy, recently retired vegetable specialist in the United States Department of Agriculture and author of many articles dealing with varietal nomenclature, vegetable seed growing, and allied topics, died 1 March; Dr. Walter Van Fleet, horticulturist and physiologist of the Bureau of Plant Industry since 1910, working primarily as a plant breeder with gladioli, chestnuts, and roses, and noted as the originator of the Van Fleet climbing rose, died 26 January; Dr. J. C. Whitten, head of the division of pomology in the University of California since 1919 and holder of a similar position in the University of Missouri from 1895 to 1918 and most intimately identified with the successful work of both institutions, died 5 June.

Publications.—A few of the horticultural publications of the year of especial merit are: V. R. Gardner, F. C. Bradford and H. D. Hooker, Jr., 'The Fundamentals of Fruit Production' (New York and London 1922); L. H. Bailey, 'The Apple Tree'; U. P. Hedrick, 'Cyclopedia of Hardy Fruits'; J. H. Gourley, 'Text-Book of Pomology'; Fritz Bahr, 'Commercial Floriculture'; W. V. Cruess and A. W. Christie, 'Laboratory Manual of Fruit and Vegetable Products' (New York 1922); A. D. Taylor, 'The Complete Garden' (New York and Toronto 1921); F. A. Waugh, 'Landscape Gardening' (New York and London 1922); E. Brainard, 'Violets of North America' (Vermont Station Bulletin 224, 1921); U. P.

Hedrick, G. H. Howe, O. M. Taylor, E. H. Francis, and H. B. Tukey, 'The Pears of New York' (New York Station Report, Part II, 1921); J. K. Shaw, 'Leaf Characters of Apple Varieties' (Massachusetts Station Bulletin 208, 1922).

HAROLD B. TUKEY,
Assistant Horticulturist, New York Agricultural Experiment Station, Geneva, N. Y.

HOTCHKISS, Henry DeWitt, American jurist: b. Albany, N. Y., 2 July 1856; d. New York, N. Y., 6 March 1922. He received his education in the schools of his native city, being graduated from the law school there in 1878. He secured admission to the bar the same year and entered the law office of the late David B. Hill. He removed to Brooklyn in 1887, was elected to the State Assembly from that city for one term, and thereafter for several years was engaged as organizer and director of the Brooklyn Heights Street Railway Company. In the latter capacity he attracted the attention of Richard Croker, then leader of Tammany Hall, by whom he was induced to join the organization. During the remaining years of Mr. Croker's leadership, Mr. Hotchkiss was his personal legal adviser and subsequently served in a similar capacity to Charles F. Murphy. In 1911 he was elected a justice of the Supreme Court; took his seat the following year and after a year in trial and special term was named to the Appellate Division of the Supreme Court to fill the vacancy caused by the elevation of Justice Nathan L. Miller (later governor) to the Court of Appeals. Owing to ill health and at his own request he was sent to trial term in 1915. His legal learning and the thorough reasoning of his decisions earned for him the entire respect of the members of his profession. His work on the bench during the last two years of his life was interrupted several times by illness. Justice Hotchkiss was a member of the Metropolitan and Manhattan clubs.

HOUSING. See BUILDING; also BUILDING AND HOUSING DIVISION OF THE DEPARTMENT OF COMMERCE.

HOWARD COLLEGE, a Baptist co-educational institution founded in 1842 and located at Birmingham, Ala. In 1922-23 it had a faculty of 22 members and a student enrollment of 490; during the summer session of 1922 the faculty numbered 30 members and student body 830. The institution's property is valued at \$797,931.72 and its income was fixed at \$78,000. President, John C. Dawson, LL.D.

HOWARD PAYNE COLLEGE, a Baptist co-educational institution, opened in 1890 and located at Brownwood, Texas. In 1922-23 it had a faculty of 26 members, 893 students, property valued at \$575,000 and an income of \$119,906.89. W. R. Hornburg is president.

HOWARD UNIVERSITY, a non-sectarian co-educational institution, for colored students founded in 1867 and located at Washington, D. C. In 1922-23 it had a faculty of 151 members and 2,079 students. The value of the institution's property and its income for 1922-23 were not given but in 1921-22 its property was valued at \$2,069,389.26 and its income at \$589,036.90. J. Stanley Durkee, A.M., Ph.D., D.D., is president.

HOWE, Henry Marion, American metallurgist: b. Boston, Mass., 2 March 1848; d. Bedford Hills, N. Y., 14 May 1922. He was the only son of the late Julia Ward Howe and Dr. Samuel Gridley Howe. He was graduated from Harvard University in 1869 and from the Massachusetts Institute of Technology in 1871, receiving the degree of LL.D. from Harvard and Lafayette College in 1905, and the degree Sc.D. from the University of Pittsburgh in 1915. His work in metallurgy and his many books on the subject won honors in several countries, including the Bessemer medal of the British Iron and Steel Institute, 1895; the Elliott Cresson gold medal of the Franklin Institute, of Philadelphia, 1895, the gold medal from the Société d'Encouragement pour l'Industrie Nationale, 1916, and the John Fritz gold medal, 1917. He was president of the jury of mines and mining at the Chicago Exposition in 1893, and in the same year was president of the American Institute of Mining Engineers. He was honorary chairman of the engineering division of the National Research Council, and also consulting metallurgist of the United States Bureau of Standards. From 1897 he was professor of metallurgy at Columbia University, New York City, and at the time of his death was professor emeritus. He had been president of many scientific associations and was a member of nearly every important society in his profession, not only in the United States but in many other countries. He published 'Copper Smelting' (1885); 'Metallurgy of Steel' (1891); 'Metallurgical Laboratory Notes' (1902); 'Iron, Steel and Other Alloys' (1903); 'Metallography of Steel and Cast Iron' (1916).

HUDSON, W. H., English author and naturalist: d. London, 18 Aug. 1922. Regarded at the time of his death as one of the foremost of the modern writers on nature and famed for his literary style, it was only in recent years that Mr. Hudson came to be appreciated. In 1901 a Civil List pension of £150 was awarded to him in "recognition of the originality of his writings on natural history." This he returned shortly before his death because he was no longer in need of it, "the recognition," he said, "in which he stood so much in need in his earlier days was now more than abundant" and that all his relations were dead. The early part of his life was spent on an *estancia* on the Argentine pampas, where he acquired the knowledge and love of nature described in his 'Naturalist in La Plata' (1892). His first book, 'The Purple Land which England Lost,' published in London in 1885, alludes to the blood-stained history of the Banda Oriental (the Republic of Uruguay) and to its brief conquest by the English. In 1887 'A Crystal Age' appeared, giving a picture of Utopia; in 1888-89 the 'Argentine Ornithology' written by Dr. P. L. Selater and Hudson which attracted much attention; and in 1893 'Idle Days in Patagonia.' By this time Mr. Hudson had settled in London and had begun to study rural England and its people, its bird-life, its trees and flowers. As his observation grew more intimate, his imagination was captivated by a second field—the English countryside; and his later books are full of a peculiar charm combined with a

spiritual insight. It has been aptly said that Hudson's "peculiar genius lay in setting forth nature and its minutest creatures with gentleness and understanding, not 'scientifically' and coldly, but humanly. He turned a loving yet illuminating searchlight upon the experiences of birds, squirrels, hornets, field-mice, dragon-flies, upon countless other atoms which men have been too prone to ignore, or else to examine patronizingly from their toppling heights of imaginary superiority." His books include, besides those already mentioned, 'Birds in a Village' (1893); 'British Birds' (1895); 'Birds in London' (1899); 'Nature in Downland' (1900); 'Birds and Man' (1901); 'E. Ombu' (1902); 'Hampshire Days' (1903); 'Green Mansions' (1904); 'The Lands' End' (1908); 'Afoot in England' (1909); 'A Shepherd's Life' (1910); 'Adventures among Birds' (1913); 'Far Away and Long Ago: A History of My Early Life' (1918); 'Birds in Town and Village' (1919); and 'The Book of the Naturalist' (1919); 'A Traveller in Little Things. (1921) and 'A Hind in Richmond Park' (1922). Theodore Roosevelt wrote the preface for an edition of 'The Purple Land'; John Galsworthy the preface for 'Green Mansions'; and Edward Garnett a foreword for 'A Hind in Richmond Park.'

HUNGARY, a country of eastern-central Europe, formerly a kingdom and united with Austria to form the dual monarchy or empire of Austria-Hungary. Officially Hungary is a monarchy and the ministry is styled the Royal Hungarian Ministry. The state is governed by a regent, who in 1922 was Admiral Nicholas von Horthy.

Area and Population.—Under the terms of the Treaty of Trianon, ratified by Hungary 13 Nov. 1920, Hungary ceded Slovakia to the new republic of Czechoslovakia, Croatia and Slavonia to Yugoslavia and Transylvania to Rumania. Later the Burgenland was ceded to Austria. The area of the old kingdom of Hungary was 125,600 square miles with a population of 20,886,487. In 1922 its area was 35,654 square miles and its population 7,840,832. Budapest, the capital, has a population of 1,184,616. Other large cities are: Szeged, 109,896; Debreczen, 103,228; Kecskemet, 72,768; and Hodmezovasarhely, 60,854.

Religion.—There is full toleration for all denominations under the constitution and full equality is accorded to all legally recognized faiths, each of which has the independent management of its own affairs. The chief religions are the Roman and Greek Catholic, the Evangelical, Jewish and Mohammedan. There are some Baptists, Unitarians and Oriental sects.

Education.—Primary education is free and compulsory for all children from six to 12 years of age. In Old Hungary there were over 15,000 primary schools with 1,750,000 pupils, but no statistics are available for the present restricted area. There are four universities all maintained by the state—Budapest, Colosvar, Pozsony and Debreczen. There are numerous theological seminaries, the majority of which are Roman Catholic.

Production.—Agriculture is the chief industry of Hungary. The soil is very fertile and

the crops are bountiful. In 1920, 267,440 acres were planted to wheat and yielded 7,930,270 quintals; 1,482,137 acres were planted under rye and yielded 4,196,430 quintals; 1,272,157 acres were planted to barley and yielded 4,364,350 quintals; 806,091 acres were planted under oats and yielded 3,355,960 quintals; 2,026,502 acres were planted to Indian corn and the yield was 12,273,770 quintals; 533,191 acres were devoted to viniculture, the great yield from which was 1,978,468 quintals; 77,824 acres were planted to sugar beets and yielded, 6,378,752 quintals. In the same year there were in the state 2,221,988 head of cattle, 1,817,405 sheep, 3,729,190 swine, and 746,423 horses. About 1,357,438 acres are under forest. The yields of the chief crops in 1921 and 1922 were as follows:

	1922 tons	1921 tons
Wheat.....	1,226,000	1,434,000
Rye.....	544,000	583,000
Barley.....	454,000	466,000
Oats.....	323,000	318,000
Maize.....	825,000	805,000
Potatoes.....	921,000	1,249,000
Sugar beet.....	573,000	542,000

The coal production of Hungary in 1920 was 4,458,694 tons. There are large deposits of brown and lignite coal. The other mining industries have been largely destroyed, the more profitable areas being now in the border states. The fisheries of the Danube and on the Balatonsee are still important and the wine industry is improving. The manufacturing industries of the country are mostly those based on agriculture. They include distilling, sugar refining, hemp and flax manufacture, etc.

Commerce.—Imports into Hungary in 1920 amounted to only 5,423 quintals and exports to 5,226 quintals. In 1922 imports were valued at 63,700,000,000 crowns and exports at 53,400,000,000 crowns.

Communications.—Hungary has 4,372 miles of railways. Good roads are numerous. Of the railways 1,858 miles are the property of the state. There are 2,156 post offices.

Finance.—The state budget for the year 1922 contemplated a revenue of 20,294,193,738 kronen and an expenditure of 26,762,508,209 kronen. The public debt of Hungary at the beginning of the year was placed at 54,453,041,000 kronen, of which 8,287,835,000 kronen are pre-war debt, 32,631,056,000 kronen debt incurred during the course of the war, and 13,534,150,000 kronen incurred since the war.

Army.—Under the terms of the Treaty of Trianon conscription was abolished and voluntary enlistment substituted. According to the treaty the army is limited to 35,000 officers and men. All recruits must undertake to serve at least 12 years consecutively, of which six years are with the colors. Officers undertake to serve at least for 20 consecutive years. Hungary has a gendarmerie numbering 12,000 and an equal number of police and 4,500 customs guards. There is no naval or air force.

Government, etc.—The executive power is vested in the Regent. The legislative power in a Parliament elected by universal suffrage. On New Year's day the Interallied Commission in charge of the plebiscite at Oedenburg, the chief city

of the Burgenland, handed the city over to the Hungarian authorities, the plebiscite having been in favor of Hungary. Count Laszlo Szechenyi, husband of the former Gladys Vanderbilt of New York, was appointed minister to the United States following the exchange of the ratifications of the treaty of peace between the two governments. The government released the Legitimist leaders from prison and the occasion was seized on by the Carlists for a great demonstration. When some of these leaders appeared in the Parliament they were cheered and a dinner was given in their honor. On 20 January a violent scene took place in the Diet when one of the Carlist leaders just out of prison attacked the Regent. He was howled down by the partisans of the latter but there was a general affray which reflected little honor on the participants. On 15 February an attempt was made on the life of the Regent, Admiral Horthy. The latter escaped uninjured. In the same month it appeared that a strong military clique was preparing a coup to place on the throne the Archduke Albrecht, who is a scion of the House of Hapsburg. A French syndicate concluded a contract with the Hungarian government for the construction of an international free port at Budapest. It provides for the formation of a joint stock company with a capital of 100,000,000 crowns, of which the syndicate contributes 40 per cent and the state 60 per cent. The company is to receive a concession for working the free port for a period of 50 years. It is understood that the syndicate is largely controlled by the Schneider-Creusot interests. The contract is approved both by the Reparation Commission and the French government. The ex-King Charles died at Funchal, Madeira, on 1 April 1922. The news of his death created a profound sensation in Budapest, where a campaign to raise funds for the royal family resulted in the collection of several million crowns. The city was plunged into mourning. The Legitimist leaders proclaimed the succession of Prince Otto to the Hungarian throne. The prince is the eldest son of the late King Charles. The prince-primate, Cardinal Cernoch endorsed the proclamation but the government confined its activities to taking precautions against a Legitimist coup. On 3 April a bomb was thrown into a hall during a dinner of the Democratic Club, killing four and wounding 30 persons. The outrage was an attempt to assassinate White Deputy Rassay, one of the anti-White Terrorist leaders in the Diet. He was to speak at the dinner, but arriving late he escaped injury.

The Bethlen government caused great indignation by its electoral edict, abolishing universal suffrage and reducing the electorate by one-fourth and substituting open polling for the secret ballot. It was thought to be a device to prevent the sweeping away at the polls of the Horthy regime. After the death of the ex-Emperor Charles it was rumored that his brother, the Archduke Maximilian was in possession of a will signed by him and appointing Maximilian guardian of the Archduke Otto, regarded by the Legitimists as King of Hungary. Under the law, however, this guardianship devolves upon the ex-Empress Zita, who also was named to that office in the Legitimist proclamation is-

sued soon after the death of Charles. The ex-Empress accepted the invitation of King Alphonso of Spain to live in Madrid with her children. At the Genoa Conference the Hungarian Premier tried to have the succession states contribute to the expenses of her household. His proposal was opposed by Benes of Czechoslovakia who declared that such a step could be undertaken only under certain guarantees. The Hungarian government addressed a memorandum to the Reparations Commission, stating that the damages incident to the Rumanian occupation in 1919 amounted to the sum of 2,500,000,000 gold francs.

A general election to the Hungarian National Assembly took place 28 May-1 June and resulted in large majorities for the Horthy regime. The supporters of the Horthy-Bethlen party are almost exclusively of the countryside constituencies. A noteworthy feature of the elections was the defeat of eight of the members of the Cabinet. The Legitimists secured a number of seats and about a score of the Socialists were elected for the first time in the history of the country.

The ex-Empress Zita left Madeira Island on 19 May for Spain where she was cordially welcomed by King Alphonso. A daughter was born to her at the El Pardo Palace, Madrid, on 31 May. The Spanish sovereigns acted as its sponsors and the papal nuncio officiated at the baptismal ceremonies. The ex-Empress notified Admiral Horthy that she still regards herself as Queen of Hungary and that she will devote her life to the securing of the throne for her son, Prince Otto. Vigorous measures were taken by the government for the suppression of radicals. In the general elections on 28 May and 1 June the Free Monarchist group was successful over the Legitimists. The Boundaries Commission's rulings caused great dissatisfaction with its decisions delimiting the frontiers between Hungary and Rumania and between Hungary and Yugoslavia. Further dissatisfaction was caused by the deportation of 250 Hungarian families from Yugoslavia on 9 July. The Hungarian government protested to Belgrade and appealed to the League of Nations to put a stop to the deportations. The government was engaged throughout the summer months in stopping the activities of the ardent patriots, notably Ivan Hejjas, who organized the invasion of the Burgenland, instituted pogroms against the Jews and in general contributed to what came to be called White Terrorism. On 18 September Hungary was admitted to membership in the League of Nations and there was great rejoicing throughout the country. Later in the month the government sent to the Allied representatives at Budapest a note of protest against the maintenance of the Interallied Commission of Military Control at Hungary's expense, although Hungary had faithfully executed all the military clauses of the Treaty of Trianon. The drop in the Hungarian krone caused anxiety in financial circles. In October a registration of all foreigners resident in Hungary was ordered with the avowed object of weeding out undesirables. On 3 October leaders of the Royalists formally announced Prince Otto, eldest son of the late King Charles, as King of Hungary in succe-

sion to his father. The leaders appeared before the Premier, Count Bethlen, and requested that the declaration of Otto's succession be announced to the National Assembly and to the Regent, Admiral Horthy. The request was refused on the ground that the National Assembly had passed a law annulling the claims of the Hapsburgs to the throne of Hungary. In November the organization of a Fascisti group, to the number of several thousand and after the model of the Italian group, planned an extreme nationalist movement to direct the destinies of Hungary regardless of the wishes of the National Assembly. The leader of the movement was the former Premier, Stefan Friedrich. On 12 November it was ordered suppressed and its organization dissolved. The order, however, was not complied with and at the end of the year the movement was increasing rapidly. The Interallied Territorial Commission announced in December the completion of its map of Hungary. It reported that its decisions were mostly in favor of Hungary, but this was disputed as only 35,000 acres from the lost territories were handed back. In December an envoy was dispatched to London to seek a reduction of the reparations imposed on Hungary by the treaty of peace. It was alleged that a full enforcement of the reparations would result in the complete economic ruin of the country.

HUNTER COLLEGE OF THE CITY OF NEW YORK, a non-sectarian educational institution for women, founded in 1870 and maintained by the municipality in 1890. In 1922-23 it had a faculty of 300 members, 8,500 students, property valued at \$4,000,000 and an income for the year 1922 of \$894,000. George Samler Davis, LL.D., is president.

HURON COLLEGE, a co-educational institution, located at Huron, S. Dak. Under the name of Pierre University it was founded in 1883 and the name was changed to Huron College in 1898. Although non-sectarian it is under the auspices of the Presbyterian Church. In 1922-23 it had a faculty of 24 members, property valued at \$384,594 and an income of \$105,000. Rev. George Shannon McCune, D. D., is president. The student enrollment was not given.

HUTCHINS, Robert Maynard, American educator: b. Brooklyn, N. Y., 17 June 1899. He is the son of the Rev. William James Hutchins, D.D., president of the Berea College. After preparation for college at Oberlin Academy, he studied two years, 1915-16, at Oberlin, but left to enter the Army. In September 1917, he enlisted in the Army Ambulance Service and was in Europe from March, 1918 to April, 1919, stationed in Italy. In recognition of his service he was given the Croce di Guerri. After his discharge, he entered Yale in 1919 and was graduated in 1921. He was class orator and won the De Forest prize awarded to that "scholar of the senior class who shall write and pronounce an English oration in the best manner." Mr. Hutchins then became master of the Lake Placid-Florida School. On 9 Dec. 1922, he was elected by the Yale Corporation secretary of the University, succeeding the Rev. Anson Phelps Stokes.

HYDROELECTRIC DEVELOPMENT.

Due to the World War, the increased cost of coal and the enormous amount of available hydraulic energy, added attention is being paid the world over, and especially in North America, to the utilization of these water-power resources. The annual report of the United States Power Commission (November 1922) shows that during the past two years it has received 357 applications for water-power developments which aggregate more than 21,000,000 horsepower. This, it is asserted, is more than double the existing water-power installation of the United States and more than six times the aggregate of all applications for power sites under Federal control in the preceding 20 years. The great benefit to mankind that will result from the development of the world's water-power resources lies not only in that such development will produce cheaper power and light, but every 35 hydrohorsepower developed will release one laboring man's effort for one year for a more profitable engagement. Further, 70 times more labor is required to produce a given quantity of steam electric power than to produce an equal amount of hydroelectric power—labor that could be utilized in other fields, such as agriculture and industry. And, as every hydrohorsepower developed saves on an average more than 10 tons of coal per annum, anything like a thorough development of the world's water-power resources should result in an enormous saving of fuel and a probable reduction in coal prices. But nevertheless, it is occasionally cheaper to generate electric current by means of coal than by water-power, because the first cost—that is the installation cost, on which the yearly interest must be earned—in many water-power developments, is enormous. However, such cases are isolated.

With the demand for more and cheaper power, water-powers are being developed on a scale never attempted before and generating units are being installed in sizes that would have been astonishing a short while ago. Just as the designing engineer of a steam-power plant endeavors to produce as much power as possible from one pound of coal, so the designer of a hydroelectric plant strives to utilize every drop of water and convert it into useful power with the minimum amount of loss and at the least cost. Nearly half the potential water-power of the world is in Africa, for that country is a great plateau, on which the streams become large before they fall to the sea, and they fall rather abruptly. Asia, though 50 per cent larger than Africa, ranks second in water-power resources. North America, South America and Europe have water-power resources that rank in the order in which the continents are named, which is also the order of their respective areas. The potential water-power of the world is estimated at 439,000,000 horsepower, when the streams are at the ordinary low-water stage, and the present installed capacity is 23,000,000 horsepower, or approximately 5 per cent of the estimated potential capacity. However, probably only 2 to 3 per cent of the potential power has been developed. Succeeding paragraphs show the estimated water-power already developed, and those de-

velopments under consideration, expressed in horsepower; they show also the estimated possible total developments expressed in potential horsepower. The reasonable estimate of the potential power here given amounts to nearly four times the world's present total used power from all sources.

North America—Middle Atlantic Area.—In this, the most densely-populated part of the Western Hemisphere, the large demand for power has resulted in the utilization of many water-power sites where they could be easily developed. In New England, water-power has been extensively used for various purposes since Colonial days, and the installed capacity is greater than the estimated potential capacity at low water. The total potential power, 95 per cent of the time, on eight of the principal rivers in Maine is estimated at 370,000 horsepower, which might be increased by storage to 550,000 horsepower. In New Brunswick, Nova Scotia and Prince Edward Island the potential power is estimated at 400,000 horsepower, of which 54,000 horsepower, or 13 per cent has been developed. The plant installed in the Androscoggin River basin in Maine, has a capacity of 121,000 horsepower; other developments on this same river, in New Hampshire, have a capacity, at 60 per cent, of 47,000 horsepower. On the Merrimack River in Massachusetts 26,000 horsepower is developed and in New Hampshire 22,000 horsepower. Four plants on Deerfield River have an installed capacity of 58,000 horsepower, and 66,000 horsepower is developed on the Connecticut River, at Turner's Falls. On the latter river, at Holyoke, there is a number of smaller plants with a total capacity of 4,800 horsepower. Plants on the Hudson River at Spier's Falls develop 38,000 horsepower; on the Mohawk River at Cohoes, 30,000 horsepower; on West Canada Creek at Trenton Falls, 28,000 horsepower; on the Susquehanna River at McCall's Ferry, Pa., 118,000 horsepower. On the Hudson River, near Glens Falls, are four plants with a total capacity of 40,000 horsepower, used in the manufacture of paper.

South Atlantic and the Eastern Gulf Area.—

This section includes the basins of all streams flowing into the Atlantic Ocean and the Mississippi River, in which there are a number of large plants. For instance in North Carolina are plants developing electrical energy as follows: At Badin, 81,000 horsepower; at Blewit, 44,000 horsepower, on the Yadkin River, and at Bridgewater, 36,000 horsepower; at Lookout Shoals, 30,000 horsepower. There are other large plants on Catawba River, and on Cape Fear and Neuse rivers. In South Carolina, on the Catawba River, are plants at Fishing Creek, Great Falls and Rock Creek, with a total capacity of 130,000 horsepower. The largest single water-power plant in South Carolina, 90,000 horsepower, is on the Wateree River. On Broad River, at the Ninety-nine Islands, is a 31,000 horsepower plant, and further down the river are two plants with a combined capacity of 26,000 horsepower. In Georgia, at Tallulah Falls of the Tallulah River, is a plant of 90,000 horsepower; on the Savannah River near Augusta there is a plant of 18,000 horsepower.

HYDROELECTRIC DEVELOPMENT

2. Huge generators of the Keokuk Power Plant on the Mississippi River
3. Keokuk Dam and power house

Among the proposed plants in the Savannah River basin are one of 75,000 horsepower on Tugaloo River and one of 75,000 horsepower on the Savannah at Calhoun Falls. In Alabama there is a 100,000 horsepower plant on Coosa River at Lock 12, and another plant of about the same capacity is to be constructed on this river near Gadsden. In general, the South Atlantic area is served by 12 large power companies that have plants in this and adjacent drainage areas. The systems are interconnected and have an installed capacity of more than 1,200,000 horsepower. The minimum potential water-power of this drainage area is about 2,000,000 horsepower, the maximum is twice as much, and the developed water-power is nearly 1,500,000 horsepower.

Ohio River Area.—This area includes the entire drainage basin of the Ohio River and its tributary streams. The plants on Ocoee River have a capacity of 45,000 horsepower, and one at Hales Bar develops 54,000 horsepower. At Muscle Shoals, on the Tennessee River, in Alabama, the United States government started to construct a plant with an initial capacity of 120,000 horsepower. The continuous output to be made available here is about 72,000 horsepower, and except in dry years it will be about 100,000 horsepower. A series of plants to be built on Little Tennessee River by the Aluminum Company of America will have an aggregate capacity of 400,000 horsepower. One of these plants, with a capacity 96,000 horsepower, is about completed. At 22 undeveloped power sites on the Tennessee River and its tributaries in Tennessee the potential power is more than 700,000 horsepower and, with storage, nearly 900,000 horsepower. This does not include the 400,000 horsepower to be developed on Little Tennessee River.

Saint Lawrence Area.—This section includes the drainage basin of the Great Lakes and the Saint Lawrence River to its mouth at Pointe des Monts. The water-power sites are fairly well distributed through the area, the provinces of Quebec and Ontario being especially favored, but in the region around Lake Erie there is relatively little potential power. Of the tributaries of Lake Superior, Saint Louis River furnishes 57,000 horsepower at a plant near Duluth, Minn., and Kaministiquia River furnishes 34,000 horsepower near Fort William, Ontario. On Saint Marys River, which connects Lakes Superior and Huron, 34,000 horsepower is developed in the United States and 17,000 horsepower in Canada. The total potential power on Saint Marys River is about 90,000 horsepower. The tributaries of Lake Huron in Ontario can furnish 160,000 horsepower, of which 56,000 horsepower is developed. In Michigan, on Au Sable River, there are plants that supply 64,000 horsepower for municipal use. At Niagara Falls, on Niagara River, which connects Lakes Erie and Ontario, are the finest and greatest power sites in North America. Here are combined a high-head waterfall that is easily developed, a large uniform flow and a market for the power. The unique scenic beauty of the falls has prevented the complete utilization of the site, but the plants in operation have a capacity of 870,000

horsepower, of which 385,500 horsepower is on the United States side. The power actually developed amounts to about 700,000 horsepower. To this total should be added 12,000 horsepower developed on the Welland Canal and 42,000 horsepower developed at Decew Falls. A license has been granted by the Federal Power Commission that will increase to 500,000 horsepower the installed capacity on the United States side of the Niagara River. The Hydroelectric Power Commission of Ontario is now constructing an additional plant of 300,000 horsepower initial capacity and 540,000 ultimate capacity. If the total flow of the river were used the falls would furnish about 6,000,000 horsepower. A plan whereby 60 per cent of the total flow of the river can be diverted for development is being considered. Of the northern tributaries of Lake Ontario, Trent River furnishes 45,000 horsepower out of the 75,000 available. Of the southern tributaries, Genesee River furnishes 51,000 horsepower near Rochester, N. Y. The total capacity of the plants now in operation on Black River and its tributaries is 104,000 horsepower and on Oswegatchie River 25,000 horsepower. The potential power of Saint Lawrence River at normal low water, between the outlet of Lake Ontario and Lake Saint Francis, is 1,000,000 horsepower, of which half would belong to the United States. Near Massena, N. Y., above Lake Saint Francis, a plant having the capacity of 76,000 horsepower is used in the production of aluminum. Between Lake Saint Francis and tidewater at Montreal the potential power at low water is 2,000,000 horsepower, all in Canada. Of this amount 192,000 horsepower has already been developed by four plants at Cedar Rapids, Saint Timothee, Soulanges Canal and Lachine Rapids. Of the tributaries of the Saint Lawrence from the north, Ottawa River has 690,000 potential horsepower, of which 71,000 has been developed. Saint Maurice River has 650,000 potential horsepower. One plant at Shawinigan Falls has a capacity of 148,500 horsepower, another, at Grand Mere Falls, has a capacity of 120,000 horsepower. Saguenay River, another tributary of the Saint Lawrence, could supply 300,000 horsepower, and with a small amount of storage in Lake Saint John the power could be doubled. Between the Saguenay and Atlantic Ocean there are nine large tributaries of the Saint Lawrence that could furnish a total of more than 1,000,000 horsepower. The developed power of the Saint Lawrence area aggregates more than 2,500,000 horsepower, and the potential power is estimated at 10,000,000 horsepower on the assumption that 60 per cent of the available flow at Niagara Falls may be diverted for this use.

Upper Mississippi Area.—This area includes that part of the drainage basin of the Mississippi River that lies north of Ohio on the east and the Missouri River on the west. In Minnesota, the plant on the Mississippi River near Minneapolis and Saint Paul has a capacity of 60,000 horsepower. In Wisconsin the plants on Wisconsin River have a total capacity of 90,000 horsepower. There is a plant of 45,000 horsepower on Chippewa River near Chippewa Falls. In Illinois is a 45,000 horsepower plant at Lock-

port on the Sanitary Canal which diverts water from Lake Michigan. On the Mississippi at Keokuk, Iowa, is a plant with a rated capacity of 170,000 horsepower. Most of this power is transmitted to Saint Louis. The potential power of this area is estimated at about 1,000,000 horsepower, of which 600,000 has been developed.

Missouri River Area includes the entire drainage basin of the Missouri River. Six plants having a combined capacity of 220,000 horsepower have been constructed at Great Falls, Mont., and the potential power between Great Falls and Canyon Ferry, near Helena is 90,000 horsepower. A 165,000 horsepower plant on Big Horn River near Hardin, Mont., is proposed. The total potential power of this basin in Montana is about 700,000 horsepower. By using Yellowstone Lake for storage 450,000 horsepower would be available on the Yellowstone River; from there to the northern boundary of the Yellowstone Park, a distance of about 50 miles, is one fall of 109 feet and another of 308 feet. In Colorado there is a plant of 21,000 horsepower. There is also some undeveloped power on the Missouri in South Dakota.

Lower Mississippi Area.—This territory embraces the parts of the Mississippi drainage basin that lie south of the Mississippi and Ohio. The principal tributaries of the Mississippi in this stretch, the Arkansas and Red rivers, enter from the west. There are only a few water-power plants in this area and all are small.

Western Gulf Area.—This includes the drainage basin of all streams that flow into the Gulf of Mexico between the Mississippi River and Cape Catoche in Yucatan. In Mexico a power plant on Conchos River near Santa Rosalia has a capacity of 37,000 horsepower. A plant on Necaxa and Tenango rivers, operating under a static head of 1,452 feet, has a capacity of 40,000 horsepower. From it power is transmitted 160 miles to the City of Mexico. The undeveloped power in Mexico is considerable, for instance, on the Necaxa an additional 50,000 horsepower and on the Rio Blanco 200,000 horsepower could be developed.

Gulf of California.—This section includes the Colorado River drainage basin in the United States and extends to Capes San Lucas and Corrientes, in Mexico. The potential power at 18 of the largest sites in the Colorado River basin has been estimated at 2,000,000 to 6,000,000 horsepower, the amount depending on the method of development. About 78,000 horsepower has been developed on Grand River and its tributaries, and 26,000 horsepower on the Salt River irrigation system of the United States Reclamation Service. In Mexico this area includes Yaqui, Mayo, Fuerte and Santiago rivers. South of the city of Guadalajara in the state of Michoacan is a 26,000 horsepower plant. Probably less than 200,000 horsepower is developed in this drainage area, including territory both in the United States and in Mexico.

Great Basin Area.—This includes the inland basin between the Rocky Mountains and the Sierra Nevada. More than 100,000 horsepower has been developed in Utah, mostly in small plants. There are three plants on Bear

River in Idaho, and one on the same river in Utah, that have a combined capacity of 119,000 horsepower. In Nevada 12,000 horsepower is developed on Truckee River at four plants, and in California 38,000 horsepower is developed on Bishop Creek. The total potential power of this basin at low water with storage might amount to 500,000 horsepower. The plants now constructed have a capacity of 250,000 horsepower.

Upper South Pacific Area.—This territory includes the drainage basins of all streams that flow into the Pacific Ocean between the northern boundary of the Klamath River basin and the south end of Lower California, at Cape San Lucas. Pit River could yield at low water about 450,000 horsepower. On Feather River one company has plants in operation or under construction to supply 145,000 horsepower, and another now planned will develop a total of 700,000 horsepower. Other plants on tributaries of Feather River have an aggregate capacity of 60,000 horsepower. Other developments on tributaries of the Sacramento River, including six plants on Cow and Battle creeks, have a total capacity of 54,000 horsepower, two at Butte Creek develop 29,000 horsepower and seven on Bear and Yuba rivers 105,000 horsepower. Six projected plants on the North Fork of Kings River and one on Kings River will have a combined capacity of 272,000 horsepower. On Kern River and its tributaries there are now in operation plants with an aggregate of 45,000 horsepower; a 40,000 horsepower plant is under construction, and two plants of 40,000 horsepower each are planned. Consideration is being given to the installation of a series of plants on Big Creek, Pitman Creek, Stevenson Creek and San Joaquin River with a total capacity of 868,000 horsepower. The present installed capacity of two plants on these sites is 94,000 horsepower, and plants of 57,000 horsepower are under construction. On Stanislaus River there are plants that develop 68,000 horsepower. The Tuolumne River, which supplies water for the municipal needs of San Francisco, and the fall available in the aqueduct will generate 157,000 continuous horsepower, with a peak capacity of 200,000 horsepower. Plants already built along the Los Angeles Aqueduct in the Great Basin area have a total capacity of 100,000 horsepower. The total developed power in this area in California is more than 800,000 horsepower and, at the present rate of increase, will soon be 1,000,000 horsepower. The potential power at low water is estimated at a little more than 3,000,000 horsepower, but the amount can probably be doubled by storage.

Lower North Pacific Area.—The section referred to includes the drainage basins of all streams that flow into the Pacific Ocean between the Klamath River basin and the United States and Canadian boundary. In Montana there is a plant of 40,000 horsepower on Clark Fork at Thompson Falls. Flathead River, a tributary of Clark Fork, can produce 300,000 continuous horsepower at six sites below Flathead Lake; with storage in this lake, the capacity could be brought up to 500,000 horsepower. In Washington a 200,000 horsepower

plant on Clark Fork is projected. In eastern Washington 189,000 horsepower is developed. The principal plants are near Spokane. In western Washington there are two plants of 29,000 horsepower total capacity on Snoqualmie River, one of 60,000 horsepower on White River, and one of 18,000 horsepower on Salmon River. Tacoma has a plant of 32,000 horsepower on Nisqually River, and Seattle has one of 21,000 horsepower on Cedar River. In Oregon are a 25,000 and a 15,000 horsepower plant on the Willamette River. On Clackamas River two plants have a total capacity of 46,000 horsepower, and Little Sandy River furnishes 19,000 horsepower, mostly for use in Portland. In British Columbia two plants on Kootenai River at Bonnington Falls have a total capacity of 42,000 horsepower. Of the undeveloped sites in the lower North Pacific area the one on which the most power can be developed is The Dalles, on Columbia River in Oregon-Washington, where about 300,000 continuous horsepower can be developed and an equal additional amount can be made available for eight months of the year. The potential power of Deschutes River has been estimated at 457,000 horsepower. On Snake River between Huntington, Ore., and Lewiston, Ida., there could be developed 90 per cent of the flow, or 800,000 horsepower, after the river has been regulated for irrigation. By diverting the Salmon River into the Snake River a total of 345,000 horsepower could be obtained 90 per cent of the time by using the present flow, or 298,000 horsepower after the river has been regulated for irrigation. Another 250,000 horsepower could be developed at 26 sites on the Salmon River. The total developed power in this area is 750,000 horsepower, and the potential power is about 11,000,000 horsepower.

Middle North Pacific Area.—This section includes the drainage basins of all streams that flow into the Pacific Ocean from the United States-Canada boundary to and including Yakutat Bay, Alaska. At Lakes Coquiltam and Buntzen, 84,000 horsepower is developed. On Stave River, six miles from its junction with the Fraser River, there is a plant of 40,000 horsepower, and at the mouth of the Jordan River there is a plant of 25,000 horsepower. The total development in this area is more than 250,000 horsepower. The undeveloped power at known sites is between 2,000,000 and 3,000,000 horsepower, and probably many large sites are still unknown.

Upper North Pacific Area.—This section includes the drainage basins of all streams that flow into the Pacific Ocean between Yakutat Bay and Cape Prince of Wales. The largest plants are one of 15,000 horsepower near Fort Snettisham, south of Juneau, and one of 10,000 horsepower on the north fork of the Klondike River, 26 miles from Dawson. The total developed power in this area is about 65,000 horsepower, mostly used in mining. The undeveloped power is unknown but may amount to 2,500,000 horsepower.

Arctic Ocean Area.—This section includes the northern parts of Alaska, Canada and Greenland, the limiting points being Capes Prince of Wales and Wilson, Dorchester and

Dyer, Holstenborg and Jensen. There is a power site on Athabaska River, but the power available is but 9,000 horsepower. Little is known of the undeveloped power resources of this area, but there seems to be no great concentration of potential power.

Hudson Bay Area.—This includes the drainage basins of all streams tributary to Hudson Bay, to Fox Channel south of Capes Wilson and Dorchester, and to Hudson Strait west of Cape Wiggins and Olga River. Three plants on Bow River, together develop 32,000 horsepower. A total of 48,000 continuous horsepower may be developed on Olga River, with storage. On Winnipeg River 250,000 continuous horsepower, including that of the present plants, may be developed without storage, and 420,000 horsepower can be developed by storage. Two plants on this river having a combined capacity of 82,000 horsepower, supply the city of Winnipeg. Another plant with an initial capacity of 84,000 horsepower and an ultimate capacity of 169,000 horsepower is now under construction. The Winnipeg River, without any regulation could develop at 19 sites, 2,500,000 continuous horsepower. On Abitibi River at Iroquois Falls, Ontario, there is a 53,000 horsepower plant. Another 22,000 horsepower plant in this area has been developed and about 250,000 horsepower is undeveloped. On Rainy River, a tributary of Lake of the Woods are two plants with a combined capacity of 24,000 horsepower. The total developed power in this area is about 225,000 horsepower, and the potential power is estimated at 5,500,000 horsepower.

North Atlantic Area.—This section includes the drainage basins of all streams that flow into the Atlantic Ocean east of Hudson Bay and north of Saint Lawrence River and Cabot Strait. Little is known of the potential power of Greenland. A 75,000 horsepower plant is said to be feasible on Bay d'Est River, in Newfoundland. The only large power plants in this area are in Newfoundland, where 60,000 horsepower is developed, used mainly by pulp and paper mills.

Lower South Pacific Area.—This is a narrow belt of high land between Cape Corrientes and the eastern boundary of Panama, in southern Mexico and Central America. The plants in this area are all small in size and the largest, with a capacity of but 2,700 horsepower, is in Salvador. The undeveloped power in Salvador is estimated at 200,000 horsepower. Nicaragua has considerable potential power but very little has been developed. In Costa Rica the total development is 15,000 horsepower.

Caribbean Sea Area.—In this is included a part of Yucatan and the northern and eastern slopes of Central America. It also includes all of the West Indies. Comparatively little potential power is here available. In Panama, the only development yields 13,000 horsepower. A plant of 3,000 horsepower on Matagua River, is the biggest in Cuba. In the Dominican Republic a 4,000 horsepower plant on a tributary of Rio Yaque del Norte is proposed. Porto Rico has developed 8,150 horsepower out of a potential total of 25,000 horsepower.

The figures of the water-power resources of the United States in the following table are

based on estimates made by the United States Geological Survey in 1908 for the National Conservation Commission and revised in 1921.

WATER-POWER RESOURCES OF THE UNITED STATES.

DIVISION	Total potential power		Installed capacity of water wheels
	Minimum Horse-power	Maximum Horse-power	Horse-power
New England.....	868,000	1,605,000	1,381,000
Middle Atlantic division.....	1,357,000	2,488,000	1,735,000
East North Central division.....	832,000	1,604,000	812,000
West North Central division.....	902,000	1,956,000	503,000
South Atlantic division.....	2,346,000	4,257,000	1,381,500
East South Central division.....	1,087,000	1,964,000	504,500
West South Central division.....	353,000	822,000	25,700
Mountain division.....	8,694,000	16,181,000	1,006,600
Pacific division.....	11,504,000	23,078,000	1,893,000
United States.....	27,943,000	53,905,000	9,242,700

In Canada the total developed water-power amounted in 1920 to 2,417,806 horsepower. These figures do not include plants under construction in 1920, as follows: In Ontario, 500,000; Quebec, 137,000; Manitoba, 77,000; Nova Scotia, 15,000, and New Brunswick, 18,000 horsepower, respectively. The undeveloped water-power is estimated by the Dominion authorities, according to provinces, as follows:

	Horsepower
Yukon.....	100,000
British Columbia.....	3,000,000
Alberta.....	466,000
Saskatchewan.....	567,000
Manitoba.....	3,218,000
Ontario.....	5,800,000
Quebec.....	6,000,000
New Brunswick.....	300,000
Nova Scotia.....	100,000
Prince Edward Island.....	3,000
Total.....	19,554,000

South America.—For convenience in reference the continent has been divided into drainage areas, and the principal developed power and known available potential power of each area are given.

North Pacific Ocean Area.—A narrow strip including parts of Colombia, Ecuador and Peru draining into the Pacific Ocean, the total potential power of which is estimated at 1,500,000 horsepower.

South Pacific Ocean Area.—This area lies wholly in Chile and includes the belt draining into the Strait of Magellan. According to a census made in 1916 the developed power in Chile amounts to 39,600 horsepower. To this must be added a 16,000 horsepower plant of the Braden Copper Company in Rancagua. The undeveloped water-power in this area is estimated at 1,800,000 horsepower.

South Islands Area.—This section includes the islands south of the Strait of Magellan and

the Falkland Islands. No developed water-power is known but the potential power is estimated at 800,000 horsepower.

Lower South Atlantic Ocean Area.—This area extends from the Strait of Magellan to Rio de la Plata and from the Atlantic Ocean to the Andes. The largest power plant in this area is at Mendoza, where about 2,700 horsepower is developed, but a plant having an ultimate capacity of 16,000 horsepower is under construction. The potential power in this area is estimated at 2,100,000 horsepower.

Rio de la Plata Area.—The chief tributaries of Rio de la Plata are the Paraná, the most important power stream in South America, and the Uruguay, which drain all of Paraguay and part of Uruguay, Argentina, Bolivia and Brazil. Along these rivers and their tributaries there are a number of falls, of which the best known is that at Maribondo, on Rio Grande near São Paulo, Brazil. The power here available has been estimated at 600,000 horsepower. The Tiete, another tributary of the Paraná, is rich in water power, and about 40,000 horsepower has been developed to supply the city of São Paulo. The principal falls on the Tiete are the Avanhanda, with 60,000 horsepower, and the Itapura, with 50,000 horsepower. At about the point where the Paraná becomes the boundary between Brazil and Paraguay the river plunges over the great cataracts of Bete Quedas (seven falls) with a total height of 375 feet. Different authorities estimate the available water power here at 20,000,000 to 40,000,000 horsepower. The government of Argentina is investigating the possible development of Iguassu Falls and the transmission of the power 800 miles, to Buenos Aires. At 70 per cent efficiency, 325,000 horsepower is available, and it is proposed to develop 228,000 horsepower, of which 168,000 horsepower will be furnished to Buenos Aires. On the Uruguay near Salto, two dams have been proposed for improving navigation, and the project of developing 60,000 horsepower, may be carried out by the government of Uruguay. The principal developed powers in the Rio de la Plata drainage basin are 40,000 horsepower on the Tiete to supply São Paulo, Brazil; 12,500 horsepower near Cordoba and 5,000 horsepower at Tucuman, Argentina; and 500 horsepower near Potosi, Bolivia. The potential water power of this drainage basin is estimated at about 16,000,000 horsepower.

Upper South Atlantic Area embraces the Atlantic drainage basin from Rio de la Plata to the São Francisco. At the well-known Herval Falls, near Taquara, north of Porto Alegre, there is a sheer drop of 400 feet, which would afford a capacity of 100,000 horsepower. Most of the rivers are short coastal streams, but their fall is considerable. The principal rivers are the Jacahy, Parahyba, Doce, Jaquitinhonha, Pardo, and Contas. All are good power streams and are easy of development. At Bracuhy Falls, near Rio de Janeiro, there is a total drop of 2,887 feet. Near Rio de Janeiro about 75,000 horsepower has been developed on the Pirahy, a tributary of the Parahyba. On another tributary of the Parahyba, 13,500 horsepower has been developed to supply the town of Nictheroy. On the Paraguassu River 20,000 horsepower has

been developed, and an undeveloped fall on this river has a capacity of 21,000 horsepower. The total potential power in the upper south Atlantic area is estimated at 3,700,000 horsepower.

Rio São Francisco Area.—Included in this area is the entire drainage basin of Rio São Francisco. The total power available at the falls of this river is estimated at 2,000,000 horsepower, and that available during periods of low water at 400,000 horsepower.

Lower North Atlantic Area.—This includes the basins of the streams that enter the Atlantic Ocean between the São Francisco and Para. No power sites of great value are known in this area, but its total potential power is estimated at 1,700,000 horsepower.

Para River Area.—This includes the tributaries of Para River which drain a long stretch of country bordered on the west by the basin of the Amazon. The total potential power of the area is estimated at 600,000 horsepower.

Amazon River Area.—This area includes the entire basin of the Amazon. Most of the potential water power of this area is in the Andes, in Bolivia, Peru, Ecuador, and Colombia, and on tributaries from the south in Brazil which have considerable flow and a series of cataracts in regions that are largely unexplored. All the streams in this area have large falls but the developed power of the Amazon basin is very small, probably not more than 15,000 to 20,000 horsepower. The potential power is estimated at 16,000,000 horsepower.

Upper North Atlantic Area.—This area includes the streams draining into the Atlantic Ocean between the Amazon and the Orinoco. It embraces British, Dutch and French Guiana and small parts of Brazil and Venezuela. The Potaro, a tributary of the Essequibo, the richest power stream, has an estimated potential power of 125,000 horsepower. So far as known there are no developed water powers and the total potential power is estimated at 4,000,000 horsepower.

Orinoco Area.—This includes all streams tributary to the Orinoco River, which ranks third in volume among the rivers of South America, being exceeded by the Amazon and Rio de la Plata. The total potential power of this area is estimated at 2,000,000 horsepower.

Caribbean Sea Area.—As here considered this area extends from the mouth of the Orinoco to Panama. In Venezuela it includes a narrow strip along the coast. About 4,500 horsepower has been developed near Caracas, in Venezuela, and perhaps 25,000 horsepower in Colombia. Bogota has a 5,500 horsepower plant. The total potential power of the area is estimated at 1,800,000 horsepower.

Interior Basins.—These include lakes Titicaca and Poopo having a drainage from more than 40,000 square miles in Bolivia, Peru and Chile. So far as known there are no developed water powers in this area, and the potential power is small. There are many other small inland basins in South America, especially in Argentina.

Europe.—Norway.—No systematic survey of water power resources has been made in Norway and the estimates of total power available vary widely. The greater part of the power resources is in southern Norway, where development is

practicable and will be limited probably only by demand. It is estimated that the amount of power that may be commercially developed is at least 5,500,000 horsepower; another estimate calls for 6,500,000 horsepower. The Norwegian Year Book for 1919 reports the undeveloped horsepower in southern Norway, as 9,531,000 horsepower, and the developed at 1,250,000 horsepower. The following are some of the principal developments: Lower Glommen River, in Ostfold, four plants, 300,000 horsepower; Maane River at Rjukan, two plants, 239,000 horsepower; Tysse i Odda, two plants 300,000 horsepower; Matre River, 96,000 horsepower; Lilledals River, 91,700 horsepower, and one at Norefallene, on Nummedalslaagen, in Buskerud, 196,000 horsepower. The utilization of water power for chemical industries in Norway is particularly noteworthy. Water power has been developed by the state to some extent, though less than in Sweden. Unutilized sites owned by the state have a capacity after regulation of about 1,000,000 horsepower, of which 200,000 to 300,000 horsepower is reserved for the electrification of railroads.

Sweden.—According to the Hydrographic Bureau of the Swedish government, Sweden has a potential water power of 6,205,000 horsepower, of which 1,105,000 horsepower has been developed. The most extensive plants are on the Dal, where at the end of 1917 there were 49 plants having a capacity of 240,905 horsepower, on the Göta, 22 plants having a capacity of 149,684 horsepower, and, on the Lule, four plants having a capacity of 76,635 horsepower. Under the administration of the Royal Waterfall Board, plants have been erected at Trollhättan, on the Göta (155,000 horsepower) at Elfkärleö (75,000 horsepower), and on the Lule at Porjus (75,000 horsepower).

Russia.—With an uncertain boundary at present time, Russia has a minimum potential water power as follows: Central Russia, 300,000; Baltic region, 150,000; Ural region, 500,000 and Lake region, 1,000,000 horsepower, or a total of 1,950,000. The maximum is estimated at 5,800,000 potential horsepower.

Finland.—The estimated potential power of Finland is 1,500,000 to 2,500,000 horsepower; developed, up to 1920, 185,000 horsepower.

Poland.—This country has an estimated undeveloped water power of about 175,000 horsepower.

Estonia, Latvia and Lithuania.—The developed power is about 20,000 horsepower; the potential power, about 200,000 horsepower.

Germany.—A large percentage of Germany's comparatively small water power resources has been utilized. The largest water power resources are in Bavaria. The southern tributaries of the Danube can furnish 1,900,000 horsepower, but for various reasons only 37 per cent, or 703,000 horsepower is capable of development. The reduction of the last figure by an efficiency factor of 75 per cent gives 527,000 effective horsepower. In Bavaria there is further available 138,000 effective horsepower, thus making a total of 665,000 horsepower. The possible effective horsepower for the principal German states is as follows: Prussia, 250,000; Baden, 280,000;

Württemberg, 58,000, and Bavaria, 665,000, or a total of 1,250,000 horsepower.

Austria.—It is estimated that Austria has a total potential water power of 3,000,000 horsepower, of which 2,000,000 horsepower is available at 283 surveyed sites. Plants at 16 of these sites are under construction. The estimated developed water power in 1920 amounted to 150,000 horsepower.

Hungary.—The potential power of Hungary is 150,000 horsepower, while 30,000 horsepower has been developed.

Czechoslovakia.—In 1920, this country had 40,000 developed horsepower and it has a potential power of 420,000 horsepower.

Jugoslavia.—Comparatively Jugoslavia has great water power resources. More than 230,000 horsepower may be obtained in the basin of Lim River; the Tara may produce as much as 340,000 horsepower; Centina River is capable of furnishing 200,000 horsepower. A plant of 31,600 horsepower, in operation since 1906, furnishes current for the manufacture of carbide. The total potential power is estimated at 2,300,000 horsepower while the developed power in 1920 was 125,000 horsepower.

Rumania.—This country has an estimated potential power, of 1,100,000 horsepower; and has developed 30,000 horsepower.

Bulgaria.—The estimated potential power of Bulgaria is 1,200,000 horsepower; developed, 8,000 horsepower.

Albania.—The estimated potential power of Albania is 500,000 horsepower; developed 1,000 horsepower.

Greece.—With an estimated potential power of 250,000 horsepower; Greece has developed 6,300 horsepower.

Italy.—The estimated potential power of Italy is 5,500,000 horsepower at ordinary river stage, 3,800,000 horsepower at ordinary low flow, and 2,700,000 horsepower at extreme low flow. A total of about 1,100,000 horsepower has been developed.

Switzerland.—The estimated potential water power of Switzerland is 750,000 horsepower at low water, 2,500,000 horsepower for flow available six months of the year, and 3,000,000 horsepower with storage. In 1920 the developed power amounted to 1,067,000 horsepower. The largest plant installed is on the Aar River at Olten. It has a capacity of 80,000 horsepower. A plant at Lake Fully, in the Valais district, utilizes the remarkably high head of 5,413 feet.

Denmark, Netherlands and Belgium.—These countries have but little available water power.

Great Britain.—This country has a number of plants installed. The largest development in the British islands is at Kinlochleven, Scotland, where a 40,000 horsepower plant is used in the production of aluminum. An additional plant at this location, to have a capacity of 72,000 horsepower is planned. The following is the estimated water power in Great Britain and Ireland:

	Twelve hour horsepower	Continuous horsepower
Scotland.....	375,000	200,000
England.....	281,000	150,000
Wales.....	109,000	60,000
Ireland.....	359,000	175,000
	<hr/> 1,124,000	<hr/> 585,000

With the use of storage, as estimated by the British Water Power Resource Committee, a total potential power of 1,000,000 horsepower could be developed. The total developed is 210,000 horsepower.

Iceland.—It is estimated that Iceland has a total potential power of 1,114,000 horsepower.

France.—In 1920 France had an estimated water power already developed, of 1,400,000 horsepower, and a potential power, at low water of 4,700,000 horsepower. The water powers of France are found along the eastern and southern borders, in the Vosges, Jura, Alps, and Pyrenees. The Rhone, itself, has potential power estimated at 822,000 horsepower. If half of the water power of the Rhine in Alsace-Lorraine is utilized there will be about 100,000 horsepower.

Spain.—Spain has already developed 600,000 horsepower, and the surveyed potential power is 4,000,000 horsepower, while the estimated total potential power is 5,000,000 horsepower.

Portugal.—The estimated potential power of Portugal is 300,000 horsepower; developed, 10,000 horsepower.

Arctic Ocean, Caspian Sea, Eastern Mediterranean, Dead Sea and Black Sea.—These areas have but slight water power resources.

West Indian Ocean.—The principal rivers whose waters reach the Indian Ocean between the Red Sea and Cape Comorin are the Tigris and the Euphrates, which drain a large part of Asiatic Turkey, and the Indus, the great river from which India takes its name. On the Tigris at the site of the ancient Nimrod dam, 300,000 horsepower are available. On the Euphrates, near Bagdad, 25,000 horsepower are available. The Euphrates could possibly produce, at different places 325,000 horsepower. The Indus could produce 20,000 horsepower. The Western Ghats, a range of mountains, has a potential power of more than 500,000 horsepower, and a plant of 100,000 horsepower, in the Andra Valley, is under construction. About 43 miles from Bombay, there is the largest hydro-electric plant in operation in Asia outside Japan; it has a capacity of 60,000 horsepower, and will be enlarged to 110,000 horsepower.

East Indian Ocean.—The principal rivers that flow into the Bay of Bengal and drain southern Tibet, more than half of India, and the western part of the Malay Peninsula are the Salwin, Irra-Waddy, Brahmaputra, and Ganges. The potential power of the entire East Indian Ocean drainage area is estimated at 23,000,000 horsepower, of which about 75,000 horsepower is developed.

China Sea.—The area draining into the China Sea extends from Singapore to Yangtsze River and includes the eastern half of the Malay Peninsula, most of Siam, French Indo-China, and a tract in the southern part of the Chinese Republic. Although the potential power in this region is estimated at 13,000,000 horsepower, the plants reported develop only 2,000 horsepower. The Yangtsze River is one of the two main rivers in China, and has a potential estimated power of 10,000,000 horsepower. The Min, a tributary of the Yangtsze, has a fall of 9,000 in 150 miles, it supplies water for a large irrigating system, which was built about 250 B. C.

Middle Pacific Ocean Area.—Includes the continental drainage from Yangtze River to Amur River and the Japanese Islands from Taiwan to Kurile Strait. The total potential power amounts to about 8,600,000 horsepower. At low water it would be about one-half. The developed power amounts to about 1,000,000 horsepower. The government of Taiwan (Formosa), in association with private interest, is building a plant of 130,000 horsepower at the outlet of Lake Candidius on the Dakusikei. The capacity of this plant can be increased to 185,000 horsepower when required. The Amur River has a potential power of 1,500,000 horsepower. No developments are known.

North Pacific Ocean.—Area extending along the north Pacific from Amur River to Bering Strait. This area is one of little rainfall and few power sites, none of which seems to have been utilized.

Africa.—The rainfall in Africa is small; in northern Africa it is less than 10 inches a year. However, there are a few mighty rivers with great potential water powers, but there are only a few small water-power developments. The water power resources as given below are according to the names of the rivers. The Kongo River affords greater water power resources than any other river system in the world and more than all the other rivers in Africa. The Stanley Falls on the Middle Kongo consist of seven cataracts having a total fall of 200 feet in 60 miles. From 10,000,000 to 15,000,000 horsepower could be developed in this section. On the lower Kongo, below Stanley Pool, there are 18 falls and rapids with a total drop of 300 feet in less than 60 miles. More than 100,000,000 horsepower could be developed on these two stretches. However, it is difficult to develop. A scheme for the construction of a 113,000 horsepower plant on the lower Kongo River has been under consideration for use in operating railways. Another plant of 20,000 horsepower at Koni Falls, on the Lufira, a tributary of the upper Lualaba, has been proposed. The Niger River, while navigable on many stretches, is, unlike other African rivers, without rapids and falls. There are no data available as to the potential water power, which power however, is very small. The Kunene River has a minimum flow, which could furnish 80,000 horsepower, but with storage it could furnish 1,500,000 horsepower. On the Orange River are but a few small developments, and great powers can be developed only by the use of storage. On the Limpopo River, at the Toli Azime Falls a development has been proposed for the production of 40,000 horsepower. The great market for power in this region is in the Rand mining district, where the mining companies generate more than 400,000 horsepower by the use of coal. The Zambezi River could furnish several power developments. The principal site is at the Victoria Falls, which is an abrupt fall of 350 feet. In the gorge and rapids below the falls which extend a distance of 50 miles, there is an additional fall of about 1,100 feet. The potential power of the falls and the rapids has been estimated at 750,000 continuous horsepower and would doubtless be much greater at all stages

above low water. Pangani River is fed by the glaciers of Mount Kilimanjaro, the highest mountain in Africa. It has many rapids and falls, and it is estimated that the falls could yield about 70,000 horsepower. The Somerset Nile falls 1,400 feet in 240 miles, and it is estimated that it would yield more than 2,000,000 continuous horsepower. With respect to all other rivers in Africa, as far as water power resources are concerned, little or no information is available; no doubt, because the water powers are comparatively small and there is no demand for power.

Oceanica.—Oceanica includes innumerable islands in the Pacific Ocean, which have a wide range in size, the largest is Australia and the smallest the islands of Micronesia. The North Island of New Zealand has a total potential power of 500,000 horsepower. On South Island there is a potential power of 3,300,000 horsepower. The government of New Zealand has appropriated \$22,000,000 for constructing several water-power plants. It has also taken over the 9,000 horsepower Horahora plant, originally installed by a mining company near Cambridge, and it has appropriated \$7,800,000 to increase the capacity of this plant. The largest plant on South Island is 12,000 horsepower. The developed power in New Zealand amounts to 45,000 horsepower. Tasmania, the so-called Switzerland of the South, has a total developed power of 34,500 horsepower, and the total potential power is estimated at 400,000 horsepower. Australia has a total potential power of 1,300,000 horsepower. The most valuable power sites are on the Clarence and Snowy rivers, where 100,000 and 137,000 horsepower, respectively, can be developed. New Guinea has a potential power of probably about 5,000,000 continuous horsepower. No power plant has been reported. The Philippine Islands have a potential power of about 1,500,000 horsepower. No water power has been developed. Celebes has a minimum potential power of 1,000,000 horsepower. The most promising power sites (100,000 horsepower) are on the Sadang River near Posso Lake. Borneo has a potential power of 2,000,000 horsepower. While the construction of a 100,000 horsepower plant is under consideration, no plants are in operation or under construction. Sumatra has an estimated potential power of 2,000,000 horsepower, of which 8,625 horsepower has been developed. A 3,000 horsepower plant of a Portland cement factory, at Indaroeng, is under construction. Java has an estimated potential power of 500,000 horsepower, of which 12,000 horsepower has been developed. Projects for the development of an additional 85,000 horsepower are under way. Hawaii has no power resources. The streams are small and are used mainly for irrigation.

GENERAL SUMMARY

A summary of the capacity of the world's water-power plants and the world's potential water power, representing 75 per cent of the theoretical power from the flow available at least 75 per cent of the time, is given in the following table, as prepared by the United States Geological Survey, 1921.

HYDROELECTRIC DEVELOPMENT

NORTH AMERICA

	Developed	Potential
Mexico.....	400,000	6,000,000
United States.....	9,243,000	28,000,000

FRANK KOESTER,
Consulting Engineer; author of "Hydro-
electric Developments and Engineering";
"Steam Electric Power Plants", etc.

I

ICE, Production of. Basing its conclusions upon the latest United States Census figures, taken in connection with other well-known facts, the National City Bank of New York, in the *Trade Record* of 21 Aug 1922, estimated the value, at the plants, of the ice manufactured in the United States at approximately \$150,000,000, of which amount \$137,000,000 worth was produced by regular ice-making establishments and about \$12,500,000 worth by other industries. While the amount of natural ice harvested is nothing like as great as the amount of ice produced by artificial means, nevertheless the value of that cut in 1919 was estimated at \$37,500,000, making the grand total value of the ice produced during the year indicated \$187,000,000. Accepting again the estimate of experts that the price of ice to the ultimate consumer is double the price at the place of production, the total of the sums paid by the public of the United States for this commodity would aggregate about \$375,000,000 annually or over \$1,000,000 a day. These figures, according to the *Trade Record*, do not include enormous quantities of ice manufactured by certain great industries solely for their own use and not placed upon the markets or included in the Census reports. The production of ice by artificial methods began in New Orleans about the close of the Civil War and by 1870 the number of ice factories in the country could be counted upon the fingers of one hand. By 1890 the number had increased to 222, by 1910 to 2,004 and by 1922 to 2,867. Capital invested in ice factories increased from about \$1,000,000 in 1880, to \$38,000,000 in 1900, and to \$270,000,000 in 1919, the year covered by the latest census reports. Official figures showing the amount of natural ice harvested are not available, but unofficial estimates indicate a steady decrease in the output coincident with the big increase in manufactured ice. A decade ago practically no natural ice was used in the southern half of the United States because it was cheaper to manufacture ice than to transport natural ice from the ice-harvesting regions. Now even the northern States, where natural ice is to be had for the harvesting, are abandoning the natural product for the artificial. This is evidenced by the fact that the largest artificial ice-producing States are in the North—New York, Pennsylvania, Ohio and Illinois, while the Federal Census of 1920 shows ice factories in every State of the Union except Vermont and New Hampshire. It is estimated that about two-thirds of the 28,000,000 tons of ice manufactured in the United States in 1919 was made of distilled water. The disappearance of the item "ice" from the export records of the United States government, indicates that the production of ice by artificial methods has become general in other parts of the world. The exportation of ice from the United States to tropical and semi-tropical countries began in 1805, and although the original experiment was not a financial success, the exportation continued until the value of the ice

exported exceeded \$250,000 annually during the period immediately following the Civil War. Shipments then began to decline slowly as the production of artificial ice developed and, continuing to decline, in 1917 the item "ice" disappeared from the official records of "merchandise exported from the United States." Ice-making machines, however, have taken the place of ice in the list of articles exported from the United States, the total value of "refrigerating machinery, including ice-making machinery" exported from the United States during the fiscal year 1921 having aggregated \$3,391,000 as against a little over \$500,000 a decade earlier.

ICELAND, a sovereign state since 1918, united with Denmark solely through the crown. It is an island state with an area of 39,709 square miles and a population of 94,690 in 1920. About one-third of the population is urban. The foreign born element is small, being less than 1,000. The Evangelical Lutheran is the only religion endowed by the state but there is full toleration for all denominations. Elementary education is compulsory from the age of 10 to 14. There are 460 elementary schools with 6,920 pupils and some continuation schools. For higher education there is a university at the capital, Reykjavik. The budget in 1922 called for a revenue of \$2,031,785 and an expenditure of \$2,579,795. The public debt of the state amounts to \$4,052,150, incurred mostly for public works. The state has neither an army nor a navy, its permanent neutrality being established by the Act of Union of 1918. Hay, potatoes and turnips are the chief agricultural products. According to the latest figures there were 579,000 sheep, 23,500 cattle, 50,600 horses and 3,000 goats in the state. Fishing is the great industry of Iceland, the yearly catch being valued at \$6,000,000. Cod fishing comprises five-sixths of the industry. The external trade of the island aggregates \$20,000,000 approximately and is about equally divided between imports and exports. The island has about 300 miles of good roads and 240 post offices. There are no railways. The executive power is vested in the king who exercises it through ministers responsible to the legislature. The legislature is bicameral. The upper house has 14 members, six of whom are elected for a term of eight years by proportional representation for the whole country. Eight members are elected by the whole Althing or legislature out of the members elected by universal suffrage. The lower house has 28 members elected for four years by universal suffrage. The legislature meets every year on 15 February unless summoned by the king at an earlier date. Money bills must originate in the lower house, but all others may originate in either house. In case of disagreement between the houses a joint session takes place and final decision is rendered by a majority of two-thirds, except in the case of a budget bill when a simple majority suffices. The ministers may vote only in the house of which they are members but

are permitted free access to either house. The ministry is divided into three departments—Ministry of Justice and of Ecclesiastical Affairs and President of the Council, Ministry of Trade and Communications, and the Ministry of Finance. The president of the council in 1922 was Siggurdur Eggerz.

IDAHO, one of the mountain group of States, bounded on the north by British Columbia and Montana, east by Montana and Wyoming, south by Utah and Nevada, and west by Oregon and Washington. It has an area of 83,888 square miles, including 534 square miles under water. In 1920, it had a population of 431,866. The State ranks 12th in area and 43rd in population. The area of Indian reservations within the State is 85 square miles with a population of 4,048. Of the total population in 1920, 425,668 were whites, 920 were negroes, 2,180 were Asiatics and 3,098 were Indians. There were 38,963 foreign born residents in the State in 1920, including 4,451 English, 4,954 Canadian, 4,143 Germans, 5,112 Swedes, 2,482 Norwegians and 1,410 Irish. The urban population in 1920 was 27.6 of the total.

Religion.—The religious denominations of the State have an aggregate membership of 135,386, including 17,947 Roman Catholics, 11,373 Methodists, 6,943 Presbyterians, 5,682 Baptists, 2,827 Congregationalists and 2,404 Episcopalians. There are also large numbers of Mormons and Disciples, or Christians.

Education.—Primary education is free and compulsory. Public schools of the State are under the supervision of a State Board of Education. There are 1,716 primary schools with 4,350 teachers and 141,996 pupils; 214 high schools with 932 teachers and 14,840 pupils, and two normal schools with 54 teachers and 425 students. The total appropriation for primary education in 1922 was \$8,000,000. Higher education may be had at the Presbyterian College of Idaho and the State University of Idaho. In addition, there are an industrial training school and a school for the deaf and blind. There are also five denominational colleges within the State to which students are admitted regardless of their religious belief.

Finances.—At the beginning of the last biennium there was in hand in the State treasury a balance of \$705,187. During the biennium receipts from all sources aggregated \$18,461,455. Disbursements amounted to \$16,967,502 for the same period, leaving a balance on hand at the end of the two-year period of \$2,199,140. The bonded debt of the State in 1920 amounted to \$3,880,750 and the assessed value of real and personal property, the same year, aggregated \$377,865,027.

Agriculture.—Idaho is classed as one of the irrigation States, much of its surface being naturally arid, but exceedingly productive when irrigated. In recent years fruit growing has been greatly developed. Livestock raising is carried on on most of the plateaus which have not so far been brought under irrigation. There were in the State 42,106 farms in 1920 with an aggregate area of 8,375,873 acres, of which 4,511,680 acres were improved land. The value of all farm property the same year amounted

to \$716,137,910. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 52,000 acres, 1,976,000 bushels, \$1,561,000; spring wheat, 679,000 acres, 15,617,000 bushels, \$14,055,000; winter wheat, 444,000 acres, 8,658,000 bushels, \$7,792,000; barley, 85,000 acres, 2,890,000 bushels, \$1,878,000; clover seed, 16,000 acres, 72,000 bushels, \$698,000; oats, 162,000 acres, 6,156,000 bushels, \$2,832,000; rye, 11,000 acres, 165,000 bushels, \$111,000; tame hay, 1,029,000 acres, 2,572,000 tons, \$25,720,000; beans, 26,000 acres, 364,000 bushels, \$1,238,000; potatoes, 86,000 acres, 15,910,000 bushels, \$4,932,000; apples, 3,900,000 bushels; peaches, 244,000 bushels, and pears, 72,000 bushels. On 1 Jan. 1923, there were in the State 273,000 horses, valued at \$15,834,000; 8,000 mules, valued at \$520,000; 162,000 milk cows, valued at \$10,206,000; 542,000 other cattle, valued at \$14,526,000; 2,642,000 sheep, valued at \$21,929,000, and 235,000 swine, valued at \$2,702,000. The wool clip in 1920 totaled 21,702,000 pounds. Within the State there are 18,682,031 acres of national forest.

Mining and Other Products.—Idaho has rich deposits of gold, silver and other metals. About 7,000 persons are employed regularly in the mining industries. Some coal is mined, as also iron, nickel, cobalt, mica, phosphate rock, tungsten, granite, sandstone, limestone and salt. The value of the gold, silver, copper, lead and zinc produced from mines in Idaho in 1922 was \$18,399,000; in 1921 it was \$15,776,819. The production of zinc and copper increased, gold decreased, and silver and lead were nearly the same as in 1921. The increase in total value was due largely to the increase in the price of lead. In general mining conditions improved in 1922. The labor situation was better, metal prices were increasing, and freight rates were reduced. Production was retarded, however, by the idleness of the Hercules and Tamarack and Custer mines for about seven months. The mine output of gold in Idaho in 1922 was valued at \$490,000, as compared with \$545,731 in 1921. As in other recent years, a large part of the gold output in 1922 came from the Gold Hill and Iowa mine, at Quartzburg, and the dredge of the Yukon Gold Company, at Murray, but the output from both these properties decreased. The deficiency was made up in part by gold from the Idaho Metals mine, near Mackay, the Talache mine, in Bonner County, and the Independence mine, in Blaine County. The mine output of silver decreased slightly, from 6,080,528 ounces in 1921 to 5,998,000 ounces in 1922. The largest silver producers in the State were the Bunker Hill and Sullivan, at Kellogg, the Hecla mine, at Burke, and the Morning mine of the Federal Mining and Smelting Company. The Hercules mine, usually one of the largest producers of silver, was active only five months and the output from the Gold Hunter and Tamarack and Custer was less than the average. The mines of the Coeur d'Alene district produced 4,423,000 ounces of silver, or 74 per cent of the total for the State. The mine output of copper increased from 1,688,195 pounds in 1921 to 3,946,000 pounds in 1922. The value of the output increased from \$217,777 to \$529,000. The mine output of lead decreased from 198,469,119 pounds in 1921 to 195,300,000

pounds in 1922, but the average price of lead was about 5.7 cents a pound, and the value increased from \$8,931,110 to \$11,132,100. The Bunker Hill mine produced much more lead than any other mine in the State. The mine output of recoverable zinc increased to 4,400,000 pounds, valued at \$250,800, as a result of the higher price of zinc and reduced freight rate.

Manufacturing Industries.—The latest manufacturing census reported 922 industrial establishments in Idaho, capitalized at \$96,061,709, employing 16,248 persons, using raw materials to the value of \$43,948,505 during the census year, and turning out products valued at \$80,510,749 in the same period. The chief industries are lumber and timber, and flour and grist milling. There are 260 lumber mills in the State and 78 flour mills. The lumber comprises white and yellow pine, larch, white fir and cedar.

Communications.—There are within the State 2,884 miles of railroad and 102 miles of electric railways. Several trans-continental railway systems cross the State. There is water communication with the Pacific Ocean through the Celilo Canal. Lewiston is the chief port of Idaho, 480 miles distant from the Pacific.

Government.—The executive power is vested in a governor, who is elected for two years. The governor for the term 1921-23 was the Hon. D. W. Davis, who was succeeded in January 1923 by the Hon. Charles C. Moore. The legislative power is vested in a Senate of 44 members and a House of Representatives of 54 members; both senators and representatives are elected for terms of two years, and sessions of the legislature are held biennially. For administrative purposes the State is divided into 44 counties. The capital of the State is Boise, which in 1920 had a population of 21,393. Pocatello, the second city of the State had a population in 1920 of 14,961. Idaho sends two senators and two representatives to the Federal Congress.

IDAHO, College of, a Presbyterian educational institution, founded in 1891 and located at Caldwell, Idaho. In 1922-23 it had a faculty of 15 members, 350 students, property valued at \$400,000 and an income of \$50,000. William Judson Boone, D.D., is president.

IDAHO, University of, a State coeducational institution, founded in 1889 and located at Moscow, Idaho. In 1922-23 it had a faculty of 125 members, 1,650 students, property valued at \$1,500,000 and an income of \$750,000. Alfred H. Upham, Ph.D., is president.

IGLEHART, Ferdinand Cowle, American clergyman and author: b. Warrick County, Ind., 8 Dec. 1845; d. 21 July 1922. He was graduated at DePauw University in 1867, received the degree of A.M. in 1869 and the degree of D.D. in 1892. He was ordained to the Methodist Episcopal ministry in 1870, and was pastor successively at Sullivan, New Harmony, New Albany, Salem, Greencastle and Evansville, Ind., from 1870 to 1882; Bloomington, Ill., Buffalo, N. Y., Newark, N. J., New York, N. Y., Brooklyn, N. Y., Newburgh N. Y., Tarrytown, N. Y., and Peekskill, N. Y. from 1882 to 1905. He was well known as a prohibitionist, and was district superintendent of the New York Anti-Saloon League from 1906-15. He was the author of:

'The Speaking Oak' (1903); 'King Alcohol Dethroned' (1917); 'Theodore Roosevelt, the Man As I Knew Him' (1919); and was a contributor to many magazines. He also was on the editorial staff of the *Christian Herald*.

ILLINOIS, one of the east north-central States of the United States, bounded on the north by Wisconsin, east by Indiana, south by Kentucky and Missouri, and west by Missouri and Iowa. It has an area of 56,665 square miles and a population in 1920 of 6,485,280. It is 23d in rank as to size and third in rank as to population among the States of the Union. Of the population in 1920, whites numbered 6,299,233, negroes numbered 182,274, Asiatics numbered 3,479 and Indians numbered 194. In the same year there were within the State 1,206,951 foreign-born, of whom 205,491 were Germans, 105,577 Swedes, 74,274 Irish, 54,247 English, 46,457 Austrians, 45,233 Canadians, 34,437 Hungarians, 27,785 Norwegians, 117,899 Russians, 94,407 Italians, 19,598 natives of Scotland and 14,344 Dutchmen. In 1920, the urban population was 67.9 per cent of the total. The seat of the State government is at Springfield, which in 1920 had a population of 59,183. The largest city of the State and the second largest in the United States is Chicago, with a population in 1920 of 2,701,705. Other large cities of Illinois, with their populations, are: Peoria, 76,121; East Saint Louis, 66,746; Rockford, 65,651; Decatur, 43,818; Joliet, 38,372; Aurora, 36,265; Quincy, 35,978; Evanston, 37,215; Danville, 33,750; Bloomington, 28,638; Rock Island, 35,177; Moline, 30,709, and Oak Park Village, 39,830.

Religion.—The various religious denominations, having an aggregate membership of 2,522,373, include 1,171,381 Roman Catholics, 287,931 Methodists, 170,452 Baptists, 187,746 Lutherans, 114,857 Presbyterians, 57,926 Congregationalists, and 40,725 Episcopalians.

Education.—Primary education is free and compulsory for all children between the ages of seven and 14. There are in the State 11,921 primary schools with 30,381 teachers and 999,866 pupils; 838 high schools with 6,218 teachers and 127,694 pupils; five normal schools with 260 teachers and 11,539 students. The 1922 State appropriation for education was \$8,000,000. For higher education there are 29 colleges and universities in the State.

Charities and Corrections.—Illinois has 257 charitable institutions, hospitals, orphanages, homes and schools for the deaf and blind. Of these, 20 are supported by public funds, 117 by private endowment and 120 are supported by various religious denominations. There are 5,421 paupers in alms houses and 5,111 prisoners in State penal institutions.

Finances.—On 1 July 1921, the balance on hand at the State treasury amounted to \$26,553,409.51. Receipts during the fiscal year, 1921-22, amounted to \$57,084,996.80. Disbursements during the same fiscal year aggregated \$53,777,298.07, leaving a balance on 1 July 1922 of \$29,861,108.14. The estimated receipts from all sources for the fiscal year, 1922-23, were \$73,000,000, while various expenditures for the same period aggregated \$85,243,055. The total bonded debt of the State, as of 1 July 1922, amounted to \$11,017,500. The assessed value of

real property on the same date was \$2,346,828,550; of personal property, \$820,994,685.

Agriculture.—The surface of the State is almost uniformly level. At present, only 10 per cent of its area is wooded and no State, except Iowa, has so large a proportion of arable land. The last agricultural census showed that in 1920 there were 237,181 farms in the State with a total acreage of 31,974,775 acres, of which 27,294,533 acres were improved land. The value of all farm property in the same year was \$6,666,767,235. The value of land and buildings was \$5,997,993,566; implements and machinery were valued at \$222,619,605, and live stock was valued at \$446,154,064. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 8,819,000 acres, 313,074,000 bushels, \$187,844,000; spring wheat, 166,000 acres, 2,407,000 bushels, \$2,575,000; winter wheat, 3,030,000 acres, 53,025,000 bushels, \$56,737,000; barley, 190,000 acres, 5,605,000 bushels, \$3,251,000; clover seed, 210,000 acres, 315,000 bushels, \$3,024,000; oats, 3,860,000 acres, 110,010,000 bushels, \$42,904,000; buckwheat, 6,000 acres, 84,000 bushels, \$71,000; rye, 256,000 acres, 4,096,000 bushels, \$3,072,000; broom corn, 21,000 acres, 7,100 tons, \$1,846,000; tame hay, 3,645,000 acres, 5,285,000 tons, \$66,062,000; sorghum syrup, 9,000 acres, 648,000 gallons, \$609,000; potatoes, 119,000 acres, 7,497,000 bushels, \$6,747,000; sweet potatoes, 9,000 acres, 855,000 bushels, \$898,000; apples, 9,720,000 bushels; peaches, 1,100,000 bushels, and pears, 510,500 bushels. On 1 Jan. 1923, there were in the State 1,183,000 horses, valued at \$82,810,000; 170,000 mules, valued at \$13,090,000; 1,148,000 milk cows, valued at \$64,288,000; 1,561,000 other cattle, valued at \$53,074,000; 516,000 sheep, valued at \$4,076,000, and 4,693,000 swine, valued at \$58,662,000. The wool clip of the State in 1920 was 3,923,000 pounds.

Manufactures.—In spite of the huge value of the agricultural output of the State, manufactured products far exceed these in value. The census returns of 1920 gave the value of all manufactured products at this date as \$3,250,000,000. The industrial output is varied, including iron and steel, the great packing plants of Chicago, machinery, electrical supplies, agricultural implements, furniture, automobiles, railway cars, woodenware, flour, woolen and knit goods and a host of lesser industries. The manufacturing establishments of the State number over 19,000, having an aggregate capital of \$3,000,000,000, employ 800,000 persons and use raw materials to the value of over \$2,000,000,000 yearly.

Mining.—Illinois ranked fourth among the States in the value of its mineral products for the year 1919, and third in total number of persons engaged in mining industries. The gross value of the mineral products of the State for that year was \$178,673,065. The industries ranked according to value of products were coal mining, petroleum and natural gas production, limestone quarrying, fluorspar mining, sandstone quarrying, lead and zinc mining, clay mining, mining of abrasive materials and pyrite. The principal mining industry, coal, reported products valued at \$138,767,835. The coal producing area of the State is part of the Eastern Interior Coal Field, which extends into Indiana and Kentucky, and covers approximately 35,000 square miles in 48

counties in Illinois and furnishes bituminous coal chiefly for steam and domestic use. In 1921 the State's production of oil was 10,044,000 barrels as compared with 9,363,000 barrels in 1922. In 1922 Illinois produced 59,100,000 tons of coal, compared with 69,602,763 tons in 1921. In the last census year the capital invested in mining industries in the State aggregated \$231,836,571. In the same year, 84,309 persons were employed in the mining industries.

Communications.—Illinois is provided with a splendid net work of waterways, connecting the Mississippi, Ohio and Wabash. The Illinois River is the principal river within the State. The chief artificial waterway is the Chicago Drainage Canal, connecting Lake Michigan with the Illinois River. The canalization of the Illinois River to the Mississippi will eventually give Chicago water transport from the Great Lakes to the Gulf of Mexico. On the Great Lakes large fleets of steamers carry cereals, iron ore and other products between the Lake ports. There are 12,188 miles of railway in the State and 3,737 miles of electric railways. The railroad transport tonnage within the State is the heaviest in the United States and Chicago is the world's greatest railroad centre.

Government.—Executive power is vested in the governor, who is elected for a term of four years. The Legislature is composed of a Senate of 51 members, who are elected for four years; a House of Representatives of 153 members, elected for two years. The Legislature meets biennially in January of odd years. The State is divided into senatorial districts, from each of which one senator and three representatives are elected to the legislature. In the election of representatives, every voter has three votes, of which he may cast one for each of three candidates or one and one-half for each of two or all three for one. A State constitutional convention proposed a new State constitution, which was rejected by the voters on 12 Dec. 1922. The fight against the new constitution centred on the clause providing for a State income tax, and on other provisions seeking to limit Cook County's (Chicago) representation in the Legislature. For administrative purposes the State is divided into 102 counties, by far the most important of which is Cook County, in which is located the city of Chicago. Illinois sends two senators and 25 representatives to the Federal Congress.

Officials.—Governor, Len Small (term 1921–25); lieutenant-governor, Fred E. Sterling; secretary of state, Louis L. Emmerson; attorney-general, Edward J. Brundage; auditor, Andrew Russel; treasurer, Oscar Nelson; superintendent of education, Francis G. Blair.

Judiciary.—Members of Supreme Court: Floyd E. Thompson, James H. Cartwright, Warren W. Duncan, Orrin N. Carter, Frank K. Dunn, William M. Farmer and Clyde E. Stone.

ILLINOIS COLLEGE, a Presbyterian co-educational institution, founded in 1829 and located at Jacksonville, Ill. In 1922–23 it had a faculty of 27 members, 478 students, property valued at \$1,132,101 and an income of \$110,269. C. H. Rammelkamp, Ph.D., is president.

ILLINOIS, University of, a State co-educational institution, chartered in 1867 and lo-

cated at Urbana, Ill. In 1922-23 it had a faculty of 949 members, and property valued at \$10,362,710 (cost), with an estimated income of \$5,377,650. The student enrollment on 1 Nov. 1922 was 9,285. David Kinley, LL.D., is president.

ILLINOIS WOMAN'S COLLEGE, a Methodist Episcopal educational institution, founded in 1846 and located at Jacksonville, Ill. In 1922-23 it had a faculty of 35 members, 525 students, property valued at \$1,016,000 and an income of \$95,000. Joseph R. Harker, LL.D., is president.

IMMIGRATION. During the fiscal year ended 30 June 1922, immigrant arrivals numbered 309,556 and non-immigrant arrivals, 122,949, making a total of 432,505 alien arrivals in the United States. Departures for the same period totaled 345,384, including 198,712 emigrants and 146,672 non-emigrants, leaving an excess of immigration of 87,121, as compared with an excess of 552,132 in the fiscal year ended 30 June 1921. The races, or peoples, chiefly represented among the immigrant aliens admitted in 1922, were as follows: Italians, 41,154; English, 30,429; Hebrew, 53,524; Irish, 17,191; Scandinavian, 16,678; Scottish, 15,596; and Spanish, 1,879. The total number of aliens of all nationalities admitted from Canada and Mexico in 1922 was 66,361 as compared with 103,075 during the preceding fiscal year. In 1922 there was a small increase in the number of Chinese arrivals of the "immigrant" alien class, the total number admitted being 4,465 as compared with 4,017 in the fiscal year 1921. There was, however, a very large decrease among Chinese arrivals of the "non-immigrant" class, 8,755 having been admitted in 1922 as compared with 18,974 in the year previous. In addition to the numbers of Chinese aliens admitted to the United States the privilege of transit under bond was granted on behalf of 7,198 members of this race, mostly destined to Cuba, Mexico, South America or the West Indies. There was a further decrease in the admission of Japanese aliens to continental United States in 1922, the total number of such aliens admitted being 8,981, as compared with 12,868 in 1921. To Hawaii, 3,856 were admitted as compared with 3,599 in 1921.

The fiscal year 1922 was the first full year under the operation of the percentage limitation act of 19 May 1921, which went into operation 3 June 1921. Based upon drastically restrictive principles this act unquestionably served to cut down immigration to the United States during 1922. Section 2 of this act provides: "(a) That the number of aliens of any nationality who may be admitted under the immigration laws to the United States in any fiscal year shall be limited to 3 per centum of the number of foreign-born persons of such nationality resident in the United States as determined by the United States census of 1910." The act contains provisions granting exceptions from the 3 per cent rule above stated, and required one year's residence in countries contiguous to the territory of the United States in the case of aliens seeking admission from these countries. On 11 May 1922 the President approved the Joint Resolution of Congress, extending the operation of the act of 19 May 1921, to and including 30 June 1924, and making cer-

tain amendments and additions thereto. This measure increased from one to five years the period which an alien must reside in the Dominion of Canada, Newfoundland, Cuba, Mexico, Central and South America, or adjacent islands, in order to gain immunity from the operation of this special legislation. There was a slight decrease in the number of aliens deported from the United States for various causes. In 1922, 4,345 were deported as against 4,517 in 1921.

Toward the close of 1922 and in the early months of 1923 there was agitation for a constructive national immigration policy. Manufacturers in many States contended that the growing shortage of labor was interfering with necessary production. Those in favor of a liberal revision of the existing law base their contention on the fact that 32,728 laborers were admitted in 1922, while 100,058 laborers left the United States. On the other hand some members of Congress declared that the 3 per cent quota was too high and in the last session of the 67th Congress efforts were made to enact legislation restricting immigration to 2 per cent of the foreign-born nationals resident in the United States as determined by the census of 1890. The American Federation of Labor appeared even more anxious than Congress for further restrictive legislation. The number of immigrants from the principal countries allowed to enter the United States under the present 3 per cent law is as follows:

Albania, 288; Armenia, 230; Austria, 7,541; Belgium, 1,563; Bulgaria, 302; Czechoslovakia, 14,557; Danzig, 301; Denmark, 5,619; Finland, 3,921; Fiume, 71; France, 5,729; Germany, 67,607; Great Britain and Ireland, 77,342; Greece, 3,294; Hungary, 5,638; Iceland, 75; Italy, 42,057; Luxemburg, 92; Memel, 150; Netherlands, 3,607; Norway, 12,202; Poland, 21,076; Eastern Galicia, 5,786; Pinsk, 4,284; Portugal, 2,465; Rumania, 7,419; Bessarabian Region, 2,792; Russia, 21,613; Esthonian Region, 1,348; Latvian Region, 1,540; Lithuanian Region, 2,310; Spain, 912; Turkey, 2,388; Sweden, 20,042; Switzerland, 3,752; Yugoslavia, 6,426; Other Europe, 86; Palestine, 57; Syria, 928; Other Asia, 81; Africa, 122; Atlantic Islands, 121; Australia, 279; New Zealand and Pacific Island, 80; totals, 358,023.

IMPORTS AND EXPORTS. See under UNITED STATES, COMMERCE, FOREIGN; WORLD INTERNATIONAL TRADE.

INCOME TAX, Federal. Though most of its important provisions did not become effective until 1922, the Federal Income Tax Law in force in 1923 was passed in 1921. This law materially reduced the surtaxes imposed by its predecessor and abolished excess profits taxes on corporations. Under it, as under the preceding laws, every citizen of the United States, wherever resident, is subject to the payment of an income tax, no matter what the source of his income may be. Aliens resident in the United States are taxed as citizens; non-resident aliens are taxed only upon such parts of their incomes as may be derived from sources within the United States. The normal tax on incomes of individuals is 4 per cent on the first \$4,000 of taxable income and 8 per cent on the remainder. Surtax rates are, as follows: From

\$6,000 to \$10,000, 1 per cent; from \$10,000 to \$12,000, 2 per cent; upon every \$2,000 additional up to \$20,000 the rate increases 1 per cent; between \$20,000 and \$22,000 the rate is 8 per cent, omitting the 7 per cent rate; upon every \$2,000 additional up to \$32,000 the rate increases 1 per cent; between \$32,000 and \$36,000 the rate is 15 per cent, omitting the 14 per cent rate; upon every \$2,000 additional up to \$100,000 the rate increases 1 per cent, the rate between \$98,000 and \$100,000 being 47 per cent; from \$100,000 to \$150,000 the rate is 48 per cent; from \$150,000 to \$200,000, 49 per cent; over \$200,000, 50 per cent. Under the preceding law surtaxes were imposed on net incomes in excess of \$5,000 running from 1 per cent on the first \$1,000 or fraction thereof up to 65 per cent upon incomes in excess of \$1,000,000.

Individuals are taxed upon net income, derived by deducting from the gross income such deductions as allowed by the law. Gross income includes gains, profits, sums received as salaries, wages or compensation for personal services, or the income from a profession, vocation, trade or business, also rents, dividends and interests. Deductions allowed include all necessary expenses paid or incurred during the taxable year in carrying on a business, trade or profession. Interest paid during the year and also taxes, other than Federal income taxes, are deductible. Assessments for local benefits are not deductible. Certain losses also are deductible provided they are incurred in the trade or business of the taxpayer or sustained in any transaction entered into for profit. Losses sustained during the year as a result of fire, storm, shipwreck, theft, etc., are deductible unless the taxpayer is fully compensated by insurance or otherwise. A taxpayer also is entitled to deduct worthless debts due him which have been charged off. The act of 1921 contains a new provision in regard to bad debts in that it allows the taxpayer to deduct a bad debt in part if he is convinced that it is in part worthless. Deductions for depreciation also are allowable, but the subject is full of complexities. Contributions to corporations or philanthropic organizations established or operated exclusively for religious, charitable or educational purposes are deductible but must not exceed 15 per cent of the net income as computed without the benefit of such deductions. After a taxpayer has determined the amount of his net income subject to taxation by deducting from his gross income such deductions as the law allows, he is, for the purpose of computing the normal tax, entitled to certain other deductions by way of credits for dependents and personal exemption. In the case of a single person or a married person not living with husband or wife, the personal exemption is \$1,000. A married person, living with husband or wife, or the head of a family is entitled to a personal exemption of \$2,500 where the net income does not exceed \$5,000, or \$2,000 where the net income is in excess of \$5,000. Further, a taxpayer is entitled to a credit of \$400 for each and every dependent receiving his chief support from such taxpayer provided such dependent is under 18 years of age or is incapable of self-support because of mental or physical infirmities. Dividends of domestic corporations are not subject to the normal tax but are subject to the surtax.

Interest on Liberty Bonds, if taxable at all, is subject only to the surtax.

The law provides that every individual having a gross income for the taxable year of \$5,000 or more, regardless of the amount of net income, must make a return; every single individual having a net income of \$1,000 or over must make a return; every married person having a net income of \$2,000 or more must make a return even though, after deductions, the net income may not be subject to taxation. Husband and wife living together have the privilege of filing either a joint return or separate return.

Every fiduciary agent should make a return for the estate or trust for which he acts, stating specifically the items of gross income and deductions and credits allowed by the law, if net income is \$1,000 or gross income \$5,000.

All partnerships must make returns of information no matter what the net income of the firm may be. These returns are not taxable but are information returns, each partner showing on his individual return his proportionate share of the proceeds of the partnership.

All corporations, except those especially exempt from taxation, must file income tax returns regardless of income received during the taxable period. Corporations are now taxed on a flat rate of 12½ per cent. A corporation having a net income of \$25,000 or less is entitled to a credit of \$2,000. There are certain classes of corporations especially exempt under the law from payment of income tax, such as labor organizations, fraternal societies, domestic building and loan associations and any community fund or foundation organized and operated exclusively for religious, charitable and scientific purposes, business leagues and chambers of commerce, clubs operated exclusively for pleasure, recreation, etc. These corporations, to secure exemption, must file with the Collector of Internal Revenue a statement showing their purposes and claiming exemption.

The net income and gross income of corporations, generally speaking, are determined in a manner similar to that applied to individuals.

Dividends received by individuals are subject to surtax when paid out of the earnings or profits accumulated by corporations subsequent to 28 Feb. 1913.

All income tax returns must be filed with the Collector of Internal Revenue before the close of business on 15 March of each year with exception of withholding returns due 1 March.

Income and profits tax collections during the fiscal year 1922 totaled \$2,086,918,464.85 as compared with \$3,228,137,673.75 in 1921. Personal income tax returns filed as of the calendar year 1920 (latest available figures) numbered 7,259,944. The total amount of income reported was \$23,735,629,183, and the tax (normal and surtax) amounted to \$1,075,053,686. The income tax yield by years for the eight years—1913 to 1920—was as follows: \$28,253,535; \$41,046,162; \$67,943,595; \$173,386,694; \$691,492,954; \$1,127,721,835; \$1,269,630,104; \$1,075,053,686.

During the year and also in 1923 Secretary Mellon of the Treasury recommended a reduction in surtax rates to a maximum of 25 per cent and also recommended that a ban be placed upon tax-exempt securities. An amendment to the law of 1921 prohibits the exchange free from

tax of bonds, notes, stocks, etc. Another amendment gives non-resident aliens, living in a contiguous country, for example Canada, the benefit of the 4 per cent rate of normal tax on the first \$4,000 of net income in excess of a personal exemption of \$1,000. Prior to the enactment of this amendment, the entire net income of every non-resident alien from sources within the United States, in excess of \$1,000 personal exemption, was subject to a normal tax rate of 8 per cent. The same amendment allows non-resident aliens the benefit of the \$400 exemption for each dependent.

INDIA, British, all that part of the Peninsula of Hindustan which is either directly or indirectly under British rule and also commonly applied to those states of the peninsula whose relations with India are the concern of the government. It does not include the native states in which British law is not in force. Since 1876 the king of Great Britain and Ireland has also the title of emperor of India.

Area and Population.—The extent of British Indian territory in 1921 was 1,093,074 square miles with a population of 247,140,000. The table following gives the area and population of the several British provinces and also of the states or agencies in political relations with the British Indian government:

BRITISH PROVINCES	Area, square miles	Population, 1921
Ajmer-Merwara.....	2,711	495,899
Andamans and Nicobars.....	3,143	26,833
Assam.....	53,015	7,598,861

Of the population, 82,000,000 speak Hindi; over 48,000,000 speak Bengali; 23,000,000 speak

Telugu; 20,000,000 speak Marathi; 18,000,000 speak Tamil; 16,000,000 speak Punjabi; 14,000,000 each speak Rajasthani and Western Hindi; 10,000,000 each speak Gujarati, Kanarese and Oriya; 8,000,000 speak Burmese; 7,000,000 speak Malayalam; while over 1,000,000 speak Sindhi, Santali, Pashto, Assamese, Gond, Kashmiri and Karen. English is spoken by 303,515. The British born population is about 120,000. The population may further be divided according to occupations, which shows 225,000,000 engaged in agriculture and pastoral pursuits, 35,000,000 in industry, 18,000,000 in trade, 5,000,000 in the professions and liberal arts, and 5,000,000 in the various services of transportation, 4,000,000 in domestic service. Of those connected with industries, 8,000,000 are engaged in the making of textiles, 7,750,000 in making dress and toilet articles, 4,000,000 in wood and lumber industries, 4,000,000 in the food industries, 2,000,000 in ceramics, 2,000,000 in the building trades, 2,000,000 in the metal trades, and 1,250,000 in the tanning trade. Delhi, the capital of India, has a population of 303,148. Calcutta, however, is the largest city with 1,263,292 and Bombay the second city with 1,172,953 inhabitants. Other large cities are: Madras, 522,951; Hyderabad, 404,225; Rangoon, 339,527; Lahore, 279,558; Ahmedabad, 274,202; Lucknow, 243,553; Bangalore, 238,111; Karachi, 215,781; and Cawnpore, 213,044. There are 18 cities with from 100,000 to 200,000 and 45 cities with from 50,000 to 100,000 inhabitants.

Religion.—There are 217,000,000 of Hindus, 11,000,000 Buddhists, 66,000,000 Mohammedans, 10,000,000 Animists, 3,000,000 Sikhs, 3,876,203 Christians and 1,248,182 Jains. Of the Christians, the Roman Catholics are the most numerous with 1,490,863 communicants, followed by the Anglicans with 492,752.

Education.—Of the total population about 20,000,000 are able to read and write, or less than 7 per cent of the population. There are in India 168,358 public institutions of education with 7,612,839 pupils and 34,623 private institutions with 593,386 pupils, 3,784 special schools with 131,592 students, 7,927 secondary schools with 1,264,819 students, and 216 colleges with 65,916 students. There are universities at Calcutta, Madras, Bombay, Allahabad, Punjab, Patna, Benares, Mysore and Aligarh. Calcutta had 17,409 matriculated students in 1920, the Punjab, 6,595 and Patna, 4,178.

Production.—Agriculture is the chief occupation of the people, about 225,000,000 of the population being engaged in it and in allied industries. In 1921, there were planted 78,000,000 acres of rice, the yield from which was 28,033,000 tons, 26,000,000 acres of wheat which yielded 6,709,000 tons, 21,000,000 acres of cotton which yielded 3,556,000 bales, 2,250,000 acres of flax which yielded 269,000 tons, 4,912,000 acres of rape and mustard which yielded 848,000 tons, 4,291,000 acres of sesamum which yielded 368,000 tons, 1,951,000 acres of ground nuts which yielded 931,000 tons, 2,509,000 acres of jute which yielded 5,915,000 bales, 2,553,000 acres of sugarcane which yielded 2,465,000 tons, 701,000 acres of tea which yielded 345,340,000 pounds, and 238,000 acres of indigo which yielded 40,000 hundredweight of dye. Nearly 30,000,000 acres are under irrigation,

or about 12 per cent of the entire cropped area. There are 250,949 square miles of reserved, protected and unclassified forest land. The wheat crop of 1922 was 3,000,000 tons above that of the year previous. Rice was 19 per cent higher, totaling 33,038,000 tons, the production of sugarcane, linseed and rape also showed a marked improvement but the groundnut crop showed a decline of 10 per cent, the production being 920,000 tons. The yield of indigo was 61,000 hundred-weight in 1922, or 48 per cent above the previous year. The total production of cotton in 1922 was 4,463,000 bales. The jute crop declined as did the crop of tea and rubber. After agriculture the most important native industry is the weaving of cotton textiles. There are 284 establishments engaged in cotton spinning and weaving which furnish employment to 282,297 persons. There are nearly 8,000,000 spindles and the looms number 118,434. The production of yarn in 1921 was 660,042,597 pounds and of cloth 367,481,791 pounds. In 1922 there were in British India, 4,827 establishments, employing 50 persons or over each, with 1,238,410 employees. Aside from the textile and ginning industries there are 542 rice mills, 334 tanneries, 182 tile and brick factories, 138 oil mills, 161 engineering workshops, 148 printing establishments, 127 saw mills, and 125 jute presses. There are 3,668 joint stock companies incorporated in India. In 1920 the quantity of coal produced was 17,962,214 tons. The average number of persons working in and about mines regulated by the Indian Mines act was 249,156. Manganese ore was produced to the extent of 537,995 tons, copper, 32,759 tons; gold 507,261 ounces; wolfram 3,577 tons and rubies 158,577 carats. The total value of the minerals produced in 1919 was 21,850,912 pounds sterling.

Commerce.—The following table shows the trend of India's trade in principal commodities for 1921 and 1922:

ARTICLES	CALENDAR YEAR —	
	1921	1922
IMPORTS		
Motor vehicles:		
Motor cars, number.....	4,612	4,201
Motor cycles, number.....	1,248	784
Motor trucks, number.....	921	694
Machinery, textile, rupees.....	95,353,600	116,681,600
Iron and steel:		
Bars and channels, tons.....	137,400	185,714
Beams, pillars, etc., tons.....	61,200	66,515
Tubes and fittings, tons.....	68,300	53,836
Cotton goods:		
Gray, yards.....	659,248,000	770,252,100
White, yards.....	291,836,000	306,914,400
Colored, yards.....	196,573,000	199,843,500
EXPORTS		
Cotton, raw, tons.....	367,981	514,989
Hides, tons.....	22,660	21,606
Jute:		
Raw, tons.....	426,783	632,759
Manufactured, tons.....	647,103	658,181
Skins, tons.....	17,993	19,434
Wheat, tons.....	187,424	107,432

1 All 1922 figures are subject to revision.

The following table shows the shares of the various countries in the import and export trade of India for the first seven months (April to October) of the fiscal years 1921 and 1922:

COUNTRIES OF ORIGIN AND DESTINATION	VALUE	
	1921	1922
IMPORTS INTO INDIA		
	<i>Rupees</i>	<i>Rupees</i>
Great Britain.....	821,641,000	806,833,000
British possessions.....	107,596,000	96,702,000
Germany.....	34,261,000	71,801,000
United States.....	143,973,000	82,652,000
Japan.....	88,204,000	77,016,000
Other countries.....	280,983,000	198,905,000
Total.....	1,476,658,000	1,333,909,000
EXPORTS FROM INDIA		
Great Britain.....	225,753,000	311,161,000
British possessions.....	284,455,000	320,854,000
Germany.....	78,846,000	122,621,000
United States.....	135,446,000	168,285,000
Japan.....	187,716,000	182,559,000
Other countries.....	309,195,000	446,904,000
Total.....	1,221,411,000	1,552,384,000

Imports from the United States consisted principally of mineral oils, machinery and mill work, iron and steel, hardware, scientific instruments and apparatus, and motor cars. Although there was a decrease in Indian trade with the United States in 1922, American manufacturers are active in India and the feeling exists that, with the revival of business and the establishment of Germany's financial position, the United States will more than maintain the position gained during and since the war. The chief imports are cotton manufactures, metals and ores, machinery and mill work, and sugar. The chief exports are jute both raw and manufactured, raw cotton, manufactured cotton, rice, seeds, tea, wheat and wheat flour, wool, opium, oils, coffee, oil cakes, fertilizers, wood, coal, bran and pollards and sugar and confectionery. Calcutta, Bombay, Rangoon, Madras, Karachi and Tuticorin handle most of the foreign trade about one-half passing through the two first named.

Communications.—In India in 1922 there were 37,029 miles of railways open to traffic, of these 7,552 miles were operated by the state, 19,100 miles were state lines operated by companies, 2,208 miles were branch line companies' lines under guarantee and rebate terms, 2,306 miles were companies' lines subsidised by the central or local governments, 2,626 miles were Indian State lines worked by the states, 1,768 miles were Indian State lines operated by the main line, 760 miles of line were companies' line guaranteed by the Indian states, 308 miles were companies' lines subsidised by district boards, 237 miles were district board lines, 90 miles were unassisted companies' lines and 74 miles were in foreign territory but operated by the British Indian railway companies. There are 18,195 miles of so-called standard gauge of 5 feet 6 inches; 15,248 miles of metre gauge (3 feet 3¼ inches) and 3,586 miles of the special gauges of 2 feet 6 inches and 2 feet. There are 56,000

miles of metalled roads maintained by the public authorities and 147,000 miles of unmetalled roads so maintained. Many of the irrigation canals are used for navigation by light draught vessels. There are in India 69,494 post offices, 88,417 miles of telegraph lines and 10,440 telegraph offices. There are 13 telephone exchanges with 17,810 connections privately owned and 245 exchanges with 8,975 connections established by the Post and Telegraph Department.

Finance.—In 1920-21, the Imperial revenue amounted to £86,857,000, the provincial revenue to £39,520,000, revenue raised in England £9,193,000, making a grand total of £135,570,000. Imperial revenue is that retained by the government in India for its own purposes and for defraying the expenditures of the Secretary of State for India in England. Provincial revenue is that assigned to the local government. The former is derived from land revenue, salt, excise, opium, income tax, railways and posts, irrigation, the mints, tributes, etc. Provincial revenue is derived from the civil departments, irrigation, registration, forests, and certain land revenues. In the budget for 1922-23 revenues were estimated at 1,332,300,000 rupees and expenditures at 1,423,900,000 rupees, thus contemplating a deficit of 91,600,000 rupees. On 31 March 1923 the national debt was estimated at 7,810,000,000 rupees, as against 4,110,000,000 rupees on 31 March 1914.

Government.—The movement for reform in India may be said to date from the year 1905, when Earl Curzon, then Viceroy, proposed that the province of Bengal be partitioned. This measure was fiercely resisted and the agitation, so aroused, soon broadened into a general demand for parliamentary institutions. In 1907, for the first time, two Indians were appointed by Viscount Morley to the Council of India in London. This was an initial step only but it created a deep sensation. India was at that time governed by a bureaucracy of officials, of whom the more responsible were British. She had no representative system, save the legislative councils in her provinces, which were nominated. These councils had been set up by an Act dated 1892. The Empire of India consists of (1) the directly governed provinces, with a population of about 240,000,000; and (2) the native states, each of which has its own prince or chief, with a total population of about 80,000,000. There are about 700 "states" of which 70 are of a considerable extent. It is to the provinces that the following narrative, in the main, applies. Under the unreformed system, the provinces were governed by the Viceroy and Governor General, sitting in Calcutta, with a Council, wholly nominated. Each province had a governor, a lieutenant-governor or administrator of lower rank. The hierarchy of officials was highly centralized. In 1909, Viscount Morley, then Secretary for India in London secured passage for the Indian councils Act. The measure was cautiously framed. It provided the provincial governors with an executive council or cabinet of four ministers, which councils hitherto had only been authorized for Bombay and Madras and there only consisted of two ministers. It also admitted elected members to the legislative councils, established by the act of 1892, and gave these councils the right to discuss finance. These concessions were

with difficulty passed through the House of Lords, yet it was clear that they did not begin to satisfy advanced opinion among the intellectuals of India. In 1911 King George held a Coronation Durbar at Delhi. He there announced that this city—the ancient seat of the Mogul empire—would be substituted for Calcutta as capital of India. The change may be compared with the transference of power from Petrograd in Russia to the more central and historic Moscow. On 20 Aug. 1917, E. S. Montagu, Secretary of State for India announced to the British House of Commons that he had been authorized to proceed himself to India, there to discuss a far wider scheme of self-government than any contemplated prior to that date. On 22 April 1918, the so-called Montagu-Chelmsford report was issued. It was signed by the Secretary of State and by Lord Chelmsford, then Viceroy. Based on its recommendations stands the constitution of India, as now developed.

At the head of affairs, there is still the Viceroy and Governor-General (now the Earl of Reading, appointed in 1921), whose term of office is usually five years. While the Secretary of State for India is still constitutionally responsible to the British Parliament and Cabinet for the government of the dependency, the actual control is passing more and more every year to the authorities within India herself. The ruling princes of the native states have been organized into a Council of Princes which meets at Delhi for the consideration of matters affecting those territories. At Delhi, there has been established also a parliament, with two chambers. The Upper House or Council of State consists of not more than 60 members of whom not more than 20 may be officials. This Council of State corresponds to the senate or second chamber in the self-governing Dominions. The life of the Council is five years. The Lower House, or Legislative Assembly, consists of 144 members of whom 41 are nominated and 103 elected by popular vote. Of the nominated members, 26 are officials. The normal life of the Legislative Assembly is three years and this period may be lengthened or shortened by the Governor-General at his discretion, should a special reason arise. In the event of differences between the two chambers, there is a provision for joint sittings. The first president or speaker of the Legislative Assembly has been Alexander F. Whyte, formerly member of the British House of Commons and son of Principal Whyte, the famous Scottish divine. The procedure in the Parliament at Delhi is based upon precedents established at Westminster and the official reports appear in similar volumes. The language used is English which has become the most convenient medium amid the numerous languages and dialects spoken by the various Indian races. The Governor-General's Executive Council or Cabinet has a varying number of ministers—eight is usual; there are 11 departments—home, foreign and political, finance, army, public works, revenue and agriculture, commerce, legislative, education and health, railways and the board of industries. While it cannot be suggested that this constitution is as democratic as that of the United States or of Great Britain and her self-governing Dominions, the scheme represents an enormous advance beyond anything previously suggested for a great Orien-

tal country. The reforms include a far-reaching devolution of powers from the central government to the provinces. Eight legislatures have been created, with members as follows: Madras 118, Bombay 111, Bengal 125, United Provinces 118, Punjab 83, Bihar and Orissa 98, Central Provinces 70 and Assam 53. In these legislatures, not more than 20 per cent of the members may be officials, while 70 per cent must be elected. A small minority are nominated and non-official. The normal term is three years. The principle underlying the constitution has come to be called "dyarchy." Broadly, it means that certain subjects are "transferred" to the control of the legislatures while other subjects are "reserved" in the control of the officials. The transferred subjects include, with reservations, local self-government, medical administration, public health and sanitation, education, public works, agriculture, fisheries, co-operative societies, excise, registration, development of industries, adulteration, and religious and charitable endowments. By the scheme of reforms, further subjects can be "transferred" from time to time and so brought under popular control. The new constitution has worked with a fair success. The non-co-operators, led by Gandhi, boycotted the elections to the new legislatures and only 200,000 votes were recorded for the parliament at Delhi. The debates, however, have been well conducted and valuable. As a proof of the extent to which Indians themselves are governing their own country, a return may be quoted, of date 1913, which shows that the total number of British officials in India was then only 1,517, or about one official to every 200,000 of population.

PHILIP WHITWELL WILSON.

History.—The year opened with the Prince of Wales on tour throughout India. In many places the day of his arrival was signalized by the proclamation of a *Hartal*, the Indian equivalent of a general strike, fomented by the Gandhi party of non-co-operation. Arrests and rioting continued on an increasing scale in several parts, the most serious being the storming of a police post at Chauri on 4 February in which 17 officials were slain. The report of the Moplah insurrection was made public on 24 January, when the extent of that movement was realized for the first time. It showed that 2,266 Moplahs were killed, 1,625 were wounded, 5,688 were captured during the fighting and 38,256 surrendered at the close. The civil disobedience movement against British rule was halted by the passage of a resolution by the Executive Committee of the National Congress at Bardoli on 14 February at which Gandhi, the apostle of the movement, was present. The civil disobedience program was suspended until the atmosphere would be so non-violent as to insure a non-repetition of the atrocities at Garakpur and other places. Hostility to British agents increased over large areas in the United Provinces and in Behar. On 10 March the active participation of Gandhi in the movement was brought to a close by his arrest charged with sedition. Thereafter a sullen quiet settled over India and the struggle entered on a new phase. The threatening political outlook was reflected in the budget statement laid before the Legislative Assembly at Delhi on 2 March. It disclosed a deficit of ₹22,000,000. The tour of the Prince of Wales ended on 17 March.

Opinions differed as to the value of his much-advertised journey; some holding that in making England see and think he had performed a valuable public service, others holding that the trip was ill-timed and therefore was bad policy and further that the very democratic affability of the prince stamped him as a modern type of monarch and therefore one without a future in India where democracy in a prince or monarch stamps him as weak. On 18 March it was announced that Gandhi had been sentenced to six years imprisonment for sedition. There was no disorder among the people as the news spread but the general unrest continued unabated. Numerous districts of the Punjab were raided by the police in March and several seizures of arms made. The British Indian government, under Lord Reading, urged the adoption of that part of the Indian Nationalist demands which dealt with the Caliphate question. This meant a full restoration to the Turks of the cities of Constantinople, and Adrianople and the districts of Anatolia and Thrace and the freedom of the Sultan as head of the Moslem world as Caliph of Islam. The recommendation of Lord Reading was merely a repetition of the old policy of "Divide and rule." It was intended to separate the Mohammedans from the Hindus and thereby deal a death blow to the Indian demand for Swaraj (self-determination). The publication of the dispatch led to the forced resignation of Mr. Montague from the British Cabinet and the arrest of Gandhi followed immediately. A speech by the British Premier, Lloyd George, in which he was understood to say that the measures of self-government granted to India were largely experimental gave the incentive to further unrest. At mass meetings throughout India it was asserted that the Premier's speech proved that the reforms in the British Indian government in 1919 were not intended to be otherwise than transient, a mere sop to political expediency. Lord Reading hastened to assure the Indian public that the speech of the Premier did not mean the abandonment of the present British-Indian policy but the damage was done and the result appeared to be the uniting of all Indian factions. The phase of the passive resistance concerning the non-payment of taxes was taken up avidly by the peasants in Madras, Bengal and the United Provinces and soon all forms of debtor obligations were included — no rents, no payment of loans, etc. Bolshevik intrigue was also manifested in the offer of a special news service to the Indian press at nominal subscription rates from Moscow. The Sikh disturbances caused the government further uneasiness. In August disturbances broke out at Guru Ka Bagh near Amritsar. This movement was caused by disputes over the ownership and custody of the Sikh shrines. The government sought to protect the lawful native owners from the Akalis or fanatics and found itself compelled to take drastic measures to stem the enthusiasm for a holy war. The actual hostilities were incited by a woman on 26 August, who said: "The English may arrest you or shoot you, but do not be disheartened. Thirty-three crores (330,000,000) of humans need not be afraid of 400 bugs. Our brethren do not fear jails or bullets, and they are martyrs if they die by bullets, and soldiers of God if they are spared. Be men; break the bonds; and prepare for the

jails and to receive bullets. I am prepared to go to jail and be shot. Be men." After this exhortation the Akalis advanced on Guru Ka Bagh armed with staves. A battle was fought on 2 September and the British police withdrew within the fencing surrounding the Shrine estates. The affairs in the Near East had a profound repercussion in India. On 18 September the mosques in Bombay were crowded by throngs who offered prayer and thanksgiving for the victories of their Turkish co-religionists in Asia Minor. Processions were held in honor of Kemal Pasha. At a meeting at Ahmedabad on 27 September resolutions were passed protesting at the British attitude toward the Turks and especially against her sending forces to Constantinople. Threats were made to aid the Turks by joining them on the battlefield, if war should be declared against Turkey. The autumn session of the Legislative Assembly adjourned after a listless session in which little was accomplished. The session appeared to take umbrage at the speech of the British Premier on the future of the Indian services. The members held that these services should be Indianized as soon as possible. It was also the general opinion of the Assembly that the Central Indian Government should have effective control over the army, railways, telegraphs and customs, leaving purely local affairs to the provincial governments. The Indian Government was urged to undertake at once the construction of the Sukkur barrage irrigation project. This work, as planned, is one of the greatest irrigation schemes in the world, is to cost \$96,000,000 and will render possible the raising of crops to the value of \$15,000,000 yearly. The Central government sent Mr. Sastry as special envoy to discuss with the Dominion governments of Australia, Canada and New Zealand the question of giving rights of citizenship to Indians lawfully resident in the Dominions. The envoy reported that he had laid a satisfactory basis for a better understanding between the Government of India and the Dominions. The tribe Jelal Khel Mahsuds refused submission to the government and on 13 November made a serious raid near the northwest frontier killing the driver of a large convoy and capturing six persons. Two days later a battle took place near Jandola between these tribesmen and government troops in which the latter lost seven killed and an equal number of wounded. As the year closed the native unrest appeared less tense but the great lull was by no means reassuring. The Sikh dissatisfaction was alleviated by the purchase of the Shrine estates by capitalists who guaranteed free entrance to the Sikhs. The non-co-operators appeared determined to enter the legislative councils and to wreck all reforms by obstruction. Good crops made for a better outlook. At the close of the year it was officially reported that during the year 19,396 persons died from snake bite, 1,454 were killed by tigers, 560 by leopards, 556 by wolves, 69 by bears, 70 by elephants and 10 by hyenas. During the year 25,000 wild animals were killed and 5,700 snakes and 200,000 rupees were paid in bounties for the destruction of these pests.

INDIAN AFFAIRS. Conditions among the American Indians for the year 1922 show important gains in population, education and in-

dustrial activities. At the close of June the number of Indians in the United States, exclusive of Alaska, was 340,917, an increase for the last decade of 13,500 and the largest number recorded under the more accurate counts of recent years. The population by States was as follows:

Alabama.....	405
Arizona.....	43,327
Arkansas.....	106
California.....	11,091
Colorado.....	779
Connecticut.....	159
Delaware.....	2
District of Columbia.....	37
Florida.....	462
Georgia.....	125

Wyoming.....	1,783

Under a thorough system of field supervision, every government Indian school was visited once or oftener and inspection made of many mission and public schools enrolling Indian children. Special efforts at the opening of the year resulted in filling government boarding schools beyond their normal capacity and an average attendance in all schools of 3,000 above any previous record. A revision and extension of the course of study requiring semi-annual examinations was made. The teaching personnel was more permanently organized and its efficiency improved. The attendance in public schools by payment of tuition for the children of non-tax-paying Indians was greatly increased and now promises, in addition to government facilities, to meet the educational needs of the Indians in most of the States. Insufficient school privileges still exist, however, in the Southwest, particularly in the large Navajo reservations where Federal provision for approximately 10,000 children is urgent, and the enlargement of boarding schools and the construction of new ones will be made as rapidly as possible. The military post of Fort Apache, Ariz., has been secured for school purposes and it is expected to

make it available for the education of 500 or more pupils.

The Indian Bureau emphasizes health work, to include the adult Indians, as an essential feature of education and contends that every reservation should have a hospital. Besides the systematic physical and sanitary training of the schools, it operated last year 12 tuberculosis hospitals, 31 schools, 10 agency and 27 general hospitals, having a combined bed capacity of 2,411 and employed approximately 150 physicians, 80 nurses and 70 field matrons. This work, in the absence of any serious epidemics, was successful but not fully adequate to the needs of the large Indian country, and the Commissioner has taken definite steps towards a more general elevation of Indian health habits and social standards. One feature of this program is a plan effected for co-operating with the American Red Cross, under which three of its trained nurses have been assigned to districts in the West and Southwest, having in view such service and survey of conditions as will promote a better use of present facilities and their extension to meet the reasonable needs of Indian home life.

Indian farming for the year was very creditable in the character and extent of cultivation and the use of modern methods and implements. The Indians manifested growing interest in agricultural fairs, and in Federal experimentation which has widened to include tests with Peruvian alfalfa, Mexican June corn, Bermuda onions, dates, etc., and are becoming more successful in irrigation methods. The irrigable area of approximately 605,000 acres on 50 reservations will be further enlarged by the completion last year of diversion dams across the Gila River, Arizona, the Big Horn River, Montana, and by other similar construction under way. Allotments of land embracing 750,000 acres were made to individual Indians; restrictions were removed from 150,000 acres and about 1,000 fee patents were issued during the year. Special gains were made to the sheep industry of the Southwest by the introduction of pure-bred rams, about 500 being supplied to the flocks of the Navajo reservations. Under the Bureau's encouragement, a number of stock-grower's associations were formed by the Indians which in some instances have become responsible for the reimbursement of funds loaned for the purchase of improved livestock. An outstanding feature of the year was an industrial campaign in which superintendents, accompanied by a service farmer, a field matron and a physician visited the homes on their reservations for the purpose of improving household conditions and planning activities so that each family would make the best use of its resources. This movement, which will be continued to cover a five-year period, has already resulted in better crops, gardens and homes, notably on the Blackfeet Reservation, Mont., where last spring 90 per cent of the Indians residing on their allotments engaged in farming. The entire Reservation was organized into an industrial association with community chapters, and the Indians voluntarily reduced their usual 4th of July celebration from 10 days to one, so as to give closer attention to their crops and livestock. It is the intention to embrace in this five-year program a definite study and improvement along lines of health,

education, domestic sanitation and social welfare, as well as to give proper stimulus to all individual and tribal industries, and thus establish a policy of such obvious merit that succeeding administrations will readily adopt it. Conjointly, the government Indian schools will this year add to their regular courses special instruction on the essentials of home-building, to conclude with competitive essays by the older pupils.

The Commissioner, in connection with extended personal inspection of field conditions, gave special attention to the affairs of the Chippewas in Minnesota and arranged for a commission to investigate fully all matters complained of by these Indians, particularly as to their land and timber equities in what is known as the Minnesota National Forest, and also asked the Department of Justice to bring original action in the Supreme Court of the United States to determine the respective rights of the Chippewas and the State of Minnesota to the swamp lands in the reservations of that State.

The oil and gas interests of the Indians, now a huge business feature of the Bureau's operations, were further stimulated by an advance in market price of oil. Oklahoma continues to lead in this production where the gross output of oil for the Five Civilized Tribes last year was 8,181,971 barrels and the total revenue to restricted Indians from oil and gas leases and royalties was nearly \$4,000,000. In the more attractive Osage Reservation, one tract of 160 acres was leased for \$1,600,000; several others bringing more than \$1,000,000 each, and the year's sales of leases embraced 102,192 acres for a total bonus of \$22,105,500. The oil production reached 29,000,000 barrels, and the income of the Osages from oil and gas royalties was \$9,235,701. In the Shoshone reservation, Wyoming, the Blackfeet and Crow reservations of Montana, oil leasing and production were active, and test wells were begun in the Navajo reservations of Arizona and New Mexico. Special encouragement was given the Indians' native industries with a view to securing larger returns for their skill, and public interest was favorably attracted to their artistic and useful craftsmanship by an exhibit at the convention of the Federation of Women's Clubs, Chautauqua, New York, and at the Southwestern Indian Fair at Santa Fe, New Mexico, where seven States were represented and a remarkable display was made of blankets, basketry, pottery, silversmithing and other arts. The Indian Bureau, in co-operation with the Department of Agriculture, is planning a special impetus to reservation road building, under an interpretation of the Federal Highway Act by the Comptroller General to the effect that the entire cost of any portion of a public highway crossing an Indian reservation may be paid from government funds apportioned under the act to the State within which the reservation is located, the State being required to provide only upkeep and repairs. Among the many other important activities, the Bureau conducted aggressive prosecutions on the reservations against the liquor traffic, often in co-operation with local authorities; called public attention to the growing use of peyote in various localities and issued a pamphlet of general information on this harmful drug; materially reduced probate expenses without

diminishing the volume of work on heirship cases and Indian estates; requested legislation necessary to adjust long-standing disputes concerning individual holdings and the land and water rights of the Pueblo Indians in New Mexico; took effective action for securing greater benefits to Indian owners and protection to lessees in the extensive Quapaw lead and zinc mining district of Oklahoma, and made large savings in the purchase of service supplies by co-operation with other departments and the Bureau of the Budget, and by watchful study of market conditions.

CHARLES H. BURKE,
Commissioner of Indian Affairs.

INDIANA, an east north-central State of the United States, bounded on the north by Michigan, east by Ohio and Kentucky, south by Kentucky and west by Illinois. It has an area of 36,354 square miles and had a population in 1920 of 2,930,390. The State ranks 37th in size and 11th in population among the States of the Union. In 1920, the population included 2,849,071 whites, 80,810 negroes and 509 Indians and Asiatics. The State had the same year 150,868 foreign born residents of whom 37,337 were Germans, 9,351 Hungarians, 9,100 Austrians, 8,522 English and 7,271 Irish. The urban population in 1920 was 50.6 per cent of the total. Indianapolis, the State capital, has a population of 314,194. Other large cities of the State are Fort Wayne, 86,549; Evansville, 85,264; South Bend, 70,983; Gary, 55,378; Terre Haute, 66,083; East Chicago, 35,967; Muncie, 36,524; Hammond, 36,004; Kokomo, 30,067; Anderson, 29,767; Elkhart, 24,277; Lafayette, 22,486; New Albany, 22,992; Richmond, 26,765; Vincennes, 17,160.

Religion.—The church membership of the State aggregates 1,777,341. Of this number, 272,288 are Roman Catholics, 271,596 Methodists, 85,786 Baptists, 59,209 Presbyterians, 47,879 Lutherans, 10,642 Reformed, 8,848 Episcopalians, and 5,768 Congregationalists.

Education.—Primary education is compulsory for all children from the ages of seven to 14 and from 14 to 16 unless employed. In primary schools in 1921 there were 15,584 teachers and 491,369 pupils. There are 820 public high schools with 5,123 teachers and 86,063 pupils. There is a State normal school for the training of teachers. In 1921, the total expenditure for all public primary schools was \$53,768,002. For higher education there are many institutions in the State, including four of nation-wide fame—Indiana University at Bloomington, De Pauw University at Greencastle, the University of Notre Dame, and Purdue University at Lafayette.

Agriculture.—About 94 per cent of the total area of the State is in farms. There were in 1921, 202,355 farms with an aggregate acreage of 20,948,981 acres, of which 17,393,982 acres were improved land. Assessed value of all farm property in 1919 was \$2,752,301,538. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 4,765,000 acres, 176,305,000 bushels, \$98,731,000; spring wheat, 4,000 acres, 44,000 bushels, \$49,000; winter wheat, 2,052,000 acres, 29,754,000 bushels, \$33,324,000; barley, 42,000 acres, 714,000 bushels, \$414,000; clover seed, 100,000 acres, 120,000 bushels, \$1,176,000; oats, 1,370,000 acres, 28,770,000 bushels, \$11,-

508,000; buckwheat, 6,000 acres, 90,000 bushels, \$90,000; rye, 318,000 acres, 3,816,000 bushels, \$3,015,000; tame hay, 2,575,000 acres, 3,734,000 tons, \$41,821,000; sorghum sirup, 11,000 acres, 935,000 gallons, \$888,000; potatoes, 74,000 acres, 5,624,000 bushels, \$4,724,000; sweet potatoes, 3,000 acres, 375,000 bushels, \$450,000; tobacco, 18,000 acres, 16,200,000 pounds, \$2,754,000; apples, 4,148,000 bushels; peaches, 650,000 bushels, and pears, 300,000 bushels. On 1 Jan. 1923, there were on the farms of the State 696,000 horses, valued at \$51,504,000; 101,000 mules, valued at \$7,777,000; 742,000 milk cows, valued at \$39,326,000; 794,000 other cattle, valued at \$25,726,000; 648,000 sheep, valued at \$5,184,000, and 4,102,000 swine, valued at \$48,814,000.

Mining.—According to the returns of the 14th Census, Indiana ranks 14th in the value of mineral products and ninth in the total number of persons engaged in the mining industries. The mining industries, ranked according to the value of products, were bituminous coal, limestone, petroleum and natural gas, clay and sandstone. The coal, limestone, petroleum and natural gas industries account for about 98 per cent of the total value of the State's mineral products. The coal fields of the State have an area of 6,500 square miles. The output in 1922 amounted to 17,330,000 short tons. The State ranks sixth in coal production. The output of crude petroleum in 1922 was 1,084,000 barrels as compared with 1,163,000 barrels in 1921. The value of the natural gas sold annually is about \$1,500,000. Sandstone and limestone are produced yearly to the value of \$6,000,000. Portland cement output in 1920 was 10,700,000 barrels. Clay working industries of the State—bricks, tiles, pipes, porcelain, etc., have an output valued at \$10,000,000 yearly.

Manufactures.—The manufacturing interests of the State are most varied and include steel and iron, machinery, automobiles and trucks, tin plate, cement, wagons, glass, flour, meat packing, oil refining, etc. The last Industrial Census reported 7,918 manufacturing establishments, employing 329,227 hands, using raw materials valued at \$1,174,971,000 in the census year, and turning out products to the value of \$1,901,846,000 in the same period. Evansville is the largest hardwood market in the United States. Through it passes most of the hardwood lumber cut of the State and also a large proportion of the hardwood cut of the Southern States. Gary, on the Lake Shore, is the centre of the iron and steel industry of the State. The livestock industry of the State centres at Indianapolis, which has the largest interurban railway traffic in the United States.

Communications.—The Ohio and Wabash rivers and Lake Michigan furnish natural facilities for water transport. In addition, the State has 7,707 miles of steam railways and 2,418 miles of electric railways. All lines from the east to Chicago pass through the State, as do many lines to the West and South.

Finances.—On 1 Oct. 1921, the State treasury had on hand a balance of \$3,075,653.38. Gross receipts during the fiscal year, 1921-22, totaled \$33,161,748.98. Advance payments, refunds and transfers, aggregating \$8,048,727.31, reduced this sum to net receipts amounting to \$25,113,021.67. Disbursements during the same

fiscal year amounted to \$32,060,462.83. Advance payments, refunds and transfers, amounting to \$8,048,727.31, made the net disbursements for the fiscal year \$24,011,735.52, leaving on hand a balance on 1 Oct. 1922 of \$4,439,998.31. The estimated receipts for the fiscal year, 1922-23 aggregate \$25,968,021.67, while the authorized expenditures for the same period amount to \$24,866,735.52. The assessed value of real property aggregates \$3,600,145,119; of personal property, \$1,381,051,076.

Government.—The Governor is the executive head of the State and is elected for four years. The Legislature, known as the General Assembly, consists of a Senate of 50 members, elected for four years, and a House of Representatives of 100 members, elected for two years. Legislative sessions are held biennially in January of odd years. In the Federal Congress, Indiana is represented by two senators and 13 representatives. For administrative purposes the State is divided into 92 counties and 1,016 townships.

Officials.—Governor, Warren T. McCray (term expires 1 Jan. 1925); lieutenant-governor, Emmett F. Branch; secretary of state, Ed. Jackson; attorney-general, U. S. Lesh; auditor, Robert Bracken; treasurer, Ora J. Davies; superintendent of education, Benj. Burris.

Judiciary.—Members of Supreme Court, Louis B. Ewhank, David A. Myers, Julius C. Travis, Benj. M. Willoughby and Howard L. Townsend.

INDIANA CENTRAL UNIVERSITY, a co-educational institution controlled by the United Brethren in Christ, founded in 1905 and located at Indianapolis, Ind. In 1922-23 it had a faculty of 17 members, 350 students, property valued at \$590,888 and an income of \$75,000. Irby J. Good, A.M., is president.

INDIANA UNIVERSITY, a State co-educational institution, founded in 1820 and located at Bloomington, Ind. In 1922-23 it had a faculty of 240 members, 3,256 students, property valued at \$2,440,481 and an income of \$1,682,046.45. William Lowe Bryan, LL.D., is president.

INDUSTRIAL ARBITRATION. Nearly 1,500,000 workers were involved in industrial disputes in which were used the good offices of the United States Department of Labor's Commissioners of Conciliation from the beginning of the Harding administration, 4 March 1921 until 30 June 1922 (the latest figures available), a period of 16 months. According to Department of Labor figures, when the Conciliation Service began its work, 70 per cent of the labor difficulties in which its intervention was sought had already reached the strike stage. But conditions had so improved and the services of the Department had so generally been recognized, according to the report, that less than 30 per cent of the cases pending before the service at the time of the report had reached the point where work was suspended. During the 16-months period indicated, over 500 cases of strikes and threatened strikes and lock-outs were acted upon by department officials. Commissioners of Conciliation satisfactorily adjusted 345 cases, while 59 cases were adjusted in co-operation with local officials and agencies. Thirty-nine were pending or in the process of adjustment. Secretary of Labor James J. Davis points out that the period of in-

dustrial readjustment through which the country had been passing made the settlement of industrial disputes more difficult, but despite that fact nearly 90 per cent of the controversies in which the Department used its good offices were equitably and satisfactorily adjusted. It is Secretary Davis' view that these settlements, without doubt, did much to aid in stabilizing the generally disturbed industrial situation. Limitations of appropriations, Secretary Davis reported, made it impossible for him to work out some plans he had for further curtailing the resort to strike or lockout measures in industrial disputes. He believes that with the creation of a conciliation organization such as he has in mind and with an appropriation of approximately \$1,000,000 per year, this gradually to be increased with the growth of industry, practically every labor controversy can be adjusted and nearly every strike can be avoided.

INDUSTRIAL ARTS COLLEGE, a State educational institution for women, founded in 1902 and located at Denton, Texas. In 1922-23 it had a faculty of 110 members and a student enrollment of 1,463. No information as to value of institution's property or its income was available. Frances M. Bralley, LL.D., is president.

INDUSTRIAL WORKERS OF THE WORLD. The Industrial Workers of the World, generally known as the I. W. W., a radical industrial union, did not figure as prominently in the news during 1922 as usual but several important events influenced the internal activity of the organization to such a degree that its public acts were considerably modified. Early in the year a serious split occurred in the ranks of the I. W. W. over adherence to the Third or Communist International at Moscow. The organization as a whole opposed unity with the international group on the grounds that the International would dictate the methods of revolutionary activity in each country, a procedure which was condemned on the score that the International was not as intimately acquainted with local conditions as were the active revolutionists residing within its boundaries, and that the International upheld the "fetish" of political action, long the object of derision of the I. W. W. Thousands of members, however, followed the lead of a few active I. W. W. favoring the Communist International and left the organization, a number of them working for Communism within independent and American Federation of Labor trade unions. At the 14th general convention of the Industrial Workers of the World, held in Chicago during the three weeks beginning 13 November, a resolution was adopted rejecting affiliation with either the Red Trade Union International at Moscow or the newly formed Syndicalist International at Berlin. Quite a furore was created in the organization when the delegates gave as their reason for refusing to adhere to the Syndicalist International the fact that the latter favored "force and violence." The action was regarded as a startling departure from even the expressed policy of what had been considered one of the most extreme groups in the United States. The convention also took a stand for the six-hour day and for a general strike for the release of political prisoners. Membership in the I. W. W., according to figures

given out by the organization, is fixed at 60,000, the largest total since the group came into existence in 1905. More conservative estimates, however, place the figure at 35,000. During the early part of 1922, prosecution of the I. W. W. for illegal activity in labor pursuits subsided, but increased in Oregon and California toward the end of the year. President Harding pardoned or commuted the sentences of 20 or 30 members of the organization held at Leavenworth under the war-time Espionage Act. Efforts were being made at the close of the year to obtain executive clemency for the 40 still in prison.

INSURANCE. The year 1922 was a prosperous year for most kinds of insurance in the United States. The divorce from Continental European business enforced by war conditions abroad has been seemingly beneficial to insurance here, as foreign business never was very profitable. Life insurance may be said to lead all other activities or investments, the total in force being estimated at \$45,000,000,000 in January, 1923. This is for American policies only, there being some investment in foreign companies by United States citizens, the total of which is not even estimatable, though certainly small. The Association of Life Insurance Presidents reported to the United States Department of Commerce in January 1923, that the estimated new life insurance written in the year 1922 was a record, 12.2 per cent above the great total of 1921. Ordinary new life insurance of the 40 leading reporting companies during 1922 totaled \$4,743,000,000, as against \$4,341,000,000 in 1921, a gain of \$402,000,000 or 9¼ per cent. The industrial new business for 1922 was \$1,418,000,000, as against \$1,257,000,000 for 1921, a gain of \$161,000,000, or 13 per cent; group business was \$221,000,000 in 1922 against \$88,000,000 in 1921, a gain of over 150 per cent. To the above must be added estimates of the amounts written by non-reporting companies, and also the sum of revivals, increases and dividend additions, which brings the grand total of new life insurance for the United States in 1922 to \$9,500,000,000, as against \$8,730,000,000 for the previous year. The total of life insurance in force in the United States, about \$45,000,000,000, has doubled in eight years. The assets of the life insurance companies approximate \$8,000,000,000, exceeding the combined resources of the savings banks and approaching closely the assets of the 16,000 State banks, and the 1,700 trust companies, both of which are estimated to be between \$8,500,000,000 and \$9,000,000,000.

In January 1923, there were in round numbers, 18,500,000 ordinary life policies in force, and 75,000,000 industrial policies. The latter paid premiums in 1922 of nearly \$300,000,000. In New York State alone the insurance of fraternal orders totaled over \$7,000,000,000. The largest individual policy-holders in the country

are Adolph Zukor, head of the Famous Players-Lasky Corp., \$5,000,000; Rodman Wanamaker, \$4,500,000; Pierre Du Pont, \$3,000,000, and James C. Penney, head of the Golden Rules Stores, \$3,000,000. The late John Wanamaker carried \$3,000,000. The average duration of life is lengthening, at least in insurance experience, and the companies are making more in consequence. The New York Life Insurance Company in 1922 had an income of \$212,458,000, and 1,717,898 policies in force for a total of \$4,042,000,000, or nearly \$2,500 per policy. The paid-for new business of the year was \$606,381,000. The Prudential led the industrials with \$6,314,000,000 in force, a gain of \$92,700,000 over 1921. The Travelers Insurance Company received premiums of \$37,335,000 in 1922, divided thus: accident, \$8,125,000; health, \$2,493,000; automobile liability, \$9,181,000; workmen's compensation, \$13,929,000. They paid losses of only \$3,108,000, over half of this being for automobile accidents. The capitalization of life insurance companies has increased materially, many turning their surplus partly into capital. Loans to policy-holders increased during 1922.

In fire insurance the year 1922 was good as far as volume of business was concerned, but the fire losses were greater than in any year except 1906, in which the San Francisco fire nearly tripled the usual total. The fire losses for the last six years in the United States are: 1917, \$250,753,640; 1918, \$290,959,885; 1919, \$269,000,775; 1920, \$330,853,925; 1921, \$332,654,950; 1922, \$410,889,350.

It is apparent that the fire insurance companies had to pay out about \$70,000,000 more than their estimates. A good part of this loss is of the sort that is called "moral," but should be styled incendiary. A long list of small New York City fires is attributed to this cause, and an examination of the fire losses in the territory where cotton losses were severe in the last two years disclosed in a diagram that the curve of cotton loss was followed closely by fire losses.

Accurate figures of the total of fire, accident, automobile liability, workmen's compensation, health, and some scores of other kinds of insurance for 1922 have not been compiled, but it is known that automobile insurance has greatly increased, and workmen's compensation. The States have gone into the latter, and New York State has \$8,000,000 in this insurance fund.

The insurance business in Europe suffers along with every other activity. But there is one unique development in Russia. The Soviet Government has taken over insurance and made it a monopoly. With only 6,500,000 gold rubles (\$3,250,000) capital they are writing a large amount of insurance, in the case of fire on 75 per cent of value, and in some cases, as crops, the insurance is made obligatory. The usual rate is 2½ per cent, and agents' commissions vary from 7 to 15 per cent.

INTERNAL REVENUE. During the fiscal year 1922 the Internal Revenue Bureau collected \$3,197,451,083, as against \$4,595,357,-

061.95 the preceding year. In 1920, which showed the largest income of eight years, the total was \$5,407,580,251.81. Income and profits tax collections in 1922 totaled \$2,086,918,464.85, as compared with \$3,228,137,673.75 the year before. Sources other than income and profits taxes yielded \$1,110,532,618.15 in 1922, as compared with \$1,367,219,388.20 in 1921. The decrease was largely attributable to the repeal of or reduction in rates of a number of taxes provided for in the Revenue Act of 1921, effective 1 Jan. 1922. The principal decreases in miscellaneous taxes in 1922 were as follows: Estates, \$14,624,414.35; distilled spirits, \$37,034,714.54; transportation, \$102,814,685.58; insurance, \$8,136,690.64; excise taxes, \$55,003,803.12; stamp taxes, \$13,668,528.08; non-alcoholic beverages, \$25,171,688.85; admission to theatres, etc., \$15,890,061.10. The decrease from these sources was somewhat offset by an increase of \$15,539,998.95 in collections from tobacco manufactures. Some of the principal sources of income and the yield therefrom during the years 1922, 1921 and 1920, respectively, were as follows: tobacco manufactures, \$270,759,384.44; \$255,219,385.49; \$295,809,355.44; capital stock tax (including other special taxes) \$90,544,039.59; \$91,281,484.31; 102,933,701.35; distilled spirits (including wines, etc.) \$45,563,350.47; \$82,598,065.01; \$97,905,275.71; sales of internal revenue stamps, \$14,616,958.05; \$20,880,868.86; \$24,437,893.75; miscellaneous, including war excise taxes, \$686,881,719.92; \$914,227,755.36; \$883,863,871.82. For the fiscal year 1922 the cost of administering the internal revenue laws was \$41,577,374.49. The operation cost for the year, on this basis, was \$1.30 for every \$100 collected, as against 87 cents for the preceding year. Deducting, however, \$7,202,723.07, expended in administering the prohibition and narcotic laws and in the enforcement of the child-labor section of the Revenue Act of 1918, leaves \$34,286,651.42 as the expenditure for collecting the internal-revenue taxes for 1922,—the equivalent of \$1.07 for every \$100 collected, as against 72 cents on a similar basis for every \$100 collected in 1921. The difference in the relative cost of collection for these two years is mainly attributable to the large reduction in 1922 revenues incident to such causes as shrinkage in business and incomes, repeal of certain miscellaneous war taxes, etc.

IOWA, a north central State of the United States, bounded on the north by

Minnesota, east by Wisconsin and Illinois, south by Missouri, and west by Nebraska and South Dakota. It has an area of 56,147 square miles, and in 1920 had a population of 2,404,021. The State ranks 24th in size and 16th in population. In 1920, the census returns showed 2,384,181 whites, 19,005 negroes, 529 Indians and 306 Asiatics. In the same year there were 345 Indians on reservations, having a total area of 3,251 acres. The same census showed 225,647 foreign born residents. Of these, 17,344 were Norwegians, 18,020 Danes, 70,642 Germans, 22,493 Swedes, 13,036 English, 12,471 Dutchmen, 10,686 Irish, 9,150 Czechoslovakians, 8,929 Canadians, 4,956 Italians, 2,894 Greeks, 4,354 Austrians, 2,560 Mexicans, 2,028 Poles, 7,319 Russians, 3,967 Scotchmen and 2,871 Swiss. The chief cities of the State, with their populations in 1920, are: Des Moines, the capital, 126,468; Sioux City, 71,227; Davenport, 56,727; Dubuque, 39,141; Council Bluffs, 36,162; Cedar Rapids, 45,566; Clinton, 24,151; Burlington, 24,057; Waterloo, 36,230; and Ottumwa, 23,003. In 1920, 36.4 per cent of the population was urban.

Religion.—The Christian churches have an aggregate membership of 937,334, including 262,513 Roman Catholics, 199,036 Methodists, 83,925 Lutherans, 68,899 Presbyterians, 44,937 Baptists, 39,524 Congregationalists, 8,126 Episcopalians and 7,575 Reformed.

Education.—Primary education is free and compulsory for all children between the ages of seven and 16 for 16 consecutive weeks annually. There are in the State 11,266 primary schools with 24,012 teachers and 475,375 pupils; 905 high schools with 3,620 teachers and 61,202 pupils and one normal school with 120 teachers and 3,461 pupils. For purposes of higher education there are in the State the University of Iowa at Iowa City, State College of Agriculture and Mechanic Arts at Ames, Drake University at Des Moines, and Upper Iowa University at Fayette.

Finances.—On 1 Jan. 1922, the balance on hand amounted to \$3,407,223. Revenue from all sources during the year aggregated \$22,248,148. Expenditures for the same period amounted to \$22,679,498. The State has no bonded debt. The assessed value of real property in 1922 was \$3,627,532,791; of personal property \$671,101,604.

Agriculture.—Iowa is pre-eminently an agricultural State and, it is claimed, has the largest proportion of arable land of all States. In 1920, the value of all crops was \$890,391,299. Farm property was valued at over \$8,000,000,000. The area of farm land in 1920 was 33,474,896 acres. Corn is the great crop of the State, which has also extensive livestock interests. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 10,123,000 acres, 455,535,000 bushels, \$255,100,000; spring wheat, 68,000 acres, 1,020,000 bushels, \$1,010,000; winter wheat, 689,000 acres, 15,847,000 bushels, \$15,689,000; barley, 150,000 acres, 4,260,000 bushels, \$2,087,000; clover seed, 132,000 acres, 224,000 bushels, \$2,330,000; oats, 6,023,000 acres, 222,851,000 bushels, \$77,998,000; buckwheat, 5,000 acres, 70,000 bushels, \$88,000; rye, 60,000 acres, 1,140,000 bushels, \$798,000; tame hay, 3,393,000 acres, 4,750,000 tons, \$47,500,000; sorghum sirup, 7,000 acres, 630,000 gallons,

\$624,000; potatoes, 94,000 acres, 8,460,000 bushels, \$5,668,000; sweet potatoes, 4,000 acres, 440,000 bushels, \$616,000; apples, 4,410,000 bushels; peaches, 200,000 bushels; pears, 75,000 bushels, and grain sorghums, 6,000 acres, 144,000 bushels, \$79,000. On 1 Jan. 1923 there were in the State 1,305,000 horses, valued at \$103,095,000; 101,000 mules valued at \$8,080,000; 1,160,000 milk cows, valued at \$67,280,000; 3,479,000 other cattle, valued at \$122,461,000; 829,000 sheep, valued at \$6,964,000, and 9,615,000 swine, valued at \$123,072,000.

Mining and Other Products.—There are about 19,000 square miles of productive coal fields in Iowa in which 16,000 miners are regularly employed. The average production is about 5,000,000 tons yearly. Other mining products are gypsum, ochre, sandstone, limestone, clays and cement. Manufacturing industries of the State are mostly those connected with agricultural produce and livestock products. The last Manufacturing Census showed 5,683 establishments, employing 105,439 persons, using raw materials to the value of \$520,240,807 and turning out products valued at \$745,472,697. Meat packing and flour milling are the chief industries.

Communications.—The transportation system of the State is highly developed. Railways traverse it in all directions, carrying a huge local as well as vast interstate tonnage. River transportation on the Mississippi and the Missouri is also immense. There are in the State 9,808 miles of railways and 946 miles of electric railways.

Government.—Executive power is vested in the Governor, who is elected for a term of two years. The legislature, officially called the General Assembly, is composed of a Senate of 50 members and of a House of Representatives of 108 members, who meet biennially. Senators are elected for four years and representatives for two years. Iowa sends two senators and 11 representatives to the Federal Congress at Washington. The Governor in 1922 was N. E. Kendall, who was re-elected in November 1922 for the two-year term, January 1923 to January 1925. The Secretary of State in 1922 was W. S. Allen.

IOWA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS, a State co-educational institution, founded 21 Oct. 1868 and located at Ames, Iowa. For the year 1921-22 it had a faculty of 359 members, 7,096 students, property valued at \$5,818,686.57 and an income of \$3,052,557.16. No figures given for 1922-23. Raymond A. Pearson, LL.D., is president.

IOWA, University of, a State co-educational institution, founded in 1847 and located at Iowa City, Iowa. In 1922-23 it had a faculty of 450 members, 6,750 students, property valued at \$6,500,000 and an income of \$3,500,000. Walter Albert Jessup, Ph.D., LL.D., is president.

IRAQ. See MESOPOTAMIA.

IRELAND, the lesser of the two islands which constitute the United Kingdom of Great Britain and Ireland, and since January 1922 officially known as the Irish Free State. The island has an area of 32,586 square miles and an estimated population in 1921 of 4,496,000. About 1 per cent of the people speak Gaelic only,

86 per cent speak English only and 13 per cent speak both Gaelic and English. Of the total population 96 per cent are Irish born. Dublin, the capital, has a population of 403,030. Belfast, the seat of the government of Northern Ireland, has a population of 393,000. The civic population is 31.1 per cent of the total. The total number of births in 1920 was 99,536; total deaths, 66,538; marriages, 26,826.

Religion.—According to the last census there were in Ireland 3,242,670 Roman Catholics; 576,611 Episcopalians; 440,525 Presbyterians; 62,382 Methodists; and 68,031 of other professions. The Roman Catholic Church has four archbishops, 24 bishops, and 3,830 priests. The Protestant Episcopal Church has two archbishops, 11 bishops, and 1,500 clergymen. The largest Presbyterian body has 36 presbyteries, 615 ministers, 561 congregations and 105,000 members.

Education.—Education in the primary grades is free and compulsory but in many rural districts the attendance law is poorly enforced. There are 8,002 primary schools with 688,955 enrolled pupils and an average attendance of 488,031. In the primary schools there are 7,590 principal teachers, 5,770 assistant teachers, and 2,380 junior assistant teachers. There are seven training colleges with facilities for the training of 1,195 normal students. Primary education is now administered by the two governments functioning in Ireland. The Northern Government has its own education department and the Free State has charge of primary education in its territory. Secondary education is administered by the Intermediate Education Board. The Board holds examinations every year and pays grants to secondary schools on the results of this examination and also on the results of periodic inspections. In 1921, 12,419 students presented themselves for the intermediate examinations. Technical education is organized under the borough county councils and urban district councils. There are 42,293 students receiving technical education in urban and county technical schools. There are also the Royal College of Science and the Metropolitan School of Art, each having about 400 students. Higher education is provided by the National University, and the University of Dublin, Dublin, and the Queens University, Belfast. The first of these has three constituent colleges—the University Colleges of Cork, Galway and Dublin. In Ireland there are 375 professors and about 5,000 university students. There are several seminaries for the training of the clergy, the largest being Saint Patrick's College, Maynooth, with 700 students.

Finance.—For the fiscal year ended 31 March 1921, Ireland contributed £46,448,000 to imperial revenue, while the Irish expenditure amounted to £32,976,000. The fiscal estimates for 1922-23 show a total expenditure forecast at £37,709,586 for the government of Southern Ireland. The cost of the army for the year is placed at £7,245,000. Compensation for destroyed property was slated to cost £10,000,000. The Post Office Department was allotted £2,750,000 and £4,000,000 were allotted to education. At the close of 1922 the balance sheet of the five Irish banks showed total assets of £171,369,818 as compared with £172,756,819 at the close of 1921.

Production.—Of the total area, 296,000 acres are woods and plantations, 9,122,000 acres are in permanent pasture and 5,271,000 acres are arable land. In 1921 there were 43,000 acres of wheat which yielded 181,000 quarters; 175,000 acres of barley the yield from which was 714,000 quarters; 1,254,000 acres of oats which yielded 5,768,000 quarters; 14,000 acres of beans; 3,000 acres of peas; 568,000 acres of potatoes, the yield being 2,556,000 tons; 266,000 acres of turnips which yielded 3,882,000 tons; 79,000 acres of mangolds which yielded 1,510,000 tons; and 2,370,000 acres of hay, which yielded 3,258,000 tons. There are 571,985 farm holdings in the country of which 372,815 are owned by the occupiers and 199,170 are rented. The fishing industry is important, the value in 1921 being £308,588 for 20,421 tons of fish. The live stock in the country in 1921 numbered 5,197,000 head of cattle, 3,708,000 sheep, 977,000 swine, 261,000 goats, 24,500,000 poultry, 555,000 horses, 230,000 asses, and 27,000 mules.

Commerce.—The foreign trade of Ireland aggregates about \$1,500,000,000 yearly, exports and imports being evenly balanced. Of Irish exports 53 per cent are farm produce, food, drink and tobacco. Forty-three per cent are manufactured goods and 4 per cent are raw materials. In 1921–22 Ireland exported eggs to the value of \$70,000,000; cattle to the value of \$120,000,000; sheep to the value of \$9,000,000; pigs to the value of \$11,000,000; potatoes to the value of \$5,000,000; condensed milk to the value of \$5,500,000; cheese to the value of \$9,000,000; poultry valued at \$12,000,000; oats valued at \$13,000,000; flax to the value of \$2,000,000; and butter to the value of \$20,000,000. Exports of manufactures the same year included \$140,000,000 worth of linen goods, of which \$12,000,000 went to the United States. The exports of whiskey and porter aggregated \$50,000,000. The island is now considered one of the best of world markets because the purchasing power of the inhabitants now exceeds \$800,000,000 gold per annum. In the year named above Ireland imported coal valued at \$50,000,000, of which the United States furnished but one cargo. The United States leads in shipments of cotton, wheat, motor cars and gasoline. The value of these aggregated \$25,000,000; corn was imported from the Argentine to the value of \$25,000,000; wine from Spain and France to the value of \$2,000,000; cutlery and hardware to the value of \$5,000,000; and \$7,500,000 worth of candy and confectionery. The United States sold in Ireland about \$48,000,000 worth of foodstuffs, wheat, manufactures, etc., last year and purchased goods there to the value of \$38,000,000. Imports of shoes last year amounted to \$24,000,000 of which \$275,000 came from the United States. The leading export of the United States to Ireland is leaf tobacco, Ireland purchasing on the average over \$8,000,000 worth each year. The imports of sugar total about \$25,000,000 yearly, of which the United States furnishes less than one-third. England and her colonies are Ireland's best customers, taking about 99 per cent of the manufactures and agricultural products. On the other hand, England sells Ireland 96 per cent of the latter's imports. The rest of the world supplies the remaining 4 per cent, but the extent of the participation of

the United States in this trade is one-half of one per cent.

Government.—The tension in the relations between Great Britain and Ireland became acute just prior to the outbreak of the World War, when with the passage of the Home Rule Bill, Sir Edward Carson inaugurated the Ulster Volunteer movement and gathered to his banner 100,000 young men, furnished them with arms from Germany and prepared to resist Parliament. The counter movement of the National Volunteers followed but before these mutually hostile forces clashed the World War broke out and the Home Rule Bill was placed on the Statute Book but its operation suspended for the duration of the war and one year thereafter. During the first two years of the war Ireland was relatively quiescent and many young men of the country went into the British service feeling that the relations of the two peoples were adjusted on a firm basis through the Home Rule Bill. But quiet was not to continue for a number of ardent spirits felt that Great Britain had suspended the operation of the Home Rule Bill through fear of Ulster and after the war would find a way to dishonor it. The Easter Rebellion of 1916 was abortive but the political effect was far-reaching. The old Nationalist party led by John Redmond was discredited and its place taken by the Sinn Fein, or Separatist party. This party swept the country at the general election of 1918 with the exception of the northeast counties where the Unionist element predominated. To meet the difficulty separate parliaments were set up in the North and South by the Act of 1920—the two bodies to choose members to sit in a Council of Ireland. The Unionists of Ulster accepted the gift of a parliament, members of which were elected 24 May 1921, and parliament opened by the King the following month. The Sinn Fein refused to work the Act and their elected members assembled in Dublin in the Republican *Dail Eireann* and again proclaimed the Republic with Eamonn de Valera as President. Chaos followed in the country and for many months a guerilla war of the bitterest intensity was fought in all counties. On 7 July 1921, through the efforts of Martin H. Glynn, ex-governor of New York, and the Vatican, the preliminaries of a truce were arranged and the British and Irish governments each sent delegations for the purpose of discussing a settlement. After prolonged negotiation a treaty was signed 6 Dec. 1921. The text of the treaty follows:

ANGLO-IRISH TREATY.

Article I.—Ireland shall have the same constitutional status in the community of nations known as the British Empire as the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand and the Union of South Africa, with a Parliament having powers to make laws for peace and order and good government in Ireland and an executive responsible to that Parliament, and shall be styled and known as the Irish Free State.

Article II.—Subject to provisions hereinafter set out, the position of the Irish Free State in relation to the Imperial Parliament, the Government and otherwise shall be that of the Dominion of Canada, and the law, practice and constitutional usage governing the relationship of the Crown or representative of the Crown and the Imperial Parliament to the Dominion of Canada shall govern their relationship to the Irish Free State.

Article III.—A representative of the Crown in Ireland shall be appointed in like manner as the Governor General of Canada and in accordance with the practice observed in making such appointments.

Article IV.—The oath to be taken by the members of the Parliament of the Irish Free State shall be in the following form.

"I do solemnly swear true faith and allegiance to the Constitution of the Irish Free State as by law established, and that I will be faithful to his Majesty King George V., and his heirs and successors by law, in virtue of the common citizenship of Ireland with Great Britain and my adherence to and membership of the group of nations forming the British Commonwealth of Nations."

Article V.—The Irish Free State shall assume liability for service of the public debt of the United Kingdom as existing at the date thereof and toward the payment of war pensions as existing on that date in such proportion as may be fair and equitable, having regard for any just claims on the part of Ireland by way of set-off or counter-claim, the amount of such sums being determined, in default of agreement, by the arbitration of one or more independent persons being citizens of the British Empire.

Article VI.—Until an arrangement has been made between the British and Irish Governments whereby the Irish Free State undertakes her own coastal defense, defense by sea of Great Britain and Ireland shall be undertaken by his Majesty's imperial forces, but this shall not prevent the construction or maintenance by the Government of the Irish Free State of such vessels as are necessary for the protection of the revenue or the fisheries. The foregoing provisions of this article shall be reviewed at a conference of representatives of the British and Irish Governments to be held at the expiration of five years from the date hereof with a view to the undertaking by Ireland of a share in her own coastal defense.

Article VII.—The Government of the Irish Free State shall afford to his Majesty's imperial force (a) in time of peace such harbor and other facilities as are indicated in the annex hereto, or such other facilities as may from time to time be agreed between the British Government and the Government of the Irish Free State, and (b) in time of war or of strained relations with a foreign power such harbour and other facilities as the British Government may require for the purposes of such defense, as aforesaid.

Article VIII.—With a view to securing observance of the principal of international limitation of armaments, if the Government of the Irish Free State establishes and maintains a military defense force, the establishment thereof shall not exceed in size such proportion of the military establishments maintained in Great Britain as that which the population of Ireland bears to the population of Great Britain.

Article IX.—The ports of Great Britain and the Irish Free State shall be freely open to the ships of the other country on the payment of the customary port and other dues.

Article X.—The Government of the Irish Free State agrees to pay fair compensation, on terms not less favorable than those accorded by the Act of 1920, to Judges, officials, members of the police forces and other public servants who are discharged by it or who retire in consequence of the change of government effected in pursuance of the hereof paragraph.

Provided that this agreement shall not apply to members of the auxiliary police force or persons recruited in Great Britain for the Royal Irish Constabulary during the two years next preceding the date hereof. The British Government will assume responsibility for such compensation or pensions as may be payable to any of these excepted persons.

Article XI.—Until the expiration of one month from the passing of the Act of Parliament for the ratification of this instrument, the powers of the Parliament and the Government of the Irish Free State shall not be exercisable as respects Northern Ireland, and the provisions of the Government of Ireland Act of 1920 shall, so far as they relate to Northern Ireland, remain of full force and effect, and no election shall be held for the return of members to serve in the Parliament of the Irish Free State for the constituencies of Northern Ireland unless a resolution is passed by both houses of Parliament of Northern Ireland in favor of holding such elections before the end of said month.

Article XII.—If before the expiration of said month an address is presented to his Majesty by both houses of Parliament of Northern Ireland to that effect, the powers of the Parliament and Government of the Irish Free State shall no longer extend to Northern Ireland, and the provisions of the Government of Ireland Act of 1920 (including those relating to the Council of Ireland) shall, so far as they relate to Northern Ireland, continue to be of full force and effect, and this instrument shall have effect, subject to the necessary modifications.

Provided, that if such an address is so presented, a commission consisting of three persons, one to be appointed by the Government of the Irish Free State, one to be appointed by the Government of Northern Ireland, and one, who shall be

Chairman, to be appointed by the British Government, shall determine in accordance with the wishes of the inhabitants, so far as may be compatible with economic and geographic conditions, the boundaries between Northern Ireland and the rest of Ireland, and for the purposes of the Government of Ireland Act of 1920 and of this instrument the boundary of Northern Ireland shall be such as may be determined by such commission.

Article XIII.—For the purpose of the last foregoing article the powers of the Parliament of Southern Ireland under the Government of Ireland Act of 1920, to elect members of the Council of Ireland, shall, after the Parliament of the Irish Free State is constituted, be exercised by that Parliament.

Article XIV.—After the expiration of said month, if no such address as mentioned in Article XII. hereof is presented, the Parliament of the Government of Northern Ireland shall continue to exercise as respects Northern Ireland the powers conferred upon them by the Government of Ireland Act of 1920, but the Parliament of the Government of the Irish Free State shall in Northern Ireland have in relation to matters, in respect of which the Parliament of Northern Ireland has not the power to make laws under that act (including matters which, under said act, are within the jurisdiction of the Council of Ireland), the same powers as in the rest of Ireland, subject to such other provisions as may be agreed to in the manner hereinafter appearing.

Article XV.—At any time after the date hereof the Government of Northern Ireland and the Provisional Government of Southern Ireland, hereinafter constituted, may meet for the purpose of discussing provisions, subject to which the last of the foregoing article is to operate in the event of no such address as is therein mentioned being presented, and those provisions may include: (a) Safeguards with regard to patronage in Northern Ireland; (b) safeguards with regard to the collection of revenue in Northern Ireland; (c) safeguards with regard to import and export duties affecting the trade and industry of Northern Ireland; (d) safeguards for the minorities in Northern Ireland; (e) settlement of financial relations between Northern Ireland and the Irish Free State; (f) establishment and powers of a local militia in Northern Ireland and the relation of the defense forces of the Irish Free State and of Northern Ireland, respectively, and if at any such meeting provisions are agreed to, the same shall have effect as if they were included among the provisions subject to which the powers of Parliament and of the Government of the Irish Free State are to be exercisable in Northern Ireland under Article XIV. hereof.

Article XVI.—Neither the Parliament of the Irish Free State nor the Parliament of Northern Ireland shall make any law so as either directly or indirectly to endow any religion or prohibit or restrict the free exercise thereof or give any preference or impose any disability on the account of religious belief or religious status, or affect prejudicially the right of any child to attend school receiving public money without attending the religious instruction of the school, or make any discrimination as respects State aid between schools under the management of the different religious denominations, or divert from any religious denomination or any educational institution any of its property except for public utility purposes and on the payment of compensation.

Article XVII.—By way of provisional arrangement for the administration of Southern Ireland during the interval which must elapse between the date hereof and the constitution of a Parliament and a Government of the Irish Free State in accordance therewith, steps shall be taken forthwith for summoning a meeting of the Members of Parliament elected for the constituencies in Southern Ireland since the passing of the Government of Ireland Act in 1920 and for constituting a Provisional Government. And the British Government shall take steps necessary to transfer to such Provisional Government the powers and machinery requisite for the discharge of its duties, provided that every member of such Provisional Government shall have signified in writing his or her acceptance of this instrument. But this arrangement shall not continue in force beyond the expiration of twelve months from the date hereof.

Article XVIII.—This instrument shall be submitted forthwith by his Majesty's Government for the approval of Parliament and by the Irish signatories to a meeting summoned for the purpose of members elected to sit in the House of Commons of Southern Ireland, and, if approved, it shall be ratified by the necessary legislation.

Signed on behalf of the British delegation.

LLOYD GEORGE,
AUSTEN CHAMBERLAIN,
BIRKENHEAD,
WINSTON CHURCHILL,
WORTHINGTON-EVANS,
GORDON HEWART,
HAMAR GREENWOOD.

On behalf of the Irish delegation:

 RIOBARD BARTUN, (ROBERT C. BARTON)
 E. S. DUGAN, (EAMON J. DUGGAN)
 SEORSA GHABGAIN UI DHUBHTHAIGH (GEORGE GAVAN DUFFY).

Dated the 6th of December, 1921.

ANNEX

1. The following are the specific facilities required:

DOCKYARD PORT AT BEREHAVEN—(a) Admiralty property and rights to be retained as at the date hereof. Harbour defences to remain in charge of British care and maintenance parties.

QUEENSTOWN—(b) Harbour defences to remain in charge of British care and maintenance parties. Certain mooring buoys to be retained for use of his Majesty's ships.

BELFAST LOUGH—(c) Harbour defences to remain in charge of British care and maintenance parties.

LOUGH SWILLY—(d) Harbour defences to remain in charge of British care and maintenance parties.

AVIATION—(e) Facilities in the neighbourhood of the above ports for coastal defence by air.

OIL FUEL STORAGE—(f) Haulbowline, Rathmullen—To be offered for sale to commercial companies under guarantee that purchasers shall maintain a certain minimum stock for Admiralty purposes.

2. A Convention shall be made between the British Government and the Government of the Irish Free State to give effect to the following conditions:

(a) That submarine cables shall not be landed or wireless stations for communication with places outside Ireland be established except by agreement with the British Government; that the existing cable landing rights and wireless concessions shall not be withdrawn except by agreement with the British Government, and that the British Government shall be entitled to land additional submarine cables or establish additional wireless stations for communication with places outside Ireland.

(b) That lighthouses, buoys, beacons and any navigational marks or navigational aids shall be maintained by the Government of the Irish Free State as at the date hereof, and shall not be removed or added to except by agreement with the British Government.

(c) That war signal stations shall be closed down and left in charge of care and maintenance parties, the Government of the Irish Free State being offered the option of taking them over and working them for commercial purposes subject to Admiralty inspection and guaranteeing the upkeep of existing telegraphic communication therewith.

3. A Convention shall be made between the same Governments for the regulation of Civil Communication by Air.

IRISH CONSTITUTION.

The text of the Constitution of the Irish Free State was published by the Provisional Government 16 June 1922, on the eve of the polling for the Irish Provisional Parliament elections. The document consists of a preamble and five sections, dealing, respectively, with fundamental rights, legislative provisions, the executive, the judiciary and transitory provisions. The preamble declares that where the treaty and the Constitution shall clash the treaty shall prevail. The official text is as follows:

PRELIMINARY—These presents shall be construed with reference to the Articles of Agreement for a treaty between Great Britain and Ireland set forth in the schedule hereto annexed (hereinafter referred to as "the Scheduled Treaty"), which are hereby given the force of law, and if any provision of this Constitution or of any amendment thereof or of any law made thereunder is in any respect repugnant to any of the provisions of the Scheduled Treaty, it shall, to the extent only of such repugnancy, be absolutely void and inoperative and the Parliament and the Executive Council of the Irish Free State shall respectively pass such further legislation and do all such other things as may be necessary to implement the Scheduled Treaty.

SECTION I.—FUNDAMENTAL RIGHTS

Article 1. The Irish Free State (Saorstát Éireann) is a co-equal member of the Community of Nations forming the British Commonwealth of Nations.

Article 2. All powers of government and all authority, legislative, executive and judicial, are derived from the people and the same shall be exercised in the Irish Free State (Saorstát Éireann) through the organizations established by or under, and in accord with, this Constitution.

Article 3. Every person domiciled in the Irish Free State (Saorstát Éireann) at the time of the coming into operation of this Constitution who was born in Ireland or either of whose parents was born in Ireland or who has been so domiciled in the area of the jurisdiction of the Irish Free State (Saorstát Éireann) for not less than seven years is a citizen of the Irish Free State (Saorstát Éireann) and shall within the limits of the Irish Free State (Saorstát Éireann) enjoy the privileges and be subject to the obligations of such citizenship, provided that any such person being a citizen of another State may elect not to accept the citizenship hereby conferred; and the conditions governing the future acquisition and termination of citizenship in the Irish Free State (Saorstát Éireann) shall be determined by law. Men and women have equal rights as citizens.

Article 4. The national language of the Irish Free State (Saorstát Éireann) is the Irish language, but the English language shall be equally recognized as an official language. Nothing in this article shall prevent special provisions being made by the Parliament (Oireachtas) for districts or areas in which only one language is in use.

Article 5. No title of honor in respect of any services rendered in or in relation to the Irish Free State (Saorstát Éireann) may be conferred on any citizen of the Irish Free State (Saorstát Éireann) except with the approval or upon the advice of the Executive Council of the State.

Article 6. The liberty of the person is inviolable and no person shall be deprived of his liberty except in accordance with law. Upon complaint made by or on behalf of any person that he is being unlawfully detained, the High Court (Ard Chúirt) and any and every Judge thereof shall forthwith inquire into the same and may make an order requiring the person in whose custody such person shall be detained to produce the body of the person so detained before such Court or Judge without delay and to certify in writing as to the cause of the detention and such Court or Judge shall thereupon order the release of such person unless satisfied that he is being detained in accordance with the law.

Article 7. The dwelling of each citizen is inviolable and shall not be forcibly entered except in accordance with law.

Article 8. Freedom of conscience and the free profession and practice of religion are inviolable rights of every citizen, and no law may be made either directly or indirectly to endow any religion, or prohibit or restrict the free exercise thereof or give any preference, or impose any disability, on account of religious belief or religious status, or affect prejudicially the right of any child to attend a school receiving public money without attending the religious instruction at the school, or make any discrimination as respects State aid between schools under the management of different religious denominations, or divert from any religious denomination or any educational institution any of its property except for the purpose of roads, railways, lighting, water or drainage works, or other works of public utility, and on payment of compensation.

Article 9. The right of free expression of opinion as well as the right to assemble peaceably and without arms, and to form associations or unions is guaranteed for purposes not opposed to public morality. Laws regulating the manner in which the right of forming associations and the right of free assembly may be exercised shall contain no political, religious or class distinction.

Article 10. All citizens of the Irish Free State (Saorstát Éireann) have the right to free elementary education.

Article 11. The rights of the State in and to natural resources, the use of which is of national importance, shall not be alienated. Their exploitation by private individuals or associations shall be permitted only under State supervision and in accordance with conditions and regulations approved by legislation.

SECTION II.—LEGISLATIVE PROVISIONS

... The Legislature

Article 12. A Legislature is hereby created to be known as the Parliament of the Irish Free State (Oireachtas). It shall consist of the King and two houses—the Chamber of Deputies (Dail Éireann) and the Senate (Seanad Éireann). The power of making laws for the peace, order and good government of the Irish Free State (Saorstát Éireann) is vested in the Parliament (Oireachtas).

Article 13. The Parliament (Oireachtas) shall sit in or near the City of Dublin or in such other place as from time to time it may determine.

Article 14. All citizens of the Irish Free State (Saorstát Éireann), without distinction of sex, who have reached the age of twenty-one years and who comply with the provisions of the prevailing electoral laws shall have the right to vote for members of the Chamber of Deputies (Dail Éireann), and to take part in the Referendum or Initiative. All citizens of the Irish Free State (Saorstát Éireann), without distinction of sex who have reached the age of 30 years and who comply with the provisions of the prevailing electoral laws shall have the right to vote for members of the Senate (Seanad Éireann). No voter may exercise more than one vote and the voting shall be by secret ballot. The mode and place of exercising this right shall be determined by law.

Article 15. Every citizen who has reached the age of 21 years and who is not placed under disability or incapacity by the Constitution or by law shall be eligible to become a member of the Chamber of Deputies (Dail Éireann).

Article 16. No person may be at the same time a member both of the Chamber (Dail Éireann) and of the Senate (Seanad Éireann).

Article 17. The oath to be taken by members of Parliament (Oireachtas) shall be in the following form:

I do solemnly swear true faith and allegiance to the Constitution of the Irish Free State as by law established, and that I will be faithful to H. M. King George V., his heirs and successors by law in virtue of the common citizenship of Ireland with Great Britain and her adherence to and membership of the group of nations forming the British Commonwealth of Nations. Such oath shall be taken and subscribed by every member of the Parliament (Oireachtas) before taking his seat therein before the representative of the Crown or some person authorized by him.

Article 18. Every member of the Parliament (Oireachtas) shall, except in case of treason, felony or breach of the peace, be privileged from arrest in going to and returning from and while within the precincts of either house, and shall not be amenable to any action or proceeding at law in respect to any utterance in either house.

Article 19. All reports and publications of the Parliament (Oireachtas) or of either house thereof shall be privileged and utterances made in either house wherever published shall be privileged.

Article 20. Each house shall make its own rules and Standing Orders, with power to attach penalties for their infringement, and shall have power to insure freedom of debate, to protect its official documents and the private papers of its members, and to protect itself and its members against any person or persons interfering with, molesting or attempting to corrupt its members in the exercise of their duties.

Article 21. Each house shall elect its own Chairman and Deputy Chairman, and shall prescribe their powers, duties and terms of office.

Article 22. All matters in each house shall, save as otherwise provided by this Constitution, be determined by a majority of the votes of the members present other than the Chairman or presiding member, who shall have and exercise a casting vote in the case of an equality of votes. The number of members necessary to constitute a meeting of either house for the exercise of its powers shall be determined by its Standing Orders.

Article 23. The Parliament (Oireachtas) shall make provision for the payment of its members and may, in addition, provide them with free traveling facilities in any part of Ireland.

Article 24. The Parliament (Oireachtas), shall hold at least one session each year. The Parliament (Oireachtas) shall be summoned and dissolved by the Representative of the Crown in the name of the King, and subject as aforesaid the Chamber (Dail Éireann) shall fix the date of reassembly of the Parliament (Oireachtas) and the date of the conclusion of the session of each house provided that the session of the Senate (Seanad Éireann) shall not be concluded without its own consent.

Article 25.ittings of each house of the Parliament (Oireachtas) shall be public. In cases of special emergency either house may hold a private sitting with the assent of two-thirds of the members present.

B. The Chamber of Deputies (Dail Éireann)

Article 26. The Chamber (Dail Éireann) shall be composed of members who represent constituencies determined by law. The number of members shall be fixed from time to time by the Parliament (Oireachtas), but the total number of members of the Chamber (Dail Éireann), shall not be fixed at less than one member for each thirty thousand of the population, or at more than one member for each twenty thousand of the population: Provided that the proportion between the number of members to be elected at any time for each constituency and the population of each constituency, as ascertained at the last preceding census, shall, so far as possible, be identical throughout the country. The members shall be elected upon principles of proportional representation. The Parliament (Oireachtas) shall revise

the constituencies at least once in every ten years, with due regard to changes in distribution of the population, but any alterations in the constituencies shall not take effect during the life of the Chamber (Dail Éireann) sitting when such revision is made.

Article 27. At a general election for the Chamber (Dail Éireann) the polls shall be held on the same day throughout the country and that day shall be a day not later than thirty days after the date of the dissolution and shall be proclaimed a public holiday. The Chamber (Dail Éireann) shall meet within one month of such day, and shall unless earlier dissolved continue for four years from the date of its first meeting and not longer. The Chamber (Dail Éireann) may not at any time be dissolved except on the advice of the Executive Council.

Article 28. In case of death, resignation or disqualification of a member of the Chamber (Dail Éireann), the vacancy shall be filled by the election in manner to be determined by law.

C. The Senate (Seanad Éireann)

Article 29. The Senate (Seanad Éireann) shall be composed of citizens who have done honor to the nation by reason of useful public service or who, because of special qualifications or attainments, represent important aspects of the nation's life.

Article 30. Every university in the Irish Free State (Saorstát Éireann) shall be entitled to elect two representatives to the Senate (Seanad Éireann). The number of Senators exclusive of university members shall be fifty-six. A citizen to be eligible for membership of the Senate (Seanad) must be a person eligible to become a member of the Chamber (Dail Éireann) and must have reached the age of 35 years. Subject to any provision for the constitution of the first Senate (Seanad) the term of office of a member of the Senate (Seanad) shall be twelve years.

Article 31. One-fourth of the members of the Senate (Seanad Éireann) exclusive of the university members shall be elected every three years from a panel constituted as hereinafter mentioned at an election at which the Irish Free State (Saorstát Éireann) shall form one electoral area, and the elections shall be held on principles of proportional representation. One member shall be elected by each university entitled to representation in the Senate (Seanad) every six years.

Article 32. Before each election of members of the Senate (Seanad Éireann)—other than university members—a panel shall be formed consisting of—

(a) Three times as many qualified persons as there are members to be elected, of whom two-thirds shall be nominated by the Chamber (Dail Éireann), voting according to principles of proportional representation, and one-third shall be nominated by the Senate (Seanad Éireann) voting according to principles of proportional representation, and

(b) Such persons who have at any time been members of the Senate (Seanad)—including members about to retire—as signify by notice in writing addressed to the President of the Executive Council their desire to be included in the panel.

The method of proposal and selection for nomination shall be decided by the Chamber (Dail Éireann) and Senate (Seanad), respectively, with special reference to the necessity for arranging for the representation of important interests and institutions in the country; provided that each proposal shall be in writing and shall state the qualifications of the person proposed. As soon as the panel has been formed a list of the names of the members of the panel arranged in alphabetical order with their qualifications shall be published.

Article 33. In case of the death, resignation, or disqualification of a member of the Senate (Seanad Éireann)—other than a university member—his place shall be filled by a vote of the Senate (Seanad). Any Senator so chosen shall retire from office at the conclusion of the three-year period then running and the vacancy or vacancies thus created shall be additional to the places to be filled under Article 31. The term of office of the members chosen at the election after the first fourteen elected shall conclude at the end of the period or periods at which the Senator or Senators by whose death or withdrawal the vacancy or vacancies was or were originally created would be due to retire; provided that the fifteenth member shall be deemed to have filled the vacancy first created in order of time and so on.

In case of death, resignation or disqualification of a university member of the Senate (Seanad), the university by which he was elected shall elect a person to fill his place, and the member so elected shall hold office so long as the member in whose place he was elected would have held office.

D. Legislation

Article 34. The Chamber (Dail Éireann) shall in relation to the subject matter of money bills, as hereinafter defined, have legislative authority exclusive of the Senate (Seanad Éireann).

A money bill means a bill which contains only provisions dealing with all or any of the following subjects—namely,

the imposition, repeal, remission, alteration or regulation of taxation; the imposition for the payment of debt or other financial purposes of charges on public moneys, or the variation or repeal of any such charges; supply; the appropriation, receipt, custody, issue or audit of accounts of public money; the raising or guarantee of any loan or the payment thereof; subordinate matters incidental to those subjects or any of them. In this definition the expressions "taxation," "public money," and "loan," respectively, do not include any taxation, money or loan raised by local authorities or bodies for local purposes.

The Chairman of the Chamber (Dail) shall certify any bill which in his opinion is a money bill to be a money bill, but if within three days after a bill has been passed by the Chamber (Dail) two-fifths of the members of either house by notice in writing addressed to the Chairman of the house of which they are members so require, the question whether the bill is or is not a money bill shall be referred to a Committee of Privileges consisting of three members elected by each House with Chairman, who shall be the Senior Judge of the Supreme Court able and willing to act, and who, in the case of an equality of votes, but not otherwise, shall be entitled to vote. The decision of the committee on the question shall be final and conclusive.

Article 35. The Chamber (Dail Eireann) shall as soon as possible after the commencement of each financial year consider the budget of receipts and expenditure of the Irish Free State (Saorstát Eireann) for that year, and, save in so far as may be provided by specific enactment in each case, the legislation required to give effect to the budget of each year shall be enacted within that year.

Article 36. Money shall not be appropriated by vote, resolution, or law, unless the purpose of the appropriation has in the same session been recommended by a message from the Representative of the Crown acting on the advice of the Executive Council.

Article 37. Every bill initiated in and passed by the Chamber (Dail Eireann) shall be sent to the Senate (Seanad Eireann), and may, unless it be a money bill, be amended in the Senate (Seanad Eireann), and the Chamber (Dail Eireann) shall consider any such amendment; but a bill passed by the Chamber (Dail Eireann) and considered by the Senate (Seanad Eireann) shall, not later than two hundred and seventy days after it shall have been first sent to the Senate (Seanad), or such longer period as may be agreed upon by the two houses, be deemed to be passed by both houses in its form as last passed by the Chamber (Dail); provided that any money bill shall be sent to the Senate (Seanad) for its recommendations and at a period not longer than fourteen days after it shall have been sent to the Senate (Seanad), it shall be returned to the Chamber (Dail), which may pass it, accepting or rejecting all or any of the recommendations of the Senate (Seanad), and as so passed shall be deemed to have been passed by both houses. When a bill other than a money bill has been sent to the Senate (Seanad) a joint sitting of the members of both houses may, on a resolution passed by the Senate (Seanad), be convened for the purpose of debating, but not of voting upon, the proposals of the bill or any amendment of the same.

Article 38. A bill may be initiated in the Senate (Seanad Eireann) and if passed by the Senate (Seanad) shall be introduced into the Chamber (Dail Eireann). If amended by the Chamber (Dail) the bill shall be considered as a bill initiated in the Chamber (Dail). If rejected by the Chamber (Dail) it shall not be introduced again in the same session, but the Chamber (Dail) may reconsider it on its own motion.

Article 39. A bill passed by either house and accepted by the other house shall be deemed to be passed by both houses.

Article 40. So soon as any bill shall have been passed or deemed to have been passed by both houses, the Executive Council shall present the same to the representative of the Crown for the signification by him, in the King's name, of the King's assent, and such representative may withhold the King's assent or reserve the bill for the signification of the King's pleasure; provided that the representative of the Crown shall in withholding of such assent or the reservation of any bill, act in accordance with the law, practice and constitutional usage governing the like withholding of assent or reservation in the Dominion of Canada.

A bill reserved for the signification of the King's pleasure shall not have any force unless and until within one year from the day on which it was presented to the representative of the Crown for the King's assent, the representative of the Crown signifies by speech or message to each of the houses of the Parliament (Oireachtas), or by proclamation, that it has received the assent of the King in Council.

An entry of every such speech, message or proclamation shall be made in the Journal of each house and a duplicate thereof, duly attested, shall be delivered to the proper officer to be kept among the records of the Irish Free State (Saorstát Eireann).

Article 41. As soon as may be after any law has received the King's assent, the clerk, or such officer as the Chamber may appoint for the purpose, shall cause two fair copies

of such law to be made, one being in the Irish language and the other in the English language, one of which copies shall be signed by the representative of the Crown to be enrolled for record in the office of such officer of the Supreme Court as the Chamber (Dail Eireann) may determine, and such copies shall be conclusive evidence as to the provisions of every such law, and in case of conflict between the two copies so deposited; that signed by the representative of the Crown shall prevail.

Article 42. The Parliament (Oireachtas) shall have no power to declare acts to be infringements of the law which were not so at the date of their commission.

Article 43. The Parliament (Oireachtas) may create subordinate legislatures but it shall not confer thereon any powers in respect of the navy, army or air force, alienage or naturalization, coinage, legal tender, trade marks, designs, merchandise marks, copyright, patent rights, weights and measures, submarine cables, wireless telegraphy, Post Office, railways, aerial navigation, customs and excise.

Article 44. The Parliament (Oireachtas) may provide for the establishment of functional or vocational councils representing branches of the social and economic life of the nation. A law establishing any such council shall determine its powers, rights and duties, and its relation to the Government of the Irish Free State (Saorstát Eireann).

Article 45. The Parliament (Oireachtas) has the exclusive right to regulate the raising and maintaining of such armed forces as are mentioned in the Scheduled Treaty in the territory of the Irish Free State (Saorstát) and every such force shall be subject to the control of the Parliament (Oireachtas).

E. Referendum and Initiative

Article 46. Any bill passed or deemed to have been passed by both houses may be suspended for a period of ninety days on the written demand of two-fifths of the members of the Chamber (Dail Eireann) or of a majority of the members of the Senate (Seanad Eireann) presented to the President of the Executive Council not later than seven days from the day on which such bill shall have been so passed or deemed to have been so passed. Such a bill shall be submitted by referendum to the decision of the people if demanded before the expiration of the ninety days, either by a resolution of the Senate (Seanad Eireann) assented to by three-fifths of the members of the Senate (Seanad Eireann) or by a petition signed by not less than one-twentieth of the voters then on the register of voters, and the decision of the people on such referendum shall be conclusive. These provisions shall not apply to money bills or to such bills as shall be declared by both houses to be necessary for the immediate preservation of the public peace, health or safety.

Article 47. The Parliament (Oireachtas) may provide for the initiation by the people of proposals for laws or constitutional amendments. Should the Parliament (Oireachtas) fail to make such provision within two years, it shall on the petition of not less than 100,000 voters on the register, of whom not more than 20,000 shall be voters in any one constituency, either make such provisions or submit the question to the people for decision in accordance with the ordinary regulations governing the referendum. Any legislation passed by the Parliament (Oireachtas) providing for such initiation by the people shall provide (1) that such proposals may be initiated on a petition of 50,000 voters on the register, (2) that if the Parliament (Oireachtas) rejects a proposal so initiated, it shall be submitted to the people for decision in accordance with the ordinary regulations governing the referendum; and (3) that if the Parliament (Oireachtas) enacts a proposal so initiated, such enactment shall be subject to the provisions respecting ordinary legislation or amendments of the Constitution as the case may be.

Article 48. Save in the case of actual invasion, the Irish Free State (Saorstát Eireann) shall not be committed to active participation in any war without the assent of the Parliament (Oireachtas).

Article 49. Amendments of this Constitution within the terms of the Scheduled Treaty may be made by the Parliament (Oireachtas), but every such amendment must be submitted to a referendum of the people; and shall not be passed unless a majority of the voters on the register record their votes and either a majority of the voters on the register or two-thirds of the votes recorded are in favor of the amendment.

SECTION III.—THE EXECUTIVE

E. Executive Council (Aireacht)

Article 50. The Executive Authority of the Irish Free State (Saorstát Eireann) is hereby declared to be vested in the King, and shall be exercisable, in accordance with the law, practice and constitutional usage governing the exercise of the executive authority in the case of the Dominion of Canada, by the Representative of the Crown. There shall be a Council to aid and advise in the government of

the Irish Free State (Saorstát Éireann) to be styled the Executive Council (Aireacht). The Executive Council shall be responsible to the Chamber (Dail Éireann), and shall consist of not more than twelve Ministers (Ain) appointed by the Representative of the Crown, of whom four Ministers shall be members of the Chamber (Dail Éireann) and a number not exceeding eight, chosen from all citizens eligible for election to the Chamber (Dail Éireann), who shall not be members of Parliament (Oireachtas) during their term of office, and who, if at the time of their appointment they are members of Parliament (Oireachtas), shall by virtue of such appointment vacate their seats; provided that the Chamber (Dail Éireann) may from time to time on the motion of the President of the Executive Council determine that a particular Minister or Ministers not exceeding three may be members of Parliament (Oireachtas) in addition to the four members of the Chamber (Dail Éireann) above mentioned.

Article 51. The Ministers who are required to be members of the Chamber (Dail Éireann) shall include the President of the Executive Council (Uachtarán) and the Vice President of the Executive Council (Tánaistí). The President of the Executive Council shall be the chief of the Executive Council and shall be appointed on the nomination of the Chamber (Dail), and the Vice President of the Executive Council and the other Ministers who are members of Parliament (Oireachtas) shall be appointed on the nomination of the President of the Executive Council; and he and the Ministers nominated by him shall retire from office should he fail to be supported by a majority in the Chamber (Dail), but the President of the Executive Council and such Ministers shall continue to carry on their duties until their successors are appointed.

Article 52. Ministers who are not members of the Parliament (Oireachtas) shall be nominated by a committee of members of the Chamber (Dail Éireann) chosen by a method to be determined by the Chamber (Dail) so as to be impartially chosen with due regard to their suitability for office and should so far as possible be generally representative of the Irish Free State (Saorstát Éireann) as a whole rather than of groups or of parties. Should a nomination not be acceptable to the Chamber (Dail), the committee shall continue to propose names until one is found acceptable.

Article 53. Each Minister not a member of the Parliament (Oireachtas) shall be the responsible head of the Executive Department or Departments as head of which he has been appointed as aforesaid; provided that should arrangements for functional or vocational councils be made by the Parliament (Oireachtas) these Ministers or any of them may, should the Parliament (Oireachtas) so decide, be members of and be nominated on the advice of such councils. The term of office of any such Minister shall be the term of the Chamber (Dail Éireann) existing at the time of his appointment or such other period as may be fixed by law, but he shall continue in office until his successor shall have been appointed; and no such Minister shall be removed from office during his term unless the proposal to remove him has been previously submitted to a committee chosen by a method to be determined by the Chamber (Dail) so as to be impartially representative of the Chamber (Dail) and then only if the committee shall have reported that such Minister has been guilty of malfeasance in office or has not been performing his duties in a competent and satisfactory manner, or has failed to carry out the lawfully expressed will of Parliament (Oireachtas).

Article 54. The Ministers who are members of the Parliament (Oireachtas) shall alone be responsible for all matters relating to external affairs, whether policy, negotiations, or executive acts. Subject to the foregoing provisions, the Executive Council shall meet and act as a collective authority; provided, however, that each Minister shall be individually responsible to the Chamber (Dail Éireann) for the administration of the department or departments of which he is head.

Article 55. Ministers who are not members of the Chamber (Dail Éireann) shall by virtue of their office possess all the rights and privileges of a member of the Chamber (Dail) except the right of vote, and shall, if not members of the Parliament (Oireachtas), comply with the provisions of Article 17 as if they were members of the Chamber (Dail) and may be required by the Chamber (Dail) to attend and answer questions.

Article 56. Should the President of the Executive Council die, resign, or be permanently incapacitated, the Vice President of the Executive Council shall act in his place until a President of the Executive Council shall be elected. The Vice President of the Executive Council shall also act in the place of the President of the Executive Council during his temporary absence.

Article 57. The members of the Executive Council shall receive such remuneration as may from time to time be prescribed by law, but the remuneration of any Minister shall not be diminished during his term of office.

Article 58. The Representative of the Crown, who shall be styled the Governor General of the Irish Free State, shall be appointed in like manner as the Governor General of Canada and in accordance with the practice observed in the

making of such appointments. The salary of the Governor General of the Irish Free State shall be of the like amount as that now payable to the Governor General of the Commonwealth of Australia, and shall be charged on the public funds of the Irish Free State (Saorstát Éireann) and suitable provision shall be made out of those funds for the maintenance of his official residence and establishment.

Article 59. The Executive Council shall prepare the budget of receipts and expenditure of the Irish Free State (Saorstát Éireann) for each financial year and shall present it to the Chamber (Dail Éireann) before the close of the previous financial year.

B. Financial Control

Article 60. All revenues of the Irish Free State (Saorstát Éireann), from whatever source arising, shall, subject to such exceptions as may be provided by law, form one fund, and shall be appropriated for the purposes of the Irish Free State (Saorstát Éireann) in the manner and subject to the charges and liabilities imposed by law.

Article 61. The Chamber (Dail Éireann) shall appoint a Comptroller and Auditor General to act on behalf of the Irish Free State (Saorstát Éireann). He shall control all disbursements and shall audit all accounts of moneys administered by or under the authority of the Parliament (Oireachtas) and shall report to the Chamber (Dail) at stated periods to be determined by law.

Article 62. The Comptroller and Auditor General shall not be removed except for stated misbehavior or incapacity on resolutions passed by the Chamber (Dail Éireann) and the Senate (Seanad Éireann). Subject to this provision the terms and conditions of his tenure of office shall be fixed by law. He shall not be a member of the Parliament (Oireachtas) nor shall he hold any other office or position of emolument.

SECTION IV. THE JUDICIARY

Article 63. The judicial power of the Irish Free State (Saorstát Éireann) shall be exercised and justice administered in the public courts established by Parliament (Oireachtas) by Judges appointed in manner hereinafter provided. These courts shall comprise Courts of First Instance and a Court of Final Appeal to be called the Supreme Court (Cúirt Uachtarach). The Courts of First Instance shall include a High Court (Ard Chúirt), invested with full original jurisdiction in and power to determine all matters and questions whether of law or fact, civil or criminal, and also courts of local and limited jurisdiction with a right of appeal as determined by law.

Article 64. The judicial power of the High Court shall extend to the question of the validity of any law having regard to the provisions of the Constitution. In all cases in which such matters shall come into question, the High Court alone shall exercise original jurisdiction.

Article 65. The Supreme Court of the Irish Free State (Saorstát Éireann) shall, with such exceptions (not including cases which involve questions as to the validity of any law), and subject to such regulations as may be prescribed by law, have appellate jurisdiction from all decisions of the High Court. The decision of the Supreme Court shall in all cases be final and conclusive, and shall not be reviewed or capable of being reviewed by any other court, tribunal or authority whatsoever.

Provided that nothing in this Constitution shall impair the right of any person to petition his Majesty for special leave to appeal from the Supreme Court to his Majesty in Council or the right of his Majesty to grant such leave.

Article 66. The number of Judges, the constitution and organization of, and distribution of business and jurisdiction among the said courts and Judges, and all matters of procedure shall be as prescribed by the laws for the time being in force and the regulations made thereunder.

Article 67. The Judges of the Supreme Court and of the High Court and of all other courts established in pursuance of this Constitution shall be appointed by the Representative of the Crown on the advice of the Executive Council. The Judges of the Supreme Court and of the High Court shall not be removed except for stated misbehavior or incapacity, and then only by resolutions passed by both the Chamber (Dail Éireann) and the Senate (Seanad Éireann). The age of retirement, the remuneration and the pension of such Judges on retirement, and the declarations to be taken by them on appointment, shall be prescribed by law. Such remuneration may not be diminished during their continuance in office. The terms of appointment of the Judges of such other courts as may be created shall be prescribed by law.

Article 68. All Judges shall be independent in the exercise of their functions and subject only to the Constitution and the law. A Judge shall not be eligible to sit in Parliament (Oireachtas) and shall not hold any other office or position of emolument.

Article 69. No one shall be tried save in due course of law, and extraordinary courts shall not be established. The jurisdiction of courts-martial shall not be extended to or exercised over the civil population save in time of war, and for acts committed in time of war, and in accordance with

the regulations to be prescribed by law. Such jurisdiction shall not be exercised in any area in which the civil courts are open or capable of being held, and no person shall be removed from one area to another for the purpose of creating such jurisdiction.

Article 70. A member of the armed forces of the Irish Free State (Saorstát Éireann) not on active service shall not be tried by any court-martial for an offense cognizable by the civil courts.

Article 71. No person shall, save in case of summary jurisdiction prescribed by law for minor offences, be tried without a jury on any criminal charge.

SECTION V. TRANSITORY PROVISIONS

Article 72. Subject to this Constitution and to the extent to which they are not inconsistent therewith, the laws in force in the Irish Free State (Saorstát Éireann) at the date of the coming into operation of this Constitution shall continue to be of full force and effect until the same or any of them shall have been repealed or amended by enactment of the Parliament (Oireachtas).

Article 73. Until courts have been established for the Irish Free State (Saorstát Éireann) in accordance with this Constitution, the Supreme Court of Judicature, County Courts, Courts of Quarter Session and Courts of Summary Jurisdiction, as at present existing, shall for the time being continue to exercise the same jurisdiction as heretofore, and any Judge or Justice, being a member of any such court, holding office at the time when this Constitution comes into operation, shall for the time being continue to be a member thereof and hold office by the like tenure and upon the like terms as heretofore, unless, in the case of a Judge of the said Supreme Court or of a County Court, he signifies to the Representative of the Crown his desire to resign. Any vacancies in any of the said courts so continued may be filled by appointment made in like manner as appointments to Judgeships in the courts established under this Constitution.

Provided that the provisions of Article 65 as to the decisions of the Supreme Court established under this Constitution shall apply to decisions of the Court of Appeal continued by this article.

Article 74.—If any Judge of the said Supreme Court of Judicature or any of the said County Courts resigns as aforesaid, or if any Judge, on the establishment of courts under this Constitution, is not with his consent appointed to be a Judge of any such court, he shall, for the purpose of Article 10 of the Scheduled Treaty, be treated as if he had retired in consequence of the change of government effected in pursuance of the said treaty, but the rights so conferred shall be without prejudice to any rights or claims that he may have against the British Government.

Article 75.—Every existing officer of the Provisional Government who has been transferred to that Government from the British Government, and every existing officer of the British Government who, at the date of the coming into operation of this Constitution, is engaged or employed in the administration of public services which on that date become public services of the Irish Free State (Saorstát Éireann)—except those whose services have been lent by the British Government to the Provisional Government—shall on that date be transferred to and become an officer of the Irish Free State (Saorstát Éireann) and shall hold office by a tenure, and shall be entitled to the benefit of Article 10 of the Scheduled Treaty.

Article 76.—As respects departmental property, assets, rights, and liabilities, the Government of the Irish Free State (Saorstát Éireann) shall be regarded as the successors of the Provisional Government, and, to the extent to which functions of any department of the British Government become functions of the Government of the Irish Free State (Saorstát Éireann), as the successors of such department of the British Government.

Article 77.—After the date on which this Constitution comes into operation, the House of Parliament elected in pursuance of the Irish Free State (Agreement) act, 1922 (being the Constituent Assembly for the settlement of this Constitution), may, for a period not exceeding one year from that date, but subject to compliance by the members thereof with the provisions of Article 17 of this Constitution exercise all the powers and authorities conferred on the Chamber (Dail Éireann) by this Constitution, and the first election for the Chamber (Dail Éireann) under Articles 26 and 27 hereof shall take place as soon as possible after the expiration of such period.

Article 78.—The first Senate (Seanad Éireann) shall be constituted immediately after the coming into operation of this Constitution in the manner following, that is to say:

(a) The first Senate (Seanad) shall consist of two members elected by each of the universities in the Irish Free State (Saorstát Éireann) and fifty-six other members, of whom twenty-eight shall be elected and twenty-eight shall be nominated.

(b) The twenty-eight nominated members of the Senate (Seanad) shall be nominated by the President of the Executive Council, who shall, in making such nominations, have

special regard to the providing of representation for groups or parties not then adequately represented in the Chamber (Dail Éireann).

(c) The twenty-eight elected members of the Senate (Seanad), shall be elected by the Chamber (Dail Éireann) voting on principles of proportional representation.

(d) Of the university members, one member elected by each university to be selected by lot, shall hold office for six years; the remaining university members shall hold office for the full period of twelve years.

(e) Of the twenty-eight nominated members, fourteen, to be selected by lot, shall hold office for the full period of twelve years; the remaining fourteen shall hold office for the period of six years.

(f) Of the twenty-eight elected members, the first fourteen elected shall hold office for the period of nine years, the remaining fourteen shall hold office for the period of three years.

(g) At the termination of the period of office of any such members, members shall be elected in their place in manner provided by Article 31.

(h) Casual vacancies shall be filled in manner provided by Article 33.

(i) For the purpose of the election of members for any university under this article, all persons whose names appear on the register for the university in force at the date of the coming into operation of this Constitution shall, notwithstanding anything in Article 14, be entitled to vote.

Article 79.—The passing and adoption of this Constitution by the Constituent Assembly and the British Parliament shall be announced as soon as may be, and not later than the sixth day of December, nineteen hundred and twenty-two, by Proclamation of the Majesty, and this Constitution shall come into operation on the issue of such proclamation.

History.—In the long annals of Ireland, the year 1922 will ever be considered, of all years, the most dramatic and decisive. On 6 Dec. 1921, there had been signed a treaty of peace between the British government of which David Lloyd George was Prime Minister and certain Irish leaders among whom Arthur Griffith and Michael Collins were the outstanding personalities. By the terms of this treaty, which are set out elsewhere, Ireland was established as a Free State, with the sovereignty of the Dominion of Canada, a constitution of her own, and complete control of her domestic affairs, including finance, currency, defence, education, post office, railways and land purchase. She may apply for a seat in the League of Nations and maintain diplomatic and consular representatives abroad. For one year, the Irish Free State would exist as a provisional government but during that period, elections were to be held and if the treaty were ratified by such a vote of the people, the new Dominion would be formally inaugurated on 6 Dec. 1922. The steps by which this result was achieved may be briefly stated. In 1918, elections had been held after the Armistice, throughout the entire United Kingdom. Those Irish members, however, who belonged to the Sinn Féin Party, had declined to take their seats in the Imperial Parliament at Westminster and had declared themselves an Irish parliament, or Dail Éireann, sitting in Dublin. On 7 Jan. 1922, the Dail Éireann ratified the treaty by 64 votes to 57. Three days later, the Dail Éireann met as the Southern Parliament of Ireland which again ratified the treaty on 14 January. On 16 January, Lord Fitzalan, Ireland's last lord lieutenant and her only lord lieutenant of the Roman Catholic faith, handed over the keys of Dublin Castle to the Provisional Government and there began that evacuation of Ireland by British troops which is now complete. The Bank of Ireland financed the new government with a loan of £1,000,000. In March, the Imperial Parliament, both Lords and Commons, passed the legislation which constitutes the Irish Free

State, the vote in the House of Commons being 295 in favor and 52 against. On 15 June, the text of the Irish Free State constitution was published, and on the next day, elections in Ireland resulted in a majority for the Free State, of 58 members to 36. On 9 September, the new parliament met in Dublin and on the 21st passed the second reading of the constitution bill by 47 votes to 16. On 25 October, that bill completed its final stages in the Southern Parliament. In Great Britain, Andrew Bonar Law had succeeded David Lloyd George as Prime Minister, and on 15 November, a new Imperial Parliament had been elected with a large Conservative majority. This parliament was immediately summoned and, on 4 December, carried the final legislation, necessitated by the Irish treaty. On 6 December, the Irish Free State was thus established, the office of "Chief Secretary to the Lord Lieutenant of Ireland," ceased to be, the Union Jack was superseded by the tricolor—orange, white and green; and Timothy M. Healy, an Irish Nationalist and Roman Catholic, was appointed to be Governor-General. On 18 December, the Irish Parliament, now completely recognized, passed "an Adaptation of Enactments Bill," the first Irish statute to become law in 123 years.

While these complicated formalities were proceeding, Ireland herself was rent by embittered controversy. When the year opened, the president of the Dail Eireann was Eamonn de Valera who had returned from a prolonged visit to the United States where he had sought recognition of Ireland as an independent republic. De Valera joined in the negotiations with the British government but dissented from the treaty. On 4 January, he declared his opposition and when the treaty was accepted by the Dail Eireann, De Valera refused to carry it out and he was succeeded as president by Arthur Griffith, with whom was Michael Collins, as chief executive. Under the treaty, Great Britain had released many political prisoners and De Valera represented a powerful body of republican extremists, including many units of the so-called "irregular army." There was an endeavor to hold the Sinn Fein Party united for the treaty and with this object in view, the elections were postponed for three months. But these conciliatory efforts failed. De Valera was influenced by "an Englishman" called Erskine Childers, who with his wife, a Boston lady of great ability, had espoused the Irish cause. Childers drafted the so-called "Document Two" which was his version of what the treaty should have been. It is, perhaps, enough to compare the oath of allegiance as determined by the treaty with the oath, as drafted by Childers and De Valera:

THE TREATY

I do solemnly swear true faith and allegiance to the Constitution of the Irish Free State as by law established, and that I will be faithful to H. M. King George V., his heirs and successors by law, in virtue of the common citizenship of Ireland with Great Britain and her adherence to and membership of the group of nations forming the British Commonwealth of Nations.

THE ALTERNATIVE

I do swear to bear true faith and allegiance to the Constitution of Ireland and the Treaty of Association of Ireland with the British community of nations and to recognize the King of Great Britain as head of the Associated States.

To the Irish Republicans, any form of allegiance to Great Britain or her king was repugnant, and in deference to this sentiment, the Sovereign did not call upon Mr. Healy to "kiss hands" on his appointment as Governor-General. By the reprisals, inflicted on Ireland before the treaty was negotiated, deep feelings against Britain had been aroused, and it was argued by the dissentients that the treaty was only accepted by the Irish delegates in London under threats of further military repression on the part of the special troops, known as "Black and Tans." Another and profound disappointment to the Republicans was the loss, under the treaty, of the six counties in eastern Ulster which include Belfast. By boycott and various methods of penetration, Sinn Fein had hoped to compel these counties to throw in their lot with the rest of Ireland, but in Belfast, a separate Parliament had been opened in state by the King; the six counties still send their members to the Imperial Parliament at Westminster; and in December, they exercised their option to remain outside the Irish Free State. The Governor-General of Northern Ireland is the Duke of Abercorn, a Conservative and a landlord, while the Prime Minister is another Conservative, Sir James Craig. The first of the tasks to be faced by Collins and Griffith was thus to abate the quarrel between Northern and Southern Ireland. The employers of Belfast, who as a rule are Protestants, were accused of discriminating against Catholic workers and there were also inflammatory disorders along the still unsettled border. In March, there were negotiations which, on the whole, enabled the two Irish States to reach a *modus vivendi*. But there remains the practical difficulty of dealing with customs in a divided Ireland. On land, the border is 225 miles long. It is crossed by at least 20 lines of railway. And in eight miles, one of these lines crosses the border six times. Owing to the troubles, it was not possible to take the usual decennial census, falling due in 1921, but in 1911, the population of Ireland was 4,390,219. About 1,200,000 of these inhabitants live in northern Ireland, that is, the six counties, as delimited, leaving to the Free State a population of little more than 3,000,000—so grave as this are the practical inconveniences of the partition. In the Irish elections, de Valera suffered a decisive reverse. In his own constituency, Erskine Childers himself obtained but a small vote. The Republicans, therefore, had two courses open to them—the first was to take their seats in the new Dail Eireann and form the regular parliamentary opposition; the second was, if a term familiar in Indian politics may be applied, to "non-co-operate." This latter was the course adopted. De Valera and his followers left the Dail Eireann severely alone and the opposition there consists of Labor, led by Tom Johnson, on law-abiding lines. As stated in his manifestos, the position of De Valera was that the only authority to be recognized in Ireland is the republic of which he was "President," that the Dail Eireann, existing on 1 Jan. 1922, still exists, that the Free State and its courts of law were an usurpation and that the Free State army is in rebellion against Ireland's independent sovereignty. In April, it was evident that serious disorders must be ex-

pected and after that month, civil war rapidly developed. Railways, roads, bridges and telegraphs were destroyed. Banks, post offices and mails were robbed. Retail stores were often looted and many private houses burned to the ground. In November, the estimate of damage was no less than £10,000,000, a figure which seems scarcely credible. The insurgents have had to be driven from Limerick, Waterford and Cork, while in Dublin, one of the glories of the city, the Four Courts, with its irreplaceable records, was seized by irregulars, under the leadership of Roderick or "Rory" O'Connor and Liam Mellows. The building was besieged by Free State troops, and on 30 June, it fell, but only after destruction by fire. The war has included many personal tragedies. Field Marshall Sir Henry Wilson, a member of the British Parliament and one of Britain's leading generals during the war, had been appointed military adviser to Northern Ireland. On 22 June, he was shot on his doorstep in London. With great solemnity, he was buried in Saint Paul's cathedral, near Wellington and Nelson. The young men, Reginald Dunn and Joseph O'Sullivan who committed the murder were hung. In August, Arthur Griffith, the president of the Irish Free State, died of influenza. It was he who, more than any man, had thought out the Sinn Féin policy and recommended it to the Irish People. By that time, De Valera was again "on the run," that is in hiding, and in an attempt to escape arrest, his secretary, Harry Boland, well-known in the United States, was fatally wounded. On 21 August, the Republicans avenged him. Michael Collins was ambushed and slain near Bandon. In November, the leader of the ambush, Tom Hales, was himself captured, but it was too late to undo his deed. The world was the more deeply stirred by the death of Collins because it had just been announced that he was betrothed to Miss Kitty Kiernan, a charming girl, whose home was in County Longford. Griffith and Collins were succeeded by W. T. Cosgrave as president of the Dail Eireann, and Richard Mulcahy as minister of defense.

The Irish Free State was now fighting for its existence. After the assassination of Sir Henry Wilson, the British government had suggested that measures against the irregulars must be taken. Not less insistent was the Roman Catholic hierarchy. On 10 October, the bishops met at Saint Patrick's College, Maynooth, and declared that "the killing of national soldiers is murder before God." Those who took part in the disorders "are guilty of the gravest sins and may not be absolved in confession or admitted to Holy Communion." Priests sympathizing with the irregularity would be "false to their sacred office and guilty of the gravest scandal" and were threatened with suspension. On the 19th, the Pope addressed to King George a personal message in which he supported peace. On 18 September, Archbishop Michael I. Curley of Baltimore issued a manifesto, denouncing "De Valera and his wreckers." A decision was also reached on the question whether the consolations of religion should be extended to hunger strikers. On 4 November, Mary MacSwiney, the sister of Terence

MacSwiney, lord mayor of Cork, who, in 1920, had starved himself to death in a London prison, was herself arrested by the Irish Free State. She also went on hunger strike in Mountjoy Prison, Dublin, and her sister, Annie, commenced a similar ordeal at the prison gates. In Washington, D. C., Mrs. Terence MacSwiney was arrested for picketing the British Embassy, but was quickly released; while the American Association for the Recognition of the Irish Republic picketed the British Consulate in New York. To Mary MacSwiney, the sacraments were refused, and Father Dominic O'Connor, spiritual adviser to Terence MacSwiney, when in prison, was ordered to undertake mission work in Central Oregon. Neither of the sisters of MacSwiney was permitted to die.

Early in October, the Free State offered complete amnesty to those rebels who should surrender their arms before the 14th day of that month. The Republicans ignored this offer, and on 10 November, at Wicklow, Erskine Childers was captured, with firearms on him. The Dail Eireann had authorized the military tribunals to punish all such offenders with death. By appealing to the British law of habeas corpus, an attempt was made, not however with his consent, to save Childers, who to the end claimed that he was no Englishman, but Irish. On the 24th he was executed and the Dail Eireann supported the authorities responsible for this stern action. To Winston Churchill, Erskine Childers was, like Roger Casement, a "mischievous murderous renegade." He was certainly a man who, like Casement, had eaten England's salt, yet his career was illuminated with a certain romantic heroism. Born in 1870 he was educated at Haileybury and Trinity College, Cambridge. Against Germany, he served in the Royal Navy Air Service and was decorated with the Distinguished Service Cross. At one time, he was a clerk of the House of Commons—a post of great honor in the civil service—and his book 'The Riddle of the Sands' aroused Britain to the German peril. He contributed more over the fifth volume to the 'Official History of South Africa.' Like Parnell, he had Protestant Irish blood in his veins, and it was he who, in his yacht, conducted the famous gun-running venture into Lowth. His uncle was Chancellor of the Exchequer in Gladstone's government of 1880, and his wife, a daughter of Dr. Hamilton Osgood of Boston, belongs to the family of John Hancock who signed the Declaration of Independence. A confirmed invalid, she exercised an influence over the Republicans in Ireland which was the more powerful because it was unobtrusive.

It was amid many disorders, therefore, that the Irish Free State was brought to the birth. The ceremonial was reduced to the utmost simplicity and was marred by further assassinations. Deputy Sean Hales, said to be brother of Tom Hales, the irregular, who led the ambush against Collins, was a Free Stater. On his way to the Dail Eireann, he was shot dead in the streets of Dublin, and Padraic O'maille, chairman of the Dail, was wounded. The houses of deputies and of officials were burned. As deterrent reprisals, the government, on 8 December, immediately executed four rebels, held in prison.

of whom two, Rory O'Connor and "General" Liam Mellows had been captured in the Four Courts. On 19 December, a further seven men were executed for wrecking trains.

Not the least remarkable feature of the outrages was the sympathy of many women with the extremists. Immune from search, there were girls who carried arms for the irregulars to use in their desperate guerilla warfare. Among the wilder ideas, against which there had to be safeguards, was a plot to kidnap the whole Dail.

As the year closed, there came, with Christmas, a hope of peace. About 10,000 prisoners crowded the jails, but of these, 264, who swore allegiance to the Irish Free State, were released. In Dublin, De Valera was seen attending mass and it is a question whether attempts to arrest him were seriously intended. The Free State Senate, which contains many important and intellectual Irish men and women—for instance, the poet, W. B. Yeats—has appointed a committee to examine the chances of a reconciliation. The widow of John Richard Green, the historian, is among the instigators of this effort.

In the United States, the affairs of Ireland usually create a certain repercussion. From the Irish consulate in New York, Joseph Connolly resigned in November as a protest against repressive measures by the Free State. Mr. Lindsay Crawford, a Canadian lawyer, is now consul and his status is assailed by followers of De Valera who deny the sovereignty of the government in Dublin. In the Supreme Court of New York, the Irish Free State has applied for an injunction restraining De Valera from drawing on Irish funds, here collected and said to amount to \$2,000,000 or more. A trustee of these funds is Stephen O'Mara, now imprisoned by the Free State, and Justice Mullan has ruled that the injunction will be dismissed unless O'Mara is spared as a witness.

The Free State is confronted by the most formidable domestic problems. The railways are to be consolidated and, in a measure, rebuilt. Housing, education, land purchase await attention. And the disorders have, for the moment, wrecked Irish finance. An army of 30,000 men is costing \$30,000,000 a year, and unemployment has reached the British scale. For some weeks, a postal strike disorganized business and there have been other labor disputes. The expenditure is estimated at \$135,000,000—equivalent to \$4,500,000,000 for the population of the United States, and this does not include interest on Ireland's share of the national debt of the former United Kingdom. A formidable deficit is anticipated and a large loan is essential.

PHILIP WHITWELL WILSON.

IRON AND STEEL. The iron ore mined, in the United States in 1922, exclusive of ore containing more than 5.5 per cent of manganese, was estimated at 46,963,000 gross tons, an increase of 60 per cent as compared with that mined in 1921. The ore shipped from the mines in 1922 was estimated at 50,046,000 gross tons, valued at \$158,222,000 an increase of 88 per cent in quantity, and of 76 per cent in value, as compared with the figures for 1921. The average value of the ore, per gross ton, at the mines in 1922 was estimated at \$3.16; in 1921 it was \$3.37. The stocks of iron ore at the mines, mainly in

Michigan and Minnesota, apparently decreased 23 per cent from 13,836,267 gross tons in 1921, to 10,699,000 tons in 1922.

These estimates, based on preliminary figures furnished by producers of 98 per cent of the normal output of iron ore, were made by Hubert W. Davis, of the United States Geological Survey, Department of the Interior. They show the totals for the principal iron-ore producing States, and, by grouping together certain States, the totals for the Lake Superior district and for groups of southeastern and northeastern States.

About 86 per cent of the iron ore shipped in 1922 came from the Lake Superior district, in which 39,602,000 gross tons were mined, and 43,095,000 tons were shipped, increases of about 58 and 89 per cent, respectively, as compared with the quantities mined and shipped in 1921. The ore shipped in 1922 was valued at \$145,150,000, a value increase of about 78 per cent. These totals include the ore mined and shipped from the Mayville and the Baraboo mines, in Wisconsin, and ore shipped by rail as well as by water from all mines, but do not include manganese ores that contained more than 5.5 per cent manganese. The ore is chiefly hematite. The stocks of iron ore in this district apparently decreased from 12,574,457 gross tons in 1921 to about 9,034,000 tons in 1922, or approximately 28 per cent. The shipments of iron ore by water from the Lake Superior district in 1922 (including manganese iron ore), according to figures compiled by the Lake Superior Iron Ore Association, amounted to 42,613,184 gross tons, an increase of 91 per cent as compared with such shipments in 1921. The average value of the ore at the mines in the Lake Superior district in 1922 per gross ton, was \$3.75; in 1921 it was \$3.58.

The mines in Minnesota furnished 70 per cent of the total amount of iron ore shipped from the Lake Superior district in 1922, and 60 per cent of the total for the United States. The mines in Michigan furnished 29 per cent of the Lake shipments, and 25 per cent of the grand total.

The Southeastern States, which constitute the second largest iron-ore producing area, including the Birmingham and Chattanooga districts, mined 5,384,000 gross tons of iron ore in 1922, an increase of 80 per cent as compared with 1921. The shipments of ore from these States to blast furnaces in 1922, amounted to 5,372,000 gross tons, valued at \$9,901,000, an increase in quantity of 84 per cent and in value of 85 per cent as compared with the quantity and value of shipments in the preceding year. The ore contains about 78 per cent of hematite, 21 per cent of brown ore, and 1 per cent of magnetite. The average value of the ore in these States in 1922, per gross ton, was \$1.84; in 1921 it was \$1.83.

The Northeastern States, which include New Jersey, New York and Pennsylvania, in 1922 mined 1,413,000 gross tons of iron ore, and shipped 1,015,000 gross tons, an increase of 109 per cent in the quantity mined and of 113 per cent in the quantity shipped in 1921. The average value of the ore in these States in 1922, per gross ton, was \$2.03; in 1921 it was \$3.75. Most of this ore is magnetite.

The imports of iron ore, from 1 January to

IRON AND STEEL

1 Sept. 1922, amounted to 684,387 gross tons, valued at \$2,894,496, or an average of \$4.23 a ton. The imports for the year 1921 were 315,768 gross tons, valued at \$1,075,909, or \$3.41 a ton. The exports of iron ore for the eleven months ending 30 Nov. 1922, amounted to 602,095 tons, valued at \$2,770,160, or \$4.60 a ton, as compared with exports for the entire year 1921 of 440,106 tons, valued at \$2,077,620, or an average of \$4.72 a ton. The statistics of imports and exports were compiled from the records of the United States Bureau of Foreign and Domestic Commerce of the Department of Commerce.

The production in 1922 of coke and anthracite, pig iron and blast-furnace ferroalloys, according to the *Iron Age*, was 26,880,383 gross tons, an increase of 62 per cent over the output in 1921, which was 16,543,686 gross tons.

The following table shows the quantity and value of the iron ore mined and shipped in the United States by the principal producing States. The figures for 1921 are final, but those for 1922 are subject to revision.

ESTIMATE OF IRON ORE MINED AND SHIPPED IN THE UNITED STATES IN 1922 AND ACTUAL OUTPUT IN 1921.

Steel Ingots.—According to the American Iron and Steel Institute, the production of steel ingots in the United States in 1922 by 30 companies, which in 1921 produced 87½ per cent of the country's total output, was 29,116,453 gross tons as compared with the 1921 production of 16,826,946 gross tons. Open-hearth production in 1922 totaled 23,624,404 gross tons as compared with 13,125,578 gross tons in 1921. Bessemer production totaled 5,469,213 gross tons in 1922 as compared with 3,679,682 gross tons in 1921. The production of all other kinds of ingots was 22,836 gross tons in 1922 as compared with 21,686 gross tons in 1921. The highest monthly output of all kinds of steel ingots in 1922 was in November when the 30 companies produced 2,889,297 tons; January

was the month of lowest production, the output being 1,593,482 tons. The world production of steel ingots in 1922 was estimated by the Boston *News Bureau* at approximately 59,000,000 tons as compared with 39,245,000 tons in 1921 and 71,521,000 tons in 1913. The output of all of the companies in the United States was estimated, by the authority referred to above, at 33,500,000 tons; the output of the United Kingdom at 6,110,000 tons; Germany's output at 8,500,000 tons; Luxemburg's at 1,420,000 tons; France's at 4,500,000 tons; Belgium's at 1,500,000 tons; all other countries, except Canada and Russia, at 3,000,000 tons. Canada's actual production was reported as 463,113 tons as compared with 645,075 tons in 1921. In 1913 Russia, the 1922 production of which country is not included in the above figures, produced 4,837,000 tons.

According to the Census Bureau's estimate, fabricated structural steel sold in the United States during 1922 totaled 1,929,400 tons compared with 997,200 tons in 1921. The 1922 sales amounted to 64.3 per cent of the shop capacity

of the country while the 1921 sales amounted to only 35.1 per cent of shop capacity.

The *Iron Age* estimated that the railroads took about 22 per cent of the rolled steel manufactured in the United States in 1922; building and other construction, 15 per cent; oil, gas, water and mining 10 per cent; automobiles, 10 per cent; agriculture, 4 per cent; food containers, 4 per cent; exports, 7 per cent. All other uses, 28 per cent. Shipbuilding took less than 1 per cent.

While the year 1922 did not show great profits for most steel companies, it was by no means unsatisfactory considering the outlook at the beginning of the year. The actual production for 12 months was estimated at only 64 per cent of capacity. Operations showed con-

tinued expansion from 1 Jan. 1922, when they were only a little more than 30 per cent, until, even in spite of the coal strike, mills were running at between 75 and 80 per cent by the middle of June. The shopmen's strike blocked transportation of already limited fuel supplies, and caused sharp curtailment of operations which resulted in lowering production to less than 50 per cent about the middle of August. It is worthy of note, however, that at the beginning of the year 1923, operations were approximately 80 per cent, a figure which they had reached about the middle of November 1922. On 1 Dec. 1922 there were 242 iron furnaces in blast (the largest number of the year), as compared to 125 at the beginning of the year. Between these two extremes the number had fluctuated, reaching 192 on 1 July and dropping to 144 on 1 September.

EXPORTS OF IRON AND STEEL FROM THE UNITED STATES IN 1922.

Steel prices at the end of 1922, according to *The Journal of Commerce and Commercial Bulletin* (New York) were 18 per cent higher than at the beginning and were 44 per cent higher than the 10-year pre-war average. The calculations, it was stated, were based on a composite steel price of bars, beams, plates, wire, rails, black pipe and black sheets, which products constitute 88 per cent of the finished steel output of the United States. The composite price at the end of the year was 2.439 cents a pound at Pittsburgh, compared with 2.062 cents at the start of the year and compared with 1.689 cents a pound for the 10-year pre-war average. "This," asserts the publication referred to, "was a modest increase when it is remembered that a 20 per cent advance in wages took place on 1 September and that coke prices are to-day (30 December) three times the prices on January 1." Pig iron prices also proved variable during the year 1922. Eastern Pennsylvania iron practically doubled in price, running up the scale from \$18 to \$34 a ton, and then dropping to \$27 a ton as the year closed. The industry was severely shaken by the "twin strikes," the shortage of fuel brought on a scarcity of pig iron, and an extensive importation of foreign iron took place for the first time since 1901. Foreign prices were set at from \$2 to \$8 a ton lower than domestic, and sales of foreign iron reached a figure of about 400,000 tons.

Iron and Steel Exports.—Exports of iron and steel from the United States in 1922 were composed principally of steel rails; black steel sheets; iron and steel bars, and rods other than wire; boiler tubes and welded pipe; structural shapes, plain material; plain wire, galvanized sheets; semi-finished steel; and iron and steel plates. Details of the shipments during the year are presented in the preceding table.

"Much less dependence on foreign sources of raw and semi-finished iron and steel than in 1921 and a considerably stronger place in the export markets" is a simple statement of the iron and steel trade for 1922. First rank in export steel trade goes to Great Britain for the year. It is an accomplishment in the face of America's huge productive and export capacity and in spite

of Continental competition. The preceding tabulation of official British foreign-trade figures and estimates for the other leading countries compiled by the United States Department of Commerce gives the trade situation in summary (quantities in long tons).

Great Britain's first rank in tonnage among exporting countries was due in some measure to the greater overseas buying of pig iron, by the United States chiefly among other customers, in the last six months of the year.

Imports of iron and steel into Japan during the first ten months of 1922, according to the United States Department of Commerce, were: 1,305,633 tons, as compared with 718,441 tons purchased from foreign countries during the corresponding period, 1921. See also **METALLURGY**.

IRVING FEMALE COLLEGE, a non-sectarian educational institution for women, founded in 1856, chartered in 1857 and located at Mechanicsburg, Pa. In 1922-23 it had a faculty of 20 members, 100 students, property valued at \$100,000 and an income of about \$45,265. E. E. Campbell, A.M., Ph.D., is president.

ISTRIA, a peninsula extending from Trieste to the Adriatic Sea, formerly a crownland of Austria-Hungary but since the Great War annexed to Italy. It has an area of 2,035 square miles and a population of 404,309. Nearly one-half of the inhabitants are Croatian, about 40 per cent are Italian and the remainder German.

ITALIAN SOMALILAND, a colony and three protectorates on the east coast of Africa, extending from British Somaliland to the course of the Juba. The area is 139,430 square miles with a population of about 650,000. The protectorates are: the sultanate of the Mijertins from Bender Ziade, on the Gulf of Aden to Cape Gabbee on the Indian Ocean. There is an Italian Resident Commissioner at (1) Alula, the capital; (2) the territory of the Nogal from Cape Gabbee to Cape Garad and (3) the sultanate of Obbia from Cape Garad to the northern boundary of the colony of Benadir, now officially called Southern Italian Somaliland, which extends to the embouchure of the Juba. Mogadisho is the capital of the colony, which is administered by a civil governor. Agriculture and cattle raising are the chief occupations of the people. Exports in 1920 were valued at 17,623,109 lire and imports at 28,447,389 lire. The chief imports are cottons, sugar, oil, rice, lumber and yarns. The chief exports are dura, Indian corn, butter, gum, cotton and hides. There are 1,135 miles of roads in the colony. The budget for 1922 forecast an expenditure of 12,992,000 lire to be met by revenue of an equal amount. There are 13 wireless stations in the colony and the station at the capital communicates with Italy. There is good steamer service with Italy and also with Port Durban. The Governor in 1922 was Carlo Riveri.

ITALY, a kingdom of southern Europe comprising Italy proper, the islands of Sardinia, Sicily and Elba and several lesser islands.

Area and Population.—The area of the kingdom previous to the World War was 110,632, but to this must be added 7,350 square miles of former Austrian lands which became Italian

after the war. Italy had a population of 40,070,161 in 1921. The population is very nearly perfectly homogeneous. There are about 85,000 of French origin, 10,000 of Teutonic ancestry, 30,000 Greeks, 80,000 Albanians, 42,200 Slavs and 12,000 Spaniards. There were 754,685 births in the country in 1919 and 677,040 deaths. In 1920 the total number of emigrants was 344,208, of whom 153,717 went to other European countries and 190,491 to countries overseas. In the same year 52,678 Italians returned to their native land from the United States. The capital is Rome, which has a population of 590,960. The largest city of the kingdom is Naples with 697,917, followed by Milan with 663,059. Other large cities are Turin (451,994); Palermo (345,891); Genoa (300,139); Florence (242,147); Catania (217,389); Bologna (189,770); Venice (168,038); Messina (150,000); Leghorn (108,585); Bari (109,218); Padua (105,135); Ferrara (102,550).

Religion.—The ruling state religion is the Roman Catholic but there is granted to all recognized denominations full freedom of worship. The latest religious census showed 32,983,664 Roman Catholics, 123,253 Evangelical Protestants and 34,324 Jews. About 1,500,000 did not profess any religion. The Roman Catholic Church has one patriarchate, 49 archbishoprics, 6 cardinal bishops, 216 bishoprics, 11 abbots and a number of prelates without territorial jurisdiction.

Education.—Public schools of every grade are regulated and maintained by the state. There are lower grade and higher grade primary schools. Instruction is free in both classes of schools but in those communes where there is but a lower grade primary school the age limits are from six to nine, while in the larger communes the age limit is extended to 12 years. Secondary education is of two kinds—classical and technical. The gymnasias and the lycees furnish the former and the technical schools and institutes the latter. Higher education is supplied by the universities and the special higher institutes and schools. At last report there were in Italy 136,968 elementary schools of all kinds with 96,443 teachers and 4,523,183 pupils. There were 1,903 secondary schools of all kinds with 326,787 students. There are 17 state universities with 36,765 students; four free universities with 1,162 students and three institutions of university rank. The higher institutes of commercial education have 4,000 students; the higher schools of agriculture have 800 students; the five engineering colleges have 6,100 students; and in other special schools there are about 1,800 students.

Finance.—The public debt of Italy on 30 April 1922, as given in a report of the Parliamentary Finance Commission, was as follows:

	Lire
Pre-war debt	13,453,600,000
National loans	35,816,100,000
Foreign loans	21,361,500,000
Long-term treasury bonds	6,796,800,000
Ordinary treasury bonds	26,037,000,000
Bank circulation for account of the state ..	8,359,800,000
Government bank notes in circulation	2,267,000,000
Interest-bearing accounts in state deposit and loan banks	487,700,000
Total	114,579,500,000

Foreign Loans	Lire
Indebtedness to Great Britain.....	12,687,173,200
Indebtedness to the United States.....	8,586,816,383
Indebtedness for bonds sold in the United States.....	51,694,069
Indebtedness to Brazil.....	35,742,000
Total.....	21,361,425,652

During the 1921-22 fiscal year the Italian treasury paid off entirely its indebtedness to the Canadian, Swedish and Dutch governments, and part of its indebtedness to the Brazilian government. The lire equals at normal \$0.193.

The total ordinary revenues of the Italian government for the fiscal year 1921-22 were 12,695,000,000 lire, an increase of 1,262,000,000 lire over the preceding year. Despite the increases in revenue and over original estimates, the deficit for the year 1921-22, set as 5,000,000,000 lire on 31 Dec. 1921, actually amounted to 6,581,000,000 lire.

Agriculture.—The Bureau of Agricultural Statistics of the Italian Ministry of Agriculture gave the area under wheat in Italy in 1922 at 11,587,100 acres and the yield at 162,404,468 bushels. The area sown to Indian corn was 3,706,600 acres with a yield of 44,466,000 centals or hundredweights. The area planted with vines was 10,423,100 acres, the vintage from which was 725,800,000 gallons. Oats were planted to 1,200,000 acres and yielded 10,032,000 centals. There were 5,730,000 acres under olives, the yield from which was 345,000,000 gallons of oil. The last livestock report showed 6,239,000 head of cattle, 11,753,900 sheep, 3,082,000 goats, 2,338,926 swine, 989,780 horses, 949,162 asses and 496,743 mules. Silk culture is carried on all over Italy but is centered in Lombardy, Piedmont and Venetia. The silk cocoon crop of 1921 was 3,000 tons. There are 670 silk spinning mills and 164 silk weaving mills. There are 35 beet-sugar factories, with an output averaging 170,000 tons annually.

The value of all forest products is about 75,000,000 lire annually.

Mining Industries.—There are 67,000 workers employed in the mining industries of the country, the output of which was valued at 644,798,281 lire in 1920. Mineral fuel led with 1,739,922 metric tons from 201 mines valued at 244,306,997 lire. Sulphur ore was second with 296,099 tons from 453 mines valued at 172,700,720 lire. Other minerals in order of importance were zinc and lead, mercury, iron, manganese, boric acid, copper and antimony. The quarries furnish employment to 46,000 persons and turn out building and decorative stone to the value of 90,000,000 lire annually.

Fisheries.—There are 165,000 persons engaged in the fisheries, employing 26,000 craft of all sizes with an aggregate tonnage of 72,000. The value of the annual catch is about 33,000,000 lire.

Manufactures.—The last industrial census reported 243,000 establishments of factory grade in the country employing 2,304,438 persons and possessing 1,620,404 horse power. The largest class of industrial establishments was of those connected with the products of agriculture and fisheries. These numbered 135,461 with 640,856 employees. There were 58,836 metal and metal-

working factories with 695,737 employees; 32,691 textile works with 656,733 employees; 5,661 chemical establishments with 100,924 employees and 5,309 establishments connected with the public services with 76,788 employees.

Commerce.—During the first eight months of 1922 Italy's exports averaged 700,000,000 lire monthly; her imports 1,240,000,000 lire monthly. In December imports rose to 1,916,000,000 lire while exports amounted to 1,010,000,000 lire.

Shipping.—At the beginning of 1922 the merchant marine of Italy consisted of 825 steam vessels of 3,129,803 tons and 4,464 sailing vessels of 261,769 tons.

Communications.—The total length of the Italian railways is 9,741 miles, of which 8,761 miles are the property of the state. Receipts of the state lines average 2,000,000,000 lire while the expenditures average 3,000,000,000 lire, leaving an average annual deficit of approximately 1,000,000,000 lire. Reorganization has become urgent as a result of these deficits over a period of several years. Plans have been considered by the Italian State Railway Director for the electrification of lines where the traffic is heavy and grades are sufficiently long to cause wasteful coal consumption under present steam operations. At the end of the year 1922 there were 756 kilometers of the state lines electrified (kilometer equals 0.62137 mile). An additional 4,224 kilometers are being electrified. There are 11,228 post-offices; 35,205 miles of telegraph lines; 10,017 telegraph offices; 324 urban telephone systems and 111,719 subscribers. The telephone system is the property of the state since 1907.

Army.—Military service is compulsory and universal, beginning with the 20th year and ending with the 39th. The establishment of the active army in 1921 was 250,000 men.

Navy.—There are five vessels of the Dreadnought class, three armored cruisers, 18 scout cruisers and flotilla leaders, two torpedo gunboats, 65 destroyers, 91 torpedo boats and 46 submarines in the Italian navy. The personnel consists of 1,000 officers and 40,000 men.

Government.—According to the Statuto Fondamentale del Regno the executive power belongs exclusively to the sovereign, who exercises it through responsible ministers. The legislative authority rests jointly with the King and Parliament. The latter consists of two chambers, a Senate and a Chamber of Deputies. The Senate is made up of the princes of the royal house and of the appointees of the King. There are at present 368 senators and nine members of the royal house. In the lower chamber there are 535 deputies, who must be at least 30 years of age, must not be in receipt of any salary from the government nor be a minister of religion. The reigning King in 1922 was Vittorio Emanuele III, who succeeded to the throne on the death of his father, 29 July 1900. The President of the Council and Minister of the Interior from 25 Feb. 1922 to 29 Oct. 1922 was Signor Luigi Facta, who was succeeded on the latter date by Benito Mussolini, the leader of the Fascisti.

History.—In the annals of Italy, the year 1922 will be ever memorable for the Fascisti Revolution, led to success by Benito Mussolini. The social, economic and industrial condition

of the country had been gravely disturbed by the war which was followed by a wave of violent Communism. The yoke of the bourgeoisie was to be broken. Placards on the walls ridiculed King and Army. In Rome, no military parade, celebrating victory was permitted by Prime Minister Nitti who also amnestied the defeatists. In opening the 25th legislature, the King was insulted. Soldiers, wearing decorations, were spat upon in the streets. Railroads refused to carry either police or military when in uniform. In Rome, persons were killed for crying, "Long Live Italy." The Minister of War issued orders forbidding soldiers to appear with arms. Factories were subjected to frequent strikes or were actually seized, irregular taxes were levied and municipalities were controlled, either by Socialist votes or by threats. For three years, 1919, 1920 and 1921, Italy seemed to be hurrying to Bolshevism. The red flag disputed precedence with her Tricolor. The red scarf and "the scythe and hammer" were emblems, commonly seen in the streets. Lenin's name was cheered to the echo. It was a violent reaction against the fever of war.

From the first, there was, however, clear evidence of another emotion. In Fiume, D'Annunzio symbolised Italian patriotism. But where patriotism was most needed, was at home, not abroad. And the man who fought the Communists in their stronghold was Benito Mussolini of Milan, editor of *Il Popolo d'Italia*. Born in 1884, Mussolini was still under 40 years old. The story of his life is so intimately bound up with the events we are narrating that it is best to tell it here. He started his career as a Marxian Socialist and before the war, was editor of the *Avanti*, director of the Italian Communist Party and a recognized leader of the Italian proletariat. Early in 1914, his mind was disturbed by the revolutionary outbreaks in Romagna of which he was a leader. After much destruction of life and property, the uprising failed, Mussolini becoming, if possible, more truculent than ever.

With the outbreak of the World War, he revealed himself, however, as an Italian first and a Socialist second. "We must act," he declared, "move, fight and, if necessary, die. Neutrals have never dominated events; events have always dominated neutrals. Blood alone moves the wheels of history." In November 1914, he was drummed, therefore, out of the Socialist Party, and at once he started his new paper. For a time he was suspected by the government and refused an opportunity to serve in the army, but in due course, he was sent to the front, was wounded, was decorated and discharged, his duty done. The defeat at Caporetto, to which Socialist propaganda contributed, ended Mussolini's adherence to that creed. He flung himself again into journalism, demanded an uncompromising peace, attacked President Wilson's "Fourteen Points" and supported D'Annunzio's advance into Fiume. It was that adventure which led Mussolini to organize the Fascisti. In March 1919, the enterprize which captured Italy was inaugurated.

It was in line with the tradition of Rienzi, the tribune of Rome. It recalled the heroism of Garibaldi and his "red shirts." A black

shirt was the uniform selected by Mussolini. For a time everything went against him. Outside his window, mobs would howl for his blood. Within, he sat, drinking milk, with a large quarter-master's pistol on his table. "If they come for me" said he, "I'll get two of them with this pistol. And there are not two of them ready to face it. Hence—I drink milk." Short of money, he denied himself food and so fought the Communists to a finish. Gradually, the tide turned. To Mussolini, there rallied officers and soldiers, accustomed to discipline and experienced in war. By midsummer, 1922, he had at his back 500,000 "squadristi" or militants and 1,000,000 "iscritti" or reserve Fascisti. The Trade Unionists joined him, to the number of 2,500,000 workers. The movement acquired, not only small arms but machine guns and artillery. The troops marched, steady as veterans and saluted their officers, like Romans, with the uplifted hand.

Occupying Fiume for a time, the Fascisti also marched into the Trentino, overpowered the constituted authorities and compelled the German elements in the population to accept a more definite Italian sovereignty—for instance, in the schools. During the spring of 1922, there was civil war between the Fascisti and the Communists. The Fascisti reopened factories, stopped strikes, destroyed Socialist newspapers, took over Bolshevik municipalities, and broke the power of the trade unions. They acted openly but were otherwise a kind of Ku Klux Klan or army of Vigilantes. In August, their victory in the industrial battlefield was complete. Communism in Italy was cowed. Mussolini realized, however, that Italian Bolshevism was caused by a complete failure of constitutional government at Rome. With the Parliament divided into groups, no cabinet was ever secure against defeat, either by the Right or by the Left. In 1917, Orlando followed Boselli as Prime Minister. In rapid succession, Nitti, Giolitti, Bonomi and Facta tried to stabilize the executive. All of them failed. What caused Bonomi's downfall in February 1922 was a message, congratulating the new Pope Pius XI who had opened his Pontificate with a significantly Liberal gesture on 10 July. Signor Facta resigned but again took up office as head of a coalition which it was thought might be strong enough to confront the Fascisti. In August, the provinces of Genoa, Milan, Parma, Ancona, Brescia and Livorno were placed under martial law but the troops obviously sympathized with the Fascisti rather than with the Constitutional government. A week later, there was the first talk of a Fascisti march on Rome. Mussolini, however, had his forces, strong though they were, completely in hand. The march was postponed.

Late in October, the Fascisti held a Congress at Naples. Hailed as Duce, Benito Mussolini stated that if the government were not peacefully yielded to him, he would take it by force. The government consulted General Diaz and other generals on the supreme question whether force should be used against the Fascisti. The generals advised in the negative and Signor Facta resigned. The only doubt in any mind

was upon what terms Mussolini would be called to power.

Facta had offered him certain minor offices. Mussolini had replied by demanding the portfolios of Foreign Affairs, War, Navy, Labor and Public Works. These negotiations having failed, there was now but one thing to do and that was, either to crush Mussolini, which notion had been vetoed by the Army, or to appoint him Prime Minister. The King sent a special train for the dictator and had him escorted in the royal automobile to the Quirinal. A government was then formed.

The name "Fascisti" is derived from the "Fasces" or Roman axe, in a bundle of rods, which is known as a symbol of power, wherever the classics are read. At first, the movement was anti-monarchist and anti-clerical, but Mussolini soon discovered that he could not rally the nobility and bourgeoisie against the Communists if he attacked the King and the Church. At Naples, therefore, he declared that the House of Savoy had cemented the Italian people. His Cabinet consisted of 14 Ministers. Including General Diaz, as Minister of War and Vice-Admiral Thaon de Revel, Minister of the Navy, there were seven Fascisti in the Council, with five Nationalists, a Democrat and a Catholic. Such an Administration showed plainly that Mussolini had no intention of playing a mere party game. It also shows that he meditated no quarrel with the religion from which authority has come, through Cardinal Vannutelli, a warm eulogium (February 1923) of his work for Italy.

Mussolini's program has been immediate and drastic. He has established Free Trade for Italy on the British plan. He has reduced the bureaucracy. He has enforced an honest payment of taxes as levied. He has begun, at any rate, to cut down the railway deficit which reached 500,000,000 lire a year. He has established private ownership of telephones and other public utilities which had been a source of corrupt extravagance. He has organized a volunteer militia for national defence and has so regularized the Fascisti themselves. And up to the present (1 March 1923), the people have supported him. In December 1922, the Milan municipal elections showed 85,000 votes for the Fascisti against 65,000 for all other parties combined. Other electoral victories were recorded in Ferrara, Modena, Forti, Venetia and Umbria. In Alessandria, the zeal of the Black Shirts was amusingly displayed. Anyone the worse for liquor was dosed with castor oil, bottles of which were prominently displayed in every drink shop. A "thieves congress" was also held, at which the hardened offenders were promised the cudgel unless they reformed their ways.

It is, of course, quite too early to pronounce any final judgment upon the Fascisti upheaval. If the Communists had retained Mussolini as leader or discovered a leader of similar courage and ability in 1920, there might have been a very different story to tell. With all its display of patriotic efficiency, Fascismo is revolutionary. It is led by a Caesar who has crossed the Rubicon of constitutional liberty. And, in Bavaria, the so-called Fascisti of that state are frankly monarchist and reactionary. Even in Italy,

there are signs that the Army will not be reduced.

In build and demeanor, Mussolini has been likened to Napoleon, who also was a south European and fond of the dramatic. His domestic reforms are really a Code Napoleon for Italy. His most potent persuasion would be, as his enemies know, a whiff of Napoleon's grape shot. Hence, there has been some anxiety over his foreign policy. Apparently, he agrees with a preceding Government in holding that Italians must emigrate. If the United States is closed to them, it follows that life in Asia Minor and even along the eastern shores of the Adriatic, must be made tolerable. Over the Ruhr crisis, Mussolini gave a qualified support to France. Undoubtedly, opinion in Italy has been of late emotionally hostile to Britain. But up to the present, (1 March 1923) Mussolini's bark, as a diplomatist, has been worse than his bite. He has decisively disciplined D'Annunzio who showed signs of independent action and, in view of the fact that the reforms within Italy herself hit many powerful interests, it is possible that the new government will be fully occupied in the immense task of carrying them through. A vital question for the Prime Minister has been: How is he to retain a majority in the Parliament? His plan is to reverse the principle of Proportional Representation. He ordains that the largest party, even if it be not a majority, shall be allotted three-fifths of the seats.

PHILIP WHITWELL WILSON.

ITALY, Sons of (Figli d'Italia). The most important Italian organization in the United States. It aims to bring together Italians in America without regard to either politics or religion, and to co-operate in every way in firmly establishing bonds of sympathy and friendship between Italy and America. In this connection, though the Order of the Sons of Italy encourages the spread of the Italian language and culture, it urges all Italians in America to become American citizens.

The order strives to convince Italians in America that they should (and with great advantage) protect their interests and the future of their children by participating in every phase of the life of this republic, feeling sure that the Italian immigrant possesses qualities of heart and mind such as to warrant his being considered not merely an efficient worker but also a valuable contributor to the progress and the moral greatness of the United States. The Order is more than 1,000 lodges strong and boasts of several hundred thousand members. It has a complete system for mutual help—assistance in case of sickness, subventions to widows of members, banks, schools, clubs, libraries, and many other forms of social welfare. Of late, as a result of the suggestions and support of Dr. Peter De Leo, several scholarships were voted for boys and girls of Italian extraction in need of financial assistance to get through college. Recently an agreement was reached with Lega Nazionale, of Rome, for co-operation in the assistance to Italian emigrants.

The Order is organized under its own form and lines. The head is called "Supreme Vener-

able." It has its own monthly publication, ably edited since its beginning by Baldo Aquilano, one of the strongest supporters of the Order, who has spared neither time nor money to insure its success. Its head (1923) is Cav. Giovanni Di Silvestro, a well-known Philadelphia lawyer. Among its members are most of the leading Italians in the country, such as the Italian Ambassador, Senator Cotillo of New York, Congressman F. H. La Guardia, and many others well-known in the fields of political science, business and education.

IVORY COAST, a French West African possession, situated between the Republic of Liberia and the British Gold Coast. It has an area of 121,976 square miles approximately and a population of 1,545,680, of whom 835 are Europeans. The frontiers of the Colony have been delimited by conventions with Great Britain and Liberia and by decree with the other French West African possessions — Guinea and Upper-Senegal-Niger. France first secured coastal rights about 1843, but did not begin regular occupation of the region until 1883. Bingerville, the seat of the administration, has about 80 Europeans among its population. Grand Bassam is the principal port. Other ports are: Assinie, Grand Lahou, Sassandra and Tabou. Inland towns are: Abijeau, Aboisso, Bondoukou, Bouake, Dimzokro and Korhogo. Indian corn, rice, plaintains, pine-apples and other fruits are cultivated by the aborigines, while the whites grow coffee and cocoa. Cocoanuts and rubber are gathered and the forests yield mahogany. Gold is found in several districts. The external trade of the region in a recent year exceeded 115,000,000 francs, with exports slightly in excess of imports. The chief imports are: tobacco, wine, foodstuffs, petroleum and motor vehicles; chief exports: palm kernels, palm oil, coffee, cocoa, rubber, mahogany and other woods, and cotton. The Ivory Coast is

visited by several lines of steamships — French, Belgian and British. There are 197 miles of railway, extending from Abidjan, on the Grand Bassam Lagoon inland between Abijeau and Bouake. It is proposed to extend this line to the Niger and the Upper Volta. There are 2,300 miles of telegraph line and 117 miles of telephone lines and a wireless station at Tabou. The colonial budget is balanced at 15,000,000 francs. The Colony is administered by a Lieutenant-Governor, who is subject to the direction of the Governor-General of French West Africa.

IVORY, SHELL AND BONE WORK.

According to a report of the Federal Bureau of Census, 39 establishments engaged primarily in the manufacture in the United States in 1921 of articles made from ivory, shell and bone, exclusive of buttons, combs and hair pins, turned out products valued at \$2,395,000 as compared with products valued at \$2,817,000 turned out by 33 establishments in 1919, and products valued at \$1,896,000 turned out by 38 establishments in 1914. The products included under this heading are such articles as mosaics, whip handles, knife handles, napkin rings, umbrella handles, hatpins, etc. Massachusetts and New York were the leading States in the industry in 1921, the former reporting 27.4 per cent, and the latter 27.1 per cent of the total value of the products in that year. The average number of wage earners employed was 674 in 1921, 842 in 1919, and 795 in 1914. Wages paid amounted to \$690,000 in 1921; \$735,000 in 1919, and \$391,000 in 1914. Materials used cost \$1,144,000 in 1921; \$1,294,000 in 1919; and \$958,000 in 1914. The above figures do not include establishments turning out products valued at less than \$5,000, of which there were three in 1921, which reported products valued at \$8,000.

JACKSON COLLEGE FOR WOMEN.

See TUFTS COLLEGE.

JACOBI, Victor, Hungarian composer: b. Budapest, 1885; d. New York City, 10 Dec. 1922. His works were chiefly light operas. His first success was 'The Proud Princess' composed in 1906. This was followed by other light operas, which, although popular, were not heard in this country. The first work to be presented in the United States was 'The Marriage Market,' produced in 1914. His greatest success was 'Sybil' (1916), with Julia Sanderson, Donald Brian and Joseph Cawthorn in the cast, and afterward played in London with Collins in the title-rôle. Later he collaborated with Fritz Kreisler in 'Apple Blossoms.' This was followed by 'The Half Moon.' 'The Love Letter,' his latest work, is founded on Molnar's play 'The Wolf.'

JAMAICA, a British colony and the largest island of the British West Indies. Attached to it are Turks and Caicos islands, Cayman Islands, Morant Cays and Pedro Cays. The area of Jamaica is 4,207 square miles and of the dependent isles 224 square miles. The population numbers 857,921, of which 15,605 are whites and 630,181 black and 163,201 colored. The capital is Kingston with a population of 57,379. There are 693 public schools with 92,716 enrolled pupils, four training schools, two secondary schools mostly supported by the state and also endowed secondary and high schools and industrial schools. The revenue in 1921 was £2,347,362 and the expenditures £2,332,635. The public debt amounts to £4,011,561. In 1921 the exports were valued at £7,146,010 and the imports at £10,313,282. The chief imports in that year were flour, cotton goods, and fish. The principal exports were bananas, coconuts, logwood, logwood extract, sugar, coffee, rum and cacao. In 1921 there were 1,074,703 acres under cultivation, of which 53,794 were planted to sugarcane, 22,297 acres to coffee, 55,368 acres to bananas, 37,837 acres to cocoa, and 18,014 acres to coconuts. There are 197¼ miles of railway in the colony of 4 foot 8½ inch gauge; 2,226 miles of main roads, and 100 miles of tramways. There is a garrison of regular troops and a local artillery militia. Port Royal is strongly fortified. The Governor is assisted by a Privy Council and a Legislative Council, composed of the Governor as President and of five ex-officio, 10 nominated and 14 elected, members. The Governor in 1922 was Sir Leslie Probyn.

JAMESTOWN COLLEGE, a Presbyterian co-educational institution, founded in 1909 and located at Jamestown, N. D. In 1922-23 it had a faculty of 29 members, 312 students, property valued at \$1,004,000, including buildings, endowment, loan fund, etc., and an income of \$101,000. Barend H. Kroeze, A.M., LL.D., is president.

JAPAN, an island empire of the Far East, consisting of the five principal islands of Honshu,

Kiushiu, Shikoku, Hokkaido, and Taiwan, and numerous lesser islands and the peninsula of Chosen (Korea). The grand total number of islands is 438, with a total area of 260,738 square miles. The population of the Empire is 55,961,140. To this must be added the population of Chosen, 17,284,207; of Taiwan or Formosa, 3,654,398, and of Karafuto, 105,765, making a grand total for Japan of 77,005,510. The number of foreigners in Japan on the date of the last census was 25,880; of whom 14,258 were Chinese, 2,384 English, 2,036 American, 568 German, 460 French, 233 Portuguese, 135 Dutch, 1,232 Russian, and 144 Swiss. Tokio, the capital, has a population of 2,173,162. The second largest city is Osaka with 1,252,972. Other large cities are Kobe, 608,628; Kyoto, 591,305; Nagoya, 429,990; Yokohama, 422,942; Nagasaki, 176,554; Horoshima, 162,391; and Kanazawa, 158,637.

Religion.—There exists the fullest religious freedom. The leading forms are Shintoism, Buddhism. There are 49,346 shrines of the former with 14,759 priests and 71,681 Buddhist temples with 52,250 priests and priestesses. There are 2,566 licensed preachers of the several Christian faiths. The Roman Catholic Church has an archbishop and three suffragan bishops.

Education.—Primary education is compulsory from the age of six to 14. The number of children of this school age is reported as 9,061,000. Educational statistics for the year 1919 showed 612 kindergartens with 1,750 teachers and 51,834 pupils; 74 schools for the blind and dumb with 495 teachers and 3,641 pupils; 25,625 elementary schools with 173,000 teachers and 8,137,347 pupils; 337 middle schools with 6,991 teachers and 158,974 students; 420 girls' high schools with 5,287 teachers and 118,932 students. 94 normal schools with 1,915 teachers and 27,078 students; 704 special and technical schools with 9,050 teachers and 160,922 students; 14,691 miscellaneous schools with 111,873 teachers and 982,071 students; 8 high schools with 356 teachers and 6,731 students; and 5 universities with 970 professors and 9,040 students. These 5 universities are the Imperial universities of Tokio, Kyoto, Tohoku, Kyushu, and Hokkaido. There are 11 other schools which were admitted to university rank in 1920—Waseda, Keio, Meiji, Chu-o, Nihon, Hosei, Doshisha, Kokugaku-in, and the universities of medicine of Osaka and A-ichi and the University of Commerce of Tokio. These institutions have about 22,000 students. There are 1,359 libraries in the empire with 4,775,266 volumes—4,500,683 Japanese and Chinese and 235,183 European. A total of 37,000 books was printed in 1918, in which year there were published 3,123 periodicals of all classes.

Production and Industry.—The arable area of Japan is about 38,000,000 acres. Of this area 22,929,369 acres are cultivated by peasant proprietors and 15,286,246 acres are cultivated by tenants. About 8,000,000 acres are under rice fields and 7,000,000 acres under other cereals.

The wheat crop of 1921 was 3,564,418 quarters; the barley crop, 5,578,398 quarters; rye, 4,518,984 quarters; and rice, 33,750,000 quarters. The last live stock census showed in Japan 1,344,865 head of cattle, 1,479,682 horses, 5,098 sheep, 470,082 swine and 125,089 goats. Having more than 7,000,000 acres of arable land, a temperature compared with that of the American Northwest and everything nature could supply for a cattle raising country, the Hokkaido, Japan's northern island, last year had 180,000 head of horses, 32,000 head of oxen, 136,000 hogs, 1,600 sheep and 556,000 fowls. While a good profit heretofore has been made from horse raising, authorities believe cattle raising, now that the Japanese are eating more meat, would be even more profitable. It is proposed to bring 3,500,000 acres of this land under cultivation and turn approximately 2,200,000 acres into pasturage. It is estimated that on this there could be raised 540,000 head of cattle, 300,000 horses, 3,000,000 sheep and 300,000 hogs. The total value of the mineral and metal products in 1919 was 641,282,129 yen (yen equals 50 cents). The largest single item was coal which was produced to the extent of 31,271,093 metric tons valued at 442,540,941 yen. Steel and iron were produced to the value of 111,539,135 yen. Copper was produced to the value of 67,581,475 yen and oil to the value of 42,562,023 yen. Silver and gold were also important, the output of these being valued at 20,700,000 yen. There are 464,727 mining workers in the empire. There are 22,391 factories employing 1,409,196 persons. The chief manufactures are textiles, including cotton, silk and woolens; paper, matches, earthenware, lacquered ware, matting, leather, knit goods and refined oil. There are 50 cotton spinning companies with 3,043,775 operating spindles and giving employment to 140,000 persons. Sericulture is an important industry, the output being about 6,500,000 koku of cocoons yearly (koku equals 4.9 bushels).

Commerce and Trade.—Japan's total foreign trade for the calendar year 1922 to 25 December, according to unofficial figures received by the Japanese Embassy at Washington, D. C., amounted to approximately 3,453,950,000 yen, as compared with 2,866,992,000 yen in 1921, and 4,284,569,000 yen in 1920—the record year. (1 yen = \$0.4985.) Exports during 1922 were estimated at 1,594,780,000 yen, and imports at 1,859,170,000 yen, resulting in an unfavorable balance of 264,390,000 yen. A comparison of these preliminary estimates with official figures for the foreign trade during 1919, 1920 and 1921 is shown in the following table. The figures for 1922 are preliminary and are subject to revision:

FOREIGN TRADE OF JAPAN

YEARS	Imports	Exports	Total trade
	Yen	Yen	- Yen
1919...	2,173,459,880	2,098,872,617	4,272,332,497
1920...	2,336,174,781	1,948,394,611	4,284,569,392
1921...	1,614,154,832	1,252,837,715	2,866,992,547
1922...	1,859,170,000	1,594,780,000	3,453,950,000

Summaries of the leading items in Japan's import and export trade for 1922, with countries of origin or destination are shown in the following table. The quantity basis is used where possible.

³ Includes estimated quantities for December.

⁴ 1 yen = \$0.4985.

Communications.—The merchant marine of the Empire consists of 2,870 steamers of 2,840,650 tons gross; 13,781 sailing vessels of European pattern of 945,033 tons; and 925 sailing vessels of Japanese pattern of 295,931 tons. Shipping companies for foreign trade are subsidized by the government, the budget for 1923 containing provisions for navigation bounties and mail subsidies

amounting to 9,965,797 yen (about \$5,000,000). There are now regular steamer routes for Japanese vessels from Japan to Europe, Australia, North and South America and to Chinese ports. There are 8,207 miles of railways in the Empire, of which 6,202 miles are owned by the state. The gross income from all lines in 1920 was 406,707,225 yen and the expenditure 326,712,559 yen. The freight carried weighed 15,002,174 tons and the passengers carried numbered 467,562,974. There are 732 miles of electric tramways in the country; 7,941 post and telegraph offices; 20,106 miles of telegraph lines and 9,069 miles of telephone lines.

Finance.—The budget for the fiscal year 1922-23 provided for a total expenditure of 1,466,000,000 yen, or about \$700,000,000, of which 938,000,000 yen is set aside for ordinary expenditures and 528,000,000 yen for extraordinary expenditures. For the army and navy alone the budget carried appropriations of 646,662,000 yen, or nearly half the total. The estimated revenue is \$722,500,000. The budget for fiscal year ending 31 March 1924, passed by the Cabinet and to be presented at next session of Parliament, gives estimated revenue and expenditures of 1,350,000,000 yen, decrease of 131,000,000 from previous year (parity of yen is \$0.4985). An important cause of decrease in expenditures is limitation of armament, accounting for 70,000,000 yen, while revival of the sinking fund, suspended since 1920, adds 42,000,000 yen to ordinary expenditures. Estimated budget, compared with the previous year, follows:

Revenue:		Compared with previous year
Ordinary.....	1,236,000,000 yen	9,000,000 less
Extraordinary..	114,000,000 yen	122,000,000 less
Expenditures:		
Ordinary.....	987,000,000 yen	45,000,000 more
Extraordinary..	363,000,000 yen	177,000,000 less
Total.....	1,350,000,000 yen	131,000,000 net dec.

The total amount of this budget was a decrease of 101,000,000 yen approximately from the expenditures of the fiscal year 1921-22, made necessary by the decrease in revenues from taxes and government enterprises. The surplus carried over from year to year is being decreased rapidly. The public debt at the beginning of 1922 amounted to 3,115,038,383 yen, of which 1,686,744,851 yen was for internal loans and 1,428,293,532 yen for foreign loans. The local debt amounts to 400,000,000 yen.

Army.—Military service is compulsory. Liability of the subject to military service begins at the age of 17 and continues to the age of 40, but actual service begins at the age of 20 years. Service with the colors is for a period of two years in all arms. The war strength of the nation on mobilization is about 700,000 combatant troops. No summary of the peace strength of the Japanese army is ever published, but in 1921 the United States War Department estimated it at 300,000 men of all ranks. In 1922, in line with the policy adopted in all government departments the Japanese War Office decided in August to retrench the personnel of the army by 56,000 men. At the same time it was proposed to reduce the expenditure on the army by a sum of about 20,000,000 yen.

Navy.—The naval program of Japan was greatly modified by the Washington conference. At present the Japanese fleet comprises 10 capital ships of the post dreadnought type, 5 armored cruisers, 13 light cruisers, four torpedo gunboats, 120 destroyers, 19 torpedo boats, and 38 submarines. See WASHINGTON CONFERENCE.

Government.—The Emperor exercises the executive power with the consent of the Imperial Diet. The latter consists of two houses, a House of Peers and a House of Representatives. The House of Peers is largely appointive and almost entirely unrepresentative, except in relation to the large taxpayers. Its membership at present is 373. The lower house has 463 members, who are elected by male Japanese subjects not less than 25 years of age, residents of the electoral district and payers of a land tax not less than three yen in a year for more than one year or direct taxes not less than three yen for more than two years. The Prime Minister to June 1922 was Viscount Takahashi, who was succeeded by Baron Kato. The Emperor is Yoshihito, who succeeded his father 30 July 1912. Owing to the continued ill-health of the Emperor the Crown Prince Hirohito was made Regent 25 Nov. 1921. The civil list of the Imperial household is fixed at 4,500,000 yen (\$2,250,000).

History.—At the beginning of the year there was a considerable reaction to the results of the Washington Conference. Student societies started demonstrations against the naval ratio which it was alleged was inimical to the best interests of Japan. The Premier, however, in an address to the Diet on 7 February extolled the results obtained from the viewpoint of Japanese national interests and of world peace. Commercial interests were especially satisfied with the results of the Conference. On 25 January a bill was introduced in the Diet by the Kokuminto party to cut down the army by one-half and to confine conscription to one year. The suffrage advocates claimed that only 20 per cent of the adult male population enjoyed the suffrage, or but 3,000,000 out of 15,000,000. The government successfully maintained its opposition to all attempts toward the presentation of a new suffrage bill. Serious disorders broke out in the capital on 23 February as the result of demonstrations in favor of the bill before the Diet granting universal suffrage. The government announced the stoppage of work at its naval bases in pursuance of the policy and aims of the Washington Conference. The naval base of Port Arthur is to be changed into a commercial port and Maizuru, an important naval station, is to be reduced to the rank of a naval port. In April the Japanese began the evacuation of the Chinese province of Shantung. The suffrage problem continued to be one of the most pressing for solution. The Opposition party presented a resolution to the House of Representatives denouncing the use of the police in suppressing the suffrage demonstrations at the opening of the debate on the suffrage bill in the Diet. The press almost unanimously supported the suffrage movement. A stormy debate took place in the Diet in March relative to the country's whole military policy in the East. Mr. Ozaki Yukio, widely known as a champion of disarmament, moved an amendment to the recommendations of

the special committee on disarmament. The latter proposed to cut the army appropriations by 40,000,000 yen and to reduce the period of military service for infantry to one year and four months. Mr. Yukio proposed a reduction of 100,000,000 yen, in view of the fact that Russia, the only potential enemy against whom these military preparations were directed, was then helpless and would so continue for many years. His amendment was defeated. On 2 May Premier Takahashi asked for the resignations of the ministers of Agriculture, the Interior, Education and of Railways; the reason assigned for this action being that he desired to obtain a cabinet in full sympathy with his policy for the speedy ratification of the treaties resulting from the Washington Conference. The Takahashi cabinet resigned on 6 June, the main reason given being a divergence of views on the reconstruction of the cabinet. Premier Takahashi had succeeded to this office on the assassination of Premier Hara and took over the personnel of the latter's cabinet intact. The withdrawal of Takahashi was deeply regretted by the advocates of disarmament because he was believed to be the best fitted to effect a reduction of armament and to still the clamor of the militarists. His aims for the extension of the suffrage had alienated from him the support of the wealthy classes and of the agriculturists. On 11 June, Admiral Baron Kato accepted the premiership and formed a non-party cabinet pledged to the execution of the Washington agreements. The Premier's acceptance was by him made conditional on the agreement by the leaders of the army that the budget of the army be reduced by 40,000,000 yen. Baron Kato is a pronounced anti-militarist and as such his elevation gave promise to those who had supported Takahashi in his pacifist policies. This promise was fulfilled as shown by the trend of events following the inauguration of the new cabinet. A series of governmental decisions of the most momentous importance was announced between 21 June and 4 July; all the Washington treaties were approved by the Privy Council, including the Yap Treaty; negotiations were begun with China to fulfill the separate treaty regarding Shantung; plans were announced for a drastic reduction of the army; the tentative naval plans were made public; the evacuation of Siberia was decided upon and the date of withdrawal actually fixed for 30 October. The evacuation of Siberia began on 4 September when a transport took the first contingent of troops back to Japan. As districts were evacuated by the Japanese the troops of the Far East Republic marched in. This caused considerable uneasiness in Vladivostok, where the Whites under Merkulov and Diedrichs had for months been in a state of war with the Chita government. A conference between representatives of Japan, Russia and of the Far East Republic met at Chang Chung in Manchuria on 4 September but broke up three weeks later following several deadlocks. The immediate cause of the breaking up of the conference was the firm refusal of Japan to evacuate the northern half of Saghalien. Japan determined to hold North Saghalien until she received satisfaction for the massacre of 1920. The representative of Soviet Russia, M.

Joffe, asserted that his government would never pay an indemnity for this massacre, which was committed by partisans and precipitated by the Japanese themselves. Later the Japanese retention of North Saghalien was characterized by the Japanese Foreign Minister as "only a qualitative guarantee for the settlement of the Nikolaievsk affairs." By 26 October the evacuation of Siberia was completed and Japan had closed the books of her adventure on the mainland at a cost of 1,500,000,000 yen. Representatives of the Moscow and Chita governments took possession of Vladivostok and of the great stores of arms and munitions there. With the completion of the evacuation the only Japanese forces remaining on Russian soil were those on North Saghalien and the Japanese public was demanding the return of these also, alleging that the resumption of trade with Siberia would be impossible until this is accomplished. There were riots in Osaka during the inauguration meeting of the Japanese federation of all labor unions. The meeting was attended by 96 delegates from 62 unions and by 200 delegates from Socialist organizations. The police were forced to intervene before the meeting concluded its work. What was regarded as a most important court decision was handed down by the Appellate Court of the District of Osaka setting Geisha girls free from the obligations contracted for them by their parents or guardians. The court held that such contracts savored of slavery and were non-enforceable.

JEFFERSON COLLEGE, a Catholic educational institution for men, founded in 1831 and located at Convent, La. In 1922-23 it had a faculty of 17 members and 150 students. Figures regarding value of institution's property and its income not given. Very Rev. P. F. Quinn, S.M., is president.

JENKS, Arthur Whipple, American clergyman and author: b. Concord, N. H., 9 Aug. 1863; d. Flushing, Long Island, 18 April 1922. He was graduated at Dartmouth College in 1884, received the degree of M.A. from the same institution in 1887 and the degree of D.D. in 1911. In 1896 he was graduated at the General Theological Seminary of New York with the degree of B.D. He was ordained a deacon of the Protestant Episcopal Church in 1892 and priest in 1893. He was rector of Saint Luke's church at Woodsville, N. H., 1892-95. From 1895-1901 he was professor of ecclesiastical history at Nashotah House, Wis., and from 1901-10 held the chair of divinity and church history in Trinity College, Toronto, Canada. In 1910 he joined the faculty of the General Theological Seminary in New York, and remained there until his death. He had long been a leader in ecclesiastical circles, and was the organizer of the courses of lenten lectures at the Church of the Trans-

figuration in New York City. He had a wide reputation as a preacher, a conductor of retreats and a writer. He traveled extensively in Europe, and it was said that he, being an enthusiastic musician, had satisfied an ambition to play on every cathedral organ in England. He was a member of the American Historical Association, the Alpha Delta Phi and the Phi Beta Kappa societies. He was associate editor of the *Anglican Theological Review* of Chicago. He contributed special articles to magazines, and was the author of 'Beatitudes of the Psalter' (1914), 'Use and Abuse of Church History' (1915), 'Moments Rich in Blessing' (1916); and edited 'A Handbook of the American Episcopal Church.' At the time of his death he was engaged in writing a 'History of the General Theological Seminary' and 'The Life of the Reverend Doctor De Koven.'

JENKS, Tudor, American lawyer, author, editor: b. Brooklyn, N. Y., 7 May 1857; d. Bronxville, N. Y., 11 Feb. 1922. He was educated at Yale, being graduated in the class of 1878. Two years later he received the degree of LL.B. from the law school of Columbia University. Relinquishing the law for a time his artistic leanings drew him to Paris where he studied painting during the winter of 1880. On his return home, however, he engaged in the practice of law, with occasional writing, until in 1882 he definitively abandoned the law for many years and entered on a literary career, becoming associate editor of *St. Nicholas*. He retained this post for 15 years and then resumed law practice, although continuing from time to time to publish books for young readers. Among his best known works are the following: 'Boy's Book of Exploration,' 'Defense of the Castle,' 'In the Days of Chaucer,' 'Magic Wand Series,' 'In the Days of Scott,' 'Electricity for Young People,' 'When America Won Liberty,' 'The Book of Famous Sieges,' 'Chemistry for Young People,' 'What Shall I Be—A Fireman?.'

JEWISH CONGREGATIONS. See CHURCHES IN THE UNITED STATES, STATISTICS OF THE.

JEWISH JOINT DISTRIBUTION COMMITTEE, American. The American Jewish Joint Distribution Committee representing the American Jewish Relief Committee, the Central Relief Committee and the Peoples Relief Committee, was organized in 1915 as an agency for distribution of relief to Jewish war sufferers. As of 31 Dec. 1922, a total of over \$55,000,000 had been appropriated from the funds of the organization, of which amount \$48,000,000 had been actually disbursed.

During the year 1922 a gigantic feeding problem was introduced in Russia, which was not accessible until that time; the year 1922 also saw a tremendous increase in the reconstruction activities for the rehabilitation of war-stricken sections of Europe and Palestine and a continuance of other activities inaugurated earlier in the period of organization—namely, medical sanitary operations, refugee relief work, and childcare.

The major part of the work in Russia was carried on in co-operation with the American Relief Administration. Approximately \$675,000

was granted by the Jewish Joint Distribution Committee for non-sectarian feeding in the Volga region. Extended feeding programs and rehabilitation operations were conducted in the Ukraine and South Russia and as of 31 Dec. 1922, approximately \$7,500,000 was appropriated for these sections, \$1,290,000 of which was applied against a reconstruction program, to be undertaken as a distinct activity of the Jewish Joint Distribution Committee, the balance to be applied for direct relief in the form of food, clothing, fuel, etc.—the child feeding was carried on under the auspices of the American Relief Administration, the reconstruction and other relief activities under the direct auspices of the Jewish Joint Distribution Committee. The reconstructive plans include the setting up of loans, programs for the establishment and support of trade schools, aid to farmers through the distribution of American seeds and machinery.

Long before Russia was opened to reconstructive activities, representatives of the reconstruction department had been assigned to Poland, Roumania, and other countries of Eastern Europe, and considerable headway had been made in Palestine. The reconstruction department provided funds for the organization of chains of credit banks; for the extension of loans to countless co-operative groups and societies; for the rebuilding of homes and shops; for the reconstruction, equipment and partial maintenance of trade and vocational schools. At the end of the year reconstruction department offices were in operation in Rumania, Poland, Lithuania, Latvia, Hungary, Czechoslovakia, Constantinople, Saloniki and Palestine. The sum of \$5,700,000 was set aside for the economic reconstruction program, and, including the amount assigned for the work in Russia, almost \$4,200,000 of this sum had been appropriated for specific reconstruction activities.

The medical department reported that 140 community bath houses were being reconstructed or repaired. Of these 140 bath houses, 53 were to be newly constructed, and it was expected that all would be completed early in 1923. In addition to these bath houses which conform to the required sanitary and hygienic standards the Jewish Joint Distribution Committee made contributions toward the repair of 73 other bath houses, which, although not adequate buildings, are used by the communities for want of better facilities.

The Jewish Joint Distribution Committee also contributed toward the repair of 34 hospitals; 31 ambulatoria; 7 sanatoria and 22 wells.

In addition to the above, \$100,000 was set aside for the treatment of favus throughout Poland; \$50,000 for a nurses' training school and \$25,000 for public health education.

In accordance with its policy of co-operating and working in conjunction with governments wherever possible, agreements were signed with the governments of Palestine and Poland. The agreement with Palestine provided \$86,713 for the equipment of an anti-malarial research unit. The agreement with Poland provided \$40,000 for the purchase of a building to be used as a hostel for students of the School of Public Hygiene at Warsaw. The total amount appropriated to

JEWISH WELFARE BOARD

31 Dec. 1922 for medical work of the American Jewish Joint Distribution Committee was \$1,525,677.42.

The Child Care Department functioned in all Central European countries, Turkey and Palestine. Over 44,000 children were registered with the bureau, and 16,000 war orphans were placed in institutions or with private families—either with money from the general fund of the Jewish Joint Distribution Committee, or with the aid of American financial adoptors. Of these, 12,000 are in Poland. In addition to the care of orphans abroad the department supervised the reunion of 800 war orphans with their relatives in America. From January to 31 Dec. 1922 the sum of \$860,000 was appropriated for child care work.

Besides the amounts specified, appropriations were made also for repatriation, refugees and cultural work, etc., bringing the total appropriation for the year 1922 to \$10,400,000.

In addition to the distribution of its own funds, the Jewish Joint Distribution Committee, also in co-operation with the American Relief Administration, sells food and clothing packages to individuals and *Landmannschaften* (countrymen organizations) to be delivered to residents of Russia, maintains a location department which traces and re-establishes communication between relatives in America and Europe, and carries on similar branches of work.

The officers of the American Jewish Joint Distribution Committee are: Felix M. Warburg, chairman; Herbert H. Lehman and James N. Rosenberg, vice-chairmen; Paul Baerwald, treasurer; George W. Naumburg, associate treasurer; H. B. L. Goldstein, comptroller; Albert Lucas, secretary. The offices of the organization are at 64 Water Street, New York.

WILLIAM J. MACK,

American Jewish Joint Distribution Committee.

JEWISH WELFARE BOARD. This Board, first called the Jewish Board for Welfare Work, was organized in April 1917, three days after the declaration of war with Germany, for the purpose of doing welfare work among soldiers, sailors and marines in the United States forces. In September 1917, the Jewish Welfare Board was formally recognized by the government as the official agency of the Jewish community for welfare work in the military and naval camps of the United States, and established an extensive program of activities which included religious services, educational activities, entertainment, the free distribution of a wide variety of articles and the performance of personal services. Subsequently, when the military operations of this country were extended overseas, workers were assigned to transports and to camps and towns in France, Belgium and Germany where uniformed men were to be found. The greatest care was exercised in selecting competent workers. A training school was maintained, which, in 12 classes, graduated 325 men and women. One hundred and seventy-eight workers served overseas, where the Board operated 57 buildings. In the United States, activities were conducted at over 200 army posts, naval stations, camps and hospitals by 490 workers. Fifty-eight buildings were erected in

the principal camps in this country. The program carried out in the camps was supplemented by the work of 175 community committees, operating in cities that were adjacent to military and naval posts. Entertainments were arranged for men on leave, home hospitality provided and community centers maintained.

The entertainments, dances and distribution of supplies were conducted on a non-sectarian basis and no charge was made for such service. A total of 15,000 entertainments, attended by over 6,250,000 men, was arranged by the Board in this country and overseas. In addition, the Board sought to meet the special requirements of the men of Jewish faith through the conduct of religious services, observance of Jewish holidays and festivals, and the distribution of religious reading materials and supplies. At its request the War and Navy departments granted furloughs to the men to enable them to celebrate properly the high holidays and Passover. The committee on chaplains of the Board likewise recommended rabbis who were qualified to serve as chaplains in the army. The chief educational activities consisted of classes in English and citizenship. Lectures of a general cultural character were likewise conducted. In all, 3,000 classes were held in this country, attended by over 100,000 men, and several members of the staff were assigned to the Sorbonne University and the American University at Beaune in France. An important element in the program consisted of personal service activities. Contact was maintained with relatives and other interested persons, so that the families back home could be kept apprised of the well being of their soldier sons. With the signing of the armistice came a change of emphasis in the program. The entertainment program in camp and community was intensified and the educational activities increased in extent and scope, in response to the need for meeting the added leisure time requirements of soldiers and sailors waiting to be discharged. A Hospital Division was organized and especially qualified workers assigned to 57 of the principal hospitals for disabled men. These workers co-operated in the general rehabilitation activities and in meeting the personal, religious and recreational needs of the men. When the men were demobilized from active service, the Board, through community committees, organized employment bureaus and co-operated with existing agencies in securing work for ex-service men.

The Jewish Welfare Board undertook, upon the signing of the Armistice, to identify Jewish soldiers who had died in France, and to locate their graves in order that Star of David markers might be placed over these graves. This was in accordance with an order issued by the War Department in February 1918. When the markers were changed, photographs of the graves were taken and mailed to the next of kin. Arrangements were also made for funeral services in the case of those bodies that were returned to this country for interment. In recognition of its services during the World War, the French government awarded to the Jewish Welfare Board, the Medal of Gratitude of the First Class. The Chairman of the Board.

an area of 42,734 square miles with a population in 1920 of 263,683. Labrador, the easternmost part of the American continent, with an area of 120,000 square miles and a population of 3,647 is now included in the colony of Newfoundland. Of the population of Newfoundland, 67,040 are connected with the fisheries, 3,000 are engaged in farming, 6,000 in mechanics and about 3,000 are miners. The chief towns, with their populations, are: Saint John's, the capital, 34,045; Harbour Grace, 4,279; Bonavista, 3,911; Carbonear, 3,540; Twillingate, 3,348. Hay, potatoes, oats, turnips and cabbage are the chief crops raised. The value of all agricultural products is about \$5,000,000 yearly. Cattle, sheep and swine are the chief farm animals. There are large pine forests in the north and there several saw mills are in operation. Iron, copper and coal are mined. Iron ore is abundant in the Conception Bay region. Exports of iron ore average 700,000 tons. Silver, lead and gold are found. There are several extensive paper and pulp mills at Grand Falls, Lomond, and Alexander Bay. Fishing is the chief occupation of the colony, the value of the products of this industry being about \$20,000,000 annually. The fishing for cod is the chief branch of the industry, the catch averaging 1,400,000 quintals yearly. The lobster catch in 1920 amounted to 2,331,295. In 1921, 101,452 seals were taken. In all about 15,000 vessels of all kinds, sail and motor, are employed in the fishing industry. Imports in 1921 were valued at 5,962,218 pounds sterling and the exports at 4,628,511 pounds sterling. Textiles, flour, coal, hardware, salt pork, machinery, tea and molasses form the bulk of the imports, while dried cod, pulp and paper, iron ore, herring, seal oil, cod oil, seal skins and lobsters constitute the exports. In 1921 imports to the value of \$3,230,305 came from the United Kingdom; \$14,841,561 from Canada and \$9,556,244 from the United States. Exports to the value of \$6,275,098 went to the United Kingdom; \$1,976,032 to Canada and \$1,854,101 to the United States. Vessels registered in 1920 numbered 3,362 sail vessels of 152,166 tons and 137 steam vessels of 22,018 tons, making a total of 3,499 vessels of 174,184 tons. The colony has 904 miles of government owned railways and 47 miles of privately owned line. The chief towns of the island are now connected by rail. There are 847 post offices, 213 telegraph and 90 telephone offices. A fleet of 13 first class steamers maintain communications along the coast and with the mainland of Canada. The affairs of the colony are administered by a Governor, assisted by an Executive Council and a Legislative Council. There is also an elected House of Assembly of 36 members. The Governor and Commander-in-chief in 1922 was Sir C. A. Harris. The Prime Minister and Colonial Secretary was Hon. Sir R. A. Squires.

NEW GUINEA, an island of the Melanesian group lying to the north of Australia. It has an area estimated at 234,768 square miles. Territorially it is divided under Australian, British and Dutch control. Until the World War the greater part of the north shore region was a German colony called Kaiser Wilhelm's Land. This was occupied by Australian forces

in September 1914 and at the peace was placed under mandate to Australia. The part of the island west of the 141st meridian belongs to the Netherlands and has an area of 151,789 square miles. The Australian part has an area of 70,000 square miles while the British portion has an area of 90,540 square miles. Coconuts, rubber, cocoa and tropical fruits are the chief products of the island. There is considerable mineral wealth but development is retarded because of the difficulty of introducing mining machinery into the inland regions, there being no improved means of transportation.

NEW HAMPSHIRE, the Granite State of New England, bounded on the north by Canada, east by Maine and the Atlantic Ocean, south by Massachusetts, and west by Vermont. It is one of the 13 original States. It has an area of 9,341 square miles, and in 1920 had a population of 443,083. The State is 43d in order of size and 41st in order of population among the States of the Union. The census of 1920 showed a population of 442,331 whites, 621 negroes, 103 Asiatics and 28 Indians in the State. In the same year the foreign born numbered 91,233, and included 52,274 Canadians, 7,908 Irish, 4,367 English, 3,467 Russians, 1,886 Swedes and 1,714 Germans. The chief cities are: Concord, the capital, with a population of 22,157; Manchester, 78,384; Nashua, 28,379; Dover, 13,029; Berlin, 16,014; Portsmouth, 13,569; Keene, 11,210; Laconia, 10,897, and Rochester, 9,673.

Religion.—The principal Christian denominations have an aggregate membership of 210,736. Of this number, 136,020 are Roman Catholics, 20,084 Congregationalists, 17,335 Baptists, 13,574 Methodists, 6,155 Episcopalians, 3,890 Unitarians and 908 Presbyterians.

Education.—The State appropriation for education in 1922 was \$1,129,246.27. The State requires that 36 weeks of schooling must be provided in every town and township yearly. Attendance is compulsory for all children between the ages of eight and 14 during the whole school period, and the compulsory age is extended to the age of 16 for those children who have not completed the elementary grades on attaining the age of 14. In the State public schools there are 2,648 teachers and 64,205 pupils. The State has 86 high schools, with 673 teachers and 13,055 pupils, two normal schools, with 31 teachers and 286 students. The Roman Catholic Church maintains parochial schools in practically all the cities and towns in the State. For purposes of higher education there are in the State, Dartmouth College and the New Hampshire College of Agriculture and Mechanic Arts.

Finances.—At the beginning of the last fiscal year the balance in the State treasury amounted to \$789,041.32. Receipts during the fiscal year amounted to \$7,691,699.35. Disbursements during the same period totaled \$6,793,157.72, leaving a balance on hand at the beginning of the current fiscal year amounting to \$1,687,582.95. For the current fiscal year 1922-23 the estimated receipts are \$3,294,766.30, while the expenditures outlined in January 1923 totaled \$4,381,188.88, but this sum was subject to change by the legislature which was then in session. The bonded debt of the State beginning

1923 was \$2,489,500. The floating debt was \$1,128,004.54, making a total indebtedness of \$3,617,504.54. The assessed value of all real property was \$456,584,737, and of personal property, \$109,884,607.

Agriculture.—Most of the population is employed in agriculture, but manufacturing interests occupy almost an equal number. There are in the State 20,523 farms with a total acreage of 2,603,806 acres. In 1920 the total value of all farm property was \$118,656,115. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 24,000 acres, 1,032,000 bushels, \$774,000; barley, 1,000 acres, 28,000 bushels, \$27,000; oats, 18,000 acres, 684,000 bushels, \$410,000; buckwheat, 1,000 acres, 25,000 bushels, \$31,000; tame hay, 450,000 acres, 585,000 tons, \$11,408,000; potatoes, 14,000 acres, 1,400,000 bushels, \$1,470,000; apples, 775,000 bushels; peaches, 32,000 bushels, and pears, 24,000 bushels. On 1 Jan. 1923 there were in the State 35,000 horses, valued at \$3,990,000; 126,000 milk cows, valued at \$7,434,000; other cattle, 34,000 valued at \$867,000; 18,000 sheep, valued at \$140,000, and 28,000 swine, valued at \$476,000. The value of all crops in 1920 was \$23,509,000. In that same year the value of the industrial products totaled \$407,205,000. Cotton goods led, with an output valued at \$85,986,000, followed by boots and shoes with \$73,871,000; paper and pulp, \$41,826,000, and woolens, \$31,245,000. The manufacturing industries are mostly located in the southern half of the State and about 100,000 persons are employed therein. An occupation which may now be regarded almost as an industry is the summer entertainment of tourists in the mountain and lake regions. Minerals are little worked, but granite and mica are quarried.

Communications.—The State has a steam railroad mileage of 1,252, and 251 miles of electric railways. The State has a fine system of modern roads, even in the mountain regions.

Government.—The executive is a Governor, elected for two years, who receives a salary of \$3,000. The legislature consists of two bodies—a Senate of 24 members, elected for two years and a House of Representatives of 422 members. The Legislature meets biennially in January of odd years. New Hampshire sends two Senators and two Representatives to the Federal Congress. For local administration the State is divided into 10 counties.

Officials.—The officials in 1922 were: Governor, Albert O. Brown, whose term expired 4 Jan. 1923; Secretary of State, Edwin C. Bean; Attorney-General, Oscar L. Young; Treasurer, John W. Plummer, and Superintendent of Education, E. W. Butterfield. Officials entering into office in 1923 were: Governor, Fred H. Brown; Secretary of State, Enos K. Sawyer; Attorney-General, Oscar L. Young; Treasurer, George E. Farrand, and Superintendent of Education, Ernest W. Butterfield.

Judiciary.—Members of Supreme Court: Frank N. Parsons, John E. Young, Robert J. Peaslee, William A. Plummer and Leslie P. Snow.

Legal Holidays.—1 January; 22 February; 30 May; 4 July; Fast Day, when appointed; Thanksgiving Day, when appointed; First Mon-

day in September; 12 October; 25 December; Day of the biennial election.

NEW HAMPSHIRE COLLEGE OF AGRICULTURE AND THE MECHANIC ARTS, a non-sectarian co-educational institution, founded in 1866 and located at Durham, N. H. In 1922-23 it had a faculty of 93 members, 1,070 students, property valued at \$2,200,000, and an income from all sources of \$766,000. Ralph D. Hetzel, LL.D., is president.

NEW HEBRIDES, a group of islands in the South Pacific under the joint administration of Great Britain and France. The group has an area of 5,500 square miles and a population of about 60,000. The larger islands of the group are Espiritu Santo, Mallicolo, Epi, Efate, Erromanga, Tanna, Futuna and Aneitum. There are 317 British and 1,300 French subjects residing in the group. Coconuts, Indian corn, millet, coffee, cotton, cocoa, and bananas are the chief products. Kauri wood is exported. Revenue in 1920 amounted to 20,507 pounds sterling and expenditures to 16,425 pounds sterling. Imports the same year were valued at 159,174 pounds sterling and exports at 245,187 pounds. There is a good trade with New Caledonia and also with Australia. The chief imports are clothing, foodstuffs, furniture and metal work. Exports comprise Indian corn, copra, coffee, cotton, cocoa and sandalwood. Considerable friction existed during 1921-22 over the joint control by England and France. There are several French and British trading companies and some of the former desired to sell out their holdings to the British but were restrained by their home government. The British Resident in 1922 was M. King; the French Resident, M. Boisivan.

NEW JERSEY. One of the 13 original States in the middle Atlantic group, bounded on the north by New York and Pennsylvania, east by the Atlantic Ocean and New York, south by the Atlantic and Delaware Bay, and west by Pennsylvania. The area of the State is 8,224 square miles. In 1920 it had a population of 3,155,900. New Jersey is 45th among the States in order of size and 10th in order of population. The reports of the Federal census of 1920 showed the population as composed of 3,037,087 whites, 117,132 negroes, 1,581 Asiatics and 100 Indians. In the same year the foreign-born residents of the State totaled 738,613 and of these 157,285 were Italians; 92,382 Germans; 46,781 English; and 65,971 Irish. The chief cities of the State, with their populations, are: Trenton, the capital, 119,289; Newark, 414,216; Jersey City, 297,864; Paterson, 135,866; Camden, 116,309; Elizabeth, 95,682; Hoboken, 68,166; Passaic, 63,824; Bayonne, 76,754; Atlantic City, 50,682; East Orange, 50,587; Perth Amboy, 41,707; New Brunswick, 32,779; Orange, 33,239; Plainfield, 27,700.

Religion.—The principal Christian denominations have an aggregate membership of 1,337,983. Of these 790,764 are Roman Catholics; 131,211 are Methodists; 102,290 are Presbyterians; 80,918 Baptists; 67,996 Episcopalians; 38,772 members of the Reformed Church; 19,680 Lutherans, and 10,839 Congregationalists.

Education.—Primary education is free for all children from the age of seven to 21 years,

and compulsory for all children from seven to 16 years of age. In the State public schools there are 12,775 teachers, and 533,073 pupils. There are 70 public high schools with 2,365 teachers and 53,710 pupils. In addition, there are three public normal schools with 105 professors and 2,015 students. The total State expenditure averages about \$30,000,000 yearly. Higher education is provided within the State at Princeton University, Rutgers College and at Stevens Institute of Technology.

Finance.—On 1 July 1921, the balance in bank amounted to \$10,055,905.87. Receipts during the fiscal year, 1 July 1921 to 30 June 1922 totaled \$20,569,804.68; disbursements during the same period totaled \$21,834,127.61 leaving a balance on hand on 30 June 1922 amounting to \$8,791,582.94. State school tax receipts during the same fiscal year amounted to \$9,000,548.21. The bonded debt of the State on 30 June 1922 totaled \$17,000,000. At the November election of 1922, the electors authorized a bond issue of \$40,000,000 for the construction and maintenance of the State highways. In the fiscal year under consideration, deposits in the 189 financial institutions reporting to the State department of banking and insurance, increased \$34,915,108.53; aggregate deposits totaled \$827,490,952.03. Savings banks had deposits of \$206,082,451.95. The 1922 report of the State Board of Taxes and Assessments showed the assessed value of real and personal property subject to local taxation for 1922 to be \$797,507,447.11, an increase of \$277,666,178.36 over 1921.

Agriculture.—Market gardening, horticulture and fruit growing are carried on within the State. The last Federal census reported 29,702 farms with a total area of 2,282,585 acres, of which 1,555,607 acres was improved land. The value of all farm property the same year totaled \$311,847,948. The chief crops, with their acreage, yield and value for the year 1922 are shown in the following table:

CROPS	Acreage	Yield	Value
Corn.....	236,000	9,912,000 bu.	\$6,938,000
Winter wheat....	77,000	1,540,000 bu.	1,694,000
Oats.....	72,000	2,232,000 bu.	1,228,000
Barley.....	10,000	220,000 bu.	253,000
Rye.....	61,000	1,159,000 bu.	985,000
Cranberries.....	11,000	200,000 bbls.	3,950,000
Hay (tame).....	303,000	483,000 tons	8,778,000
Potatoes.....	95,000	16,435,000 bu.	11,833,000
Sweet potatoes....	20,000	3,500,000 bu.	2,520,000
Apples.....	2,610,000 bu.
Peaches.....	2,000,000 bu.
Pears.....	405,000 bu.

On 1 Jan. 1923 there were in the State, 72,000 horses, valued at \$9,288,000; 6,000 mules, valued at \$786,000; 153,000 milk cows, valued at \$13,511,000; 32,000 other cattle, valued at \$1,242,000; 10,000 sheep valued at \$75,000; 132,000 swine, valued at \$2,310,000.

Other Products.—The fisheries of the coast, lakes and streams are very valuable, the catch including shad, sturgeon, perch, bass, trout and menhaden. Mineral deposits of the State are magnetic iron, manganese, zinc, graphite, talc and soapstone. Clay products are one of the

leading commercial ventures of the State being valued at over \$20,000,000 yearly. Other products of the State are Portland cement, coke, mineral waters, green sand marl. New Jersey is the sixth industrial State of the Union. Its production is very varied and Newark has perhaps the widest range of manufactures of any city in the country. The output of the industries in 1920 was valued at \$2,990,939,000. Silk mills with Paterson as their chief centre, employed in that year 25,046 persons and turned out goods to the value of \$120,075,000. Oil refining is now one of the leading industries with products valued in 1920 at \$328,120,000. Explosives the same year were produced to the value of \$197,074,000. The production of chemicals totaled in value \$189,117,000; machinery, \$140,000,000; shipbuilding, \$124,000,000; woollens and worsteds, \$118,000,000; rubber goods, \$98,410,000; wire and wire cloth, \$93,353,000; tobacco, cigars and cigarettes, \$55,470,000; leather and leather products, \$45,000,000.

Communications.—The agricultural and industrial activity of New Jersey is greatly affected by its proximity to the great markets of the metropolitan districts of New York and Pennsylvania. Transit facilities are well developed, especially electric railway lines in the northern end of the State. There are 2,461 miles of steam railroads within the State and 1,593 miles of electric railways. The canal mileage is 175 miles but this is now little used for freight haulage. Many of the coastal cities are connected with New York and other Atlantic ports by regular steamship lines. Atlantic City on the southern coast has become one of the famous all-year resorts of the East and Cape May at the southern end of the State is another famous resort.

Government.—The executive of the State is the Governor who is elected for a three-year term and receives a salary of \$10,000. The legislature meets annually in January and is composed of the senate and the general assembly; the senate has 21 members, one from each county of the State, elected for three years; the general assembly, or lower chamber, has 60 members who are elected annually in proportion to the population of the counties as determined by the Federal census. New Jersey sends two senators and 12 representatives to the Federal Congress. The State for local administration purposes is divided into 21 counties which are subdivided into cities, boroughs and townships. The Governor in 1922 was Edward I. Edwards, who in November was elected United States Senator and was succeeded in the governorship on 16 Jan. 1923 by the Hon. George S. Silzer, whose term expires 16 Jan. 1926. Other State officials are: Secretary of State, Hon. Thomas F. Martin; attorney-general, Hon. Thomas F. McCran; auditor, Harry B. Salter; treasurer, Hon. William F. Read; comptroller, Hon. N. A. K. Bugbee; superintendent of education, Hon. John Enright.

NEW MEXICO, one of the mountain group of States, bounded on the north by Colorado, east by Texas, south by Texas and Mexico, and west by Arizona. Its area is 122,634 square miles and in 1920 its population totaled 360,350. New Mexico is fourth among the States of the

Union in order of size and 44th in order of population. In 1920 the population included 334,673 whites, 19,512 Indians, 5,733 negroes and 432 Asiatics. The same year the foreign born totaled 29,077, of which 19,906 were Mexicans, 1,678 Italians, 888 English and 423 Austrians. In 1920, 82 per cent of the population was rural. The chief cities of the State, with their populations, are: Santa Fe, the capital, 7,226; Albuquerque, 15,157; Roswell, 7,062, and Raton, 5,544. Indian reservations occupy 6,282 square miles of the area of the State and have an Indian population of 21,530.

Religion.—The principal Christian denominations have a total membership of 209,908, of whom 177,727 are Roman Catholics, 11,505 Methodists, 6,721 Baptists, 3,892 Presbyterians, 1,718 Episcopalians, and 366 Congregationalists.

Education.—Primary education is free and compulsory for all children between the ages of six and 16. English is the language of the schools, although Spanish is the language in most common use among the population. There are 1,430 elementary schools in the State, with 81,399 pupils and 2,752 teachers; 72 high schools, with 261 teachers and 3,876 pupils. In addition there are 26 Indian schools, with 141 teachers and 2,291 pupils. These are maintained by the Federal government. The State supports three public normal schools, with 60 professors and 2,009 students. For higher education there are many institutions including the College of Agriculture and Mechanic Arts, School of Mines, a military institute and the State University.

Finances.—At the beginning of the fiscal year 1921-22 the balance on hand amounted to \$3,481,099.41. Receipts during the year totaled \$8,716,255.71. Disbursements for the same period amounted to \$6,889,124.47, leaving a balance at the beginning of the fiscal year 1922-23 amounting to \$5,308,230.65. The estimated receipts for the fiscal year 1922-23 aggregate \$9,000,000. The bonded debt of the State at the end of 1922 was \$4,712,000.

Agriculture.—New Mexico grows cereals, vegetables, fruits and cotton. The value of all agricultural crops in 1920 was \$40,619,000. Live-stock industries are considerable. Dry farming is practised to a great extent. About 945,000 acres are included in irrigation projects, of which 550,000 acres actually receive water. In 1920 there were 29,845 farms with an acreage of 24,409,633 acres, of which less than 2,000,000 acres was improved land. The total value of all farm property in that year was \$325,185,999. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 182,000 acres, 2,475,000 bushels, \$2,030,000; spring wheat, 60,000 acres, 660,000 bushels, \$792,000; winter wheat, 45,000 acres, 225,000 bushels, \$270,000; barley, 10,000 acres, 140,000 bushels, \$133,000; oats, 62,000 acres, 930,000 bushels, \$539,000; rye, 2,000 acres, 8,000 bushels, \$8,000; broom corn, 11,000,000 acres, 1,500,000 tons, \$278,000,000; tame hay, 172,000 acres, 458,000 tons, \$6,045,000; sorghum sirup, 1,000 acres, 55,000 gallons, \$58,000; beans, 45,000 acres, 840,000 bushels, \$608,000; potatoes, 4,000 acres, 200,000 bushels, \$290,000; sweet potatoes, 1,000 acres, 120,000 bushels, \$240,000; grain sorghums, 145,000 acres, 1,595,000 bushels, \$1,276,000; apples, 750,000 bushels;

peaches, 98,000 bushels, and pears, 18,000 bushels. On 1 Jan. 1923 there were in the State 181,000 horses, valued at \$8,145,000; 21,000 mules, valued at \$1,386,000; 47,000 milk cows, valued at \$2,350,000; 838,000 other cattle, valued at \$18,352,000; 2,062,000 sheep, valued at \$13,197,000, and 89,000 swine, valued at \$890,000.

Forestry, Mining and Other Products.—Over 8,000,000 acres of the State are included in the national forest area and about 4,000,000 acres of forested land are privately owned. The State has valuable mineral resources. Its mineral output includes gold, copper, silver, coal, zinc, lead, granite, limestone, sandstone and marble, while some of the sands contain traces of platinum. The coal output in 1922 was 3,100,000 tons. The value of the output of all mineral industries in 1920 was \$45,000,000. The manufacturing industries are rather limited, the largest being railway car construction and railroad repair shops, followed by the lumber industry and flour milling. Woolen mills and cement works have increased in importance of late years. The value of the manufactures in 1920 was \$20,000,000. Metal mines in New Mexico in 1922 produced \$374,000 in gold, 700,000 ounces of silver, 2,600,000 pounds of lead, 31,000,000 pounds of copper, and 4,500,000 pounds of zinc, as compared with \$196,822 in gold, 571,899 ounces of silver, 14,267,358 pounds of copper, 678,601 pounds of lead, and 228,000 pounds of zinc in 1921.

Communications.—The State has 2,978 miles of steam railways and 12 miles of electric railways. The State is remarkable as one of the few in which the old-time life of the West may still be found, although even there it has practically disappeared. The State has some reputation as a winter resort, while many anthropologists and artists now visit the Indian pueblos to study the old Indian and Spanish types and the relics of the old Aztec civilization.

Government.—The State executive is a Governor, who is elected for a two-year term. The legislature consists of two chambers—a senate of 24 members and a house of representatives of 49 members. The legislature meets biennially in odd years and sessions are limited to 60 days. For local government the State is divided into 29 counties.

Officials.—State officials in 1922 were: Governor, Merrill C. Mechen; lieutenant-governor, Wm. H. Duckworth; secretary of state, Manuel Martenz; attorney-general, Harry I. Boumar; auditor, Ed. Safford; treasurer, O. A. Matson, and superintendent of education, John O. Conway. Officials entering into office in 1923 were: Governor, Jas F. Hinkle; lieutenant-governor, Jose A. Baca; secretary of state, Soledad C. Chacon; attorney-general, Milton J. Helmick; auditor, Juan N. Vigil; traveling auditor, W. F. Whittier; treasurer, O. A. Matson, and superintendent of Education, Miss Isabel L. Eckles.

Judiciary.—Members of supreme court, Hon. Frank W. Parker, chief justice; Samuel W. Bratton and C. M. Botts.

NEW MEXICO COLLEGE OF AGRICULTURE AND MECHANIC ARTS, a State co-educational institution founded in 1889 and located at State College, N. M. In 1922-23 it had a faculty of 35 members, 392 students,

property valued at \$663,000, and an income of \$366,116. H. L. Kent, M.S., is president.

NEW MEXICO SCHOOL OF MINES, a State co-educational institution, founded in 1889 and located at Socorro, N. M. In 1922-23 it had a faculty of eight members, 85 students, property valued at \$217,790, and an income of \$68,958.21. E. H. Wells, B.S., is president.

NEW MEXICO STATE UNIVERSITY, a co-educational institution founded in 1889 and located at Albuquerque, N. M. In 1922-23 it had a faculty of 28 members and 770 students. Its campus and buildings were valued at \$670,000. It also had funds totaling \$101,000 and owns approximately 310,000 acres of land. Its income for the year was \$220,276.82. David S. Hill, Ph.D., LL.D., is president.

NEW ROCHELLE COLLEGE, a Roman Catholic educational institution for women, founded in 1904 and located at New Rochelle, N. Y. In 1922-23 it had a faculty of about 35 members, 470 students, and property valued at \$1,500,000. No income figures given. Rt. Rev. Monsignor Joseph F. Mooney, D.D., is president.

NEW SOUTH WALES. See AUSTRALIA.

NEW YORK, the Empire State, and the most populous in the Union, bounded on the north and west by Lake Erie, the province of Ontario, Lake Ontario and the province of Quebec, Canada, east by Vermont, Massachusetts and Connecticut, and south by the Atlantic Ocean, New Jersey and Pennsylvania. Its area is 49,204 square miles and in 1920 its population was 10,385,277. In 1920 the census reported 10,172,027 whites, 198,483 negroes, 9,214 Asiatics and 5,503 Indians. The population the same year included 2,786,112 foreign-born white persons, of whom 2,528,497 were 21 years old and over. Of these, 474,994 were born in Italy, 458,239 in Russia, 290,237 in Germany, 280,508 in Ireland, 224,799 in Poland, 138,279 in Austria and 120,299 in England. The citizenship status of the foreign-born whites of voting age in New York State by country of birth, as enumerated in 1920, was as follows:

COUNTRY	Total	Naturalized
All countries.....	2,528,597	1,153,813
Italy.....	474,994	139,330
Russia.....	458,239	182,139
Germany.....	290,237	203,307
Ireland.....	280,508	177,678
Poland.....	224,799	66,971
Austria.....	138,279	59,129
England.....	120,299	74,109
Canada.....	99,792	59,656
Canada-French.....	14,078	8,177
Hungary.....	71,413	28,701
Sweden.....	51,114	29,058
Rumania.....	36,230	18,226

Scotland.....	34,155	19,007
France.....	29,345	15,370
Norway.....	25,445	11,917
Greece.....	22,907	3,993
Switzerland.....	14,521	8,563
Denmark.....	13,328	7,764
Netherlands.....	12,196	7,120
Spain.....	10,774	1,144
Finland.....	11,896	2,901
Lithuania.....	11,407	2,105
Jugoslavia.....	7,604	2,014
Syria.....	6,986	1,767
All other countries.....	45,837	16,337

Religion.—The principal Christian denominations have an aggregate church membership of 4,315,404. Of this grand total, 2,745,552 are Roman Catholics, 328,250 Methodists, 227,685 Episcopalians, 222,888 Presbyterians, 182,443 Baptists, 73,581 Lutherans, 73,991 members of the Reformed Church, and 65,021 Congregationalists.

Education.—Primary education is compulsory for all children between the ages of 7 and 16. Physical training was made compulsory in all State schools in 1916. In the primary schools of the State there are enrolled 1,744,758 pupils. Outside of New York City there are 55,732 teachers in elementary public schools. The State has 978 public high schools, with 8,705 teachers and 207,372 pupils. There are 10 public normal schools, with 371 teachers and 7,370 students, and 132 vocational schools, with 1,423 teachers and 76,250 pupils. The total expenditures on education average \$150,000,000 yearly. The State appropriation for education in 1922 was \$41,247,926.94. For higher education there are 132 universities, colleges, and professional and technical schools, including Columbia University, New York University, College of the City of New York, Cornell University, Syracuse University, University of Rochester, Union University, Colgate University, Hobart College, Vassar College, Fordham University, Niagara University, and scores of special schools, specializing in science, engineering, mechanics, etc. At West Point is the United States Military Academy.

Chief Cities.—The chief cities, with their populations in 1920, were: Albany, the capital, 113,344; New York, 5,620,048; Buffalo, 506,508; Rochester, 295,750; Syracuse, 171,717; Yonkers, 100,226; Utica, 94,156; Schenectady, 88,723; Troy, 72,013; Binghamton, 66,800; Niagara Falls, 50,760; Elmira, 45,305; Mount Vernon, 42,726; Poughkeepsie, 35,000; Auburn, 36,142; New Rochelle, 36,213; Watertown, 31,263; Oswego, 23,626; Cohoes, 29,987; Rome, 26,341; Kingston, 26,688; Gloversville, 22,026; White Plains, 21,031; Lockport, 21,308. In 1920 only 17.3 per cent of the population of the State was rural. In the same year the Indian reservations occupied 137 square miles of the area of the State and had an Indian population of 6,432.

Finances.—The balance at the beginning of the fiscal year 1922 was \$93,765,708.41. Receipts during the year amounted to \$153,242,723.91. Disbursements for the same period totaled \$172,943,706.21, leaving a balance on hand at the beginning of 1923 of \$74,064,726.11. The assessed value of real property in 1922 was \$15,141,722,139; of personal property, \$248,676,834. The total funded debt of the State amounts to \$236,024,000. On 1 Jan. 1920 the city of New York had a gross bonded debt of \$1,238,260,597.

Charities and Corrections.—At the beginning of 1923, the chairman of the State Hospital Development Commission reported more than 56,000 patients and inmates as wards of the State. These patients were costing approximately \$22,000,000 yearly. The following table shows the number of inmates in each class of institution:

INSTITUTION	Inmates
Fifteen insane hospitals (two criminal).....	39,391
Four hospitals for feeble-minded.....	5,521
One epileptic hospital.....	1,554
Seven reformatories.....	3,356
Two veterans' homes.....	605
Two schools.....	375
One tuberculosis institution.....	301
One hospital for children.....	200
Four prisons.....	4,741
Total.....	56,044

Agriculture.—The 14th census reported 193,195 farms in the State with an aggregate area of 20,632,803 acres, including 13,158,781 acres of improved land. The same year the total value of all farm property was \$1,908,483,201. Market gardening, fruit growing, sugar beet raising and tobacco are the principal crops. The chief crops, with their acreage, yield and value for the year 1922 were: Corn, 798,000 acres, 28,329,000 bushels, \$23,513,000; spring wheat, 21,000 acres, 336,000 bushels, \$396,000; winter wheat, 445,000 acres, 8,678,000 bushels, \$10,240,000; barley, 158,000 acres, 4,108,000 bushels, \$3,040,000; clover seed 11,000 acres, 28,000 bushels, \$280,000; oats, 1,059,000 acres, 31,770,000 bushels, \$16,203,000; buckwheat, 208,000 acres, 4,368,000 bushels, \$4,368,000; rye, 55,000 acres, 880,000 bushels, \$854,000; tame hay, 4,870,000 acres, 6,818,000 tons, \$96,134,000; beans, 93,000 acres, 1,302,000 bushels, \$4,948,000; potatoes, 340,000 acres, 37,400,000 bushels, \$22,440,000; tobacco, 2,000 acres, 2,500,000 pounds, \$814,000; apples, 36,000,000 bushels; peaches, 3,400,000 bushels, and pears, 3,200,000 bushels. On 1 Jan. 1923 there were in the State 510,000 horses, valued at \$58,650,000; 7,000 mules, valued at \$931,000; 1,678,000 milk cows, valued at \$105,714,000; 410,000 other cattle, valued at \$10,045,000; 532,000 sheep, valued at \$4,522,000 and 546,000 swine, valued at \$8,463,000. The wool clip of 1920 was 3,044,650 pounds. The census in 1920 placed the value of all farm crops that year at \$417,046,864. The State that year was second in the production of hay and grapes. It was also second in the quantity of buckwheat grown and was second in the value of dairy products which were valued at \$756,045,942. The State also led in the value of livestock products with \$225,465,739.

Mining.—The State has considerable mineral resources. Iron is mined in the Lake Champlain district, and near the Pennsylvania border petroleum and natural gas are produced. Graphite is also produced as are many of the baser minerals. The salt industry is important in Onondaga county. The output of gypsum in 1920 was valued at \$3,530,000. Portland cement was produced to the extent of 4,441,250 barrels in 1920, valued at \$7,700,406. The talc output was 62,495 tons, valued at \$750,000. Quarry products of granite, trap rock, marble, lime, limestone and sandstone were valued at \$6,988,735 in 1920. The value of bricks, pottery and tile produced the same year was \$13,000,000. The value of the natural gas produced was estimated at \$6,000,000.

Manufactures.—The last census of manufactures placed the value of the total manufactured products of New York State for the census year at \$8,867,004,906. The manufactured products of the State comprise almost every-

thing made in modern industry. The census reported 49,330 establishments, capitalized at \$6,012,082,567, employing 1,524,761 persons, who received in salaries and wages during the census year \$1,971,754,707. The cost of raw materials used in industry was \$4,943,213,919. The value of products was \$8,867,004,906, making the value added by manufacture, \$3,923,790,987. The chief industries are men's and women's clothing, printing and publishing, foundry and machine shop products, bread and bakery products, electrical machinery, apparatus and supplies, boots and shoes, knit goods, tobacco, cigars and cigarettes, ship building, photographic materials, paper and wood pulp, confectionery and ice cream, furniture, iron and steel, leather, condensed milk, chemicals, cars and general railroad shop repairs, silk goods, automobile bodies and parts, illuminating and heating gas, jewelry, brass, bronze and copper products, paper boxes, cotton goods, dyeing and finishing of textiles, lithographing, steam, gas and water engines, and cordage and twine.

Communications.—Over one-half the export and import trade of the United States passes through the port of New York. The Port of New York Authority was created to organize New York harbor into an economic and non-wasteful commercial agency through co-operation of the New Jersey with the New York authorities. In the year ending 30 June 1922, 5,201 vessels entered the port of New York, having an aggregate tonnage of 18,450,608. The State has a steam railroad mileage of 8,390 miles and 5,772 miles of electric railways. The canals of the State in use for commercial purposes have aggregate length of 638 miles. The State Barge Canal connects New York City with Buffalo by deep water route, 790 miles in length, and a minimum depth of 12 feet. It has a capacity of 20,000,000 tons per season.

Government.—The executive is the Governor who is elected for a two-year term. The legislature is composed of a senate of 51 members elected every two years, and an assembly of 150 members elected yearly. The legislature meets yearly in January. The question of a constitutional convention has to be submitted to the people every 20 years. New York sends two Senators and 43 Representatives to the Federal Congress. The State for local administrative purposes is divided into 62 counties. The cities are divided into three classes. The first class cities are those having over 175,000 inhabitants; second class, over 50,000 to 175,000, and third class, those having less than 50,000. Each city is incorporated by a charter under special legislation. The government of New York City is vested in a board of aldermen, elected for two years.

Officials.—State officials in 1922 were: Governor, Nathan L. Miller; lieutenant-governor, Jeremiah Wood; secretary of state, John J. Lyons; attorney-general, Charles D. Newton; comptroller, William J. Maier; treasurer, N. Monroe Marshall and commissioner of education, Frank P. Graves. The State officials entering into office in January 1923 were: Governor, Alfred E. Smith; lieutenant-governor, George R. Lunn; secretary of state, James A. Hamilton; attorney-general, Carl Sherman; comp-

troller, James W. Fleming; treasurer, George Kent Shuler and commissioner of education, Frank P. Graves.

NEW YORK BARGE CANAL. See CANALS.

NEW YORK, College of the City of, a non-sectarian institution, co-educational, except in preparatory and day college of liberal arts, founded in 1848 and located at New York, N. Y. In 1922-23 it had a faculty of 636 members, 14,316 students, property valued at \$8,306,930.81 and an income of \$1,072,668.13 (institution is supported by New York City). Sidney E. Mezes, LL.D., is president.

NEW YORK PORT AUTHORITY, a body corporate and politic, created in 1921 under the terms of the compact between the States of New York and New Jersey, and consisting of six commissioners—three from New York and three from New Jersey—for the better co-ordination of the terminal, transportation and other facilities of commerce in, about and through the port of New York. The legislatures of both States authorized in 1921 commissioners to sign the compact for the creation of the Port of New York District and the creation of the Port of New York Authority. The compact was signed 30 April 1921 by commissioners from New York and New Jersey and was subsequently approved by Congress and the President. This compact vested broad powers in the Port Authority which were to become effective as soon as the two States should have agreed upon and adopted a comprehensive plan. The port district, as defined in the compact, contains 105 organized municipalities. It embraces a population of about 8,000,000 people; is served by 12 trunk lines of railway, which bring in and take out of or through the port over 75,000,000 tons of freight per annum. An immense number of foreign and domestic steamships, not less than 8,000, annually bring to or take from the port over 45,000,000 tons of freight. There is also a very large local waterborne traffic within the port. The comprehensive plan was worked out by the commissioners and their engineers during 1921 and submitted to the legislatures of New York and New Jersey at the sessions of 1922. The New Jersey legislature approved the plan 20 Feb. 1922 and the New York legislature the day following. Congress approved the plan in June and the President on 1 July 1922. By this preliminary legislation the powers and jurisdiction of the Port Authority were defined and the general plan approved. The comprehensive plan for the co-ordination and extension of the facilities of the Port of New York proceeds along the following fundamental principles: (1) That terminal operations within the port district, so far as practicable, should be unified; (2) That there should be consolidation of shipments at proper classification points so as to eliminate duplication of effort, inefficient loading of equipment and realize reduction of expenses; (3) That there should be the most direct routing of all commodities so as to avoid centres of congestion, conflicting currents and long truck-hauls; (4) That terminal stations established under the plan should be union stations, so far as practicable; (5) That the process of

co-ordinating facilities should as far as practicable adapt existing facilities as integral parts of the new system, so as to avoid needless destruction of existing capital investment and reduce as far as may be possible the requirements for new capital; and endeavor should be made to obtain the consent of the States and local municipalities within the port district for the co-ordination of their present and contemplated port and terminal facilities with the whole plan; (6) That freight from all railroads must be brought to all parts of the port wherever practicable without cars breaking bulk, and this necessitates tunnel connection between New Jersey and Long Island, and tunnel or bridge connections between other parts of the port; (7) That there should be urged upon the Federal authorities improvement of channels so as to give access for that type of waterborne commerce adapted to the various forms of development which the respective shore fronts and adjacent lands of the port would best lend themselves to; (8) Highways for motor truck traffic should be laid out so as to permit the most efficient interrelation between terminals, piers, and industrial establishments not equipped with railroad sidings and for the distribution of building materials and many other commodities which must be handled by trucks; these highways to connect with existing or projected bridges, tunnels and ferries; (9) Definite methods for prompt relief must be devised that can be applied for the better co-ordination and operation of existing facilities while larger and more comprehensive plans for future development are being carried out.

In 1922 the commissioners held several public hearings and conferred with committees of railroad presidents, official and civic bodies and representatives of business interests. In May the Port Authority took emergency action with reference to an embargo against shipment of potatoes to New York placed by the Pennsylvania Railroad, and through the Interstate Commerce Commission forced that road to raise the embargo. In December 1922 the same commission called on the railroads entering the port district to co-operate with the Port Authority in carrying out the plan of development. The roads opposed the unification of their terminals and other features of the plan. At a public hearing in New York on 5 April 1923 the roads questioned the constitutionality of the acts instituting the Port Authority.

NEW YORK STATE COLLEGE OF FORESTRY, a State educational institution for men, founded in 1911 and located at Syracuse, N. Y. In 1922-23 it had a faculty of 30 members, 330 students, property valued at \$425,067.53 and an income of \$19,870. Franklin Moon, M. F., is dean.

NEW YORK STATE LIBRARY SCHOOL, a State co-educational institution founded in 1887 and located at Albany, N. Y. In 1922-23 it had a faculty of 12 members, and 101 students. The school is open only to college graduates desiring to make librarianship a profession. The minimum course is two years. The school confers the degrees of bachelor of library science and master of library science. James I. Wyer, director of the New York State Library, is also director of the school.

NEW YORK UNIVERSITY, a non-sectarian, partly co-educational institution, founded in 1831 and located in New York City. In 1922-23 it had a faculty of 708 members, 12,910 students, property valued at \$5,436,722.72 and an income of \$2,109,775.22. Elmer Ellsworth Brown, Ph.D., LL.D., is chancellor.

NEWSPAPERS. The total number of newspapers, magazines and periodicals published in the United States and territories varies very slightly from year to year. The 1919 census total was 20,887 publications in 10,025 towns and cities. The *Editor and Publisher* of New York took a census at the close of 1922, and made the figures 20,854 (a loss of 33), in 10,080 towns and cities.

From its very complete tables most of the following figures showing 55 more towns are taken. The general condition of the newspapers, as reflected in advertising and circulation, is also nearly static. The 1919 census reports 2,382 daily newspapers, but the canvass of the *Editor and Publisher* found but 2,033, three and a half years later. Apparently some 349 have died or been merged, or failed to report their existence. There were 426 morning newspapers, with a total circulation of 10,809,619 daily; 1,607 evening newspapers, with a total circulation of 18,898,332, and 546 Sunday newspapers, with a total circulation of 19,676,727, these all being averages for the year 1922. The average advertising charge of morning newspapers per agate line was shown to be \$2.52 per million circulation, evening papers, \$3.40 per million, and Sunday papers, \$2.33 per million. The morning papers increased in circulation during 1922, 6.6 per cent., the evening 3.4 per cent, and the Sunday issues 3.3 per cent. The New York City daily newspapers printed 160,628,884 lines of advertising in 1922, a figure exceeded only in 1920, when it was seven-tenths of 1 per cent greater.

The distribution of newspapers and periodicals throughout the United States and Canada at the close of 1922, is shown in the following table:

SECTION	Number of towns	Number of publications
New England.....	439	1,060
New York.....	472	2,144
Middle Atlantic States.....	655	1,881
Southern.....	2,118	3,667
Middle West.....	1,996	4,576
Western.....	3,444	5,492
Pacific slope.....	913	1,871
Alaska and Territories.....	43	165
Canada.....	760	1,504
Totals.....	10,840	22,358
1921 totals.....	10,780	22,353

The average circulations of the great dailies during 1922 is interesting for comparison:

There were in the United States in 1922, besides the daily and weekly newspapers cited, 94 tri-weeklies, 532 semi-weeklies, 102 fortnightlies, 342 semi-monthlies, 3,510 monthlies, 120 bi-monthlies, 410 quarterlies, and 80 irregulars.

Canada has 26 morning newspapers, 112 evening and seven Sunday issues besides 973 weeklies. The total daily average circulation of the morning papers was 492,399, the evening, 1,262,984, and the Sunday 270,439. The total combined circulation of all periodicals of every class, in the United States and Canada, was estimated to be 225,000,000 per issue. The subscription receipts of all these were estimated at \$200,000,000 a year, and the advertising income at \$390,000,000.

During the year there was a continuance of the tendency of late years of the disappearance from publication of some of the great journals in large cities. By 15 February, Saint Louis, Cleveland and Detroit had each only one morning newspaper, Chicago two, and Pittsburgh two. The causes assigned were the increased political independence of the reading public, and the consequent passing out of the purely party organ, the increasing standardization of the daily press of the country through the service of the Associated Press. From the latter it follows that of two papers in a city, printing the same news, that the one with the better business management, or that one possessing some unique qualities of interest will survive.

One of the noteworthy events of 1922 was the sale of the London *Times* to John Walter and Major John Jacob Astor, and the expressed intention of the new owners to maintain the highest traditions of *The Times* and to insure its continuance as a national institution, "conducted solely in the best interests of the nation and Empire." It was said that the price paid for the shares held by the late Lord Northcliffe was £1,390,000.

In Pittsburgh, Pa., the *Dispatch* was sold 15 Feb. 1923 to other Pittsburgh papers—the *Post*, *Sun*, *Gazette-Times* and *Press*. The *Leader* of the same city was sold to the same group and ceased publication.

In November, Mr. W. R. Hearst purchased the Washington *Herald*. In that city the afternoon paper, the *Times*, is also the property of Mr. Hearst.

In November also came the announcement from Philadelphia of the foundation of a na-

tional correspondence school of journalism by the National Woman's Christian Temperance Union, with an advance enrollment of 300 women, from every State in the Union.

NEW ZEALAND, Dominion of, a self-governing British state in the South Pacific, comprising the two principal islands, the North and South islands, Stewart island and some outlying islands. The island group is 1,000 miles in length by 180 in width at the broadest part, 1,200 miles from the coast of Australia. The area is 103,581 square miles; population on 30 June 1921, 1,221,447, exclusive of Maoris (52,554) and residents of Cook and other annexed islands (13,269). The population of the chief cities and towns in 1921 was as follows: Auckland, 157,757; Wellington, 107,488; Christchurch, 105,670; Dunedin, 72,255; Hamilton, 13,798; Gisborne, 14,450; Napier, 17,187; Hastings, 12,990; Wanganui, 23,523; North Palmerston, 16,885; Invercargill, 19,210; Timaru, 15,507; New Plymouth, 12,645; Nelson, 10,632, and Grey Valley boroughs 8,366. Births in 1920 numbered 29,921, including 1,424 illegitimate births. Deaths the same year numbered 12,109, leaving an excess of births over deaths of 17,812. In 1920, 44,062 persons immigrated to the Dominion and 32,924 emigrated, leaving an excess of immigration over emigration of 11,138.

Religion.—There is no State-aided religion. The chief denominations and their adherents are the Church of England, 459,021; Presbyterian, 260,659; Roman Catholic, 151,605; and Methodists 106,024. Others in order of numbers are the Baptists, Salvation Army, Brethren, Church of Christ, Congregationalists, Jews (2,341).

Education.—At the beginning of 1921 there were in the Dominion, 2,437 primary schools, with 6,335 teachers and 199,802 children on the rolls and an average attendance of 171,102. Education is free and compulsory between the ages of 7 and 14 years. Instruction in the primary schools is secular only. There are 59 district high schools with 110 teachers and 2,157 students. In the technical high schools there are 2,766 students. There are also 35 incorporated or endowed secondary schools with over 400 teachers and 9,196 students. For higher education there are the Otago University at Dunedin with 55 faculty members, Canterbury College at Christchurch with 29 faculty members, Auckland University College with 24 faculty members, and Victoria University College at Wellington with 24 members of the faculty. Students in attendance at these institutions number 3,672. The University of New Zealand is merely an examining body, in receipt of an annual grant of 4,000 pounds sterling. In 1921 there were 119 native village schools with 263 teachers and 5,508 pupils. Education expenditures for all kinds of instruction in 1921 totaled 3,224,000 pounds sterling.

Agriculture.—About two-thirds of the area of the Dominion are arable. There are 17,000,000 acres under forest. In 1921 wheat was grown on 219,985 acres and yielded 6,872,000 bushels; oats was grown on 147,559 acres and yielded 5,225,000 bushels; barley was grown on 46,802 acres and yielded 1,587,000 bushels. Live stock in 1921 numbered 334,000 horses, 3,113,000 head of cattle; 23,236,000 sheep, and 342,000 swine.

There are 132,249 persons engaged in agriculture, pastoral and dairying. The dairy season for the year 1921-22 was a record one from the point of view of production. The total output of butter for export was 46,000 tons, an increase of 30 per cent over that of the year previous. The output of cheese was 60,000 tons, an increase of 12 per cent over the year previous. The total value of the exports of butter and cheese in 1922 amounted to \$16,501,074.

Manufactures.—In 1920 there were reported 4,357 manufacturing establishments, employing 64,951 persons, capitalized at 33,436,120 pounds sterling and making products of an aggregate value of 69,780,296 pounds sterling. The 20 leading industries with the value of their products in 1920 are the following: Meat freezing and preserving £16,364,394; butter and cheese factories, £12,495,670; tanning, fellmongering and wool scouring, £4,941,998; sawmills, sash and door factories, woodware, £3,622,266; grain mills, £2,807,916; printing and bookbinding, £2,639,362; clothing and waterproof factories, £2,029,579; boot and shoe factories, £1,443,436; tailoring establishments, £1,375,276; gas works, £1,189,754; woolen mills, £1,143,265; engineering establishments, £1,250,567; breweries and malt houses, £1,084,121; biscuit factories, £1,077,956; fertilizer works, £996,319; furniture and cabinet making, £990,233; motor and cycle works, £821,810; agricultural machinery, £519,040; tinned ware and sheet metal works, £493,511; electric light supply works, £647,071.

Mining.—Gold, silver and tungsten ores are mined and exported. In 1920, exports of gold reached 212,973 ounces, valued at £883,748; silver totaled 369,400 ounces, valued at £87,665; and tungsten, 10 tons valued at £1,378. In the same year the Dominion exported 80,088 tons of coal and consumed 1,763,617 tons. The value of the coal exported and used domestically that year was £1,892,126. In 1922 the Dominion became an importer of coal instead of an exporter, home consumption having at last exceeded the domestic supply.

Commerce.—The total imports in 1920 were valued at £61,595,828 and exports at £46,441,946. These totals decreased about 15 per cent in 1921. A further decrease was noted the first six months of 1922 after which a recovery set in and by December the volume of exports for the 12 months of 1922 amounted to £42,720,894 while imports for 11 months were £36,455,000. The chief articles imported were clothing, iron and steel, metal manufactures, motor cars, tobacco and cigars, books, paper and stationery, machinery, sugar, boots and shoes, textiles, tea, wines and spirits, drugs and chemicals, fruits, oils and leather and leather manufactures. Exports included agricultural produce, wool, meat, kauri gum, tallow, butter, cheese, hides and skins, timber and gold. The continued decline in the number of sheep in the Dominion is causing alarm. It is attributed to the growth of the dairying industry in the South Island, in districts hitherto devoted to sheep raising. The extension of the grain growing area is also believed to have affected the number of sheep raised. Estimates of New Zealand's trade with the United States for 1922 indicate a favorable balance of about \$8,500,000 for the United States.

New Zealand's exports to the United States in 1922 to 21 September totaled \$8,497,254. It is estimated that they would aggregate about \$11,500,000 for the full year. With imports from the United States totaling \$19,967,225 for the 12-month period, the above-mentioned credit balance is apparent. In 1921 New Zealand exported to the United States products to the value of \$9,839,291 and imported products from this country to the value of \$28,071,813. Exports of wool in 1922 were valued at £11,882,553; exports of frozen meats at \$3,490,192; exports of butter at £1,120,200; exports of cheese at £1,161,196.

Communications, Shipping, etc.—There are 384 steamers registered of 64,837 tons and 163 sailing vessels of 21,223 tons. The clearances at the ports in 1920 were 707 of 1,976,255 tons. There are in the Dominion 3,147 miles of railways, of which all but 138 miles are state-owned. The gross receipts from the state railways in the fiscal year 1921-22 amounted to £6,643,591 and the working expenses to £6,237,727, leaving a net revenue of £405,864 or a trifle over 1 per cent on the capital invested in the lines. The money for their construction having been borrowed at an average rate of four per cent, the lines were clearly run at a loss. However, the lines had been built primarily by the state for the development of the country and the encouragement of land settlement and production.

Economics and Finance.—The year ended 31 March 1922 was a year of adversity for the Dominion. An enormous decline in the prices of the chief exports had reduced the national revenue and forced the Government and the citizens to undertake a policy of retrenchment. Wages had to be adjusted, inflated land values had to be reduced. Unemployment did not assume important dimensions; no important commercial failures occurred, and the upward movement of produce prices came soon enough in the year to save the farmers from disaster. In August the Premier presented the following budget statistics to the Parliament.

	1913-1914	1921-1922
Revenue.....	£12,229,661	£28,127,007
Expenditure.....	11,825,864	28,466,838
Public debt.....	94,689,855	219,054,383
Interest charges.....	2,871,512	10,875,185
War pensions.....		1,726,174
Other pensions.....	473,330	1,069,277

For the first time in a generation the expenditure exceeded the revenue in 1921-22.

Pensions.—New Zealand having been one of the pioneers in the matter of old age and other pensions there are given herewith the several classes of pensions in force there in July 1921:

CLASS	Number in force	Annual value	Average pension
Old age.....	20,075	£747,794	£37
Widows.....	3,448	199,984	58
Maori war.....	778	38,122	49
World war.....	30,900	1,698,500	55
Miners.....	480	30,240	63
Influenza epidemic.....	812	67,396	83

Defense.—Under the Dominion Defense Act there is a gradual military training for every male New Zealander between the ages of 12 and 25 years, with limited service in the reserve up to the age of 30. The Territorial Force in 1922 had a strength of 23,188. The naval force consists of the training ship *Philomel* and the cruiser *Chatham*.

Government.—Attached to New Zealand are the Auckland islands. Area, 330 square miles and uninhabited. There is a depot of provisions and clothing for the use of shipwrecked sailors on the largest island. The Chatham Islands, area, 375 miles, pop. 445, also belong to the Dominion, as do the Cook and other South Pacific islands, including Rarotonga, Mangaia, Atiu, Aitutaki, Mauke, Mitiaro, Hervey islands, Nieu, Palmerston, Penrhyn, Manahiki, Rakaanga, Danger, Suwarrow. Aggregate population, 13,209. Aggregate area, 280 square miles. The legislative power of the Dominion is vested in a Governor-General and a General Assembly of two chambers—a Legislative Council and a House of Representatives. The Legislative Council has 41 members at present mostly appointees, but there are provisions to make this chamber elective within the next seven years. There are 80 members in the House of Representatives, including four Maoris. Members are elected by the people for terms of three years. The present Parliament, elected, December 1919, has 48 members of the Reform Party, 18 Liberals, 10 Labor, 4 Independents. The government supporters number 50 and the opposition 30. The Prime Minister in 1922 was Right Hon. W. F. Massey P.C. The Governor-General and Commander-in-Chief in 1922 was His Excellency Viscount Jellicoe of Scapa.

This colony received the largest total of new immigrants in 40 years; 14,500 coming from Great Britain and other parts of the empire. Of this total 5,286 were assisted by the British government and almost an equal number by that of New Zealand. A bill of complaint was sent to Wellington stating that New Zealand's control of former German Samoa was a hopeless failure. The Minister of External Affairs was sent to the island to investigate and reported that prohibition was the cause of most of the prevalent unrest. It was regretted that this cause could not be remedied because it was imposed under the terms of the mandate by which New Zealand assumed control of former German Samoa. A citizen's association of whites adopted a resolution on 1 April requesting the government to hold a plebiscite of the taxpayers to determine whether the prohibition now enforced in Samoa should be lifted.

On 18 August the New Zealand Parliament ratified the Washington treaties. The establishment of a fuel oil station by the United States Shipping Board at Pago Pago, Samoa, was believed to foreshadow competition in the Australian and New Zealand ship routes as no oil had hitherto been available on these routes beyond the Panama Canal. A favorable trade balance was reported for the six months ended 30 June 1922 amounting to £10,703,894, compared with £1,006,006 for the same period of 1921. This was largely obtained by economizing on imports, which fell off £12,002,395 or about

40 per cent, whereas exports amounted to £26,892,366, a decrease of only £292,495. On 30 October, the Premier, Mr. Massey, issued an election manifesto in which he emphasized the necessity of an arrangement with Great Britain and the other British Dominions for naval protection in the Pacific. At the same time he advocated a vigorous immigration policy and deprecated the rising tide of revolutionary Socialism. Parliament ended its session on the last day of October with the expectation of a general election taking place in December. The leader of the Liberals, Mr. Wilford, outlined his policy for a united empire and constitutional methods and the Labor Party issued a manifesto reaffirming the international character of its political faith. On 10 November the locally-manned shipping was tied up by a strike in protest of the award of the Court of Arbitration which reduced wages slightly.

NIAGARA UNIVERSITY, a Roman Catholic educational institution for men, founded in 1856 and located at Niagara Falls, N. Y. In 1922-23 it had a faculty of 26 members and a student enrollment of 340. Figures showing the value of the institution's property and its income not given. Very Rev. William E. Katzenberger, C.M., is president.

NICARAGUA, a republic of Central America. Area 49,200 square miles; population, 638,119; capital, Managua (60,342). The state borders on the Atlantic for a distance of 300 miles and on the Pacific for a distance of about 200 miles. The people are of mixed Indian and Spanish blood with an admixture of negroes on the eastern coast. The chief towns other than the capital named above are: Leon (47,234); Granada (21,925); Matagalpa (32,271); Masaya (17,287); Jinotega (16,990); Chinandega (14,415); Esteli (10,583); Matapa (10,561); Boaco (14,342); Diriamba (11,151); Corinto (7,567), and Bluefields (4,706).

Education and Religion.—There are in the Republic 356 elementary schools and 10 secondary schools. There are three universities—Leon, Managua and Granada and in addition several state normal schools. Roman Catholicism is the prevailing religion. This church has an archbishop and three bishops.

Production.—Agriculture, lumbering and mining are the chief occupations of the inhabitants and the chief sources of the national wealth. Bananas, coconuts, plantains, oranges and pineapples, rice, wheat and tobacco are the chief crops raised. The coffee crop averages 22,500,000 pounds yearly. There exists a great divergence in standards of living between the eastern and western parts of the country. In the east most of the foodstuffs are imported from the United States and in the west a sufficiency of food is raised for the domestic consumption. The forest products are considerable, consisting of mahogany and cedar, dyewoods, gums and medicinal plants. Cattle raising is increasing, there being now about 1,250,000 head of cattle in the republic. Several placer gold mines are worked by British and American capital. Gold exports in a recent year amounted in value to £185,125. Silver, copper and precious stones are found also.

Commerce.—Imports in 1920 were valued at £2,772,877 and exports at £2,157,669. The value of the chief imports in the year named, was: Cotton goods, \$5,242,188; chemicals, \$581,509; iron and steel, \$754,074; flour, \$665,660. The value of the chief exports was: Coffee, \$2,874,140; bananas, \$817,142; lumber, \$1,953,768; hides and skins, \$316,798, and sugar, \$2,345,904. Of the imports the United States furnished \$11,247,588; the United Kingdom, \$1,634,623. Of the exports the United States took \$9,294,809; France, \$546,043, and the United Kingdom, \$306,491.

Communications.—The chief ports on the west coast are Corinto and San Juan del Sur, through which pass about two-thirds of the foreign commerce of the country. On the east coast the chief ports are Bluefields, Cap Gracias, Las Perlas and San Juan del Norte. Clearances at all ports in 1920 were 846 vessels of 460,779 tons. Several good roads are under construction, about 200 miles being completed. The single line of railway has a length of 171 miles. It runs from Corinto to Leon, Managua and Granada with two short branch lines. There is a private line of 20 miles near Rio Grande on the Atlantic Coast, the property of a fruit plantation.

Finance.—The budget estimates for 1922 contemplated a revenue of £677,105 and an expenditure of £559,704. The total debt of the republic in 1922 was \$951,580.

Defense.—The standing army numbers 2,000 officers and men, which in war time is capable of being raised to 7,000 men. Military service is compulsory. Naval defense consists solely of a patrol boat with a crew of 25 men and mounted with a machine gun. It is assigned to the Pacific littoral.

Government.—The executive power is vested in a President elected for four years. The legislative power resides in a bicameral Congress. The Senate has 13 members elected for six years. The lower chamber has 40 members elected by universal suffrage for four years. The President exercises his functions through a council of Ministers. The President in 1922 was Dr. Diego Manuel Chamorro. In 1916 a treaty was concluded between the United States and Nicaragua under the terms of which the United States acquires the canal route through Nicaragua and a naval base in the bay of Fonseca on the Pacific Coast and Corn island on the Atlantic Coast for the sum of \$3,000,000.

History.—On 22 Feb. 1922 the *Gaceta Oficial* published the texts of concessions, noteworthy here inasmuch as one of them authorized prospecting for oil and natural gases in the departments of Bluefields, Chontales, and Nueva Segovia; another, "anywhere in the Republic." On 7 March, at Managua, 2 American marines received prison sentences for killing native police 8 Dec. 1921. In April it was stated that the government had authorized the Tropical Radio Telegraph Company, organized under the laws of Delaware, U. S. A., to operate wireless stations in or near Managua, Bluefields, Cape Gracias a Dios, and other places in the Republic. On 21 May a band of rebels under command of Gen. Arcenio Cruz seized the government fort called La Loma, near the capital; but almost

immediately gave it up to American Marines, who returned it to the government troops. In July it was announced that the city of San Juan del Norte had been made a free port; in August, that a 15-year contract for a freight and passenger hydroplane service on Lake Managua and the San Juan River had been approved by the President. On 19 and 20 August the Presidents of Honduras, Nicaragua and Salvador, with their respective Ministers of Foreign Affairs, met on board the U. S. S. Tacoma, in the Gulf of Fonseca. The Ministers of the United States in the three countries named were also present. A treaty was then and there drawn up and signed, witnessing agreement as follows: In view of the differences of opinion which had arisen as to the General Treaty of Peace and Amity signed in Washington by the five republics of Central America on 20 Dec. 1907, the Executives of Honduras, Nicaragua and Salvador declared that the three states over which they presided should regard the said treaty as being in force in everything that affects the relations maintained by the three republics. Moreover, the three signatory Presidents would call a conference to be attended by the respective plenipotentiaries of the five governments of Central America for the purpose of deciding upon measures which would tend to make really practicable, in the future, the political unification of Central America. Beginning on 4 December, the conference just referred to took place in the building of the Pan-American Union, Washington. It was said in the *Bulletin* of that Union (January 1923), that the conference was the direct response to the invitation President Harding extended, by the Secretary of State, to the Presidents of the five Central American republics. But the real genesis of that significant conference dealing with Central American affairs is found in the meeting, "at the request of the President of Nicaragua," on board the *Tacoma*, those August days. See also CENTRAL AMERICAN CONFERENCE.

MARRION WILCOX.

NICHOLS, Edward Hall, American surgeon: b. Reading, Mass., 6 Jan. 1864; d. Boston, Mass., 12 June 1922. Graduating from Harvard in 1886, he received the degree of A.M. and M.D. in 1892 from the same university. He was connected with the Boston City Hospital as executive assistant and assistant superintendent from 1892-94, and in 1896 went to the Harvard Medical School, serving as assistant pathologist, demonstrator of surgical pathology, instructor, assistant professor in surgical pathology and surgery, associate professor, and after 1916 until his death as clinical professor of surgery. He was director of the cancer laboratory of the Croft Research Fund at Boston from 1899-1905, and in medical charge of the Harvard football team after 1904. As surgeon-in-chief to the first Harvard surgical unit, he saw service in France with the British army in 1915. In 1917 he was major of the Medical Officers' Reserve Corps, and assigned to the United States Base Hospital No. 7 as chief surgeon. He went again to France in July 1918, remaining there until January 1919, and soon afterwards was promoted to lieutenant-colonel of the Medical Corps. He was a fellow of the

American Academy of Arts and Sciences, also of the American College of Surgeons, and a member of the American Surgical Society, the Nu Sigma Nu Society and the Phi Beta Kappa. He was the author of numerous articles pertaining to surgery.

NICK CARTER. See DEY, FREDERICK VAN RENSSELAER.

NICKEL. The production of nickel oxide in the United States in 1918 was 45,886 tons; in 1920 it fell to 28,000 tons, and in 1921 to 5,200 tons. These figures tell the story of the demoralization in the industry. Most of the world's nickel is mined in the Sudbury district of Ontario, Canada, but a good deal of it is normally refined in the United States. The Canadian production was 30,700 short tons in 1920, valued at \$24,534,000, and 9,650 short tons in 1921, valued at \$6,753,000. A partial resumption of activity awaits the demand for nickel as alloy. In 1922 the United States exported 4,500 tons of nickel oxide and matte, of the value of \$1,100,000; also nickel and nickel articles valued at \$350,000.

NIGER TERRITORY, French. See FRENCH WEST AFRICA.

NIGERIA (officially "The Colony and Protectorate of Nigeria"), a British possession in West Africa comprising an area formerly under separate administrations. The seat of government is at Lagos. The area is about 332,000 square miles with a population of 16,250,000. Slave holding formerly existed but was abolished in 1917. Mohammedanism is prevalent, but there are several Christian missions at work. There are in the southern province 1,624 schools of all grades with about 123,776 pupils, including 43 government schools with 6,054 students, 158 assisted schools with 26,291 pupils and 1,443 unassisted schools with 84,444 pupils in attendance. The northern provinces have 116 schools with about 4,000 pupils and 31,000 Mohammedan schools with 210,000 pupils. The revenue in 1920 was reported as £6,819,274 and the expenditure at £6,493,523. The debt was reported at the same time as £10,245,593. The chief products of the colony are palm oil, kernels, rubber, ground nuts, ivory, hides, live stock, feathers, cotton, cocoa, coffee, and crude drugs. Iron, lead and tin are worked and there is a colliery now in operation in the south. Imports in 1920 were valued at £25,216,407 and exports at £16,987,018. In that year there entered the ports of the colony 1,434,222 tons of shipping. The chief imports were cotton goods, and coopers stores; the chief exports: Palm kernels, oil, raw cotton, tin ore, cocoa, hides and skins. There are 1,126 miles of railways in operation and several miles of line are under construction. There is a wireless station at Lagos. There is a mail service to Liverpool and Calabar.

NIKISCH, nē kish, Arthur, Hungarian orchestral conductor: b. Lebenyi Szent Miklos, Hungary, 12 Oct. 1855; d. Leipzig, Germany, 23 Jan. 1922. Regarded by most critics as the greatest conductor of his day and by some as the greatest of all time, Nikisch, for many years before his death, had been an outstanding figure in the musical world. He had achieved distinction not only as a wielder of the baton, but also

as a violinist and pianist, especially as a pianoforte accompanist; at the age of 40 he had been made conductor of the famous Gewandhaus concerts at Leipzig; at different times he had directed many of the great orchestras of the world; he had toured practically every civilized country on the globe and his fame was known to music lovers everywhere. Heralded as a musical prodigy, he appeared in public for the first time as a pianist when he was but 8 years old. In 1866, at the age of 11, he entered the Vienna Conservatory where he studied violin, composition and piano under Hellmesberger, Dessoff and Schener, respectively. While a student, he composed a symphony and other music. He left the Conservatory in 1873, and for a while was engaged as a first violinist with the Vienna Royal Opera Orchestra. In 1877 he became assistant director of the Leipzig Opera and two years later he was made chief director. Thereafter his rise to fame was rapid. Frequently conducting without a score, he displayed such marvelous skill with the baton and his success as an interpreter and producer of not only the more modern types of music but of the classical masterpieces as well was so marked that in 1889 he was called to the United States as director of the Boston Symphony Orchestra, succeeding Wilhelm Gericke. He remained as conductor of the last named organization until 1893, when he went to Budapest as director at the Royal Opera House. In 1895 he succeeded Reinecke as conductor at the Leipzig Gewandhaus and also as director of the Conservatoire. He retained the latter position for only a short time, but he held the conductorship at the Gewandhaus, together with that of the Berlin Philharmonic Orchestra, until his death. At the head of the latter he toured Europe in 1897. He conducted with great success in London in 1902, 1904-06, and in 1912 toured the United States with the London Symphony Orchestra. Moscow and Petrograd were common ground to him. His last tour was to South America. Of him one of his biographers said at the time of his death: "While Richter might be regarded as the first post-Wagnerian conductor, Nikisch is generally held to be the greatest, and, if that is held to be true, he must be reckoned so far as the greatest conductor the world has seen."

NILSSON, CHRISTINE, Swedish opera singer: b. Wexio, Sweden, 20 Aug. 1843; d. Stockholm, 22 Nov. 1922. She was the daughter of a small farmer on the estate of Count Hamilton and her beautiful voice attracted the attention of the Baroness Leuhussen, who had been a singer and who gave her some lessons. She was afterward instructed by Franz Berwald and in six months sang before the Swedish court. The Baroness Leuhussen then took her to Paris, where she studied with Wartel, the famous tenor. She made her debut at the Théâtre Lyrique, Paris, on 27 Oct. 1864, as Violetta in a French version of 'La Traviata,' and she remained at this theatre three years. On 8 June 1867, she made her first appearance in London with enormous success, sang at the Birmingham Festival in oratorio, and became established as a popular favorite. She appeared as Ophelia in the first performance of Ambroise Thomas's 'Hamlet' at the Paris opera 9 March

1867. In 1870 she toured in the United States under Maurice Strakosch and several seasons thereafter, with brilliant success. From 1872-77 Madame Nilsson sang at Drury Lane and Her Majesty's Theatre, London. She toured in Sweden, Russia, Austria, Spain and the United States. She retired on 20 June 1888, but appeared once more at Sims Reeves's retirement, 11 May 1891. Her voice was pathetic and sentimental, very sweet and even with a range of three octaves. At Rossini's advice she rarely used the extreme upper notes on account of the strain. Her great parts were Marguerite in 'Faust,' Mignon, Ophelia, Elsa, Elvira, Violetta, Juliette and the countess in 'Figaro.' She had charming manners and in her early days a naïveté which captured everyone. Madame Nilsson was married twice; on 27 May 1872, to M. Auguste Rouzeaud in Westminster Abbey; and after his death to the Count Casa di Miranda in 1887.

NOBEL PRIZE AWARDS. The Nobel Prize in physics for 1921 was awarded to Dr. Albert Einstein, of Germany, whose studies in relativity created such wide-spread discussion; that for 1922 went to Professor Neils Bohr of Copenhagen. The Prize in literature for 1922 was awarded to Jacinto Bonavente y Martinez, the second writer of his nation so honored by the Swedish Academy, Jules Echegaray being the first Spaniard to receive the Prize in literature. The Peace Prize was awarded to Dr. Frithiof Nansen for his work as League of Nations Commissioner in relieving the starving populations of Russia and Asia Minor and for his endeavors to promote the brotherhood of nations. The Chemistry Prize for 1922 was awarded to F. W. Aston of England. The value of each prize averages \$40,000. Nobel awards have been made to the following Americans: Theodore Roosevelt (Peace Prize 1906); A. A. Michelson (Physics Prize 1907); A. Carrel (Prize in Medicine 1912); Elihu Root (Peace Prize 1912); T. W. Richards (Chemistry Prize 1914), and Woodrow Wilson (Peace Prize 1918). No American has been awarded the Prize in Literature.

NON-PARTISAN ASSOCIATION FOR THE LEAGUE OF NATIONS. See PEACE AND ARBITRATION, INTERNATIONAL.

NORDAU, Max Simon, German physician and author: b. Budapest, Hungary, 29 July 1849; d. Paris, France, 22 Jan. 1923. He studied medicine in Paris and Budapest, and after receiving his M.D. degree in 1872 from the University of Budapest, he traveled through the principal countries of Europe. In 1878 he returned to Budapest and practiced his profession for two years, then went to Paris, studied medicine for two years more, and resumed active practice there. He had begun his literary activities at a very early age, and before taking up his medical studies was a contributor and dramatic critic for *Der Zwischenact*. Later he was correspondent and editorial writer for a number of other newspapers. His collected newspaper writings constituted the material for his earlier books, which include 'Pariser Studien

und Bilder' (1878); 'Seifenblasen' (1879); 'Von Kreml zur Alhambra' (1880); 'Paris unter der dritten Republik' (1881). This group is characterized by drastic arraignment of social and political conditions. 'Die Konventionelle Lügen der Kulturmenschheit' (1883); 'Conventional Lies of Society'; condemns what the author considered the fundamental falsity underlying some of the modern social, ethical and religious standards. In 1892 appeared his best known work, 'Entartung,' which was translated into English under the title, 'Degeneration.' It was a storm center of bitter criticism, maintaining, as it did, that the present civilization has caused human degeneracy, especially among the higher classes, a degeneracy reflected pronouncedly in the often depraved musical, artistic, and literary standards, and that the authors and creators of such works could be nothing more than degenerates, mental and moral. Among his other works are the following: 'Paradoxe' (1885; in English, 'Paradoxes'); 'Die Krankheit des Jahrhunderts' (1887; in English, 'The Malady of the Centuries'); 'Seelen Analysen' (1892); 'Die Drohnenschlacht' (1897); a novel, 'Gefühlskomödie' (1891; in English, 'A Comedy of Sentiment'); dramas, 'Der Krieg der Millionen' (1882); 'Das Recht zu lieben' (1893); 'Die Kugel' (1894), and 'Dr. Kuhn' (1898). These were followed by 'The Drones Must Die' (1899); 'Zeitgenössische Franzosen' (1901); 'Morganatic' (1904); 'On Art and Artists' (1907); 'Die Sinn der Geschichte,' and 'Zionistische Schriften' (1909); 'Mörchen' (1910), and 'Der Lebenssport' (1912). During the World War, on account of his Teutonic birth, he was taken into custody by the French, but was released on parole, whereupon he went to Madrid. He was a disciple of Lombrosa, a Jew; and was for many years a prominent leader in the Zionist movement. In this capacity he narrowly escaped assassination in 1903. Too proud and sensitive to become the recipient of any form of charity, he spent his declining days in straitened circumstances. At the time of his death he left unfinished a comprehensive work on philosophy.

NORTH CAROLINA, a South Atlantic State of the American Union and one of the Old South group, bounded north by Virginia, east by the Atlantic Ocean, south by the Atlantic Ocean and South Carolina, and west by Tennessee. It has an area of 52,426 square miles and in 1920 had a population of 2,559,123. The State is 27th in order of size and 14th in order of population. In 1920 the census reported 1,783,779 whites, 763,407 negroes, 11,824 Indians and 113 Asiatics. In the same year the foreign-born residents of the State numbered 7,099, of whom 967 were English and 703 German. The rural population in 1920 was 80.7 per cent of the total. The chief cities of the State with their populations are: Raleigh, the capital, 27,076; Charlotte, 46,338; Winston-Salem, 48,395; Wilmington, 33,372; Asheville, 28,504; Durham, 21,719 and Greensboro, 19,861. In 1920, 98 square miles of the State's area were occupied by Indian reservations, on which there dwelt a population of 8,268.

Religion.—The principal Christian denominations have an aggregate membership of 1,080,723; of these, 535,299 are Baptists, 338,979 are

Methodists, 69,898 are Presbyterians, 19,450 Lutherans, 18,545 Episcopalians, 6,109 members of the Reformed Church, and 4,989 Roman Catholics.

Education.—The direct legislative appropriation for schools in 1922 was \$850,000. The amount spent on the operation and maintenance of public schools was \$15,000,000. In 1921 there were 18,322 teachers in public schools and 860,328 pupils. School attendance is compulsory, and separate schools are provided for white and colored children. The State has 455 high schools, with 982 teachers and 30,868 pupils. There are nine normal schools for the training of elementary teachers. For higher education there are 15 university and college institutions of which the chief are the State University at Chapel Hill, the State Agricultural and Engineering College at West Raleigh and the State College for Women at Greensboro.

Finances.—At the beginning of the fiscal year 1921-22, there was a balance on hand of \$1,017,916.46. Receipts during the fiscal year 1921-22 amounted to \$12,914,522.75. Disbursements for the year ended 30 June 1922 amounted to \$6,552,870.79, leaving a balance at the beginning of the fiscal year 1922-23 of \$6,361,651.96. The bonded debt of the State in 1922 was \$27,025,600. The council of the corporation of foreign bondholders claims that the State has a defaulted debt amounting to \$12,600,000. The State claims that these bonds were fraudulently issued during the period of reconstruction following the Civil War. In 1921 the assessed value of real property was \$1,817,927,383; of personal property, \$761,148,217.

Charities and Corrections.—The State has a State Board of Charities and Public Welfare. The county is the unit of administration. The chief institutions with the number of inmates in each in 1922 were: State Hospital for the Insane, Morganton, 1,167; State Hospital for the Insane, Raleigh, 1,157; State Hospital for the Insane, Goldboro, 1,000; Jackson Training School for Boys, Concord, 360; Training School for Delinquent Girls, Samarcard, 200; State Penitentiary, Raleigh, 1,052; Confederate Soldiers' Home, Raleigh, 145; Confederate Women's Home, Fayetteville, 20; Caswell Training School for Mental Defectives, Kinston, 300, and the Orthopedic Hospital, Gastonia, 50.

Agriculture.—North Carolina is an agricultural State and its soil, climate and latitude all make for the development of a greater range of farm products than most States enjoy. Among the crops raised are wheat, corn, oats, potatoes, sweet potatoes, apples, peaches, nectarines, grapes, beans, peas, tobacco, peanuts, cotton, sugar-cane, strawberries, soya and velvet beans, and sugar-beets. Practically all trucking crops are raised in the eastern part of the State where the climate and the soil are favorable and where transportation facilities to the great markets are adequate. The chief crops with their acreage, yield and value for the year 1922 were: Corn, 2,526,000 acres, 50,520,000 bushels, \$44,963,000; winter wheat, 612,000 acres, 5,508,000 bushels, \$7,491,000; oats, 178,000 acres, 3,738,000 bushels, \$2,504,000; buckwheat, 5,000 acres, 100,000 bushels, \$97,000; rye, 40,000 acres, 320,000 bushels, \$384,000; tame hay, 800,000 acres, 1,-

120,000 tons, \$20,384,000; sorghum sirup, 30,000 acres, 2,940,000 gallons, \$2,352,000; potatoes, 48,000 acres, 4,512,000 bushels, \$4,557,000; sweet potatoes, 110,000 acres, 12,430,000 bushels, \$9,944,000; cotton, 1,626,000 acres, 852,000 bales, \$104,370,000; tobacco, 515,000 acres, 306,940,000 pounds, \$93,003,000; peanuts, 127,000 acres, 113,665,000 pounds, \$4,547,000; apples, 5,570,000 bushels; peaches, 1,008,000 bushels and pears, 110,000 bushels. North Carolina has cheap land, mild climate and long grazing seasons, and therefore has many of the conditions suitable for the raising of livestock. The dairy industry is well developed. There are 14 creameries in operation which manufacture over 1,300,000 pounds of butter yearly. There are 30 cheese factories in operation and about 5,000 children are attending the dairy schools under the direction of the State Department of Agriculture. Poultry raising has made great strides in recent years. Hogs are raised in practically all parts of the State. On 1 Jan. 1923 there were in the State 166,000 horses, valued at \$17,928,000; 260,000 mules, valued at \$33,280,000; 365,000 milk cows, valued at \$12,235,000; 274,000 other cattle, valued at \$4,685,000; 81,000 sheep, valued at \$454,000, and 1,271,000 swine, valued at \$16,904,000.

Mining and Minerals.—Minerals are found in great variety, but not in great quantities. The ores found in the State comprise iron, copper, silver and gold. Other economic minerals are corundum, mica, talc, monazite, zircon, garnet and kaolin, and about 200 others.

Manufacturing Industries.—The great sources of wealth of the State are cotton, tobacco and lumber. Census statistics show that in 1919 the value of manufactured products was \$943,807,949, an increase of over 249 per cent over the value of the State's manufactured products for 1914. One-fifth of the total value of all tobacco manufactured in the United States was manufactured in North Carolina. The State has 377 cotton mills, operating 5,255,320 spindles, 72,514 looms and 12,119 cards, using 218,883 horse power and consuming 305,360,316 pounds of raw material and employing 75,000 operatives. The estimated value of the yearly output of the cotton mills is \$237,980,155. There are three silk mills in operation and two cordage mills, nine woolen and 169 knitting mills, employing 18,360 workers, and having a combined output valued at \$26,691,774. The State has 13 furniture factories, the yearly output of which is valued at \$32,106,739, and employing 9,229 operatives. The 5,582 industrial establishments reporting to the census showed aggregate investments of \$699,802,985. There are 531 flour mills in the State.

Transportation.—The State is traversed by eight great railway systems and by an ever-growing number of smaller individual lines and branches. Steamboats ply the waters of the great sounds and rivers of the State. The total railway mileage in the State amounts to 4,958 miles of main lines and 1,273 miles of sidetracks, valued at about \$251,566,950. The State is giving more attention to the improvement of her highways than ever before in her history. Recent enactments of the General Assembly provided \$50,000,000 to be expended in highway improvement

within the next five years under the direction of the State Highway Commission. This Commission is composed of nine business men, representing nine construction districts into which the State is divided, and this Board, together with the Chairman, who is an all-time officer, have charge of the construction and maintenance of the roads on the State highway system, which embraces about 6,000 miles of highways connecting the county seats and principal towns of the State.

Fisheries.—The fishing industry of the State is one of the greatest of the South Atlantic group. Shad are the most important product, followed by oysters, mullets, weakfish, etc.

Recent Legislation.—The outstanding legislation of the 1921 session of the Legislature was the passage of a \$50,000,000 road bill for the construction of a State system of durable, dependable roads, connecting the principal towns and the county seats throughout the State. About 6,000 miles of roads are being constructed as a result. Of this, nearly 1,000 miles are hard surfaced, asphalt or concrete, and 5,000 miles are gravel surfaced. A gasoline tax of one cent a gallon yields nearly \$1,000,000 yearly, and the motor vehicle license tax nets around \$2,500,000, all of which goes into the fund for maintaining the roads and paying the interest on the \$50,000,000 bond issues which are being issued and sold as needed to construct the State highways. To enlarge the State's educational and charitable institutions during 1922, bond issues amounting to \$6,745,000 were issued, the State University receiving about \$1,500,000 of this amount. The public school fund was also increased. The Democratic majority in 1920 was 80,000, the largest in the history of the State, all of the State's ten representatives in Congress being elected from the Democratic Party.

Legal Holidays.—New Year's Day; 19 January (birthday of General R. E. Lee); 22 February (birthday of General Washington); 12 April (Resolutions Day); 10 May (Confederate Memorial Day); 20 May (Anniversary of the Mecklenberg Declaration of Independence); 4 July; First Monday in September; General Election Day; 11 November (Armistice Day); Thanksgiving Day; 25 December.

Government.—The Governor is the State executive. He is elected for a term of four years and receives a salary of \$6,500. The Legislature, known as the General Assembly, is composed of a Senate of 50 members and a House of Representatives of 120 members, elected for two years. The Legislature meets biennially on the Wednesday after the first Monday of January of odd years. Sessions are limited to 60 days. North Carolina sends two Senators and ten Representatives to the Federal Congress. For local administration the State is divided into 100 counties.

State Officials.—(1922). Governor, Cameron Morrison; Lieutenant-Governor, W. B. Cooper; Secretary of State, J. Bryan Grimes; Attorney-General, Jas. S. Manning; Auditor, Baxter Durham; Revenue Commissioner, A. D. Watts; Treasurer, B. R. Lacy, and Superintendent of Education, F. C. Brooks.

Judiciary.—Members of Supreme Court: Chief Justice, Walter Clark; Associate Justices,

Platt D. Walker, William A. Hoke, W. P. Stacy and W. J. Adams

NORTH CAROLINA COLLEGE FOR WOMEN, a State educational institution, founded in 1891 and located at Greensboro, N. C. In 1922-23 it had a faculty of 134 members, 1,272 students, property valued at \$2,500,000 and an income of \$540,000. Julius Isaac Foust, LL.D., is president.

NORTH CAROLINA STATE COLLEGE OF AGRICULTURE AND ENGINEERING, an educational institution for men, founded in 1887 and located at Raleigh, N. C. In 1922-23 it had a faculty of 102 members, 1,225 students, property valued at \$2,500,000 and an income of \$400,000. W. C. Riddick, LL.D., is president.

NORTH CAROLINA, University of, a State educational institution for men (women, however, being admitted to graduate work and to upper classes), founded in 1793 and located at Chapel Hill, N. C. In 1922-23 it had a faculty of about 125 members, 1,870 students, property valued at \$4,000,000 and an income of \$480,000 (maintenance appropriation by State). Harry Woodburn Chase, LL.D., is president.

NORTHCLIFFE, Viscount, (Alfred Charles William Harmsworth), British publisher: b. Chapelizod, near Dublin, Ireland, 15 July 1865; d. London, England, 14 Aug. 1922. He was the eldest of 14 children, of whom 10 survived him, and to his mother, a woman of decisive character, he was, to the end, devoted, never omitting to send her a daily message, whether by letter or telegram. Her maiden name was Geraldine Maffett and her father was a land agent in Dublin, of Scottish ancestry.

The father, Alfred Harmsworth, was of Hampshire (England) stock. He was a barrister of limited means and uncertain health and his large family suffered privations. The eldest son was sent to Stamford Grammar School where he was not too happy and later to a school in West Hampstead. He played cricket and football and was an eager rather than a deep student.

At school he started a magazine and his career as journalist opened more seriously when he began free lance work for various journals, at a very modest remuneration. His contributions were not always accepted but by the time he was 21 years old he had saved \$5,000 and had a partnership offered him by a publishing firm at Coventry.

In 1887 he and his second brother, the present Lord Rothermere, started a weekly paper called *Answers*. It was a copy of *Titbits* with which Sir George Newnes had made a hit and the title was suggested by *Notes and Queries* which little journal Harmsworth admired and afterward bought. *Answers* was only a moderate success until Harmsworth offered certain speculative inducements to the readers which boosted the circulation sky-high. From this time forward, the young man's finances never were in doubt. He published anything that would pay, however trivial, sentimental, religious or sensational its character. His profits were enormous, for that line of business.

In 1894 he bought the London *Evening News*

which was losing \$1,500,000 a year. Within 12 months that loss had been turned into a profit of \$70,000 and so encouraged, Harmsworth, in 1896, started the *Daily Mail* which revolutionized morning journalism in Britain. News, previously expanded to a column, was compressed into a paragraph. The serious and discursive editorial was cut to a kind of exclamation mark. Immense sums were spent on getting news of a short and snappy style, and the price of the paper was (½d) instead of the penny charged by older journals. The *Daily Mail* was an immediate success. Its big chance came with the South African War when its circulation rose to 600,000, then considered a fabulous figure. To-day, it is selling nearly, if not quite three times that number. Editions are published in London, Paris and Manchester.

Harmsworth was now famous. He acquired large wood pulp interests in Newfoundland. He traveled in India, Europe and America. He financed the Jackson Harmsworth Arctic Expedition, and in 1895 he stood as Conservative candidate for Portsmouth, but unsuccessfully. He was created successively, knight, baronet and, in 1905, baron; he adopted the title, Northcliffe; he was among the first in Britain to drive a motorcar and he was the patron of aeronautics.

At this stage of his career, Northcliffe was one of a trio—the others being Sir George Newnes and Sir C. A. Pearson—who exploited a certain phase of British intellect. In 1870, public elementary education had been authorized by law. At 12 to 14 years of age, successive generations of boys and girls left school, with minds still unformed and yet with the habit of reading. They had little money and even less critical judgment. As Lord Salisbury, the Prime Minister said: "The *Daily Mail* is written by office boys, for office boys"—a sardonic remark which, at the time, was not without truth. A minority in Britain was learned, cultured, efficient and powerful. Harmsworth and his competitors swept aside this minority and like John Wesley, claimed the world for parish.

But, in 1908, Northcliffe dared his greatest gamble. He acquired control of *The Times*. The office boy, publishing for office boys, the man who had made his millions out of chit-chat-snap-comic-cut-wildwest-home-fashions fare for the people was enthroned in Printing House Square, the Jove of journalists, managing the heritage of the Walter family and dictating the bolts of "the thunderer." It was finance that forced *The Times* into his hands nor was he the only bidder. Pearson nearly forestalled him. The effect of his conquest was curious. On the one hand, he improved the mechanical production of the newspaper, he brushed up its foreign correspondence, humanized its lighter features and co-ordinated "the make up," all of which helped to quadruple the circulation. On the other hand, the mystery that had surrounded *The Times* was for ever dispelled. It might be more widely read. But it could no longer make and unmake governments. The very reduction of its price from three pence to one penny before the war—was abdication. *The Times* became thereby no more than the equal in au-

thority with Lord Burnham's *Daily Telegraph* or the *Morning Post*. The great tradition had been popularised out of recognition.

Lord Northcliffe, as chief proprietor of *The Times*, entered on the final phase of his career. His ambition was immense, allowing his mind no rest, he became subject to strange idiosyncracies which, at an early period, caused his friends anxiety. In face and physique—especially profile—he bore a certain resemblance to Napoleon of whom he believed himself to be the re-incarnation. He cultivated the lock of hair which fell over Napoleon's forehead. He saw himself as emperor with field marshals around him. His title—Northcliffe—was so chosen as to enable him to sign himself with the Napoleonic "N." Constantly he would talk of Napoleon and even suggest to some member of his staff a new biography of the idol.

To determine the fate of the British empire and all who ruled it became his task in life. And with the Great War, he realized his supreme opportunity. For years, he had been among the many who had believed that a conflict with Germany was inevitable. He had so attacked Germany as to do his part in securing the fulfilment of these forebodings. A whole hearted imperialist, he was the very apostle of preparedness. In 1914 he secured for *The Times* the semiofficial representation of the Red Cross interests. His onslaughts against Lord Haldane, the fairness of which has been challenged, were a factor in securing Lord Kitchener's appointment as Secretary of War. In a few weeks, Northcliffe was as dissatisfied with Kitchener and especially with Kitchener's censorship as he had been suspicious of Haldane, and in the spring of 1915, it was *The Times* that published the warning as to high explosive shells which French had communicated to Colonel Repington who was then that journal's military correspondent.

The first or Asquith Coalition was then formed, with Lloyd George as Minister of Munitions. But Northcliffe, too powerful to be wholly censored, a privileged guest in court and in camp and in chancelleries, was still restless. And his agitation for a small war cabinet, with dictatorial powers led in December 1916, to Asquith's fall, and to Lloyd George's rise to supreme office. It was Northcliffe's Austerlitz.

In Lloyd George, he met his match. The Prime Minister recognized, frankly, that even Parliament had become subject to the press. But he also realized that Northcliffe, after all, controlled only a minority of newspapers circulated. He mobilized Northcliffe's rivals against Northcliffe and defied the Napoleon of Fleet Street. In 1917, Northcliffe was offered the position of British Ambassador at Washington which he declined and he also refused to join the War Cabinet. He did, however, lead the British War Mission to the United States, and in 1918 he became Director of Propaganda in enemy countries. But he carefully abstained from any post which would bring him under the kind of criticism that he liked to level at others nor did he make his charges in the House of Lords, where he had a seat and could have been answered, face to face. Lloyd George had the

advantage of being ready at any time to confront his enemies in Parliamentary debate.

Northcliffe was finally checkmated when Lloyd George won "the coupon election" of 1918 by a majority which made him master of Britain's fate at the Paris Conference. That Northcliffe wished to be a delegate was an open secret. He was passed over. And, indeed, the shades were already gathering around him. In 1919, an adenoma was removed from his throat. The operation was successful but it left Northcliffe excitable and feverish. His papers exploited the public indignation against waste after the war. Lloyd George was furiously denounced without being destroyed. In 1921, after a particularly severe trouncing from the Prime Minister, Northcliffe suddenly decided upon a tour round the world. On landing in New York, he or his colleagues committed the unpardonable offence, as it is regarded in Britain, of announcing in an interview that King George had warned Lloyd George personally against continuing bloodshed in Ireland. Lloyd George's rejoinder was a crushing blow to Northcliffe's prestige. He appeared in the House of Commons and read an explicit repudiation from the King himself and Northcliffe was refused the usual hospitalities of the British Embassy at Washington. His tour continued and everywhere he was received with marks of distinction. He warned Australians against keeping their country underpopulated and so inviting the attentions of Japan. But, on his return, his editorial staffs were not always convinced of the wisdom of the pronouncements for which he desired publicity. In one case, an intimate colleague, had to protect his professional standing by an appeal to the law.

The fact was that Northcliffe's over-strained mind had failed. When he died, a service for him was held in Westminster Abbey and he was buried at Marylebone. His wife, the daughter of Robert Milner, a West Indian merchant, survived him.

Northcliffe, though erratic and addicted to despotism, was beloved. He had no child and his heir is his nephew, Esmond Cecil Harmsworth, eldest surviving son of his brother, Lord Rothermere. When his uncle died, he was Unionist member for Thanet. His brother, Cecil Bisshop Harmsworth was for some years Lloyd George's under-Secretary for Foreign Affairs. Hildebrand Aubrey Harmsworth and Sir Robert Leicester Harmsworth, Bt., two other brothers, shared Northcliffe's achievements in journalism.

Probably the historian will correct the common impression that Northcliffe was omnipotent over statesmen. It was his business as a newspaper man to magnify his own importance. As a matter of record, Britain seldom followed his advice. He wanted tariffs and the country remained free trade. He denounced the Lloyd George budget and defended the House of Lords. The country turned down the House of Lords and accepted the budget. He opposed Home Rule until some form of Home Rule became inevitable and again events belied his judgment. His final enthusiasm was for French policy at Genoa and Lord Rothermere is following in his footsteps by vigorously supporting Poincaré and the Ruhr occupation. Yet here again, Bonar Law, with the support of all parties, has dis-

THE LATE VISCOUNT NORTHCLIFFE

1900

associated Great Britain from France and the Harmsworth counsels. What makes piquant reading over breakfast or in the train, is not of necessity the material on which the nation has based its policy. The rise of the Labor Party, which Northcliffe had hated, is a symptom that he represented an era of imperfect education which has already passed away. Indeed, he appreciated this and in his later years, developed the more responsible side of the newspaper business, issuing some publications of the highest intellectual value. Northcliffe left a fortune of \$25,000,000 of which \$10,000,000 must be paid away in British Death Duties.

PHILIP WHITWELL WILSON.

NORTH DAKOTA, a west north-central State, bounded on the north by Canada, east by Minnesota, south by South Dakota, and west by Montana. It has an area of 70,837 square miles and in 1920 had a population of 646,872. The State is 16th in order of size and 36th in order of population. Of the population in 1920, 639,954 were whites, 6,254 Indians, 467 negroes, and 197 Asiatics. The foreign-born residents the same year numbered 131,503, and included 38,190 Norwegians, 29,617 Russians, 15,550 Canadians, and 11,960 Germans. The rural population in 1920 was 86.4 per cent of the total. The chief cities are: Bismarck, the capital, population, 6,951; Fargo, 21,961, and Grand Forks, 13,450.

Religion.—The principal Christian denominations have an aggregate membership of 225,877, of whom 95,859 are Roman Catholics, 72,026 Lutherans, 13,479 Methodists, 9,295 Presbyterians, 6,268 Baptists, 8,913 Congregationalists, 2,455 Episcopalians and 1,435 members of the Reformed Church.

Education.—Primary education is free and compulsory for all children between the ages of seven and 15. There are in the State 4,532 primary schools, with 9,308 teachers and 173,976 pupils; 690 high schools, with 3,457 teachers and 90,195 pupils, and five normal schools, with 1,800 students. For higher education there are the State University, the State Agricultural College and Fargo College.

Finances.—On 1 July 1921 the State had on hand a balance of \$3,054,390.17. Receipts during the fiscal year 1921-22 amounted to \$14,762,853.87. Disbursements for the same period totaled \$15,411,760.94, leaving a balance on hand on 1 July 1922 amounting to \$2,405,483.10. The bonded debt of the State on the latter date was \$7,048,200. The assessed value of all property, real and personal, in 1922 was \$1,300,000,000.

Agriculture.—Agriculture is easily the chief source of wealth. In 1920 the value of all crops was \$301,782,000, as against \$57,374,000 for manufactured products. Even the latter consisted mainly of flour and other by-products of agriculture. The State produces every cereal and crop grown in the north temperate zone. Much of the grain and nearly all forage crops are fed locally to livestock. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 680,000 acres, 18,700,000 bushels, \$9,350,000; spring wheat, 8,740,000 acres, 123,234,000 bushels, \$110,911,000; barley, 1,008,000 acres, 25,704,000 bushels, \$10,025,000; oats, 2,388,000 acres, 78,804,000 bushels, \$20,-

489,000; rye, 1,581,000 acres, 24,506,000 bushels, \$14,704,000; tame hay, 1,028,000 acres, 1,655,000 tons, \$12,412,000; potatoes, 198,000 acres, 17,820,000 bushels, \$5,524,000. On 1 Jan. 1923 there were in the State 797,000 horses, valued at \$44,632,000; 8,000 mules, valued at \$552,000; 503,000 milk cows, valued at \$22,132,000; 814,000 other cattle, valued at \$17,420,000; 240,000 sheep, valued at \$1,752,000, and 478,000 swine, valued at \$6,453,000. The census of 1920 reported 77,690 farms having a total area of 36,214,751 acres, of which 24,563,178 was improved land. The assessed valuation of all farm property in 1920 was \$1,759,742,995.

Mining and Manufacturing.—There are considerable coal lands in the western part of the State from which a brown, low grade coal is produced for domestic consumption. Cement is another important mineral product. Flour and grist milling, dairying and the creamery industry are the principal manufacturing activities. In recent years the State has striven to stabilize agriculture by dairying development. The 1921 return from all dairy products was estimated at \$30,000,000 by the State Agricultural Station at Brookings. About 20,000,000 pounds of cream is sold to creameries yearly.

Legal Holidays.—1 January; 12 February; 22 February; 30 May; 4 July; first Monday in September; 12 October; Thanksgiving Day; 25 December, and every day on which an election is held throughout the State and every day appointed by the President of the United States or by the Governor of the State for a public fast, thanksgiving or holiday.

Charities and Corrections.—The number of inmates in the chief charitable and corrective institutions of the State on 1 July 1922 was as follows: State Penitentiary, Bismarck, 228; Tuberculosis Sanitarium, Dunseith, 102; Feeble-minded School, Grafton, 323; Deaf School, Devils Lake, 117; Insane Asylum, Jamestown, 1,256; State Training School, Mandan, 130; and Blind School, Bathgate, 30.

Transportation.—The State has a steam railroad mileage of 6,406.87 miles and an electric railway mileage of 27 miles.

Government.—The State executive is a Governor, who is elected for two years and receives a salary of \$5,000. The Legislative Assembly comprises a senate of 49 members, elected for four years and a lower house of 113 representatives, elected for two years. The Legislature meets biennially in January. The State sends two Senators and three Representatives to the Federal Congress. For local administration the State is divided into 53 counties.

State Officials.—(1922). Governor, R. A. Nestos; lieutenant-governor, Howard R. Wood; secretary of state, Thomas Hall; attorney-general, Sveinbjorn Johnson; auditor, D. C. Poindexter; treasurer, John Steen, and superintendent of public instruction, Minnie J. Nielson. The State officials entering upon their duties in January 1923 were: Governor, R. A. Nestos; lieutenant-governor, J. A. Hyland; secretary of state, Thomas Hall; attorney-general, George Schafer; auditor, D. C. Poindexter; treasurer, John Steen, and superintendent of education, Minnie J. Nielson.

Judiciary.—Members of Supreme Court

(1922): Luther E. Birdzell, J. E. Robinson, R. H. Grace, Harry A. Bronson, A. M. Christianson. The members of the Supreme Court entering upon their duties on 1 Jan. 1923 were: H. A. Bronson, A. M. Christianson, L. E. Birdzell, Sveinbjorn Johnson and W. L. Nuessle.

NORTH DAKOTA, University of, a State co-educational institution, founded in 1883 and located at University Station, Grand Forks, N. D. In 1922-23 it had a faculty of 109 members, 1,449 students, not including students of the 1922 summer session nor extension students; property valued at \$1,259,500, and an income of \$552,300, including \$193,049 for buildings and improvements. Thomas F. Kane, Ph.D., LL.D., is president.

NORTHERN TERRITORY. See AUSTRALIA.

NORTHLAND COLLEGE, a co-educational institution, affiliated with the Congregational Church but non-sectarian, founded in 1892 and located at Ashland, Wis. In 1922-23 it had a faculty of 17 members, 175 students, property valued at \$232,958.99 and an income of about \$45,000. Joseph D. Brownell, D.D., is president.

NORTHWESTERN COLLEGE, a co-educational institution of the Evangelical Association, founded in 1861 and located at Naperville, Ill. In 1922-23 it had a faculty of 42 members, 574 students, property valued at \$626,789.73 and an income of \$167,782.45. Edward E. Rall, Ph.D., is president.

NORTHWESTERN COLLEGE, a Lutheran co-educational institution, founded in 1865 and located at Watertown, Wis. In 1922-23 it had a faculty of 17 members, 154 students, property valued at \$260,000, and an income of \$62,000. E. E. Kowalke, A.B., is president.

NORTHWESTERN UNIVERSITY, a co-educational institution, founded in 1851 and located at Evanston and Chicago, Ill. In 1922-23 it had a faculty of 575 members, 8,500 students, including 300 part time students and those taking summer courses, property valued at \$13,000,000, and an income of approximately \$2,000,000. Walter Dill Scott, Ph.D., LL.D., is president.

NORTH-WEST TERRITORIES, a part of the Dominion of Canada, lying between the Yukon and the Prairie Provinces and north of British Columbia. Area, 1,242,224 square miles; Population in 1911, 18,481. The Territories are divided into three Districts — Mackenzie, Keewatin and Franklin. The government is by a Commissioner and five councillors. Commissioner in 1922: William Wallace Corey. See CANADA.

NORWAY, a kingdom of northwest Europe occupying the northern and western parts of the Scandinavian peninsula. The kingdom has an area of 124,965 square miles and a population of 2,646,306 (census of 31 Dec. 1920). The census showed a rural population of 1,861,424 and an urban population of 784,882. In 1920, there were 70,691 births, exclusive of the stillborn, and including 5,253 illegitimates. In the same year, 5,581 persons emigrated from Norway, of whom 5,216 came to the United States. The

1920 census showed one city of over 100,000 inhabitants, five above 20,000, 18 above 10,000, and 26 above 5,000. The chief cities, with their populations in 1920, are the following: Kristiania, the capital, 258,341; Bergen, 91,081; Trondheim, 54,520; Stavanger, 43,883; Drammen, 26,174; Haugesund, 16,563; Alesund, 16,347; Kristiansand, 16,543; Skien, 16,503; Frederikstad, 15,579; Kristiansund, 15,183; Tonsberg, 12,588; Larvik, 11,391; Frederikshald, 11,218; Sarpsborg, 10,881; Horten, 10,413; and Arendal, 10,358.

Education.—Primary education is free and compulsory. The school age in cities is from six and one-half years and in the country districts from seven years; both terminating at 14 years. The last school census reported 6,000 elementary schools with 282,117 pupils in the rural districts and 3,379 classes in the urban areas with 96,784 pupils. There are 113 secondary schools with 20,714 pupils and 10 private schools. There are 10 normal schools with 1,263 students; four of these schools are private. For higher education there is the University of Kristiania, attended by 1,500 students. There are also technical high schools and one agricultural high school and many special schools; 10 schools for abnormal children and nine reformatory schools.

Religion.—The national church is the Evangelical Lutheran and is the only denomination endowed by the state. Its upper clergy are nominated by the sovereign. There exists partial toleration of other denominations, the exception being members of the Society of Jesus (Jesuits). The last religious census showed 62,553 dissenters from the state religion. These consisted of 2,046 Roman Catholics, 7,659 Baptists, 10,986 Methodists, 715 Mormons and 145 Quakers.

Agriculture.—Most of Norway is so barren and rugged that it cannot support a dense population. It may well be described as a seaboard nation, for all its larger cities are seaports and it has no densely populated interior districts. The sea is the great controlling factor in the development of Norwegian industrial life, which largely determines the location of population. The fiords of the southern half of the country facilitate direct trade connections with the commercial nations of Europe and America. In this section the climate is congenial, and lumbering, agriculture and manufacturing are favored by the soil, the topography, and the waterpower resources. This part of the country contains more than two-thirds of the population and all of the large cities. Norway is a rugged country. The mountains are not high, but their slopes are steep, especially oceanward, so the relief is bold and picturesque. The larger part of the country is a plateau severely eroded by glaciation and by streams. These combined with the location in the far north, cause practically three-fourths of the area to be barren — unproductive of any vegetation of value. Only 3 per cent of the total area is now classed as cultivated land. The arable soil is generally in small bodies, in narrow strips along streams, lakes and fiords. About 21 per cent of the area is under forest. The number of farms is given as 261,484, of which only 265 had an area over 125 acres and 15,070 are from 25 to 125 acres. According to the report of the director of the Department of Agriculture of the Norwegian government

the state of the crops in Norway during 1921 was as shown in the following table:

Crops	Average crops	Computed crop in 1921
	Tons	Tons
Hay.....	1,812,279	1,834,928
Straw.....	823,468	673,602
Total.....	2,635,747	2,508,602
Wheat.....	30,028	26,445
Rye.....	26,728	26,484
Barley.....	123,482	93,167
Oats.....	243,351	188,152
Mange corn.....	22,198	18,254
Peas.....	5,803	4,008
Total.....	451,585	356,570
Potatoes.....	928,889	707,489
Turnips.....	410,886	348,367

Live stock reports show 1,049,642 head of cattle, 1,207,923 sheep, 221,062 horses, 203,099 goats, 214,305 swine. The forest products are one of the chief sources of the national wealth. Of the total forest area (27,434 square miles) about 75 per cent is covered with pine trees. The value of unwrought timber exported in 1920 was 109,846,200 kroner and of wrought timber 226,669,000 kroner.

Fisheries.—A third of the total export values in normal years is represented by the products of

Items	1920	1921
Herring:		
Salted, spring, barrels.....	1,222,000	626,000
Salted, fat, barrels.....	193,000	168,000
Salted, large, barrels.....	850,000	394,000

the fisheries. The total value of this industry in 1919 was 135,890,096 kroner. The chief fisheries

are for cod, herring, mackerel, salmon and sea trout and lobsters. Minor branches of this industry are the fisheries for whale, walrus, seal, and sharks, which produce products of a normal yearly average of 40,500,000 kroner. Whale oil production in 1920 amounted to 37,275 metric tons. According to *Harmand* (a Norwegian publication), the fisheries of Norway during 1921 had difficulties to contend with. As anticipated, the results of the winter herring fisheries were very poor. The amount of fish caught was less than in 1920 and the prices exceptionally low. All of the fisheries were, as a rule, operated at a loss during the year. Computations based on prevailing prices of fish show that the approximate value of Norwegian fish caught in 1921 was about 55,000,000 crowns, as compared with 80,000,000 crowns in 1920 and 133,000,000 crowns in 1919. The preceding table shows the quantity of fish and fish products exported from Norway in 1920 and 1921.

Minerals and Mining.—Norway is not rich in mineral wealth. While ores of considerable variety are found, few of them are of high grade or so located as to be easily accessible for mining. Iron ore is found in both the northern and southern parts of the country, but its percentage of iron is low and the production is therefore difficult in competition with richer ores. Pyrites containing both iron and copper occur in large quantities in a number of places. There is also a shortage of coal for smelting. The mineral products include silver, copper, pyrites, iron, feldspar, nickel and sulphur. The value of all mineral products in 1918 was 37,131,000 kroner; of furnace products, 28,369,000 kroner. In the years following the war these values decreased greatly but the production to a much less extent. There are in the country 127 mining establishments with 8,000 hands and 14 smelters with 1,100 hands.

Manufactures.—The enormous amount of waterpower in Norway has given added impetus to its manufacturing industries so long hampered by lack of coal. Development of hydroelectricity has reached a total of 1,215,000 horsepower, but a great expansion is contemplated in the near future. The chief use of this power so far developed is for the production of pulp and paper and of electrochemical products. Of this latter the chief products are ammonium nitrate, sodium nitrate, calcium carbide, and ferrosilicon. The manufacturing establishments in 1920 numbered 8,069, with 158,259 operatives. Of these factories, 2,348 were engaged in the making of articles of wood, bone, horn, etc., 1,830 in food products, 1,295 in machinery and metal work, 510 in clothing, 390 in quarries and ceramics, 347 in paints, oils, chemicals and soaps, 340 in printing, 306 in the electrical industry, 251 in textiles, 213 in paper, 127 in leather and rubber, and 57 in mining.

Commerce.—The Central Bureau of Statistics stated the values of the foreign commerce of Norway in 1921 based on prices in 1913. The values thus obtained give a general impression of the change which has taken place in trade in recent years. According to these figures Norwegian imports in 1921 were valued at 462,050,000 crowns (1 crown=\$0.2680 at normal exchange), as compared with 765,280,000 crowns in 1920 and 524,860,000 crowns in 1913. The figures

also show a decrease in the value of exports, which declined from 367,030,000 crowns in 1913 to 330,900,000 crowns in 1920, and 234,470,000 crowns in 1921. If 100 represents the value of imports and exports in 1913, then the 1921 exports were equal to 64 and the 1920 exports to 90, while 1921 imports were equal to 88 and 1920 imports to 146. The volume of imports in 1921 was 12 per cent lower and exports 36 per cent lower than in 1913. In 1921 there was a decrease of 30 per cent in the volume of exports from Norway, as compared with 1920. Exports in 1922 had an estimated value of 730,000,000 crowns.

Shipping.—The arrivals at Norwegian ports in 1921 aggregated 2,232,426 tons as compared with 2,850,892 tons in 1920; clearances aggregated 3,477,187 tons as compared with 3,397,618 tons in 1920.

On 30 June 1922 the total tonnage of Norwegian shipping, according to *Lloyds' Register*, was 2,237,000 tons, as compared with 2,285,000 tons on 30 June 1921, and 1,923,000 tons on 30 June 1914. On 13 Oct. 1922 it was announced that The Hague Arbitration Tribunal had awarded Norway approximately \$12,000,000 in the case between the United States and Norway involving claims growing out of the requisitioning by the United States during the war of Norwegian vessels. The budget for 1923 appropriated 15,000,000 kroner for assistance to Norwegian shipping. On 26 Feb. 1923 the United States paid Norway \$12,239,852, the amount of the award by the tribunal of arbitration which passed on the claims growing out of the seizure during the World War of Norwegian ships.

Finance.—The budget for the fiscal year 1921-22 showed ordinary and extraordinary revenues of 717,077,800 kroner with expenditures of a similar sum. The ordinary revenue is derived from the income tax, customs, excise, succession dues, stamps, luxuries taxes, posts and telegraphs, and railways. The extraordinary revenues are derived from excess profits, taxes, tonnage tax, and loans. The extraordinary expenditures are for the construction of railways, telegraph and telephone lines, water-power developments, and other public works. The public debt at the beginning of the year 1922 amounted to 1,220,555,000 kroner.

Railways.—The total length of railways in Norway is 2,072 miles, of which all is state-owned except 271 miles. Coal furnishes the motive power for the main lines and mostly for the branch lines, although on account of the coal shortage of the last two years wood was used to some extent. Very little electrification has so far been accomplished, but plans are under way for extensive expansion in that direction. The main lines centre in the capital and radiate in different directions.

Roads.—There are 7,828 miles of improved roads and 12,926 miles of secondary roads.

Defense.—The army is in effect a national militia with universal service beginning at the age of 18 and continuing to the age of 55. The peace strength of the land forces is 138,500 men capable of expansion upon mobilization to 282,000 men. The navy personnel has 190 officers and 1,000 men on the active lists. The vessels are four old cruisers, two gunboats,

four destroyers, 29 torpedo boats, four submarines and ten minelayers.

Government.—The legislative power is vested in the Storting, which meets yearly and is composed of 150 members elected by universal suffrage for three year terms. The executive power is vested in the sovereign who may exercise his veto twice. The Storting of 1922 had 57 Conservatives and Moderates; 37 Liberals; 29 Communists; 17 Agricultural Party; 8 Socialists and 2 Democrats. The reigning sovereign in 1922 was His Majesty Haakon VII; the Premier and Minister of Finance in the same period was Otto Albert Blehr.

History.—The Storting opened on 26 January and received from the Government bills for a state monopoly of the importations of cereals, flour, brandies and wines; for compulsory arbitration of labor conflicts, and for the reform of the consular service. It was estimated that the Government's expenditures for the year be reduced by 76,000,000 kroner from that of the previous year. On 18 January it was announced that the Norwegian government had recognized the Obregon administration in Mexico. A Court of Arbitration was set up to decide the question of Norwegian shipowners' claims against the United States Shipping Board for vessels requisitioned during the World War, of which Prof. Max Huber of Switzerland was made President. On 18 March the Odelsting, or Lower House, passed the bill establishing compulsory arbitration in all labor disputes. The passage of this act marked the final effort to rid industry of the menace of strikes. The great advantage claimed for it is that it will prevent cessation of work and its consequent unemployment during a labor dispute. Power now rests in the Government, whenever the public interest is endangered, to decide that an arbitration court shall pass on the merits of the dispute and does not permit of a stoppage of work during settlement. Five members constitute the arbitration court, of these one is appointed by the labor element involved, one by the employers, and three by the Government. Judgment is passed by a simple majority and is binding for a period not exceeding two years but may be extended by mutual consent of the parties. Illegal stoppage of work is punished by a fine. The new legislation is tentative.

The Government is finding great difficulty in enforcing the liquor law. Smuggling is thriving along the coast and many voices are calling for the repeal of the law, since it is claimed that Prohibition is a "total fiasco." Friction with Moscow was caused by the seizure of Norwegian sealers, whalers and fishermen in the White Sea. The Norwegian government protested to the Soviet government on 6 June against the seizures of vessels, cargoes and crews and sent a war vessel to those waters to protect her subjects. The Foreign Minister, Dr. Raasted resigned early in June and was succeeded by Dr. Mowinckel. The former had been severely criticised by the Conservatives for his commercial treaty with Soviet Russia and for the unsuccessful negotiations with Spain relative to the importation of alcoholic liquors. However, he was supported by the Prohibition

elements. On 19 June the Government submitted to the Storting a bill authorizing the governmental measures necessary to prevent the sale of the Spitzbergen mines to foreigners. The Socialists took umbrage at the conditions imposed on labor in these mines but were reassured that as soon as the question of the sovereignty over the Spitzbergen Islands was definitely settled the Norwegian labor laws would be enforced there. On 7 July it was announced that the taxes of foreigners owning property and shares in Norway would be reduced by half. At the same time the Storting authorized the Treasury to cancel collection for 1922-23 of ordinary government taxes on property and income which had been demanded of shareholders living abroad. On 8 August the Government was authorized to conclude a commercial agreement with Spain. It was proposed to sanction the annual importation of 500,000 litres of liquors and strong wines, these to be used chiefly for medicinal and technical purposes. The operation of the Treaty with Russia was fraught with many difficulties. It was charged that Russia was beginning to ship from Archangel stocks of wood belonging to the Norwegian company known as the Russian Forest Interests. The company filed formal notice that it would claim these cargoes upon their arrival in England. On 4 August the Foreign Office stated that the safe of the former Norwegian consulate in Moscow had been blown open and rifled of its contents. When the Norwegian delegation in Moscow protested the Soviet Government replied that consular property did not have extraterritorial privileges as the vault was unsealed and contained documents belonging to Russians. This was denied. The loss was estimated at 1,000,000 kroner. On 29 August the Permanent Court of Arbitration at The Hague closed its session on the shipping case between the Kingdom of Norway and the United States after deliberations lasting two months. The chief points discussed were whether the United States actually did requisition the Norwegian ship-building contracts and, if so, what was taken when they were requisitioned, the date of the requisition (3 Aug. or 6 Oct. 1917), and the value of the things so requisitioned. On 13 October the award of the Court was handed down. The verdict was in favor of Norway. Claims presented by Norway amounted to \$13,000,000 plus interest from August 1917 and the Court awarded approximately \$12,000,000. The United States had recognized its liability for about \$2,500,000. The United States representative when the award was announced, gave formal notice that the United States reserved the right to move for a new trial on the ground of essential error. In September the Queen of Holland and her Consort paid an official visit to Norway where they received an enthusiastic welcome. In the autumn friction developed with Denmark over Norwegian rights in Greenland and the question was still unsettled at the close of the year. A system of industrial shop councils in all public and private plants and businesses employing 50 persons or more was established by the Government on 26 November. The Norwegian budget for the year ended 30 June 1922 appropriated 25,000,000 kroner for govern-

ment assistance to shipping. The appropriation is managed by the Ministry of Commerce. Aid is granted only to vessels conforming to Government requirements as to seaworthiness, officers and crews, etc. Only 700,000 kroner of the appropriation are for steamers in foreign trade. The object of the subsidy is to facilitate trade in food supplies and their transportation to remote districts and to meet special emergencies and conditions. On 1 July the Norwegian merchant fleet totaled 2,237,000 tons but the number of ships was about 15 per cent less than that of the prewar fleet. At the close of April the number of the unemployed registered was 43,000. This total was reduced to 21,000 by 1 August. No strikes are possible in Norway, all disputes being settled by compulsory arbitration under the law for this purpose. Plans were presented to the Government for the extraction of oil from Spitzbergen coal, which is especially rich in oil content. It was proposed to establish a plant in northern Norway to produce about 3,000 tons of crude oil the first year from 20,000 tons of coal, increasing this amount to 18,000 tons of oil later or enough to satisfy the domestic demand for motor oil.

NORWEGIAN LUTHER COLLEGE, a Lutheran educational institution for men, opened September 1861 and located at Decorah, Iowa. In 1922-23 it had a faculty of 22 members, 302 students, property valued at \$922,608.15 and an income of \$60,919.41 (1 May, to 31 December). Oscar L. Olson, Ph.D., was acting president, 1 March 1923.

NORWICH UNIVERSITY, a non-sectarian military college, founded in 1819 and located at Northfield, Vt. In 1922-23 it had a faculty of 26 members, 276 students, property valued at \$420,130.70 and an income of \$152,430.47. Charles A. Plumley, LL.D., is president.

NOTE CIRCULATION OF EUROPEAN COUNTRIES. See EUROPEAN COUNTRIES, NOTE CIRCULATION AND GOLD RESERVE OF BANKS OF ISSUE.

NOTRE DAME COLLEGE OF MARYLAND, a Catholic educational institution for women, founded in 1896 and located at Baltimore, Md. In 1922-23 it had a faculty of 14 members, and a student enrollment of 85. No information was given as to the value of the institution's property or its income. Sister Mary Philemon, S.S.N.D., is president.

NOTRE DAME UNIVERSITY (correct corporate name "University of Notre Dame"), a Catholic educational institution for men founded in 1842 and located at Notre Dame, Ind. Statistics for 1922-23 show a faculty of 108 members, a student enrollment of 1,950, and property valued at \$4,500,000. Income figures for the year not given. Matthew J. Walsh, Ph.D., is president.

NOVA SCOTIA, a Maritime Province of the Dominion of Canada. Area, 21,428 square miles; population in 1921, 523,837. Halifax, the capital, is the largest city and the chief naval station in Canada. Its population is 58,372. Other cities are: Sydney, 22,545; Glace Bay, 17,007; Amherst, 9,998; Dartmouth, 7,899; New Glasgow, 8,974; Sydney Mines, 8,327; and

Truro, 7,562. The provincial budget is balanced at \$4,000,000 approximately. The public debt in 1920 was \$17,941,871. The Province is administered by a Lieutenant-Governor, who holds office for five years and is appointed and paid by the Dominion Government. A Legislative Council appointed by the Crown and holding office for life forms part of the legislative system together with a House of Assembly of 43 members elected for five years. The Lieutenant-Governor in 1922 was McC. Grant; Premier, G. H. Murray. For Production, Industry, etc., see CANADA.

NUTS, Exports and Imports of. See HORTICULTURE.

NYASALAND, a British African Protectorate lying along the southern and western shores of Lake Nyasa and extending towards the Zambesi. Its area is 39,573 square miles with a population in 1921 of 1,427 Europeans; 561 Asiatics and 1,199,531 natives. The principal settlement is Blantyre but the seat of the government is at Zomba. Good roads are being extended in all directions between the various settlements. There are no government schools, but several missionary societies maintain schools for the native children. These schools number 2,030 with 120 European teachers and 117,638 pupils. Coffee, tobacco and cotton are the chief crops. Coffee exports in 1920 reached 64,362 pounds; tobacco exports to 4,963,000 pounds; and cotton, 1,149,000 pounds. Imports in 1921 were valued at £507,573 and exports at £670,072. The revenue the same year amounted to £268,018 and the expenditures to £261,868. The public debt amounts to £3,213,800. The trade ports are Port Herald, Kota-Kota, Karonga, and Fort Johnston. There is a rail line from Chindio on the Zambesi in Portuguese East Africa to Blantyre a distance of 174 miles. The Protectorate is administered under the Colonial Office by the Governor and Commander-in-chief, assisted by an Executive and a Legislative Council. The Governor and Commander-in-chief in 1922 was Sir George Smith.

NYDEGGER, James Archibald, American physician: b. Fort Pendleton, near Oakland, Alleghany County, Md., 26 June 1864. In 1890 he received the degree of B.L. from Saint John's College, Annapolis, Md., and the degrees of A.M. and D.Sc. from the same institution in 1912. In 1892 he was graduated with the degree of M.D. from the University of Maryland. On 1 July following his graduation he was appointed

assistant surgeon of the United States Public Health Service, becoming passed assistant surgeon 7 July 1896 and surgeon 4 Feb. 1909. Dr. Nydegger served at Baltimore, at Gulf Quarantine, Miss., Charleston, S. C., Reedy Island Quarantine, Del., South Atlantic Quarantine, Ga., New Orleans, Cape Charles, Va., and the quarantine stations at Cincinnati, New York, Liverpool, London, Paris, Madrid, etc. In 1898-99 he was in charge of the yellow fever post epidemic areation in the vicinity of New Orleans and served as executive officer in New Orleans during the epidemic of yellow fever there in 1899. In 1912, Dr. Nydegger originated hygienic survey in schools by the United States Public Health Service and from 1913-16 was professor of tropical medicine in the University of Maryland. In 1915 he was awarded the certificate of the London School of Tropical Medicine. Dr. Nydegger is author of several articles on public health; is a member of the American Public Health Association, the American Association for the Promotion of Hygiene and Public Baths, of the American Medical Association and of the Southern Society of New York.

NYE, Irene, American educator: b. Eureka, Kan., 12 Nov. 1874. She is a lineal descendant of John Howland of the *Mayflower* and of William Chesebrough, the first English settler of Stonington, Conn. She received her preliminary education at the Southern Kansas Academy, Eureka, Kan., and in 1895 was graduated with the degree of A.B. from Washburn College, Topeka, Kan. In 1911 she received the degree of D.Ph. from Yale University. From 1895-1901 she was teacher of Latin and Greek at Southern Kansas Academy; from 1905-08 was scholar in classics in Washburn College, and fellow in 1909-11 at Yale. In 1911-12 Miss Nye was professor of Latin at Washburn College, becoming professor of classic languages there in 1912. In 1915 she became assistant professor of Greek and Latin at the Connecticut College for Women, advancing to the professorship in 1916, which position she still holds, together with that of dean of the department since 19 May 1917. She is member of the American Philological Association, the New England Classical Association, and of the Archaeological Institute of America. She has published: 'Sentence Connection Chiefly Illustrated from Livy' (1911), and is a contributor to *The Classical Journal*, *Classical Philology*, and various educational journals. She has made a specialty of Plautine translation and investigation.

OATS. In its final report issued in December the Department of Agriculture estimated the 1922 oat crop of the United States at 1,215,496,000 bushels valued at \$478,548,000, compared with the 1921 crop of 1,078,341,000 bushels valued at \$325,954,000 and the 1920 crop of 1,496,281,000 bushels valued at \$688,311,000. The acreage for the three years was as follows: 1922, 40,693,000 acres; 1921, 45,495,000 and 1920, 42,491,000. The average yield per acre in 1922 was 29.9 bushels, compared with 23.7 bushels in 1921 and 35.2 bushels in 1920. The average price of the crop on 1 December was 39.4 cents per bushel, compared with 30.2 cents per bushel on 1 Dec. 1921 and 46 cents per bushel on 1 Dec. 1920. Iowa led the States in production with a total yield of 222,851,000 bushels, compared with 164,840,000 bushels in 1921 and 229,866,000 bushels in 1920. Minnesota was second with a production of 142,746,000 bushels, compared with 99,480,000 bushels in 1921 and 138,825,000 bushels in 1920. Illinois was third with a production of 110,010,000 bushels, compared with 121,741,000 bushels in 1921 and 171,193,000 bushels in 1920. Wisconsin was fourth with a yield of 101,558,000 bushels, compared with 63,958,000 bushels in 1921 and 107,878,000 bushels in 1920. North Dakota produced 78,804,000 bushels in 1922, 48,792,000 bushels in 1921 and 60,432,000 bushels in 1920. South Dakota produced 74,400,000 bushels in 1922, 58,300,000 bushels in 1921 and 75,446,000 bushels in 1920. Nebraska, which in 1920 produced 83,040,000 bushels, dropped to 70,054,000 bushels in 1921 and to 56,106,000 bushels in 1922. Pennsylvania, which produced 47,190,000 bushels in 1920, dropped to 35,283,000 in 1921, but increased its production to 41,242,000 in 1922. Texas produced 33,465,000 bushels in 1922, compared with 33,575,000 bushels in 1921 and 32,780,000 bushels in 1920. New York produced 31,770,000 bushels in 1922, 24,912,000 bushels in 1921 and 40,772,000 bushels in 1920. Oklahoma dropped from 54,450,000 bushels in 1920 to 35,300,000 bushels in 1921 and to 30,000,000 bushels in 1922. Kansas likewise dropped from 65,299,000 bushels in 1920 to 38,827,000 bushels in 1921 and to 28,386,000 bushels in 1922. Ohio, which produced 68,068,000 bushels in 1920, dropped to 35,650,000 bushels in 1921, increasing to 39,774,000 bushels in 1922. Montana, on the other hand, increased from 11,726,000 bushels in 1920 to 14,832,000 bushels in 1921 and 19,200,000 bushels in 1922. Missouri, which in 1920 produced 58,499,000 bushels, dropped to 42,960,000 bushels in 1921 and then down to 17,872,000 bushels in 1922.

The world production of oats in 1922 was estimated by the Department of Agriculture 18 November at 3,113,284,000 bushels. At that time it was stated that the total production of 24 countries amounted to 3,017,538,000 bushels, compared with 2,742,438,000 bushels for the same countries in 1921 and an average annual production of 3,007,782,000 bushels for the five-year

period from 1909-13. At the time this report was made, the 1922 Canadian crop was estimated at 558,358,000 bushels, compared with 426,233,000 bushels in 1921 and a five-year average crop for the years mentioned of 351,690,000 bushels.

No figures, it was asserted, were available for Austria, Denmark, Norway, Russia and Australia. The production of other European countries was estimated at a total of 1,169,830,000 bushels in 1922, compared with 1,175,223,000 in 1921 and a five-year average production for the years 1909-13 of 1,430,887,000 bushels.

OBERLIN COLLEGE, a non-sectarian co-educational institution, founded in 1833 and located at Oberlin, Ohio. In 1922-23 it had a faculty of 163 members, 1,798 students, property valued at \$6,444,867 and an income of \$752,663. Henry Churchill King, D.D., LL.D., L.H.D., is president.

OCCIDENTAL COLLEGE OF LOS ANGELES, a non-sectarian co-educational institution, founded in 1887 and located at Los Angeles, Calif. In 1922-23 it had a faculty of 36 members, 481 students, property valued at \$660,246 and an estimated income of \$110,000. Remsen duBois Bird, D.D., is president.

OCEAN DEPTHS, Measurement of. See PHYSICS.

OCEANIA, British. The British territories in Oceania comprise the self-governing states and territories which form the Commonwealth of Australia with the dependencies of Papua or New Guinea and Norfolk Island, the Dominion of New Zealand and dependent islands, the Colony of Fiji, the Solomon and Tonga Islands, and many lesser islands. For these see the articles on the territories above named.

OCEANIA, French Establishments in. The French possessions in Oceania comprise the Society Islands, the chief of which are Tahiti and Moorea, area, 650 square miles and a population of 13,255. Phosphate is the chief product; The Marquesas Islands, 480 square miles and a population of 3,424; The Tuamotu Islands, area, 160 square miles and population 3,828; The Leeward Islands, population 5,925; Gambier, Tubuai and Rapa Islands, population 4,000. The total area of the French Establishments is 1,520 square miles. They have a native population of 26,219; and a French population of 28,875. There are about 2,656 other Europeans and approximately 1,000 Chinese. Tahiti is the most important of the islands. Its chief town is Papeete with 3,617 inhabitants. Copra, mother of pearl, cocoanuts, oranges and vanilla are the chief products. The Establishments are administered by a Governor assisted by an Administrative Council. The budget for the year 1921 was balanced at 5,980,000 francs.

OFFICERS' RESERVE CORPS. See ARMY OF THE UNITED STATES.

OGDEN COLLEGE, a non-sectarian educational institution for men, founded in 1877 and located at Bowling Green, Ky. In 1922-23 it had a faculty of 9 members, and 95 students. Value of property and income not given. Charles E. Whittle is president.

OHIO, one of the east north-central States of the American Union, bounded on the north by Michigan and Lake Erie, east by Pennsylvania and West Virginia, south by West Virginia and Kentucky, and west by Indiana. The area of the State is 41,040 square miles and in 1920 it had a population of 5,759,394. Ohio is 35th in order of size and fourth in order of population among its sister States. Of the population in 1920, 5,571,893 were whites, 186,187 were negroes, 1,163 were Asiatics and 151 were Indians. In the same year the foreign-born residents of the State numbered 678,697 and included 111,893 Germans, 48,073 Austrians, 43,140 English, 29,262 Irish and 24,176 Canadians. The chief cities of the State, with their populations in 1920, are: Columbus, the capital, 237,031; Cleveland, 796,841; Cincinnati, 401,247; Toledo, 243,167; Akron, 208,435; Dayton, 153,559; Youngstown, 132,258; Canton, 87,091; Springfield, 60,840; Lakewood, 41,732; Lima, 41,326; Hamilton, 39,675 and Lorain, 37,295.

Religion.—The principal Christian denominations have an aggregate membership of 2,291,793. Of this number, 843,356 are Roman Catholics, 399,045 Methodists, 160,413 Presbyterians, 105,753 Baptists, 93,192 Lutherans, 56,101 members of the Reformed Church, 47,175 Episcopalians, and 45,606 Congregationalists.

Education.—Primary education is free and compulsory for all children from six to 18 years of age. There are in the State 9,753 public primary schools with 19,022 teachers and 868,449 pupils, and 574 public high schools with 5,943 teachers and 121,538 pupils. For higher education there are in the State about 40 universities and colleges, the more important of which are the State Universities at Columbus and Athens, Cincinnati University, Western Reserve University, Ohio Wesleyan University, Oberlin College, Miami University, Denison University, Wooster University, Wittenberg College, Kenyon College, Mt. Union College and the Case School of Applied Science.

Finances.—The balance at the beginning of the last fiscal year amounted to \$14,326,673.95. Receipts during the fiscal year amounted to \$56,929,119.73. Disbursements for the same period amounted to \$51,698,436.12, leaving a balance on hand at the beginning of the fiscal year 1922-23 amounting to \$19,957,357.56. The estimated receipts for the fiscal year 1922-23 amount to \$43,373,950. The bonded debt of the State in 1922 was \$25,000,000 and the floating debt, \$1,665, making a total State debt of \$25,001,665. The assessed value of real property was \$6,386,334,425; of personal property, \$4,358,323,898.

Agriculture.—Ohio has extensive agricultural interests. The census of 1920 reported 256,699 farms, and the total value of all farm property at \$3,095,666,336. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 3,823,000 acres, 149,097,000 bushels, \$98,404,000; spring wheat, 28,000 acres, 420,000 bushels, \$491,000; winter wheat, 2,516,000 acres,

35,224,000 bushels, \$41,212,000; barley, 73,000 acres, 1,424,000 bushels, \$926,000; clover seed, 206,000 acres, 227,000 bushels, \$2,429,000; oats, 1,472,000 acres, 39,744,000 bushels, \$17,885,000; buckwheat, 25,000 acres, 500,000 bushels, \$400,000; rye, 87,000 acres, 1,235,000 bushels, \$1,025,000; tame hay, 3,374,000 acres, 4,892,000 tons, \$52,834,000; sorghum sirup, 4,000 acres, 248,000 gallons, \$260,000; potatoes, 126,000 acres, 11,214,000 bushels, \$10,093,000; sweet potatoes, 3,000 acres, 360,000 bushels, \$486,000; tobacco, 52,000 acres, 46,800,000 pounds, \$8,892,000; apples, 7,298,000 bushels; peaches, 1,584,000 bushels; and pears, 450,000 bushels. On 1 January 1923 there were on the farms in the State 771,000 horses, valued at \$71,703,000; 32,000 mules, valued at \$3,104,000; 1,069,000 milk cows, valued at \$59,864,000; 857,000 other cattle, valued at \$27,167,000; 2,094,000 sheep, valued at \$14,867,000, and 3,091,000 swine, valued at \$37,401,000. Ohio raises much pure-bred livestock and the meat packing industry is well developed. The wool clip of 1921 was 13,200,000 pounds.

Minerals.—The State has extensive mineral resources, ranking fourth in the Union in value of mineral output. The chief products are coal and clay manufactures. Coal production in 1922 amounted to 26,500,000 tons and oil to 6,762,000 barrels. In 1920, 8,533,470 tons of pig iron were produced from 79 furnaces. Besides coal and iron the mineral wealth of the State includes glass sand, salt, petroleum, natural gas, limestone and sandstone, pyrite, potash, mineral waters and gypsum.

Manufacturing.—Manufacturing is very extensive. Of the 264 classifications of the Federal census, Ohio is a considerable producer in all but 46 and ranks first in 18. The rubber centre of the world lies within the State at Akron, where tires valued at \$545,812,000 were turned out in 1920. Youngstown, Canton and Steubenville are the chief centres of the iron and steel industry, while Lima is the centre of the oil industry. Toledo and Cleveland manufacture great numbers of automobiles. The value of all products is over \$2,250,000,000. Over 1,000,000 persons are employed in industries in 16,000 establishments.

Communications.—The State has 9,195 miles of steam railways and 4,169 miles of electric railways. Cleveland is one of the principal lake ports.

Government.—The State executive is a Governor, elected for two years, who receives a salary of \$10,000. The legislature is composed of two chambers, a Senate of 37 members and a House of Representatives of 125 members, the members of both houses being elected for terms of two years. Ohio sends two Senators and 22 Representatives to the Federal Congress. For local administration the State is divided into 88 counties. The legislature meets biennially in odd years.

Officials.—The Governor in 1922 was the Hon. Harry L. Davis, who was succeeded in January 1923 by A. V. Donahey, who was elected in November 1922 for the two-year term, ending January 1925. The Secretary of State in 1922 was Harvey C. Smith. Other State officials who entered office with Governor Donahey in 1923 were: Lieutenant-Governor, Earl D.

Bloom; Secretary of State, Thad. H. Brown, Attorney-General, Chas. C. Crabbe; Auditor, Joseph T. Tracy; Treasurer, Harry S. Day, and Superintendent of Education, Vernon Riegler.

Judiciary.—Members of Supreme Court: Hon. C. T. Marshall, Chief Justice; Hon. R. M. Wanamaker, Hon. James E. Robinson, Hon. Thomas A. Jones, Hon. Edward S. Matthias, Hon. Robert H. Day, and Hon. Florence E. Allen, Judges.

OHIO NORTHERN UNIVERSITY, a Methodist co-educational institution, founded in 1871 and located at Ada, Ohio. In 1922-23 it had a faculty of 48 members, 987 students, property valued at \$600,000 and an income of \$127,000. Albert Edwin Smith, D.D., Ph.D., is president.

OHIO WESLEYAN UNIVERSITY, a Methodist co-educational institution, founded in 1842 and located at Delaware, Ohio. In 1922-23 it had a faculty of 114 members, a total of 1,711 students (938 women, 773 men), property valued at \$1,300,307.88 and an income of \$407,522.62. John Washington Hoffman, M.A., D.D., LL.D., is president.

OILCLOTH AND LINOLEUM, Manufacture of. According to the Department of Commerce, there were 29 establishments engaged primarily in the manufacture of oilcloth and linoleum in the United States in 1921, which turned out products valued at \$62,799,000 as compared with products valued at \$68,110,000 turned out by 32 establishments in 1919. Of the 29 establishments reported for 1921, 12 were located in New Jersey; five in Pennsylvania; three each in Massachusetts and New York; two in Maine; and one each in Illinois, Indiana, Maryland and Ohio. New Jersey, the leading State in the industry in 1921, produced 34.3 per cent of the total value of products in that year. The average number of wage earners employed in the industry was 6,640 in 1921 and 6,544 in 1919. Wages paid totaled \$8,545,000 in 1921 and \$7,719,000 in 1919. Materials used cost \$34,919,000 in 1921 and \$41,509,000 in 1919. Oilcloth made on cotton back in 1921 was as follows: Enameled, 3,007,000 square yards; table, wall and shelf, 64,196,000 square yards. Linoleum made on jute back was as follows: Linoleum (including cork carpets) 26,247,000 square yards; inlaid linoleum, 12,554,000 square yards. Floor covering made on felt back totaled 31,728,000 square yards. Artificial leather manufactured during the year totaled 283,000 square yards as compared with 13,632,000 square yards manufactured in 1919. The large decrease in the production of artificial leather by the oilcloth and linoleum industry was partly caused by a change in classification, two of the important establishments in 1919 having changed the character of their products so as to be included in the upholstering industry in 1921. In 1921 there were 19 establishments included in the classification "upholstering materials not elsewhere specified" which reported the production of artificial leather valued at \$15,033,000, compared with products valued at \$26,282,000 reported by 17 establishments in 1919.

OIL OF CASSIA. See FOOD STANDARDS, FEDERAL.

OKLAHOMA, one of the west, south-central States, formerly known as Indian Territory, bounded north by Kansas, east by Arkansas and Missouri, south by Texas and west by Texas. Its area is 70,057 square miles and in 1920 it had a population of 2,028,283. It is 17th in order of size and 21st in order of population among the States of the Union. In 1920, whites among the population numbered 1,821,194, negroes numbered 149,408, Indians numbered 57,337 and Asiatics numbered 344. The foreign-born in the same year totaled 39,968 and included 17,029 Germans, 2,686 English, 5,005 Russians, 2,475 Canadians, 2,122 Italians, 1,393 Austrians and 1,120 natives of Scotland. The chief cities, with their population in 1920, are: Oklahoma, the capital, 91,258; Tulsa, 72,075; Muskogee, 30,277; Okmulgee, 17,430; Enid, 16,576; Shawnee, 15,348; Ardmore, 14,181 and McAlester, 12,095.

Religion.—The principal Christian denominations have a membership of 424,492 in Oklahoma, of whom 129,436 are Baptists, 113,202 are Methodists, 47,427 are Roman Catholics, 23,618 Presbyterians, 3,899 Lutherans, 3,566 Episcopalians, and 3,419 Congregationalists.

Education.—Separate schools are provided for white and colored children, all children not negroes being classed as white. There are in the State schools 510,139 whites and 41,276 colored pupils, and 14,181 teachers. The State maintains 605 public high schools with 1,954 teachers and 35,786 pupils. There are seven normal schools with 125 teachers and 4,660 students. For higher education the State maintains the university at Norman, and the Agricultural and Mechanical College at Stillwater, and also an Agricultural and Normal University for colored students at Langston.

Finances.—At the beginning of the last fiscal year there was on hand a balance of \$7,649,020. Receipts for the ensuing fiscal period amounted to \$41,374,406. Disbursements for the same period amounted to \$38,932,356, leaving a balance on hand of \$10,101,070. The State debt amounts to \$2,972,900, and the assessed value of real and personal property is \$1,664,448,745.

Agriculture.—Agriculture is one of the main interests of the State. The value of all crops in 1920, according to the Federal census, was \$522,565,000, with cotton production of 1,006,242 bales giving the State fourth place in the production of this staple. Dry farming is practised in the western part of the State. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 3,200,000 acres, 57,600,000 bushels, \$40,320,000; winter wheat, 3,300,000 acres, 31,350,000 bushels, \$30,723,000; barley, 129,000 acres, 2,193,000 bushels, \$1,206,000; oats, 1,500,000 acres, 30,000,000 bushels, \$13,500,000; rye, 31,000 acres, 310,000 bushels, \$248,000; broom corn, 180,000 acres, 18,000 tons, \$3,834,000; tame hay, 965,000 acres, 1,448,000 tons, \$18,100,000; sorghum sirup, 17,000 acres, 1,122,000 gallons, \$808,000; potatoes, 40,000 acres, 2,720,000 bushels, \$3,346,000; sweet potatoes, 27,000 acres, 2,052,000 bushels, \$2,421,000; cotton, 2,951,000 acres, 635,000 bales, \$73,025,000; peanuts, 17,000 acres, 10,540,000 pounds, \$401,000; grain sorghums, 1,450,000 acres, 19,575,000 bushels, \$15,660,000; apples, 1,140,000 bushels, peaches, 2,-

070,000 bushels, and pears, 197,000 bushels. On 1 Jan. 1923 there were on the farms in the State 715,000 horses, valued at \$28,600,000; 337,000 mules, valued at \$19,244,000; 1,364,000 other cattle, valued at \$22,915,000; 87,000 sheep, valued at \$505,000, and 1,401,000 swine, valued at \$12,329,000. Flax is an important crop. The wool clip of 1920 was 526,000 pounds.

Mineral and Other Products.—Oklahoma has come into front rank in recent years because of its vast stores of petroleum. In 1922 the production of oil was 146,631,000 barrels. Natural gas is also found, and in 1922, 2,800,000 tons of coal were mined. Other mineral products are lead and zinc. The chief manufacturing industries are flour and grist milling, cotton ginning and the manufacture of cottonseed oil and oil cake. Zinc is smeltered and refined in the State. There are 2,445 industrial establishments in Oklahoma, employing 38,314 persons and capitalized at \$260,000,000. The value of the zinc output in 1920 was \$19,518,000; that of the foundries and machine shops, \$13,510,000, while 25 other industries had an output exceeding in value \$500,000.

Communications.—There are 6,527 miles of steam railways and 331 miles of electric railways in the State.

Government.—The State executive is a Governor, elected for four years, who receives a salary of \$4,500. The legislature comprises two chambers, a Senate of 44 members, elected for four years, and a House of Representatives of not less than 99 nor more than 102 members, elected for two years. The constitution provides for the initiative and the referendum. Eight per cent of the legal voters have a right to propose any legislative measure and 15 per cent of the voters may propose amendment to the constitution by petition. The referendum may be ordered except in emergencies either by petition signed by 5 per cent of the voters or by the legislature. The State sends two Senators and eight Representatives to the Federal Congress. Indians in order to qualify as voters must have severed their tribal relations. The Governor in 1922 was the Hon. J. B. A. Robertson, who was succeeded in January 1923 by the Hon. J. C. Walton, who was elected in November 1922 for the four-year term, ending January 1927. The Secretary of State in 1922 was Joe S. Morris.

OKLAHOMA AGRICULTURAL AND MECHANICAL COLLEGE, a State co-educational institution founded in 1891 and located at Stillwater, Okla. In 1922-23 it had a faculty of 113 members, 3,100 students, property valued at \$2,133,779.11 and an income of \$741,850. President, James Burnette Eskridge, A.M., Ph.D.

OKLAHOMA BAPTIST UNIVERSITY, a co-educational institution, founded in 1915 and located at Shawnee, Okla. In 1922-23 it had a faculty of 28 members, 665 students, property valued at \$320,000 and an income of \$105,000. John Benjamin Lawrence is president.

OKLAHOMA CITY COLLEGE, a Methodist-Episcopal co-educational institution, founded in 1911 and located at Oklahoma City, Okla. In 1922-23 it had a faculty of 28 members, 464 students, property valued at \$330,000

and an income of \$52,000. Edwin G. Green, A.B., is president.

OKLAHOMA COLLEGE FOR WOMEN, a State educational institution, founded in 1898 and located at Chickasha, Okla. In 1922-23 it had a faculty of 43 members, 520 students, property valued at \$890,000 and an income of \$118,750. G. W. Austin, B.S., is president.

OKLAHOMA, University of, a State co-educational institution, founded in 1890 and located at Norman, Okla. In 1922-23 it had a faculty of 208 members, 3,408 students in first semester, property valued at \$2,413,312.14 and an income of \$949,252. Stratton Duluth Brooks, LL.D., is president.

OKUMA, MARQUIS Shigenobu, Japanese statesman: b. Saga, Hizen, February 1838; d. Waseda, a suburb of Tokio, 10 Jan. 1922. His father, a Samurai, was an artillery officer and is said to have planned that his son also should enter the military service. The early years of young Okuma's life were devoted mainly to the study of Chinese literature. Later in Nagasaki, where his father at one time commanded the garrison, he acquired a knowledge of English and Dutch, gaining from a study of scientific and political books in both languages, which he secured through the aid of some missionaries, many of the progressive ideas which were the foundation of his future greatness. At that time Nagasaki was the centre of the new Occidental learning. Okuma soon became an admirer of Western political ideas, and eventually came to know American history better than the average American. Thomas Jefferson is said to have been his ideal statesman. Undoubtedly, his study of Occidental ways was in no small degree responsible for his early determination to devote his energies to the abolition of the existing feudal system of his country, the establishment of a constitutional government, the restoration to power of the Emperor, and the abolition of the Shogunate. His persistent and courageous advocacy of these reforms was largely instrumental in bringing about the revolution of 1867 which resulted in bringing the Shogunate rule to an end. Shortly after the reorganization of the government Okuma was appointed chief assistant in the office of Foreign Affairs. In 1869 he was made Minister of Finance; in 1870 he was made a councillor of state and a few months later was chosen president of the commission that represented the Japanese government at the Vienna exhibition. In 1872, he again was appointed Minister of Finance and this time held the post until 1881, when he resigned because of a disagreement with Marquis Ito, the Premier. He discharged the duties of his office with conspicuous ability. In 1882 he organized the Progressive Party of which he was for many years the leader. Six years later he was persuaded to accept the post of Foreign Minister in the Kuroda Cabinet. Japan was then beginning her attempts to secure a revision of her treaties with foreign powers and to regain the rights of sovereignty which she had been forced to sign away. The premature publication of a draft of the treaty which Okuma had negotiated disclosed the fact

that provision had been made for the retention of foreign judges in Japanese courts. This concession aroused such violent opposition that upon one occasion a political fanatic attempted Okuma's assassination, hurling at his carriage a dynamite bomb which so shattered one of his legs that it had to be amputated. Okuma resigned after a few months, service and did not again hold office until 1896 when he was appointed Minister of Agriculture and Commerce in the Matsukata Cabinet. This post he resigned the following year because of an estrangement between himself and the Prime Minister. When Marquis Ito retired as Prime Minister in 1893, Okuma was chosen to head a cabinet of his own and served in the dual capacity of Premier and Minister of Foreign Affairs. Again his tenure of office was short-lived, dissensions among the members of his official family causing him to resign within a few months. He retired to Waseda and soon thereafter became president of Waseda University, one of the largest universities under private management in Japan and of which he was the founder. In 1919-20, the students enrolled numbered 4,100, and it had a faculty of 141 members. Okuma was president of the institution until his death. When the Yamamoto Cabinet was overthrown in March 1914, Okuma again was called upon to organize a new cabinet. He accomplished the task on the 15 April following, assuming the duties of Premier and Minister of Home Affairs. In the latter part of July of that year, the World War broke out and Okuma formulated Japan's policy with regard thereto. In July 1915 the Okuma Cabinet resigned as a result of investigations into bribery cases growing out of preceding Parliamentary elections, but at the request of the Emperor, Okuma decided to remain in office and reconstructed his cabinet the following month. A second attempt to assassinate him was made in January 1916, also by a bomb-thrower. Attacks upon his cabinet led to its downfall in October 1916 and once more he retired to Waseda, where he spent the remainder of his days. Frequently referred to as the "Sage of Waseda" and called by some the "Grand Old Man of Japan," Okuma, despite the occasional outbreaks of public disapproval which some of his official acts aroused, retained his popularity among his countrymen to the last. He was, perhaps, as near an approach to a real Democrat as Japan had ever produced. He was a fluent, forceful and popular speaker. He liked to appear in public and rarely a night passed that he did not attend a banquet or some other popular gathering, usually being one of the speakers on such occasions. Soon after becoming president of Waseda University, he succeeded in getting Japan's greatest scholars to collaborate on 'Fifty Years of New Japan' which was published in English. He published numerous pamphlets, magazine and newspaper articles, especially with reference to political matters. Ever an advocate of higher education, he did as much to advance the cause of learning in the Japanese empire as, perhaps, any other individual of his time. In addition to Waseda University, he founded also the Japanese Women's University. He was an enthusiastic horticulturist and at Waseda had a remarkable

collection of tropical plants and what is said to have been the finest collection of orchids in the Japanese empire.

OLIVET COLLEGE, a Congregational co-educational institution, founded in 1844 and located at Olivet, Mich. In 1922-23 it had a faculty of 23 members, 310 students, property valued at \$90,000 and an income of \$60,000. Paul F. Voelker, Ph.D., is president.

OMAHA, University of, a non-sectarian co-educational institution, founded in 1909 and located at Omaha, Neb. In 1922-23 it had a faculty of 23 members, and approximately 600 students, property valued at \$175,000 and an income of \$35,000. Daniel E. Jenkins, D.D., is president.

OMAN, an independent State of southeastern Arabia, the integrity of which has been guaranteed by both Great Britain and France. It extends along the southern shore of the Gulf of Oman and has a coast line nearly 1,000 miles long. Inland it extends to the Great Desert of Arabia. The area is about 82,000 square miles with a population of 500,000, mostly Arabs though there is an infusion of negro blood in the coast settlements. Muskat is the capital. The latter is being abandoned for the better site of the adjacent Muttrah. The present Sultan is Seyyid Taimur bin Feysil, who succeeded on 5 Oct. 1913. The products of the country are dates, fruit, limes, hides and skins. The exports are valued at 140,000 pounds sterling yearly with imports one-third less than this amount. Rice and cotton textiles are the chief imports. The British Political Agent and Consul in 1922 was Major M. E. Rae, I.A. There is a weekly mail service to and from Bombay and there exists cable communication with the Indo-European telegraph system.

ONIONS. The commercial crop of late onions grown in the United States in 1922 was estimated by the Department of Agriculture at 24,074 cars of 500 bushels each. Production in 1921 was 18,823 cars. The yield per acre in 1922 was estimated at 309 bushels with 259 bushels in 1921. Idaho, in 1922, produced as much as 460 bushels per acre while Michigan and Utah had yields up to 400 bushels per acre. The area of the 1922 crop was 38,991 acres compared with 36,381 acres in 1921. New York State led in production with a crop of 4,476 cars; Ohio was second with 4,184 cars; Indiana came third with 3,473 cars. California produced 3,262 cars; Massachusetts, 2,508 cars; Michigan, 1,386 cars; Colorado, 1,067 cars; Minnesota, 1,058 cars; Illinois, 750 cars. Other States produced less. Of the production of 24,074 cars, it was estimated that 2,896 cars, 12 per cent of the crop, went to nearby markets; that 20,194 cars, or 84 per cent of the crop, went to distant markets, and that 984 cars, or 4 per cent of the crop, were not marketed.

ONTARIO, the second largest Province of the Dominion of Canada, lying between Quebec and Manitoba. It has an area of 407,262 square miles and in 1921 had a population of 2,933,662. Toronto, the capital, has a population of 521,893. Other cities of the Province are: Hamilton, 114,151; Ottawa, 107,843; London, 60,959; Windsor, 38,591; Brantford, 29,440; Kingston,

21,753; Kitchener, 21,763; Sault Ste. Marie, 21,092; Fort William, 20,541; Guelph, 18,128; Peterborough, 20,994; St. Catharines, 19,881; St. Thomas, 16,026, and Stratford, 16,094. The Province is administered by a Lieutenant-Governor, a cabinet and one chamber of 111 members. Members of the chamber are elected for four years. Lieutenant-Governor in 1922, Colonel Harry Cockshutt; Premier, E. C. Drury. For industry, production, etc., see CANADA.

OPIUM. See LEAGUE OF NATIONS; NARCOTICS.

ORANGE FREE STATE, a Province of the Union of South Africa (q.v.).

ORANGES. Practically all of the commercial oranges produced in the United States are grown in Florida and California. The orange crop of 1922 was estimated by the Department of Agriculture at 24,900,000 boxes, compared with 20,300,000 boxes in 1921 and 29,700,000 boxes in 1920. Florida produced 8,400,000 boxes in 1922, 7,300,000 boxes in 1921 and 8,100,000 boxes in 1920. California produced 6,500,000 boxes in 1922, 13,000,000 boxes in 1921 and 21,600,000 boxes in 1920. The total value of the 1922 crop was \$61,395,000, compared with \$49,175,000 in 1921 and \$64,908,000 in 1920. The average price of oranges on 1 Dec. 1922 was \$2.47 per box, compared with \$2.42 per box in 1921 and \$2.19 per box in 1920. Alabama's crop of Satsuma oranges (not included by the Government in the foregoing estimate) totaled 330,000 boxes, of which 285,000 were classed as commercial. The crop is localized in two counties on the Gulf of Mexico. During the summer of 1922 a trial shipment of oranges grown in Chile was received in New York and gave such satisfaction that more were ordered immediately. Plans were then worked out for regular importations and according to the United States Department of Commerce 10,000 crates were shipped from Valparaiso to New York during the season. In 1921 there were 2,228 fruit bearing orange trees in Arica province, Chile, from which it is expected oranges will be shipped to the United States in the near future.

ORE DETECTOR, an instrument which by means of an electric current indicates the presence of metallic ore at distances under the ground. It measures currents of electricity flowing from ore bodies where they are generated by the chemical action of water, air and minerals on the ore. Each ore body, where chemical actions are taking place, is said to be a natural battery. If the pure metal exists, unattacked by chemicals, or if the chemical action has come to an end, there is no electrical current and the detector does not operate. In the latter case an independently generated current is used to indicate the presence of mineral ore. The detector is the invention of Dr. Conrad Schlumberger, professor of Physics at the Paris School of Mines, who at first employed it to detect the presence of unexploded shells. The instrument consists fundamentally of a wire which picks up electricity from two points on the earth and of a dry battery which produces another current. The latter current is forced into the wire until it counteracts and stops the elec-

tric flow from the ground. When the two currents are equal and opposite an indicator points to zero. Since it is possible to measure to the one-thousandth part of a volt the current from the dry battery the amount of electricity in the earth is easily determined.

The battery with its measuring equipment is called the potentiometer and may easily be carried by a man. The wire through which the current from the earth flows is attached at each end to electrodes which are in contact with the ground. The entire apparatus is easily moved from place to place, making possible the taking of several measurements in a short time.

Although the instrument will measure very minute currents it gives no indication as to the metal or mineral which produces them. The strength of the current and the area over which it is spread tells much about the probable size and richness of the ore. The known mineralogical character of the locality will usually indicate the nature of the metal. In its present stage of development the instrument will detect ore at a distance of 100 feet below the level of the ground and even deeper at times. Its principal value is to show where drillings should be made. It works on anthracite coal as well as on metallic ores, but will not indicate the presence of bituminous coal because of the non-conductile quality of the latter. In the anthracite the current is very probably due to the presence of minute particles of iron in the carbon. The ores on which it will not work are all metals in a pure state, lead sulphide, zinc sulphide, iron oxides, manganese oxides, and none of the carbonates or sulphates or other oxides, because in them the chemical activity has reached a conclusion. For instance, gold can not be detected when it is pure, but can be detected in iron pyrites where it is held, as it were, in solid solution. Stray earth currents at times disturb calculations but they are soon discounted. The instrument is so sensitive that in a trial near Wilkes-Barre it was affected by the current from a trolley line half a mile away. When an electric motor is anywhere near the indicating needle oscillates wildly. Although of very recent invention the detector has been used to detect nickel deposits in Canada, copper in Michigan and Tennessee, and coal in Wilkes-Barre, Pa.

OREGON, one of the Pacific Coast States, bounded north by Washington, east by Idaho, south by California and Nevada, and west by the Pacific Ocean. The area of the State is 96,699 square miles and in 1920 it had a population of 783,389. Oregon is ninth in order of size and 34th in order of population. In 1920 the population included 769,176 whites, 2,144 negroes, 7,510 Asiatics and 4,589 Indians. The foreign-born population in 1920 was 102,151, of whom 10,532 were Swedes, 13,740 Germans, 13,744 Canadians, 7,953 English, 4,213 Irish, 4,324 Italians, 6,955 Norwegians and 1,928 Greeks. Indian reservations occupied 1,860 square miles in 1920 and had a population of 6,629. The population is about equally divided between urban and rural. The chief cities, with their populations in 1920, are: Portland, 258,288; Salem, the capital, 17,679; Eugene, 14,027; Astoria, 10,595; Pendleton, 7,387; La Grande,

6,913; Medford, 5,756; Baker City, 7,729; Corvallis, 5,752, and Oregon City, 5,686.

Religion.—The principal Christian denominations have a total membership of 179,468. Of these, 49,728 are Roman Catholics, 30,381 Methodists, 16,672 Presbyterians, 15,635 Baptists, 6,373 Congregationalists, 5,726 Episcopalians, and 4,499 Lutherans.

Education.—Primary education is free and compulsory for all children between the ages of nine and 15. There are in the State 2,527 primary schools with 6,915 teachers and 160,924 enrolled pupils, and 235 high schools with 1,164 teachers and 29,235 pupils. For higher education there are an Agricultural College at Corvallis, and the State University at Eugene. In addition, there are several denominational colleges. The percentage of illiteracy for the State is 1.5 per cent; that of native born four-tenths of 1 per cent.

Finances.—At the beginning of the two-year period, 1 Oct. 1920 to 30 Sept. 1922, the balance on hand in the State treasury amounted to \$1,160,845.50. Receipts from 1 Oct. 1920 to 30 Sept. 1922 amounted to \$81,312,806.48. Disbursements for the same period amounted to \$78,119,825.38, leaving a balance on hand 1 Oct. 1922 amounting to \$4,353,826.60. On 1 Oct. 1922 the total bonded indebtedness of the State was \$50,759,020.

Agriculture.—Oregon is a semi-arid State with the Cascade Range dividing the State into regions of good rainfall and an arid zone. West of the Cascades almost every variety of crop grown in the temperate zone is produced. East of the Cascades the climate is dry and cold with little or no rainfall, but irrigation by private companies and by the State has enabled agriculture to make a beginning in recent years. The value of all crops in 1920 was \$131,884,000, wheat in the lead with 20,000,000 bushels. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 69,000 acres, 2,277,000 bushels, \$2,072,000; spring wheat, 249,000 acres, 2,864,000 bushels, \$3,093,000; winter wheat, 844,000 acres, 16,880,000 bushels, \$18,230,000; barley, 80,000 acres, 2,160,000 bushels, \$1,598,000; clover seed, 5,000 acres, 5,000 bushels, \$60,000; oats, 267,000 acres, 6,675,000 bushels, \$3,805,000; rye, 37,000 acres, 444,000 bushels, \$377,000; hops, 12,000 acres, 9,600,000 bushels, \$864,000; tame hay, 965,000 acres, 1,930,000 tons, \$26,248,000; potatoes, 49,000 acres, 5,145,000 bushels, \$2,675,000; apples, 6,300,000 bushels; peaches, 300,000 bushels, and pears, 1,260,000 bushels. The Federal census reported 50,206 farms in 1920 with a total acreage of 13,542,318, of which 4,913,851 acres was improved land. The total value of all farm crops was \$818,559,751 in 1920. The wool clip was 14,040,000 pounds. The fruit industry is one of the most important in the country. Apples, peaches, pears, prunes, apricots and plums of all kinds are grown in the Hood River, Medford and The Dalles districts. Dairy farming is increasing rapidly and livestock raising is extensive. On 1 Jan. 1923 there were in the State 272,000 horses, valued at \$22,032,000; 14,000 mules, valued at \$1,064,000; 220,000 milk cows, valued at \$13,200,000; 626,000 other cattle, valued at \$17,653,000; 1,953,000 sheep, valued at \$12,490,000, and 231,000 swine, valued at \$2,587,000.

Fisheries.—Oregon has great salmon fisheries rivaling the State of Washington in this particular. The oyster fisheries are also important, while the catches of sturgeon and halibut are very large.

Forestry.—It is estimated that Oregon has 500,000,000 board feet of standing timber, or one-sixth of the United States' total. About 20,000,000 acres are under forest. The chief varieties of lumber produced are Douglas and white fir, hemlock, spruce, cedars, larch, yellow pine and redwoods. Oregon lumber is shipped to all parts of the world, more than a billion feet passing through the Panama Canal yearly on its way to the Atlantic.

Manufactures and Mining. In 1920 manufactured products of Oregon were valued at \$366,783,000, the lumber products leading with \$85,348,000. Flour was second with a value of \$42,550,000. The other principal industries are ship building, meat packing and canning. Salmon canneries in and about Astoria are among the largest in the world. The State has some mineral resources. Gold, silver and copper are found. Coal is mined but not in large quantities. Granite and other building materials are quarried to the value of about \$500,000 yearly. Other minerals found are cobalt, platinum, lead and gypsum. The production of metals in Oregon in 1922 shows a decrease of \$252,000, as compared with 1921. The loss was entirely in gold, but silver and copper showing increases. The value of the gold produced decreased from \$882,034 in 1921, to \$501,870 in 1922. In recent years the usual ratio of gold production has been about 54 per cent from placers and 46 per cent from deep or quartz mines, and the deep mines have been decreasing their gold output while the placers have been increasing theirs. There are more hydraulic mines in Oregon than of any other class, but most of them are small. The silver output of Oregon for 1922 is estimated at 47,000 ounces, an increase of 11 per cent in quantity and value over 1921. The estimated output of copper in 1922 is 1,089,000 pounds, valued at \$145,000, an increase of 914,700 pounds, and \$123,000. This increase is due almost entirely to the resumption of production by the largest copper mine in the State, which was idle in 1921. At the end of 1922 there were less than 100 productive metal mines in Oregon and no new ones of special importance began operations in 1922.

Communications.—The State has very important navigation facilities. The Columbia River is one of the great Western waterways and carries a large freight tonnage along the whole of the 400 miles of its course from the Idaho border. The Snake River also has a large traffic and plans for its further development have been projected. The State has a steam railroad mileage of 3,455 miles and 722 miles of electric railways. The great Columbia Highway, one of the most beautiful in America, lies within the State, running along the Columbia River from Portland. In recent years Oregon has become a favorite vacation ground for many thousands from other States, some patronizing the coast resorts in Portland with its mild climate, while others seek the mountains, Crater Lake, etc.

Recent Political History.—One of the great issues of the year in Oregon was the campaign waged over the adoption of the law designed to do away with all private schools and all parochial schools, at which a feature of the teaching is instruction in religious matters. The title of the law was Compulsory Education, and the purpose, as defined by the advocates of the law was "to require any parent, guardian or other person having control, charge or custody of a child over eight and under 16 years of age from and after 1 Sept. 1926 to send such child to a public school during the entire school year excepting: (a) children physically unable; (b) children who have completed the eighth grade; (c) children between the ages of eight and 10 living more than one and one-half miles, and children over 10 years living more than three miles from a public school, except when transportation is furnished; (d) children taught by parent or private teacher." The reasons in support of the law were outlined by its advocates and purported to be the assimilation and education of foreign-born citizens in the principles of American government, which would be best secured by and through attendance of all children in public schools, preventing those coming into the State from forming groups, establishing schools and bringing up their children in an environment often antagonistic to the principles of the American government. Six elements of the voting population of Oregon opposed the compulsory education law, the Episcopalians, the Lutherans, the Catholics, the Presbyterians, Seventh Day Adventists, and representatives of the private schools. The law was the outstanding issue of the campaign and many persons attributed the defeat of Governor Olcott for re-election to the fact that he had identified himself early in the campaign with those opposed to the measure, while his opponent had the support of the advocates of the law. At the election 7 November the law was adopted by the voters and immediately thereafter its opponents prepared an appeal to the courts on the ground that the law is unconstitutional, in that it denies the primary right of the parent to select the mental and moral training of the child.

Government.—The State executive is a Governor, who is elected for a term of four years and receives a salary of \$5,000. The legislative power is vested in a Legislative Assembly. The initiative and referendum is part of the legislative system. The legislative assembly consists of a senate of 30 members, elected for four years, and a house of representatives of 60 members, elected for two years. Under the constitution considerable power in initiating laws and amendments and enacting and rejecting the same is reserved to the people. The Governor in 1922 was Ben W. Olcott, who was defeated for re-election in November 1922, and was succeeded in January 1923 by Walter M. Pierce.

State Officials.—Governor, Walter Pierce; secretary of state, Sam A. Kozer; attorney-general, I. H. Van Winkle; treasurer, O. P. Hoff, and superintendent of education, J. A. Churchill.

Judiciary.—Members of Supreme Court: Chief Justice McBride, Judge Bean, Judge Barnett, Judge Harris, Judge Brown, Judge Rand and Judge McCourt.

OREGON AGRICULTURAL COLLEGE, a State co-educational institution, founded in 1868 and located at Corvallis, Ore. In 1922-23 it had a faculty of 450 members, 4,548 students, 3,400 of whom are in regular long courses (nine months), property valued at \$3,386,680 and an income of \$1,661,825. William Jasper Kerr, Sc.D., is president.

ORGANIZED RESERVES. See ARMY OF THE UNITED STATES.

ORTH, Samuel Peter, American educator: b. Capac, Mich., 1 Aug. 1873; d. Nice, France, 26 Feb. 1922. He was graduated from Oberlin College with the degree of B.S. in 1896; studied law and political science at the University of Michigan, 1896-97, and was graduated from Columbia University with the degree of Ph.D. in 1903. He was professor of political and social science, Buchtel College, Akron, Ohio, 1897-1902; practiced law at Cleveland, Ohio, 1903-12, and was professor of political science at Cornell University thereafter until his death. He was a lecturer on international law, economics, and political science at Western Reserve University, the Case School of Applied Sciences, and Oberlin College, 1904-10. From 1904-05 he was president of the Cleveland board of education and from 1905-08 was assistant United States attorney. In 1894 he was a member of the Cook Arctic Expedition to Greenland. He wrote 'Centralization of Administration in Ohio,' 'Five American Politicians' (1903); 'The History of Cleveland' (1909); 'Socialism and Democracy in Europe' (1913); 'Readings on the Relation of Government to Industry' (1915); 'The Imperial Impulse' (1916); 'The Boss and The Machine' (1918). He was a frequent contributor to literary, political and professional journals.

OSGOOD, Irène (née de Belot), American author: b. Virginia, 1875; d. Guilborough Hall, Northamptonshire, England, 12 Dec. 1922. Although from childhood most of her life was spent in England and Paris, Mrs. Osgood never surrendered her American citizenship. She was twice married. Her first husband, to whom she was married in 1903 and who died in 1904, was Capt. Charles Pigott Harvey, high sheriff of North Hants, England, and Lord of the Manor in Lincolnshire. Her second husband was Robert Harborough Sherard, an English author and nephew of the poet Wordsworth, divorced by her in 1915. The name Irène Osgood was granted her by Royal Deed-Pole. She was a member of the Society of Authors, the Royal Literary Fund Society, the Institut des Lettres Française, the Foreign Theatre Society, Les Amies de Pigeon, the Royal Agricultural Society, the Royal Society of Arts, the Ethnological Society, the Royal Botanical Society, the Royal Rose Society, the Society for the Protection of Wild Birds, the Authors League of America etc. During the World War she maintained and managed three hospitals for wounded soldiers on her estate which she placed at the disposal of the Red Cross. She published: 'An Idol's Passion' (1895); 'The Chant of a Lonely Soul' (1896); 'Litanies to Tanet' (adapted from the French, 1896); 'To a Nun Confessed' (1907); 'Servitude' (1908); 'Where Pharaoh Dreams' (1909, 1913); 'A Blood

Moon (1911); 'A Mother in Dreams' (poems, 1913); 'The Indelicate Duellist' (1913); also several short stories. In addition to the foregoing, she also published a number of plays, including: 'Servitude,' 'The Pale Witch Queen,' 'Fatima Yasmeen,' 'The Southern Widow,' 'Une Aventure du Capitaine Lebrun,' produced in Paris, 1913; 'The Menace,' produced 1914. She compiled: 'The Winged Anthology' and 'The Garden Anthology.'

OTTAWA UNIVERSITY, a Christian-Baptist coeducational institution founded in 1865 and located at Ottawa, Kan. In 1922-23 it had a faculty of 25 members, 482 students, property valued at \$1,000,000 and an income of \$95,000. Silas Eben Price, D.D., is president.

OTTERBEIN COLLEGE, a coeducational institution of the United Brethren, founded in 1847 and located at Westerville, Ohio. In 1922-23 it had a faculty of 36 members, 520 students, property, including endowment, valued at \$1,034,963.42 and an income of \$160,000. Walter G. Clippinger, D.D., is president.

OTTLEY, James Henry, American publisher: b. Phelps, Ontario county, N. Y., 8 Oct. 1851; d. New York City, 3 March 1922. He was the son of Enoch Ottley and Frances Elizabeth Henry Ottley, both descendants of Mayflower pilgrims. After graduation from the Canandaigua Academy, he went West, where he found employment in Bloomington, Ill., and later in Saint Louis, Mo. In 1882 he went to New York, and thereafter traveled extensively in this country and abroad. His publishing career began in 1893, when he bought the McCall Company, publishers of *McCall's Magazine*, at a time when the financial returns from the maga-

zine were not indicative of great success, and, securing the devotion and co-operation of all his employees, the business prospered. He retired in 1913, a millionaire, and to his faithful employees he gave \$100,000 in amounts proportionate to their length of service. Mr. Ottley asserted he distributed this fortune "because no man can make a great success alone. He must have the help of others. My employees had been my helpers. It seemed unfair to leave the business and give them no share in its surplus earnings."

OUACHITA BAPTIST COLLEGE, a coeducational institution, founded in 1886 and located at Arkadelphia, Ark. In 1922-23 it had a faculty of 21 members, 301 students, property valued at \$350,000 and an income of \$75,000. Charles E. Dickon, A.M., D.D., LL.D., is president.

OUR LADY OF THE LAKE COLLEGE, a Catholic educational institution for women, founded in 1896 and located at San Antonio, Texas. In 1922-23 it had a faculty of 31 members, 256 students, and property valued at \$530,942. Very Rev. H. A. Constantineau, D.D., is president.

OXYGEN, Liquid. See CHEMICAL MANUFACTURING.

OZARKS, College of the, a coeducational institution, of the Presbyterian Church of the United States, founded in 1884 and located at Clarksville, Ark. In 1922-23 it had a faculty of 17 members, 140 students, property valued at \$150,000 and an income of \$30,000. Hubert S. Lyle, D.D., is president.

P

PACIFIC COLLEGE, a Friends coeducational institution, founded in 1891 and located at Newberg, Ore. In 1922-23 it had a faculty of 16 members, 165 students and 40 more in music department. The institution's property was valued at \$66,000, and it had an endowment of \$200,000 and an income of \$20,000. Levi T. Pennington, A.B., is president.

PACIFIC, College of the, a Methodist coeducational institution, founded in 1851 and located at San Jose, Calif. In 1922-23 it had a faculty of 36 members, 447 students, property valued at \$270,000 and an income of \$147,500. Tully Cleon Knoles, D.D., is president.

PACIFIC QUESTION. See WASHINGTON CONFERENCE.

PACIFIC UNION COLLEGE ASSOCIATION, a Seventh Day Adventist coeducational institution, founded in 1909 and located at Saint Helena, Calif. In 1922-23 it had a faculty of 30 members, 364 students, property valued at \$233,347.68 and an income of \$164,674.58. William E. Nelson, B.S., is president.

PACIFIC UNIVERSITY, a Congregational, coeducational institution, founded in 1849 and located at Forest Grove, Ore. In 1922-23 it had a faculty of 25 members, 290 students, property valued at \$400,000 and an income of \$51,000. William Clarence Weir is president.

PACKERS AND STOCKYARDS ACT. See AGRICULTURE IN THE UNITED STATES, subsection AGRICULTURAL LEGISLATION.

PADGETT, Lemuel Phillips, American public official: b. Columbia, Tenn., 28 Nov. 1855; d. Washington, D. C., 2 Aug. 1922. He was graduated from Erskine College at Due West, S. C., in 1876, receiving from the same college the degree of LL.D. in 1916. He studied law, was admitted to the bar in 1877, and had practised since 1879 at his birthplace, Columbia, Tenn. He was a presidential elector in 1884, a member of the Tennessee State Senate from 1898-1900, later a member of the National Monetary Commission, and a regent of the Smithsonian Institution. A member of Congress after 1901, he was regarded as one of the ablest and most respected men in the House and enjoyed the confidence of the Republicans as well as of his Democratic colleagues. Always a firm friend of the Navy, Representative Padgett was in large measure responsible for the legislation directed toward maintaining the strength of the sea forces. At times he firmly opposed members of his own party who wished to reduce the personnel of the Navy below the safety limit suggested. During the Wilson Administration when the Democrats controlled Congress, he was chairman of the Naval Affairs Committee.

PAGE, Gertrude, English author: d. Salisbury, Rhodesia, 1 April 1922. She was a daughter of John E. Page of Woburn Lands

and Bedford, and was married to George Alexander Dobbin, son of Capt. R. A. Dobbin, Indian Staff Corps of Armagh, Ireland. Her novels, written under her maiden name are: 'Love in the Wilderness,' 'The Edge of Beyond,' 'The Silent Rancher,' 'Two Lovers and a Lighthouse,' 'Winding Paths,' 'The Rhodesian,' 'The Great Splendour,' 'Where the Strange Roads go Down,' 'The Pathway,' 'Follow Aiter,' 'The Supreme Desire,' 'Some There Are,' 'The Veldt Trail,' 'The Course of my Ship' (with R. A. Foster-Melliar) and 'Paddy the Next Best Thing.' The last named story was dramatized by Robert Ord and Gayer Mackay for the Savoy Theatre, London.

PAGE, Thomas Nelson, American author and diplomat: b. Oakland Plantation, Hanover county, Va., 23 April 1853; d. there, 1 Nov. 1922. He was directly descended from Governor John Page, an intimate friend of Thomas Jefferson, and from Gen. Thomas Nelson, one of the signers of the Declaration of Independence. His father, Major John Page, served in the Confederate army on the staff of Gen. William Nelson Pendleton. He was educated at Washington College, now Washington and Lee University, and thereafter studied law at the University of Virginia from which he was graduated LL.B. in 1874. The degree of Litt.D. was conferred upon him by Washington and Lee University in 1887, by Yale University in 1901, and by Harvard University in 1913. Tulane University conferred the degree of LL.D. upon him in 1889. William and Mary College in 1906, and Washington and Lee University in 1907. From 1875-93 Doctor Page practised law at Richmond, Va., devoting a considerable part of his time, however, to literary work. His first attempt in fiction was 'Marse Chan,' a negro dialect story first printed in *The Century* magazine in 1884 and incorporated, with 'Meh Lady' and other stories in the volume entitled 'In Ole Virginia' published in 1887. This was the beginning of a series of stories and books in which the author depicted with rare skill life in Virginia prior to the Civil War and during the reconstruction period that followed.

His published works include: 'In Ole Virginia' (1887); 'Two Little Confederates' (1888); 'On Newfound River' (1891-1906); 'The Old South' (1891); 'Among the Camps' 1891; 'Elsket and Other Stories' (1892); 'Befo' de War' (with Armistead C. Gordon); 'Pastime Stories' (1894); 'The Burial of the Guns' (1894); 'Unc' Edinburgh'; 'Meh Lady'; 'Marse Chan'; 'Polly'; 'Social Life in Old Virginia'; 'The Old Gentleman of the Black Stock' (1896, revised 1901); 'Two Prisoners' (1897); 'Red Rock' (1898); 'Santa Claus's Partner' (1899); 'A Captured Santa Clause' (1892); 'Gordon Keith' (1903); 'The Negro—The Southerner's Problem' (1904); 'Bred in

the Bone' (1905); 'The Coast of Bohemia' (Poems, 1906); 'Under the Crust' (1907); 'The Old Dominion—Her Making and Her Manners' (1908); 'Robert E. Lee, the Southerner' (1908); 'Tommy Trot's Visit to Santa Claus' (1908); 'John Marvel, Assistant' (1909); 'Robert E. Lee, Man and Soldier' (1912); 'The Land of the Spirit' (1913); 'Life of Thomas Jefferson' (in Italian, 1918); 'Italy and the World War' (1920); 'Dante and His Influence' (1922). Doctor Page was twice married. His first wife was Anne Seddon Bruce whom he married in 1886 and who died 22 Dec. 1888. His second wife was Mrs. Florence Lathrop Field, widow of Henry Field of Chicago, whom he married in 1893 and who died 6 June 1921. From 21 June 1913 to August 1919 Doctor Page served as Ambassador to Italy. He was a member of the American Academy of Arts and Letters, of the Metropolitan and Cosmos clubs of Washington, of the Westmoreland Club of Richmond, the Tavern Club of Boston, and the Authors, Century, and University clubs of New York.

PAINE COLLEGE, a colored Methodist coeducational institution, founded in 1883 and located at Augusta, Ga. It is financed by the Methodist Episcopal Church, South. Statistics for 1922-23 show a faculty of 18 members (4 white, 14 colored), 204 students, property valued at \$165,000 and an income of approximately \$32,000. Ray S. Tomlin was acting president in January 1923.

PAINTING AND SCULPTURE. Of all the tendencies that have been observed in these arts, the most important appear to be the movement away from eccentricity, away from subjects of astonishment, and the inclination toward good form. Even in that annual exhibition of the art of the vanguard, the Salon d'Automne, a Parisian censor perceived this change. One was, indeed, obliged to admit the presence of *faux*, but only in diminishing numbers (*L'Illustration*, 4 Nov. 1922) and already giving place to artists who adhere to approved traditions. Thus, while Van Dongen was showing 'Neptune' whimsically costumed, there were to be seen examples of better taste, as in G. d'Espagnat's 'Young Woman and Child,' in a portrait by Sorine, in Charles Guérin's 'Lady with Bracelets,' Ottman's portrait of Eve Francis, and Tinayre's 'Panochka,' carved in mahogany. Scarcely less important is a tendency or drift toward the æsthetic view of works of art, and away from that rather supercilious variety of expertising by which too often the public has been led to ascribe interest and value to a painting, for instance, merely because of the painter. (*Burlington Magazine*, 15 July 1922). At the Barbazanges Gallery, in Paris, there was an exposition of the art of Ireland. E. M. O'Rourke Dickev, Eva and Getitia Hamilton, Paul Henry and others being represented by landscapes; Sean Keating and I. B. Yeats by works uniting the study of landscape and that of popular types of inhabitants; Shannon, Sir John Lavery and Albert Power by portraits. Also in Paris there was held an unusually complete exposition of Japanese paintings. In New York and other American cities, exhibitions of

Gainsborough's 'Blue Boy' called attention to the power there may be in a single painting,—one not conceived in queerness and born into unpleasantness,—to win and hold such favor as the Post-Impressionist collections failed to secure. Summer exhibitions, again proving the healthful influence of out-door study, were those at Old Lyme (paintings by Everett L. Warner, George M. Bruestle, Clark G. Voorhees, Guy Wiggins, and sculpture by Mrs. Vonnoh), and at Goshen, Nyack and Nanuet, the works of the Nanuet painters who, earlier in the year, sent a "traveling exhibition" to Milwaukee, Muskegon, Saint Louis and Seymour, while planning a December exhibition of the group for New York City. The Newport Art Association's eleventh exhibition, 16 July-12 August, included the work of contemporary American painters and sculptors in many parts of the country.

The Metropolitan Museum of Art announced, in January, the donation of nine paintings by Mary Cassatt, a figure of Christ attributed to Andrea Solario, three landscapes by Gustave Courbet, a Dutch interior by Brekelenkam, and a stucco relief of the Madonna and Child by Donatello. A portrait of Mlle. de Gottignies, by Van Dyck, came as part of the Edmund C. Converse bequest. In the Abbott H. Thayer memorial exhibition, 20 March-30 April, 26 works were shown, illustrating that painter's achievement at widely separated periods of his career. A Thirteenth century French statue of exceptional interest was secured by purchase. The Dreicer collection was installed permanently in such a manner that visitors may study most conveniently the individual objects. An acquisition of very exceptional importance was Andrea del Sarto's painting (oil on wood) of the Holy Family, called the Borgherini Madonna, from the Murray collection at London. This panel, according to the *Bulletin* of the Museum for June, "was cleaned of the dense varnish with which it was covered, and now shows as an undoubted example of the latest and most powerful period of Andrea del Sarto's art." A summer exhibition at the Metropolitan Museum included water-colors by Sargent, Winslow Homer, Hassam, Dougherty and Marin.

The Hispanic Society of America opened, in the central building, upper galleries in which are shown: P. Ribera's 'Carmen'; by Ignacio Zuloaga, four examples; by H. Anlada-Camarasa, 'Girls of Burriana'; by A. La Gándara, 'Portrait of Madam Y'; by Sorolla, four examples; also admirable works by José Jiménez Aranda, Fortuny y Garbo, E. Sala y Francés, F. Domingo y Marqués, Madrazo y Kuntz, Madrazo y Agudo, E. Lucas, Rico y Ortega, A. de Beruete, R. Madrazo y Garreta, J. Pinazo, V. D. Bécquer and other painters.

The Boston Museum of Fine Arts received, as the gift of Mrs. E. F. Greene, a portrait of the Infanta Maria Theresa, by Velasquez,—that painting which Justi in his work on Velasquez had labelled incorrectly 'Mariana, the second wife of Philip IV.' A Homner portrait was the gift of Mrs. E. W. Longfellow. Ownership of the collection of Mr. and Mrs. H. H. Sherman,—chiefly paintings, including canvases by Italian masters of the 15th, 16th and 17th

centuries, together with works by living American artists and examples of the Spanish, Dutch and Flemish schools,—passed to the Museum of Fine Arts; the donors retaining, however, actual possession of the objects, except two of the paintings, for the present.

The Art Institute of Chicago, closing on 5 March the 26th annual exhibition by artists of Chicago and the vicinity, opened on 15 April the second international watercolor exhibition,—of which the declared purpose was “primarily to remove the prejudice which still lingers in the mind of the public with regard to watercolor painting and to illustrate the possibilities of this medium.” Thirteen nations were represented, including English, French, Hungarian, Scandinavian, American and Belgian groups. . . . Special exhibitions were arranged for the summer, and in this connection the *Bulletin* of the institute commented: “One finds the reaction toward the so-called academic in contemporary European art effectively illustrated by the exhibition of Alexandre Iacovleff. . . . Some of his fellow artists in Paris have resurrected Ingres for their leader.” . . . A valuable addition to the collections was the portrait of Conrad Zeller by Christoph Amberger. In important respects more interesting was the acquisition of Copley’s portrait of Brass Crosby, Lord Mayor of London. . . . At the 35th annual exhibition of American painting and sculpture, the Logan gold medal was awarded to Frank W. Benson; the Peabody prize to F. S. Chase; the Potter Palmer gold medal to John Singer Sargent, for a portrait of Mrs. Swinton; Peterson Purchase prizes to H. D. Murphy and J. E. Costigan; the Keith Spaulding prize to William Wendt; the Harris bronze medal to K. A. Buehr and silver medal to Eugene F. Savage; honorable mention in the department of sculpture to Ruth Sherwood and Janet Scudder; the Cahn prize to A. H. Krehbiel.

The Cleveland Museum of Art added to its collection two late gothic heads, assigned to the school of Michel Colombe, and a portrait by W. M. Chase, painted about 1882 or 1883. . . . A special exhibition of Renaissance art was held in Gallery II. . . . The fourth annual exhibition of works by Cleveland artists and craftsmen was opened to the public on 2 May, and we dwell upon this a moment, as upon an intimation of the kind of training that was given in places widely separated. Awards were made as follows: First, prize for landscape, to Frank N. Wilcox for his painting, ‘The Gravel Pit’; second prize to Clara L. Deike; third to Mary S. Collins; first prize for portraits, to Paul Travis; second, to Edith Stevenson; third, to W. J. Edmondson; first prize in miscellaneous class to H. G. Keller; second to Paul Shively; third, to Paul Travis; in decorative painting, first prize to H. G. Keller; second, to W. J. Edmondson; third, A. F. Biele; in the class of industrial painting, Frank N. Wilcox first; C. E. Gaertner, second; F. Craft, third; in water-colors, first to A. F. Biele; second to H. G. Keller, and third to H. H. Volck. . . . The second exhibition of contemporary American paintings was opened to the public on 8 June.

The Pennsylvania Academy of the Fine Arts held the 117th annual exhibition at Philadelphia,

5 February–26 March. The Temple gold medal was awarded to William L. Lathrop, the Walter Lippincott prize to Irving R. Wiles, the Mary Smith prize to Mary Townsend Mason, the Jennie Sessan gold medal to George Oberteuffer, the Carol H. Beck gold medal to Ellen Emmett Rand, the George D. Widener memorial gold medal to Beatrice Fenton. We mention also the paintings by Victor Higgins, Gari Melchers, Daniel Garber, Walter Ufer, E. W. Redfield, W. M. Paxton, Ralph McLellan, Robert Susan, C. F. Ryder, Juliet White Gross, E. A. Payne, G. Glen Newell, Elmer Schofield, Horace Brown, J. S. Sargent, Philip L. Hale; sculpture by Walker Hancock, J. M. Loré, Allan Clark, Margaret French Cresson, and Edith Barretto Parsons. The 30th annual exhibition of small oil paintings opened at the Art Club of Philadelphia on 21 October. The gold medal was awarded to Clifford Addams, with honorable mention of J. F. Folinsbee and R. Sloan Bredin.

The Carnegie Institute, Pittsburgh, held the 21st annual international exhibition of paintings, 27 April–15 June; at which the medal of the first class went to George W. Bellows and the medal of the third class to Henri Lebasque, with honorable mention of Charles Reiffel, Henry B. Snell, and Fred Wagner. It was announced in October that this institute at an early date in 1923, will “conduct an exhibition of paintings, sketches, and drawings by American artists” in such wise that meritorious new pictures may pass into the possession of people of moderate means.

The Buffalo Fine Arts Academy, Albright Art Gallery, in *Academy Notes*, announced the following accessions: Allen Tucker’s landscape, ‘The East Wind,’ Paul Sain’s, ‘Nenuphars,’ a bronze figure by Jeanne Poupelet, and William Kennedy’s, ‘Old English Village.’ There were exhibited eight caryatid figures, the last works of Augustus Saint Gaudens,—figures that, in a very special sense, harmonize with their architectural surroundings.

The Worcester Art Museum acquired Paul Gauguin’s ‘La Femme Accroupie,’ painted in Tahiti in 1891; also ‘Magdalene,’ painted by El Greco about 1590, and until recently in the Colegio de Ingleses in Valladolid.

At The Brooklyn Museum, a Benjamin West exhibition included, with famous portraits, a commendable showing of the less well-known historical and decorative works of that painter who so conspicuously was undefeated by his own versatility. . . . Modern English pictures (by Orpen, Frank Brangwyn, P. Wilson Steer, Augustus John, and many others) were on view in December.

West’s ‘Death of Hyacinthus’ and Doré’s ‘Scottish Highlands’ were presented to the Toledo Museum of Art. The donor was A. J. Secor, for many years that organization’s vice-president; and by gift from him the museum afterward obtained important canvases by masters of the Barbizon School and other French painters, together with examples of the art of Holland, England, and America.

The collection of The City Art Museum of Saint Louis was enriched by the acquisition of an important 16th century example by Jean Clouet,—a portrait of Guillaume Gouffier, Ad-

miral of France. . . . In the remodelled building of the Milwaukee Art Institute, there was an exhibition of the works of Wisconsin painters and sculptors. . . . The Detroit Institute of Arts, from 10 October to 12 November, showed a group of paintings and drawings by the Russian artist, A. E. Iacovleff. The annual exhibition for Michigan artists was held in December. . . . The Minneapolis Institute of Arts held its eighth annual exhibition of selected works by local artists from 29 September to 31 October.

At the National Academy of Design, New York City, the winter exhibition, 17 November-17 December, was memorable especially for light in landscapes or interiors (where objects are "caught," as Omar put it, "in a Noose of Light"), and for characterization in several portraits of persons who, decidedly, were not represented as too proud to fight and too humble to drink. . . . Edward W. Redfield, for his landscape, 'The Valley in Springtime,' received the Carnegie prize; Gertrude Fiske, for an otherwise unflattered nude, the Shaw Memorial prize; G. B. Troccoli the Proctor prize; Brenda Putnam, for her 'Sun Dial,' the Barnett prize in sculpture; Leon Kroll, for the rather sentimental 'Sleep,' the First Altman prize; Childe Hassam, for 'The Sun Room,' the Second Altman prize; Harriet W. Frishmuth, for her little bronze group, 'Fantasie,' the Watrous gold medal; Guy Wiggins, for 'The Quiet Valley,' the J. Francis Murphy Memorial prize. . . . In the center gallery, and a single field of view, this charming trio, 'Nymphs Surprised,' 'Morning Light,' 'Shadow Patterns,' by F. C. Jones, Marjorie Conant and Mildred B. Miller, respectively. In the same room, 'Self Portrait,' by George E. Harris; Charles S. Chapman's 'The Village Woods,' and Walter L. Palmer's 'Sparkling Brook.' In the Vanderbilt Gallery were Ipsen's portrait of Capt. Robert A. Bartlett; 'Reflected Light,' by Victor Higgins; a large, quiet Connecticut landscape by Robert H. Nisbet; Costigan's light-noosing of 'Cows in Cornfield'; Lever's 'Across the River Exe'; 'Snowy Banks,' by Gardner Symons; Ochtman's 'A Morning in Summer'; 'Evening Glow,' by S. L. Reckless; 'Mt. Aetna,' by Thalia Malcom; D. Carlsen's 'Delft and Brass'; 'The Vineyard,' by Karl Anderson; 'The Maumee River,' by Carlton T. Chapman; 'Overlooking Dover Plains,' by G. Glenn Newell, 'Aisles of the Forest,' by John F. Carlson, etc. In the South Gallery one painting merited name of best: W. Herbert Dunton's 'My Children,' unsentimental, but truly warm-hearted, and an admirable composition in two ovals,—one strong, including oval and one included, as though just thought of after the general plan had been settled. In the same gallery and the academy room, well-deserving sculpture also: Pollia's bust of George E. Giguère; the portrait of a Chinese, by Nathan D. Potter; Prince Katcho, by Gozo Kawamura; 'Polo Players,' by H. N. Moeller; 'American Bison,' by Eli Harvey; 'Desha,' by A. D. Lenz; 'Nancy Lee' and 'New Born,' by Gertrude K. Lathrop; 'Alexander Zilot,' by G. W. Derujinsky; 'The Surf,' by Chester Beach; 'Peary,' by M. M. Jacobs, and 'Col. John Caswell,' by H. P. Erskine.

MARRION WILCOX.

PALESTINE, an ancient state on the eastern shore of the Mediterranean for centuries under Turkish rule until its conquest in 1917-18 by British forces, now a state under British mandate with a civil administration under a British high commissioner. The natural and historic boundaries of Palestine run on the north from the desert on the east along the ridge of Mount Hermon to the Litani, east by the Great Desert, south by the desert of Sinai to the Gulf of Akaba and west the Mediterranean Sea. Its present political boundaries are on the west the Mediterranean; south the line running from just west of Rafa to the east of Taba at the head of the Gulf of Akaba; north the line established by the Franco-British Convention of 1920 running south of Ras-el-Nakura on the coast, midway between Acre and Tyre, east and northward to Metulla and, across the upper Jordan Valley to Banian, thence south to the east shore of Lake Huleh and down the left bank of the Jordan and the eastern shore of the Sea of Tiberias to Wady Samakh, thence, to El Hamme in Yarmuk Valley and thence the east bank of the river. The area under mandate to Britain is 9,000 square miles in extent with a population according to an announcement made 12 Jan. 1923 by the British colonial office of 753,412, divided as follows: Moslems, 589,564; Jews, 83,794; Christians, of various denominations, 73,026; Druses, 7,028. The following information is summarized from the report of High Commissioner Sir Herbert Samuel for the 18 months ending with December 1922.

Immigrants numbering 17,000, nearly all Jews, entered Palestine in that period, but emigration and the increased death rate due to post-war conditions prevented any noticeable increase in the Jewish population. The cost of government was completely defrayed by taxation, according to this account, which continues: "The Turkish system of taxation has been continued, with the objectionable features removed. The report states also that the Turkish tobacco monopoly held by the Regie Company had been abolished, with the subsequent lowering of prices. Yet the government has been enabled to increase its revenue. The cultivation of tobacco, mostly for local consumption, has begun, several cigarette factories being started in various parts of the country. The report also calls attention to the gradual reforms instituted in the financing of the municipalities. The police force is composed of 1,600 men, representing the various sections of the population. The standards of the police force are undergoing constant improvement, and a local gendarmerie has been created, which promises great efficiency. The cost of the British military garrison, which was £4,000,000 in 1921, was estimated to have been reduced to one-half for 1922, and there are hopes for considerable further reduction for 1923 and subsequent years. The administration has been responsible for the establishment of efficient law courts and magistracy, and marked improvement is noticeable in the sanitary conditions of the towns and in the health of the population. Vigorous campaigns against malaria and trachoma are being waged, and the water supply is improved. In the educational field the government is carrying out a program of primary schools for Arab children throughout the whole country.

During 1921 the government opened 75 such schools. A land survey of the whole country has been begun, and the registration of land ownership commenced. The land courts which had been established are aiding in clearing the existing confusion as to titles, the report declares.

"The whole of the railway system has been taken over by the administration and is being operated without loss. The public works department has engaged during the past two years in road construction, the main roads with few exceptions now being in good order. The post office pays its own way and is improving in efficiency, and the public telephone system which had been initiated by the British administration is developing rapidly. Passing to the measures taken by the government looking toward the fulfillment of the Jewish National Home program, the report states that in accordance with the policy of Lord Balfour's Zionist declaration, of which the full text is given, the Hebrew language had been granted official status and is being used by the administration, in which there is a considerable Jewish element. Jews have started a number of new industrial enterprises, and Jewish organizations have purchased considerable areas of land, care having been taken by the government that Arab cultivators who had claimed lands through previous occupation should experience no hardships. Otherwise, the report states, the government has not intervened in either the sale or purchase of land, which has been entirely free.

"A number of new factories, including a carpet factory employing 130 persons, a carpentry and cabinet makers' factory employing 63 persons, a small confectionery factory, a mother-of-pearl factory and two large hand cigarette factories, besides Jewish printing works with an Intertype plant were all started in Jerusalem by Jews in 1921. Only two important concessions were granted in 1921, both only provisionally and both to Pincus Rutenberg, the Jewish engineer, for the electrification of the country by using the waters of the Jordan. Special reference is made to the Zionist school system, in which 11,500 Jewish children of school age receive instruction, a system which includes 46 Froebelian, 62 elementary schools, 6 secondary schools and 10 technical schools. The Zionist schools are generally similar to corresponding schools in Europe, especially Switzerland. Hebrew is the language of instruction, and special emphasis is laid on Jewish literature, history and Jewish national subjects. The rest of the curriculum resembles that of schools in other countries, except in the orthodox schools, where another 5,500 children are instructed and where Hebrew is not the language of instruction. They are on a lower level than Zionist schools, according to the report. Special tribute is paid to the American Zionist Medical Unit, which is referred to in the report as the 'largest and best organized voluntary service.' Five thousand two hundred patients were cared for in hospitals in Jerusalem, Jaffa, Safed and Tiberias, in addition to 335,228 visits to clinics. The same unit conducts disinfection and sanitation activities and has taken measures to combat malaria in the Jewish colonies and labor camps. The government has recognized the authority of the Rab-

binical Office in Jerusalem, which is comprised of one Sephardic and one Askhenazic Chief Rabbi, six rabbinical councillors and two lay councillors. The largest transaction reported for the year was the purchase by the Jewish National Fund and Palestine Land Development Company of seven villages in the Galilee district, comprising 62,634 dunams, for which 226,040 Egyptian pounds had been paid. The rights of the existing tenants were safeguarded. State lands controlled by the government include 889,978 dunam (about 222,494 acres) cultivatable lands and 44,242 marshes, pasture, orchards and gardens, besides 340 houses, mills and other buildings. The government possess also 244 quarries and the waste lands, much of which is capable of productivity."

PAN-AMERICAN CONFERENCE. See PEACE AND ARBITRATION, INTERNATIONAL.

PAN-AMERICAN INTERNATIONAL CONFERENCE. See PEACE AND ARBITRATION, INTERNATIONAL.

PAN-AMERICAN UNION. See PEACE AND ARBITRATION, INTERNATIONAL.

PANAMA, a Latin-American republic of Central America and previous to 3 Nov. 1903, a department of the republic of Colombia. It has an area of 32,380 square miles; a total length of nearly 500 miles and a breadth varying from 37 to 110 miles. The population, according to the census of 1920, numbers 401,428, a medley of Spanish, Indian and negro elements. There are eight provinces. The capital, Panama City has 61,369 inhabitants. The largest city is Colon (40,886). Ports of minor importance on the Pacific are Montijo, Pedregal, Aguadulce, and Mutis. On the Atlantic are Bocas del Toro, Porto Bello, and Mandingo. Roman Catholicism is the prevailing religion. This church has 71 edifices served by 70 clergymen. There are some Protestants in the Canal Zone and there is full toleration for all denominations. Primary education is free and compulsory from the age of 7 to 15 years. There are 398 public schools with an enrollment of 22,000 children. There is a National University in the capital. There are several private schools of secondary grade. The finances of the republic have been reorganized by a fiscal agent of the United States. The budget for the two-year period 1921-23 balanced at \$13,672,995. The foreign debt of the state consists of bonds issued in the United States for public works to the value of \$2,500,000. The soil of the republic is very fertile, but only about five-eighths of the whole area is occupied and such cultivation as is carried on is according to old methods. Bananas form the principal crop. Other crops are rubber, coffee, cocoa, coconuts, copaiha, sarsaparilla and ipecacuanha. Sugar growing and cattle raising are increasing in importance. Pearl fishing is carried on and turtle shell is exported. Most of the common minerals are found except coal. In 1920 the exports of the republic were valued at \$3,648,210 and the imports at \$16,587,648. The chief exports were bananas, coconuts, balata, hides and gum. About 76 per cent of the total imports in 1920 came from the United States and about 90 per cent of the exports went to the United States. This was exclusive of canal ma-

terials which are duty free under a special agreement with the United States and are not included in the foreign trade summaries of the republic of Panama. Several lines of steamers maintain communications with both shores of the republic and with North America and Europe. The Panama Railroad crosses the isthmus from Colon to Panama and is owned by the United States government. The United Fruit Company has a line and branches in the province of Bocas del Toro with about 145 miles. New lines are projected and existing lines are being extended. There are 96 post offices and 37 telegraph offices in the republic. Good roads are under construction in several parts of the state. At the head of the government is a President elected for a term of four years and ineligible to succeed himself. There are three vice-presidents and a Cabinet of five ministers. There is a Governor at the head of each Province. The legislature consists of a Chamber of 33 deputies elected for four years, which meets biennially in September. The President of Panama in 1922 was Dr. Belisario Porras, who assumed the office 1 Oct. 1920.

History.—On 2 Jan. 1922 an earthquake caused a flood in Gatun Lake, Panama Canal. . . . The increase of traffic on the Canal lent force to the suggestion that another waterway should be constructed from ocean to ocean; and so there was an awakening of interest in the old Nicaragua Canal scheme (see 'Encyclopedia of Latin America,' articles 'Nicaragua Canal' and 'Nicaragua'). . . . Demonstrations were noted of more active interest, also, in the improvement of roads and of living conditions on the Isthmus. . . . On 3 March, at the memorial services for Brigadier-General Gorgas held in Birmingham, Ala., the diplomatic representative of Panama in the United States, Hon. J. E. Lefevre, paid tribute, in an eloquent address, to the great sanitarian,—the man who had made the Panama Canal possible. . . . On 28 August Dr. Ricardo J. Alfaro, as Envoy Extraordinary and Minister Plenipotentiary of Panama in the United States, presented his credentials at the White House. Dr. Alfaro was formerly legal adviser to the Legation of Panama, and he was the special envoy of his country at the inauguration of President Harding. He has held the ranking position in the Panaman Cabinet, that of Secretary of Government and Justice; has served as Professor of History in the Instituto Nacional, and is the author of the 'Life of General Tomás Herrán,' 'Boundaries between Panama and Costa Rica,' together with a number of valuable monographs.

PANAMA CANAL. Commercial traffic through the Panama Canal, during the calendar year 1922, exceeded that of any former year not only in the number of ships, ship tonnage, tons of cargo carried but also in the amount of tolls collected. Furthermore, the traffic in the last six months of the year likewise showed a decided increase over the traffic during the first six months of the year. An analysis of the traffic for the year 1922 shows that in the Atlantic to Pacific business there was an increase over the preceding year of 11 per cent in the number of transits, 15 per cent in tolls, 20 per cent in net

tonnage and 29 per cent in cargo tonnage. In the Pacific to Atlantic traffic there was an increase over the year 1921 of 3 per cent in the number of transits, 7 per cent in net tonnage, 8 per cent in tolls, and 27 per cent in cargo tonnage. Combined, the traffic showed an increase over 1921 of 8 per cent in the number of transits, 12 per cent in tolls, 14 per cent in net tonnage, and 28 per cent in cargo tonnage.

Compared with the first six months of the year 1922, the last half showed an increase of 21 per cent in transits, 26 per cent in tolls, 29 per cent in net tonnage, and 37 per cent in cargo tonnage. This increase, according to figures given by *The Canal Record* was particularly marked in the Pacific to Atlantic traffic, the last half of the year showing an increase over the first half of 32 per cent in transits, 43 per cent in net tonnage, 45 per cent in tolls, and 93 per cent in cargo tonnage.

Coastwise traffic between ports of the United States also continued to gain. In October, 1922, the last single month for which figures were available, shipments were the heaviest for any month since the opening of the canal. This traffic, in point of tonnage, tolls and tons of cargo carried, made up almost 30 per cent of the whole traffic through the canal in that month.

The Canal Record stated that many large shipments of fresh fruit are being dispatched from North Pacific Coast ports to Europe through the canal, practically all vessels in this service equipped with refrigerating plants being loaded to their capacity. What is reported as the largest single shipment of apples from any northern Pacific coast port was carried by the steamer *Narenta* of the Royal Mail Steam Packet Company, which passed through the canal on 19 December with 125,000 boxes of apples from Portland, Ore., to British ports. The *Narenta* carried a cargo of 4,854 tons, in which were 3,732 tons of fresh fruits and 640 tons of canned fruits.

A summary of the commercial traffic through the canal in 1922 compared with that of previous calendar years follows:

CALENDAR YEAR	No. of ships	Tolls	Tons of cargo
1914 *.....	350	\$1,508,737 56	1,758,625
1915 †.....	1,154	4,297,467 11	4,893,422
1916 †.....	1,217	3,671,162 68	4,774,822
1917.....	1,960	6,107,696 63	7,443,610
1918.....	2,070	6,313,455 39	7,284,159
1919.....	2,133	6,973,095 30	7,477,945
1920.....	2,814	10,295,862 21	11,236,119
1921.....	2,783	11,261,098 80	10,707,005
1922.....†	2,997	12,573,407 77	13,710,556

* Canal opened to traffic August 15, 1914.

† Canal closed approximately three months by slides.

According to the report of the Treasurer of the United States, the total amount expended on account of the Panama Canal proper up to the 30 June 1922 was \$477,128,265.95 while the tolls collected to that date amounted to \$59,346,188.74, as shown by the table on next page.

Deducting from total expenditures the total amount of tolls received shows the net expenditure upon the Canal up to the 30 June 1922 to have been \$417,782,077.21. Deducting from the latter amount the proceeds of bonds sold \$138,600,869.02, shows the amount expended upon the

PANAMA CANAL ZONE — PAPER AND PULP

Canal out of the general fund of the Treasury to have been, \$279,181,208.19. See also CANALS.

PANAMA CANAL ZONE, a strip of territory ten miles wide, or five miles on either side of the centre line of the Panama Canal. Area, 441 square miles water included or with a land area of 332 square miles. Civil population on 30 June 1921, 23,757, of whom 8,158 were Americans. There are in the Zone 2,672 American women and 2,661 American children. Land owners have been ousted and the Zone is now a military reservation. The Governor of the Zone in 1922 was Colonel Jay J. Morrow, U. S. A., appointed to this post, 28 March 1921.

PAPER AND PULP. Since paper has come to be made almost wholly of wood, the manufacture of wood pulp and paper are regarded as a single industry. Some mills make pulp exclusively from either ground wood, or wood chemically treated with sulphite; other mills make both pulp and paper. The different grades and qualities of paper are commonly styled news print; standard news (which is simply news print conforming to the common standards of newspaper requirements); book papers, of better color, heavier weight, and often surfaced, for printing illustrations; paper board, bag paper, wrapping paper; fine paper, including a great variety of fancy and ornamental papers, and the heavily surfaced papers known as writing papers; tissue paper, hanging paper, boxboard, felt and building paper, and some minor classifications. Measured in short tons, paper board is now the largest product, news print and boxboard call for about equal quantities, then come book paper, wrapping paper and fine paper. Measured in square yards news print is far in the lead, involving the most work for the mills, and serving as a general standard by which other papers are gauged. For 20 years its production has increased almost uniformly, the exceptions being in 1917-18, when there was a 2 per cent reduction in output, and 1920-21, when there was a 15 per cent reduction. In other words, the paper trade experienced a slump, beginning in 1920 and extending into 1921. This was compensated for in 1922, when the production of all kinds of paper increased 31 per cent, on the average, the gain being greatest in bag paper (62 per cent), and least in news print (18 per cent).

Notwithstanding this return to almost the highest peak of production in 1922, the prices of paper reduced steadily during the two years 1921 and 1922. It is claimed that this was the natural reaction from the "boosting" of paper prices during the war, when consumers claim to have been unmercifully squeezed by the pro-

ducers. A shortage of paper invited higher prices, and for a long while there was no apparent stock or paper supply ahead of immediate needs. Even in the beginning of 1923, the stocks of paper on hand at the mills were singularly small, compared with stocks of other staple articles. The following table gives the production for the past two years, and the stock of paper at the mills:

PAPER PRODUCTION OF THE UNITED STATES IN SHORT TONS

Kind of Paper	1920	1921	1922	Stock at mill Dec. 31, 1922
Standard news...	1,308,000	1,131,000	1,342,000	17,000
Total news print (incl. standard)	1,512,000	1,226,000	1,448,000	19,000
Book paper.....	1,104,000	726,000	982,000	36,000
Paper board.....	2,313,000	1,665,000	2,154,000	55,000
Bag paper.....	312,000	131,000	212,000	3,795
Wrapping paper.....	832,000	652,000	836,000	65,000
Pine paper.....	389,000	242,000	361,000	37,000
Tissue paper.....	177,000	70,000	198,000	8,712
Hanging paper.....	114,000	70,000	92,000	2,835
Boxboard.....	1,378,000	1,122,000	1,571,000	25,000
Felt and building paper.....	367,000	286,000	420,000	8,112
Other grades.....	313,000	210,000	311,000	23,000
Total paper and paper board production.....	8,812,000	6,478,000	8,585,000	283,454

The consumption of news print during 1922 increased faster than the production, so that stocks were lower at the end than at the beginning of the year. The trend of prices is well illustrated by the course of news print, as purchased in the open market, during the past two years. The prices are per 100 pounds.

PRICES OF STANDARD NEWS PRINT IN OPEN MARKET

September.....	4 18	3 66
October.....	4 07	3 79
November.....	4 17	3 83
December.....	3 67	3 87

Pulp wood production naturally follows closely the range of paper and paper board production. According to the United States Department of Commerce, 172 mills consumed 3,726,963 cords of pulp wood in 1922 against 3,196,846 cords consumed by them in 1921. The production of wood pulp by these mills in 1922 amounted to 2,437,530 tons as against 2,062,773 tons in 1921. These mills, it was stated, consumed nearly 70 per cent of the total quantity of pulp used in 1921, and produced about 72 per cent of the total.

The total exports of paper mill products from the United States in 1922 were valued at \$24,152,567, as against \$29,029,673 in 1921. This appears a falling off, but it is more than double the export of 1913—\$11,687,000. The imports of paper into the United States are trifling.

but a considerable quantity of pulp is made in Canadian mills and shipped here to be made into paper. The Canadian output of newsprint in 1922 was 1,082,000 short tons, a record, and 34 per cent gain over 1921. Because Canada has more wood than the United States her paper making industry is likely to grow faster than that of the latter country. Newfoundland also has begun making newsprint, turning out 60,000 tons in 1922, and Mexico has one small paper mill. Imports of paper into the United States in 1922 were valued at \$85,914,879 as compared with \$88,673,487 in 1921. Imports of newsprint in 1922 totaled 1,029,268 short tons valued at \$72,354,266 against 792,508 short tons valued at \$79,125,355 in 1921.

In all the world there are 2,825 paper mills, and their total production in 1920 was figured at 14,500,000 tons, from which it is apparent that the United States makes a little over half the world's paper. The International Paper Company, sometimes styled the paper trust, has no monopoly of the market, as is apparent from its production of 433,809 tons in 1922, 205,114 in 1921, and 532,000 in 1920.

The Government Printing Office in Washington buys its paper on submitted bids, and on 31 Jan. 1923, purchased a large lot, of which sample prices were \$4.03, \$4.35 and \$4.44 per 100 pounds for news in rolls. Public Printer George H. Carter thinks it is costing too much, and in his annual report urged the establishment of a Government mill of 50,000 tons capacity, at a cost of about \$1,000,000. He states that the Government Printing Office uses 137 square miles of paper annually, and that 27 cents of every dollar there spent goes for paper.

For some years there has been friction in paper-making circles over the validity of the Eibel patents involving an improvement in the wire arrangement of Fourdrinier machinery, generally adopted, and making for more rapid production. About one-third of the mills had refused to pay royalties, and were sued by the inventor, who early in 1923 won his case, establishing the validity of the patents.

There is a large and increasing manufacture of paper boxes and cartons, cards and envelopes, paper patterns, playing cards, etc., but no accurate figures of their progress have been collected since the Government census of 1919. In all, these minor industries give employment to about 160,000 people, or considerably more than the 114,000 engaged in the manufacture of paper and pulp.

PAPUA, Territory of, an Australian territorial possession on the southeastern part of the Island of New Guinea. Area, 90,540 square miles; population, Europeans, 1,096; Papuans about 250,000. The Territory is governed by an Executive Council of six official members and a legislative council of nine members. Revenue in 1921 amounted to £82,316; expenditures to £146,827; exports in 1921 were valued at £171,404; imports at £484,770. The territory produces copper, gold, tin, zinc, cinnabar, iron, manganese, sulphur, graphite, brown coal and petroleum. There is steamer connection between Sydney and the Territorial port of Port Moresby. There are five wireless stations. See **NEW GUINEA**.

PARAGUAY, a republic of South America lying between the rivers Paraguay and the Alto Parana has an area of 75,673 square miles and a population of 1,000,000, exclusive of about 50,000 Indians in the Chaco region. The region of the Chaco is in dispute between Bolivia and Paraguay. The population of Paraguay proper is predominantly Guarani Indian, with large numbers of the descendants of Europeans chiefly Spanish and also some negroes. In addition there are in the country about 60,000 foreigners, including 30,000 Argentines, 15,000 Italians, 7,000 Spaniards, 3,000 Germans and a sprinkling of French, English, Brazilians and other nationals. Asuncion, the capital, has a population of 99,836. Other large cities with their populations are: Villa Rica (26,000); Concepcion (15,000); Encarnacion (12,500); Luque (15,000); Carapegua (15,000); Paraguari (10,000); and Villa del Pilar (10,000). Roman Catholicism is the established faith of the inhabitants, but there is full freedom for all denominations. The civil ceremony alone gives validity to a marriage. Education is free and there is a compulsory attendance law but it is non-enforceable in many districts because of the lack of schools. The last school reports showed 1,268 primary schools with 78,399 pupils; 74 private schools with 4,021 pupils; national colleges at Asuncion, Villa Rica and Pilar with 740 students. There is a national university with 34 professors and 247 students and six normal schools with about 200 students.

Production.—With a subtropical climate considerably modified and made healthful by several mountain chains and an extensive hydrographic system, most of the products of the tropical and temperate zones are successfully cultivated. The extensive plain of the Gran Chaco affords excellent pasturage for cattle, and the slopes of the mountains of the country are covered with luxuriant forests, where many useful woods and medicinal plants are found. Beef products, the valuable quebracho wood, and yerba mate or Paraguay tea are the chief articles of export. Lapacho, curupaz, and cedar are valuable woods found in considerable quantities, and oranges, tobacco, coffee, rice, cotton, mandioca, and sugar are grown and exported. The beautiful nanduti lace is one of the products of native industry. There are about 30,000,000 acres of good grazing lands in the republic and 20,000,000 acres of timber lands. There are 5,249,000 head of cattle, 600,000 sheep, 500,000 horses, 61,000 swine and 90,000 goats. Paraguay tea is one of the chief articles of export. The cultivation of the tree from seed is being undertaken by German settlers over extensive tracts and is meeting with success. There are seven sugar refineries in the country. Indian corn, beans, rice and sweet potatoes are grown for home consumption.

Commerce.—The general world depression during 1921 was directly reflected in Paraguay and both imports and exports showed a marked decrease in 1921 from those of 1920. Imports that reached in 1919 a record figure of 15,835,970 Argentine gold pesos (\$0.96), declined to 13,118,504 pesos in 1920 and to 8,358,922 pesos in 1921—decrease of nearly 50 per cent in two years. Exports showed a decline from 14,816,117 gold pesos in 1919 and 14,959,175 in 1920

to 9,316,721 in 1921 — a decrease of about 40 per cent from those of 1920.

Importations from the United States showed a decrease of 54 per cent in 1921 as compared with 1920, dropping from a value of 3,129,556 gold pesos to 1,444,257 pesos and a decrease in the percentage of the total import trade of Paraguay from 24 per cent in 1920 to 17 per cent in 1921, which compared favorably, however, with only 6 per cent in the year 1913. While nearly all lines of goods showed decreases (the most notable being hardware, machinery, etc., from 1,790,234 to 377,242 gold pesos), a noteworthy increase appeared in the 1921 imports of textiles, which rose from a value of 375,494 to 599,932 gold pesos.

The following table shows the principal articles exported from Paraguay in 1920 and 1921:

ARTICLES	1920	1921]
Animal products:		
Cattle, live, number.....	17,990	6,614
Fat, kilos.....	23,482	102,548

Skins, wild animal, kilos.....	37,349	1,441

Shipping in 1921.—The Paraguay and Parana Rivers offer excellent water transportation facilities to a large part of Paraguay. Although more than 1,000 miles from Buenos Aires, large and comfortable river steamers operate a biweekly mail and passenger service between Buenos Aires and Asuncion, the up-river trip requiring four days and the down-river passage three days. There are other steamers connecting at Asuncion for the voyage on the upper Paraguay as far as Corumba, Brazil, while another line of smaller vessels makes the trip on the upper Parana to Posadas and on to Iguazu.

Asuncion is the only important river port of Paraguay and nearly all the export and import trade of the country passes through this city. The arrivals and departures of steam and sail-

ing vessels during 1921 are shown in the following table:

KINDS OF VESSELS	Entrances		Clearances	
	Number	Tons	Number	Tons
Steam vessels.....	1,660	192,683	1,690	185,408
Sailing vessels.....	1,352	117,710	1,395	119,600
Total.....	3,012	310,393	3,085	304,008

It will be noted that the number of Paraguayan vessels far exceeds the vessels of all other flags entering the port of Asuncion, while Argentine vessels exceed all other flags combined in the matter of tonnage. This is due to the regular schedule of the larger vessels plying between Buenos Aires and Asuncion, which fly the Argentine flag and which have a practical monopoly of the river traffic. This monopoly results in excessive freight charges and passenger fares, the freight at the present time from Buenos Aires to Asuncion on many articles being higher than the freight from European ports to Buenos Aires.

Railways and Railway Traffic.—With the exception of private, narrow-gauge, logging railroads, the only railway of Paraguay is the Paraguayan Central, which traverses the southeastern section from Asuncion to the city of Encarnacion, situated on the Upper Parana—the boundary between Paraguay and Argentina. Here a ferry across the Parana makes connection with the Argentine railways, thus permitting a through international service between the capitals of the two countries. A biweekly international mail and passenger service makes the trip either way in 54 hours.

This railway has a total main-track length of 274 miles, with 26 miles of sidetrack. On 30 June 1921, the rolling stock consisted of 477 freight cars, with a maximum individual capacity of 30,000 kilos; 46 passenger cars, including dining and sleeping cars; and 24 locomotives. The track is of standard gauge. The railway is owned by a corporation with its main offices in London. The local manager resides in Asuncion and the general shops are located at the town of Sapucay, Paraguay.

The receipts of the Paraguayan Central Railroad are reported as £232,873 for the fiscal year ended 30 June 1921, as compared with £257,998 in 1920, while operating expenses were £133,766 in 1921 and £152,044 in 1920. This shows an operating profit of £99,107 for 1921, compared with £105,953 in 1920. The outstanding capital shares and loans of the company as of 30 June 1921, amounted to £2,836,703.

Finance and Banking — Government Revenues.—In common with many other countries of the world Paraguay was beset during 1921 with financial difficulties, originating in the general world economic depression of the previous year, which culminated in the latter part of 1920 in the failure of two important Paraguayan banking institutions. A moratorium was granted the banks, providing for small payments to certain creditors and deferred payments for the greater part of their liabilities. Money was naturally very scarce during the year and several of the smaller commercial houses and a few of the more important concerns went into bankruptcy.

The Government revenues also suffered during 1921, owing to the great decrease in imports and exports, from which most of the receipts are derived in the form of import and export duties. The customs receipts for the calendar year 1921 amounted to 633,913 Argentine gold pesos and 41,304,198 Paraguayan paper pesos, compared with 997,631 Argentine gold pesos and 41,313,651 Paraguayan paper pesos in 1920.

Internal-revenue receipts on the other hand showed a slight increase over the 1920 figures, the amount for each of these years being much larger than any previous year.

Paraguay is peculiarly afflicted in the matter of currency and foreign exchange. The Paraguayan paper peso is nonconvertible paper, whose value rests fundamentally upon credits in Argentine gold. It has no foreign-exchange value except in terms of the Argentine gold or paper peso, in which currency all international transactions are negotiated at exchange rates that vary from day to day.

Government.—The legislative power is vested in a bicameral Congress, a Senate and Chamber of Deputies, the members of both being elected directly by the people. At present there are 20 Senators and 40 Deputies. The executive power is vested in a President elected for a term of four years, assisted by five ministers. For administrative purposes the republic is divided into 12 departments.

History.—Hemmed in by her stronger and more populous neighbors, Paraguay, though potentially one of the richest of the South American republics in natural resources has been hampered, since her birth as a nation, by unstable governments. The country has been in an almost constant state of unrest or political upheaval, which has retarded the increase of population, the exploitation of natural resources and the development of a general system of education to combat effectively the overwhelming illiteracy. In consequence the interior has remained largely pastoral. Shut in by her bigger neighbors, Paraguay has only two effective outlets, both of which are through foreign territory: by the Paraguay River into La Plata estuary, and over a native railway 232 miles long connecting with the national railway system of Argentina. This has helped to stifle the national aspirations for extended foreign trade with the nations of Europe and America, and has made Paraguay largely a feeding ground for the local towns just over her border. The long railway hauls across country to the ports and the fact that only vessels of comparatively light draught ascend the Paraguay River to Asuncion have handicapped Paraguay in the race for foreign commerce. This, in its turn, has tended to keep the national population down.

Paraguay has been attempting, since 1920, to place herself in the line of progressive, law-abiding nations; but the task has been difficult. Commerce and trade had to be rebuilt; public education had to be dragged out of the slough of despond; public confidence in the stability of the nation and the fitness of the Paraguayan people for self-government had to be restored; the national finances had to be placed upon a sound basis; and finally the professional, disturbing element had to be subjected to order or driven out of the country. This was the

aim of the Government inaugurated with Dr. Eusebio Ayala as President in 1920. The fight was an unequal one; but considerable progress was made. Friendly relations were established with the neighboring nations; steps were taken for the settlement of the national boundaries in dispute, especially with Bolivia; and efforts were made to solve the dominant national problem of an effective system of public education, primary and secondary, free and compulsory. As a result the attendance of students at the national university in Asuncion almost doubled between 1919 and 1923.

Paraguayan imports from the United States, which were 3,129,556 gold pesos in 1920, declined to 1,444,257 gold pesos in 1921 and declined further during 1922, owing to the entry of Great Britain and other European nations into the field following the close of the World War; and to the fact that the American exporters to Paraguay made no serious effort to retain the export trade which the war had thrown into their hands. Exports from Paraguay to the United States, however, remained practically the same in 1922 as in 1920 and 1921.

The expenditure of the Paraguayan government, which was about \$4,000,000 in 1922, was slightly more than the receipts, with a tendency to normality in 1923.

PARCEL POST. See POSTAL SERVICE, UNITED STATES.

PARK COLLEGE, a Presbyterian co-educational institution, founded in 1875 and located at Parkville, Mo. In 1922-23 it had a faculty of 23 members in the college and 5 in the academy, 366 students in the college and 99 in the academy, property valued at \$2,350,000 and an income of \$165,000. Frederick William Hawley, D.D., LL.D., is president.

PARKIN, George Robert, Canadian author and lecturer: b. Salisbury, New Brunswick, 8 Feb. 1846; d. London, England, 25 June 1922. He was principal of Upper Canada College, Toronto, from 1895 to 1902, after which he was organizing secretary of the Rhodes Scholarship Trust, residing in London. He spent a year visiting the universities and colleges of the United States and wrote articles about them. He lectured on Imperial Federation. His publications are: 'Imperial Federation' (1892); 'Round the Empire' (1892); 'The Great Dominion' (1895); 'Life and Letters of Edward Thring' (1898); 'Life of Sir John A. Macdonald, Prime Minister of Canada' (1906); and 'The Rhodes Scholarships' (1913).

PARKS, National. See NATIONAL PARKS AND MONUMENTS.

PARLATORIA DATE SCALE. See HORTICULTURE.

PATENTS. The report of Commissioner of Patents Thomas H. Robertson for the fiscal year 1921-22 shows that during that period there were filed in the United States Patent Office, Department of the Interior, a total of 113,597 applications for patents and registration of trade marks, labels and prints. The number of such applications filed during the three preceding years was: 107,656 in 1920-21; 102,940 in 1919-20, and 75,657 in 1918-19. Of the applications filed during 1921-22, 94,226 were for

patents; 17,029 for trade-mark registrations; 1,574 for label registrations, and 768 for the registration of prints. The patent applications are subdivided into 88,243 for inventions; 5,645 for designs, and 338 for patent reissues. During the year the office granted 38,083 patents on mechanical inventions; 258 reissue patents, and 2,862 design patents. It also registered 12,247 trade-marks, 1,560 labels and 541 prints. The number of applications awaiting action at the end of the year was 75,916, due, it was said, to the inadequacy of the office force to handle the tremendous increase in business. The number of amendments filed during the year was 167,014, the number of appeals on merit taken was 1,677, the number of petitions to the Commissioner was 3,242, the number of notices of opposition filed was 503 and the number of interferences declared was 2,260. The receipts of the office during the year amounted to \$2,894,286.58; disbursements to \$2,722,205.37, leaving a net surplus of \$172,081.21.

PATTEN, Simon Nelson, American university professor and author: b. Sandwich, Ill., 1 May 1852; d. Brown's Mills, N. J., 24 July 1922. Having attended Northwestern University for two years, he went to Germany in 1878 to continue his education at the University of Halle. From 1882-88 he served as principal of public schools in Illinois and Iowa, and was then appointed professor of political economy at the University of Pennsylvania, where he remained for 29 years. In 1905 he was awarded the degree of Doctor of Laws by the University of Illinois. He was well known as an author and lecturer in the field of economics and social science. He was a member of the American Academy of Political and Social Science and was president of the American Economic Association, 1908-09. He published 'Premises of Political Economy' (1885); 'Economic Basis of Protection' (1890); 'Theory of Dynamic Economics' (1892); 'Theory of Social Forces' (1896); 'Development of English Thought' (1899); 'Theory of Prosperity' (1902); 'Heredit and Social Progress' (1903); 'The New Basis of Civilization' (1907); 'Product and Climax' (1909); 'The Social Basis of Religion' (1911); 'Reconstruction of Economic Theory' (1912); and 'Culture and War' (1916).

PATTERSON, John Henry, American manufacturer: b. on a farm near Dayton, Ohio, 13 Dec. 1844; d. on board a train en route to Atlantic City as it was passing through Kirkwood, N. J., 7 May 1922. He was a son of Col. Jefferson Patterson and a grandson of Col. Robert Patterson, one of the original proprietors of Cincinnati, Ohio. As a boy he worked in his father's saw and grist mill; attended the public schools in Dayton, thereafter studied at Miami College, now Miami University, Oxford, Ohio, and in 1867 was graduated from Dartmouth College with the degree of A.B. From 1867-70 he was collector of tolls on the Miami Canal. He then engaged in the retail coal business at Dayton, later acquired an interest in coal mines in Jackson County, Ohio, and for several years was manager of the Southern Ohio Coal and Iron Company. In 1882 he became identified with the National Manufacturing Company of Dayton, Ohio, en-

gaged in the manufacture of a machine for the tabulation of sales as they were made and containing a receptacle for money. This was the beginning of the enormous industry developed by him. A year later he was made a director of the National Manufacturing Company, and in 1884 the National Cash Register Company, of which he was president and manager until a year before his death, was organized. His brother, Frank J. Patterson, was associated with him in this enterprise, as he had been in the Southern Ohio Coal and Iron Company. Mr. Patterson made the perfection and introduction of cash registers his life work. At the time of his death the plant of the National Cash Register Company at Dayton, Ohio, covered over 140 acres of ground and gave employment to over 5,400 persons. In addition to the factory employees, the sales force of the company numbered 7,500 people, and the annual output was approximately \$30,000,000. Mr. Patterson took an active interest in the welfare of his employees during his latter years, and for at least 10 years before his death was classed as a "model employer." During the Dayton flood, in 1913, Mr. Patterson spent money without stint in providing food and clothing for the flood sufferers, and erected a tent city in which to house them.

PEA APHIS. See ENTOMOLOGY, UNITED STATES BUREAU OF.

PEABODY, Mrs. George Foster, (Katrina Trask), American poet, playwright and philanthropist: b. Brooklyn, N. Y., 1857; d. Saratoga Springs, N. Y., 7 Jan. 1922. She was a daughter of George L. and Christina Cole Nichols. Her father was a direct descendant of Anneke Jans; her mother was a daughter of Jan Van Kool, who changed his name to John Cole after coming to America in the beginning of the 19th century. As Katherine Cole she married Spencer Trask, senior member of the New York banking firm of Spencer Trask and Company, 12 Nov. 1874. He was killed in a railroad accident 31 Dec. 1909, and on 6 Feb. 1921 she married George Foster Peabody, one of the executors of Mr. Trask's estate and a former treasurer of the Democratic National Committee. Several years prior to her second marriage, Mrs. Peabody announced that "Yaddo," her magnificent estate near Saratoga Springs, would, upon her death, be converted into a home for writers, musicians and other creative artists. Mrs. Peabody's philanthropies were so numerous that she came to be known as "the Beloved Lady of Yaddo." She published: 'Under King Constantine,' which, at the time of her death, had run into five editions; 'Sonnets and Lyrics' (1894, 1903); 'John Leighton, Jr.' (1898); 'Lessons in Love' (1900); 'Free, Not Bound' (1903); 'Night and Morning' (1906); 'Mors et Victoria' (1906); 'King Alfred's Jewel' (1908, third edition, 1909).—the last two were published anonymously; 'In the Vanguard' (a drama, 1913); 'The Mighty and The Lowly' (1915), and 'Without the Walls' (1919). On 15 Nov. 1922 the employees of the Trask estate presented to the city of Saratoga Springs a stairway erected in Congress Park in memory of Mrs. Peabody.

PEABODY, Josephine Preston. See MARKS, JOSEPHINE PRESTON PEABODY.

PEABODY MUSEUM OF ARCHAEOLOGY AND ETHNOLOGY OF HARVARD UNIVERSITY. The Peabody Museum added extensively to its collections during the year 1922, through explorations, by purchase, and by gifts. The greater part of the main hall of the first floor of the new section was supplied with exhibition cases, and several new collections were installed. The South American gallery was partially rearranged, and new material added. Two new house-group models of Northwest Coast Indians were prepared.

Field work in Middle America was carried on only incidentally. The expedition to Arizona continued its investigations of a group of remains first brought to light during the work of 1920-21. These appear to be of a people immediately succeeding the Basket-makers, or possibly they represent a modified or later culture of this people. Convincing evidences that these remains ante-date those of the Cliff-dwellers were found in a cave east of Marsh Pass, where Basket-maker structures and artifacts were encountered underlying Cliff-dweller structures and debris.

In addition to the excavations in this cave, a considerable range of country was explored, several new sites marked, and one Basket-maker burial cave discovered. From a burial in this cave an unusually fine atlatl or spear-thrower was taken, very similar to those used by the Mayas of northern Yucatan and the ancient Mexicans. A number of beautifully woven bags and baskets, and a variety of other artifacts were also secured.

A short expedition was sent among the Kwakiutl Indians of Vancouver Island for the purpose of securing ethnological material. Considerable collections were secured also from the tribes of southern Cameroon in West Africa, and a number of burial places of the New England Indians were investigated.

The Museum has issued three publications during the year, as follows: *Harvard African Studies*, Volume III; *Papers*, Volume VIII, Number 3, The Turner Group of Earthworks, Hamilton County, Ohio; *Papers*, Volume X, Tribes of Eastern Peru.

CHARLES C. WILLOUGHBY, A.M.,
Director.

PEACE AND ARBITRATION, International. During the year there were many organizations working in the interests of international peace. Among the special groups were the following: The Academy of Political and Social Science; l'Alliance Française; The American-Scandinavian Society; The China Society of America; The English Speaking Union; The Foreign Policy Association; The Italy-America Society; The Japan Society; The National Committee on American-Japanese Relations; The National Association for Constitutional Government.

Among the organizations devoting their attention more exclusively to the ways of peace between nations were the following: The American Association of International Conciliation; The American Group of the Interparliamentary Union; The American Peace Society;

American School Citizenship League; The American Union against Militarism; The Carnegie Endowment for International Peace; The Church Peace Union; The Committee on Educational Publicity in the Interests of World Peace; The Federal Council of the Churches of Christ in America; The Fellowship of Reconciliation; The General Committee on the Limitation of Armament; The Institute of International Education; The International Chamber of Commerce; The International Relations Clubs; The International Student Committee for the Limitation of Armament; The League of Nations Union; The American Association for International Co-operation; The National Council for the Reduction of Armaments; The Pan American Union; The Peace Associations of Friends in America; The Peace Association of Friends of Philadelphia; The Peace Committees of Various Church Federations; The Peace Committees of Various Yearly Meetings of Friends; The Society for the Abolition of War; The Women's International League for Peace and Freedom; The World Alliance for International Friendship Through the Churches; The World Peace Foundation.

The Carnegie Endowment for International Peace actively continued its work for the advancement of the cause of peace among nations and the proposal of peaceful settlements of international differences. An outstanding feature of the work of the division of intercourse in education was the continuation of aid in the reconstruction of the devastated portions of France, Belgium, Serbia and Russia. The division of Economics and History devoted its attention exclusively to the active preparation of the Economic and Social History of the World War, under the general editorship of Dr. James T. Shotwell. The division of International Law was largely occupied at the beginning of the year in assisting in the work connected with the Washington Conference on the Limitation of Armament and Pacific Problems. It also completed several large publication enterprises which had been in progress since 1918.

The American Association for International Conciliation continued its various lines of activity — including the encouragement of International Relations Clubs, a stimulation of prize essay contests and the distribution of its various publications on current international problems and treaties. The Inter-American Division continued to issue the *Inter-America*, in English and in Spanish. It also co-operated with the Department of State, The Smithsonian Institution and the Pan-American Union in the selection and appointment of delegates to the Twentieth International Congress of Americanists, which was held in Rio de Janeiro 20-30 August, prior to the celebration of the centenary of Brazilian independence. It has served as an intermediary in the application of funds received from the Carnegie Endowment to pay the expenses, wholly or in part, of five delegates to this Congress. The director of the division was one of the official delegates to the Congress and delivered a series of lectures in Uruguay and Argentina. This division also welcomed many visitors from Latin-America, including delegates to the Pan-American Conference of Women in

Baltimore and to the Tacna-Arica Conference in Washington.

The Institute of International Education with its five bureau divisions (Europe, Far East, Latin-America, Scholarships and Fellowships, International Relations Clubs) has continued its activities as heretofore. Among these were investigation of Chinese institutions, the exchange of fellowships with France, arrangement for tours of visiting professors of foreign countries, exchange of professorships, grants to professors on leave of absence, and various publications. The Institute co-operated with Italy-America Society in organizing a tour of students to Italy. Tours were also organized to France under the joint auspices of the Institute and the Federation de l'Alliance Française, to Scandinavia under the joint auspices of the Institute and the American-Scandinavia Foundation, and to Great Britain under the joint auspices of the Institute and the English-Speaking Union. The division of International Relations Clubs continued its publications, the most important being Syllabus XIII on "The Economic Situation in Europe" by Faith Moors Williams, a "Report on Education in China" by Paul Monroe, and "A Bibliography on the United States for Foreign Students" by D. S. Muzzey and others.

The Twentieth Conference of the Interparliamentary Union was held in the palace of the Federal Parliament, at Vienna, Austria, on 28-30 August. Its delegates represented 24 different nations. Its special aim is to unite in common action the members of all parliaments, constituted in national groups, in order to secure the co-operation of their respective States in the firm establishment and the democratic development of the work of international peace and co-operation between nations, by means of a universal organization of nations. Its object is also to study all questions of an international character suitable for settlement by parliamentary action.

During the year the American Peace Society continued its influence through the publication of the *Advocate of Peace* and in other ways. During the Washington Conference it circularized all the delegations with documents of the Society and co-operated with the Government in its investigations.

The American School Citizenship League, which has for one of its purposes co-operation with educational agencies in foreign countries for the promotion of international understanding, continued to encourage a serious study of world relationships through its World Essay Contest which is open to students of all countries. During the year the League conducted correspondence with about 40 countries concerning the contest. It distributed a large quantity of literature on various phases of international relations to assist speakers in preparing addresses.

The Church Peace Union, which was founded by Andrew Carnegie in 1914 to promote international friendship and good will through the churches, has published many pieces of literature dealing largely with the application of the Gospel to international relationships. It has furnished many speakers for addresses in pulpits and before associations of clergymen or church con-

ferences. It undertook a campaign in support of the treaties resulting from the Washington Conference on Limitation of Armaments. In August, it was responsible for an important conference which met at Copenhagen to discuss the problems of the world peace and at which representatives from the churches of 26 nations were present.

A similar organization, The World Alliance for Promoting International Friendship Through the Churches, created in 1914 by the action of the Church Peace Union and which is largely financed by the funds of the Carnegie Endowment, is an agency through which the Union works. The Church Peace Union is in active co-operation with several other organizations including the following: Federal Council of the Churches of Christ in America; The World Peace Foundation; The Mission Boards, and the Committee on Co-operation in Latin-America. It is also joined with other organizations in the study of Japan and the Far Eastern question and in the study of American Relations to Mexico. Believing that the best means of promoting friendship is through personal contact, it continues to send abroad delegations to visit the countries of Europe and the Orient.

The World Peace Foundation early in the year co-operated in securing support of the results of the Washington Conference. Throughout the remainder of the year it continued its educational work of supplying information and assistance to those interested in international questions. It especially expended much time and effort in distributing in the United States the publications of the League of Nations. It also associated itself with the Church Peace Union in securing support (especially among the churches) of an international program of co-operation, association and larger participation in the work of establishing international peace through world organization.

The League of Nations Union during the year produced the second Year Book of the League of Nations and also was active in forming the American Association for International Co-operation with a program of restoring American representation at the council table of the family of nations.

In November, the League to Enforce Peace, which has been rather inactive since the election in 1920, inaugurated a movement to consolidate all forces in favor of larger co-operation with Europe, believing that economic and other forces were operating to justify expectations of the success of such a movement.

The American Association for International Co-operation continued its program of education based upon the idea that the American government should resume its historical policies in favor of the settlement of international disputes by judicial methods in a world court and of co-operation with great international associations for the common welfare. It urged that the American government should accept invitations for representation on European international commissions for social welfare and reconstruction, declaring that it can co-operate fully in all these undertakings without assuming membership in the League of Nations. Late in the year it planned a national conference of friends

of international co-operation with a hope of crystalizing a nation-wide sentiment in favor of assuming obligations and responsibilities resulting from the position of the republic among the nations.

In December, the American Association for International Co-operation and the League of Nations Non-Partisan Committee voted to unite under the name "Non-Partisan Association for the League of Nations," with former Justice John H. Clarke of the United States Supreme Court, as president, with the hope that simplification of machinery and concentration of effort might "greatly accelerate the movement to place the United States in international affairs," as a member of the League of Nations upon terms consistent with the Constitution of the United States.

The Foreign Policy Association, which was formed in the spring of 1918 to encourage the study of important international questions affecting the United States and to communicate the results of such a study with a view to a better public understanding of foreign problems, has continued its program in favor of reduction of reparations, reduction of debts and reduction of armaments—which it regards as essential to the reconstruction of Europe. It urges co-operation with the League through its commission until a policy of full membership can be adopted. As a first step it urges the promotion of the unofficial American representative on the American Reparations Commission to full membership, claiming that the United States as the fifth member of the Commission would be the natural arbiter between the conflicting positions of the Allies. It insists that there can be no return of normal conditions in Europe or indeed in the world until the Russian people are again received into the family of nations. It has urged the recognition of President Obregon in Mexico, opposes armed intervention, and claims a share of credit for the gradual improvement of Mexican-American relations. Some of its most important work was done through stimulation of other groups. To co-ordinate the activities of the different groups interested in the Washington Conference it organized The National Council for Reduction of Armament, representing 32 branch organizations.

The National Council for the Reduction of Armaments during the year prepared a campaign textbook entitled "War on War" by Frederick J. Libby.

In November, after several years of study the International Chamber of Commerce, the American section of which has headquarters at Washington, completed plans for the establishment of a new international court of arbitration for the prompt and economical settlement or adjustment of commercial disputes between different countries—a court independent of all agencies established by Governments, administered from the headquarters of the International Chambers at Paris and composed of representative business men chosen from 28 nations, including the United States. The court appoints one arbitrator to try each case submitted to it, unless the parties concerned desire the appointment of two arbitrators and one umpire, or of three arbitrators. It also determines the country or town in which the arbitration shall be conducted.

Among the most important meetings of the year for discussion of international problems was the second session of the Institute of Politics at Williams College in August. Each of the four leaders of conferences on the rehabilitation of Europe presented constructive programs for alleviations of the European situation, including especially the economic adjustment of the German reparations problem, rectification of public finances, elimination of trade barriers and adjustment of the interallied debt problem. In a noteworthy address at the concluding session Dr. B. M. Anderson proposed that Great Britain and the United States as creditor nations, in consideration of economic reforms and settlements by the countries of continental Europe, should be willing to cancel all debts owed to them by the continental Allies. To part of this proposal, Oscar T. Crosby, as leader of the conference on interallied debts, raised a dissenting voice.

The Pan-American Union, the international organization of 21 American Republics, which maintains an office at Washington administered by a Director General and an Assistant Director, had many notable activities for the year 1922. The Section of Education rendered a variety of services to educational officials in Latin-American countries. It devoted much time to furthering the interchange of teachers and students between the Americas, and particularly to looking after the interests of Latin-American students in this country. It also distributed various publications and answered numerous inquiries concerning educational institutions and various modern social agencies, etc. The Counselor's office gave special attention to the development of Latin-American study among the women's clubs of the United States and also prepared press releases for distribution to the newspapers of the Americas. For commercial purposes the Union is in touch with government officials, commercial organizations, manufacturers, merchants, exporters and importers, and shipping interests, in both North and South America, doing all it can to facilitate the building up of trade among the American nations. Along general lines it is in touch with men in public life, editors, newspaper men, college presidents, professors, students, scientists and travelers, supplying information tending to increase interest in and knowledge of the twenty-one American nations. The Statistical Division published the annual review of the trade of Latin-America, and prepared articles on various phases of Latin-American commerce which were published in the *Bulletin*. During the year the Financial Section was established to keep in touch with the movement of capital in Latin-America and to Latin-America. The Columbus Memorial Library proved increasingly useful to members of the embassies and to students and authors. Special numbers of the *Bulletin* in Spanish and Portuguese editions devoted to subjects of common importance to the nations of the American continent were continued. The Union also proved useful in the preparation of programs for important Pan-American International Conferences held at Washington, Mexico, Rio de Janeiro and Buenos Aires, and also for an additional conference to meet at Santiago, Chile, in March, 1923.

Conducted in close co-operation with the work of the Union are the activities of the Inter-

national Sanitary Bureau, under the resolutions of the International Sanitary Conference, and including the publication of its *Bulletin Panamericano de Sanidad* which contains articles of interest to health officers in the countries of Latin-America.

A new plan for a "World Association of States," to be superimposed on the League of Nations and the Pan-American Union and designed to draw in nations not members of either, was submitted to the Institute of International Law at its meeting in Grenoble, France, 28 August 1922, by Professor Alejandro Alvarez of Chile. The plan was approved by the Twenty-seventh Commission of the Institute in executive session at Paris late in 1922. It assumes that the League of Nations is inadequate as a world power, and proposes to retain it purely as a European organization. The same principle applies to the Pan-American Union.

One of the most important and hopeful facts bearing on the work for peace during the year was the activity of the foreign offices of the world in efforts to settle disputes and to arrive at better understandings.

The Permanent Court of International Justice which was first definitely planned by Elihu Root and Dr. James Brown Scott and finally established by the League of Nations on 13 Dec. 1920 as its agency for settlements of disputes, was formally opened at The Hague on 15 June, rendered its first decision on 31 July and closed its first session on 10 August after settling two disputes. (John Bassett Moore was chosen as the American member.) On 2 August the Council of Ambassadors decided to submit the Kiel dispute to the Court for settlement.

Although America rejected the League of Nations Covenant, she continued to favor international arbitration as the surest road toward international understanding. Highly significant in this connection was the reopening of the British-American Claims Commission which under the treaty of August 1910 had only begun its work when the World War suddenly interrupted its activities. Even more significant was the agreement of June 1921 with Norway for arbitration of certain important claims arising from certain requisitions by the United States Shipping Board Emergency Fleet Corporation in the World War. Under the treaty each government appointed one arbitrator and the President of the Swiss Confederation named the third. Chandler P. Anderson was named by the United States and Paul Benjamin Vogt by Norway. This was the first important arbitration with direct bearing upon the war. Its importance was due not only to the amount of money involved but also to certain legal questions the decision of which was likely to establish significant precedents. In October, The Hague Court of Arbitration decided that the Norwegian ship-owners (Christoffer Hannevig and others) from whom vessels were requisitioned were entitled to \$14,000,000. Counsel for the United States stated that the Court had exceeded its authority and that its award was not in accord with the evidence. The State Department will determine whether the award will be accepted. If accepted the principle established will open the way for new claims aggregating \$75,000,000. In Febru-

ary 1923 Secretary Hughes sent a draft of \$12,239,852.47 in full for damages awarded, and thus supported the principle of arbitration, but at the same time dissented from the reasons expressed in the opinion of the majority of the tribunal and denied that the opinion could be regarded as authoritative or as a precedent.

On 31 Dec. 1921, the United States resumed relations with Germany by reception of Karl Lang as chargé d'affaires. On 10 August the two nations signed an agreement at Berlin for settlement of American war claims by a mixed commission composed of one member from each country and an umpire. This commission was fully organized for business by the close of the year. Its work was made easier by the readiness of the German government to adjudicate all meritorious claims and especially by its readiness to admit full liability for damages, both personal and property, arising from the sinking of the *Lusitania* by submarine craft—an admission which amounted to a plea of guilty to the commission of an unlawful act.

As a result of the Washington Conference a commission appointed to discuss amendments to the rules of war (under the terms of the Washington pact) began its sessions at The Hague on 11 Dec. 1922.

Several events of the year indicated the prospect of improved relations throughout the Western Hemisphere. In several ways the United States used its influence to promote international understanding. The American treaty with Colombia which undertook to settle all differences concerning Panama was ratified by Colombia on 24 Dec. 1921 and by the United States on 2 March 1922. It was proclaimed on 30 March. Mexico seemed to be returning to stable conditions and to a sense of international duty and responsibility. From a series of diplomatic discussions, under influence of the American government, emerged a plan for settling the long-standing Tacna-Arica dispute arising from the treaty of Ancon (of 1883) and involving Chile, Peru and Bolivia. On 17 January—following the failure of Chilean proposals to Peru for settlement by direct negotiation and by a plebiscite and the later agreement of Chile to arbitrate—Secretary Hughes invited the two countries to send representatives to Washington for a conference to arrange a settlement of questions arising from the treaty of Ancon. Chile accepted on 18 January and Peru on 19 January. On 15 May the Conference was begun. On 16 May Bolivia presented a plea for participation which both Chile and Peru on 22 May declined to consider. On 7 June Chile decided the arbitration must be limited to the method of the plebiscite and refused to arbitrate whether the plebiscite should be held. On 23 June, Secretary Hughes submitted a plan of arbitration which was accepted by both disputants. Peru did not wish a political arbitration, but desired a judicial solution of the problem through a competent technical body such as the United States Supreme Court or the Permanent Court of The Hague. She would have preferred to submit the dispute to the League of Nations if the United States had been a member of it. On 8 July, she proposed to Peru, in case of their failure to agree upon a settlement to submit the

dispute for a settlement through the good offices of the United States. This Chile accepted. On 20 July, the representatives of the two countries signed at Washington the Tacna-Arica arbitration protocol (and also a supplementary act on the plebiscite) referring the long standing territorial dispute to President Harding for final arbitration. This was regarded as a signal triumph for the principle of arbitration. The agreement to arbitrate was ratified by the Peruvian Congress on 13 September by a vote of 94 to 8. In Chile it produced considerable friction in the government, causing members of the cabinet to offer their resignation, which, however, President Alessandri refused to accept. Finally at noon on 15 January, following the ratification (by both countries) of the protocol (and also of the supplementary act submitting to arbitration the question of the plebiscite) ratifications were exchanged at the Pan-American Union at Washington. On 30 Jan. 1923 President Harding accepted the invitations of Chile and Peru to act as arbitrator.

On 20 September, Bolivia and Chile failed to agree on terms for revision of the treaty of 1904, Chile refusing to negotiate regarding a Pacific port for Bolivia.

During the year new steps were taken to improve the situation in Central America where an arrangement for a federation had been repudiated by Guatemala in December 1921 and had broken up on 2 February, on the eve of the expected birth of the proposed union. On 22 August following political troubles which threatened to result in war, an important meeting of the presidents of Nicaragua, Salvador and Honduras occurred on board the United States ship *Tacoma* in the Gulf of Fonseca in order to concert measures looking to the establishment of more peaceful relations in Central America. At this meeting these three presidents signed a renewal of the general treaty of peace and friendship of 1907—a treaty with the governments of Costa Rica and Guatemala later definitely recognized as still in force. A few weeks later, the American government, gratified at this action and believing that friendly relations could further be assured by exchange of views and recommendations, invited the governments of the five Central American republics to send their Plenipotentiaries to Washington for a conference on Central American affairs and proposed the negotiation of new treaties to insure permanent peace and co-operation among the Central American states, the adoption of effective measures for limitation of armaments in Central America, efforts to establish an international tribunal for the amicable adjustment of disputes which diplomacy might not be able to settle, and the consideration of other questions which might be unanimously discussed. All accepted promptly. At the conference which met on 4 December, they agreed on "Pan-American solidarity" but they split on the issue of federation which was proposed by Honduras as a subject of first consideration. The conference had not completed its work at the close of the year, but by 12 Jan. 1923, its subcommittees had agreed upon all points submitted in the American invitation. The conference adjourned 7 Feb. 1923 with 12 treaties and conventions, and three protocols to its credit.

Several Latin American arbitrations or arbitration treaties were completed during the year. On 7 Feb. 1922, under a treaty of 12 January, arrangements were made by Great Britain and Costa Rica to submit to Chief Justice Taft, for arbitration, differences arising over certain petroleum concessions to a British financial group. On 24 March 1922, the Federal Council of Switzerland submitted a report of 150 pages and rendered its award upon certain long pending boundary disputes between Colombia and Venezuela which earlier had been submitted to the crown of Spain by an arbitration treaty of 1881 and decided in 1891 but, because of failure to mark the frontiers, had not been eliminated. The Swiss decision was in favor of Colombia. On 16 January Colombia ratified a general arbitration treaty of 13 Nov. 1918 with Bolivia. On 15 February ratifications of a general arbitration treaty signed 18 July 1917, by Peru and Uruguay were exchanged. A general arbitration treaty between Spain and Uruguay signed at Madrid, 23 March, was approved by Uruguay on 15 June.

The program arranged for the fifth international ("Pan-American") conference of American states to be held at Chile in March 1923 included consideration of plans for co-operation in the improvement of all means of communication, measures tending toward closer association of the American republics for promotion of the general welfare and wider application of the judicial or arbitral settlement of their disputes, bases for limitation of military and naval expenditures and questions arising from encroachments from a non-American power.

In November, in connection with the preparation of the program, Uruguay proposed a Pan-American League of Nations and obligatory arbitration among the American republics, and Chile proposed a plan for reduction of armaments "in equal proportion" on the American continent. As substitutions Secretary Hughes proposed "a close association of American republics to promote mutual interests," a declaration favoring "judicial settlement" of all questions arising between the American republics, and reduction of armaments in a "just and convenient manner."

Canadian-American relations continued friendly. On 7 January the Great Lakes and Saint Lawrence ocean ship canal project was approved by the International Joint Commission in a report to the State Department at Washington and to Canada. On 17 May the United States Government notified Canada it would be glad to negotiate a treaty to deepen the Saint Lawrence waterway. On 12 July, Premier W. L. McKenzie King, of Canada, and G. P. Graham, Minister of Defense, proposed to Secretary Hughes at Washington to extend the Rush-Bagot agreement of 1817 by a permanent treaty for low armaments and border peace.

During the year 1922 several international conferences, together with a series of complicated and difficult negotiations expressed a renewed endeavor to secure better understanding and closer co-operation of governments which had co-operated to end the World War.

At the beginning of the year, the Washington Conference on Reduction of Armaments, a part of the great movement for adjustment

which began with the Armistice of November 1918, held the center of the international stage. Its open diplomacy attracted the attention of the world. Considering its net practical results as expressed in definite treaty agreements, it was successful beyond all expectations. It was founded upon the fact that all parties in interest were at peace and was especially marked by an Anglo-American accord which could be made the basis or nucleus of an association for wider regulation of maritime affairs and greater limitations of naval armaments. Perhaps its greatest triumph was the elimination of the Anglo-Japanese Alliance and the substitution of a four-power agreement which satisfied British and Japanese requirements "without exceeding the limits of the traditional foreign policy of the United States." It eliminated all apparent danger, and greatly reduced mutual misunderstandings and apprehensions which threatened to result in expensive naval rivalry if not in actual hostilities. It substituted the rule of reason for the rule of the sword. While the new international court was assuming its robes of dignity at The Hague, the Washington Conference was strengthening its hands by restating sound principles of the law of nations, and by providing for the appointment of a commission to consider and report upon the condition and requirements of international law affecting new agencies of warfare. On 6 February it closed with the signing of five treaties: (1) The Four-Power Pacific Treaty; (2) The Naval Limitation Treaty; (3) The Treaty Regulating Submarines and Poison Gas; (4) The Nine-Power Treaty Relating to International Policy toward China; (5) The Treaty Relating to Chinese Tariff Revision.

All were ratified by the American Senate by the close of March, following somewhat extended debates on the Four-Power treaty. In the April meeting of the American Society of International Law, Hon. Elihu Root said of the Four-Power treaty: "I doubt if any formal treaty ever accomplished so much by doing so little. It provided that we should all respect rights which we were bound to do already."

President Harding promptly stopped further naval construction and also fortification work at Guam and the Philippines.

Elihu Root in referring to the influence of the Conference later said: "The time has not yet come when international affairs are sufficiently settled to make immediately practicable a general conference to consider, clarify, extend and strengthen the law of nations, but it is already high time for those who believe in a world controlled by law to begin their preparation for such a conference, and the Washington Conference on Limitation of Armaments, as a by-product of its own special work, has contributed materially toward that preparation."

In December 1922, in his annual message to Congress, President Harding said: "The Four-Power pact, which abolishes every probability of war on the Pacific, has brought new confidence in a maintained peace, and I can well believe it might be made a model for like assurances wherever in the world any common interests are concerned."

Even before the close of the Washington Conference, the League of Nations (represent-

ing 51 nations) began work on an ingenious plan for a 50 per cent reduction of the armies of European countries exclusive of Russia. Early in July, its mixed Commission on the Reduction of Armaments at a Paris session in connection with Lord Cecil's plan for a collective guarantee considered also Rear Admiral Seagraves' proposal for extension of the Washington naval convention to all members of the League. On 7 September following the opening of the third session of the League of Nations Assembly, the Commission proposed the extension of the Washington treaty. Lord Robert Cecil, in presenting to the League Assembly a land disarmament proposal through regional agreements, stated that 24 European powers had refused to disarm because of fears of aggression. However, Britain reported a 55 per cent reduction of her navy, France 36 per cent, Italy 49 per cent and Japan 50 per cent. France, Poland, Japan, Sweden and Switzerland reduced their armies. The French army was reduced to 690,000 men. Poland demobilizing 1,000,000 retained only 260,000 men.

The League's Temporary Commission, appointed to consider and arrange reduction of national armaments, continued its work on proposals but under existing conditions (without wider co-operation) was unable to accomplish much.

On 2 December, the Moscow Conference on Limitation of Armaments in Eastern Europe was opened. The states represented were Soviet Russia, Poland, Finland, Latvia, Estonia and Lithuania. In opening the Conference the Soviet Commissary of Foreign Affairs followed the precedent set by Secretary Hughes, at the Washington Conference, by submitting a definite proposal which formed the basis of discussion.

Among the other prominent international conferences to consider world problems, were the Genoa Conference and the Lausanne Conference. Others of less prominence were held at Ghent, London and Paris.

INTERNATIONAL CONFERENCES OF EUROPE.

The Washington Conference was the preliminary to another prominent international conference dealing with larger issues and concerning more countries. Encouraged by the successful methods of the Washington Conference, the principal Allied governments reached a decision at Cannes to call a European economic conference at Genoa. The American government declined an invitation to participate, apparently regarding the conference as inter-European and as political rather than economic. This decision was one of immediate tactics rather than of fundamental policy.

The Genoa Conference which met on 10 April, primarily to consider the Russian economic situation, but also with hope for a 10-year European compact of non-aggression similar to the recent Pacific pact concluded at Washington following the conference for the reduction of armaments, absorbed the attention of all Europe, and of other countries also, for several weeks. It was another effort in the direction taken by President Wilson in the League of Nations — an effort to substitute a general system of international association for the older idea of alliances. It was planned to be a Pan-European assembly to agree upon adjustment as guaran-

tees of future peace. It proved, beyond all else, a battle between British and French necessities—between the opening of markets and provision for French financial and military security. Lloyd George brought reluctant France to Genoa by pledges that nothing but the economic reconstruction of Russia would be discussed. He went with a firm desire to promote disarmament of land forces. France, however, desired to postpone disarmament until the situation in Germany and Russia would warrant such a risk. The French view had the support of the new European states which by their location feared German or Russian attack. At the beginning of the Conference, Lloyd George promptly informed the Russian representative that Russia must recognize all her debts, assume liability for foreign property confiscated by the Soviets and abandon fantastic claims against the Allies. He soon received a sudden surprise which temporarily paralyzed his plans for peaceful adjustments. On 17 April the German and Russian representatives created consternation and anger among the Allies by concluding a two-party treaty cancelling indemnity claims and pre-war debts, restoring diplomatic relations and abrogating the Brest-Litovsk treaty and apparently threatening (by a Russo-German combination) to reverse the decision of the World War. The Allies promptly informed Germany that she must not participate in further conferences with Russia, and later gave notice of reserving the right to nullify any clause of the Russo-German treaty which might be found contrary to existing treaties.

Failing to reach an agreement with Russia, and finding that the Conference had reached a deadlock while Soviet Russia boldly dominated the situation, the powers which called the conference planned (by 15 May) to invite all governments represented at Genoa to meet at the Hague on 15 June to make another attempt to adjust the Russian economic situation. The American government was invited to join the new parley on Russia, but declined (15 May) mainly on the ground that the proposed conference seemed to be "a continuance, under a different nomenclature, of the Genoa Conference and destined to encounter the same difficulties." Secretary Hughes considered the Conference useless so long as Russia maintained the attitude of her note on 11 May to the Allies, repudiating national and international debts. The American Debt Commission, however, agreed to defer all important negotiations until the termination of the European Conference.

On 15 May the Genoa Conference ended. Its chief useful act was the arrangement of an eight-months' truce with Russia which probably prevented a Polish or Rumanian campaign for the year. In its effort to bring Russia back into the economic circle, it completely failed.

The cause of the Genoa failure was partly due to the suddenness with which the proposal was launched by Lloyd George after his talk with M. Briand at Cannes. But the larger, fundamental cause was deeper. It really appeared in the fact that between Russia and the Western nations there still existed a gulf which neither side was willing to see bridged by sweeping concessions. Russia stiffly refused to sacrifice her fundamental doctrine which rejected

the idea of property. The Western nations were equally unwilling to recognize the Russian communistic ideas. Lloyd George's situation as leader was also greatly weakened by the absence of the United States. In a speech in the House of Commons, after his return from Genoa, he asserted that the abstention of the United States had complicated the whole problem of reconstruction, contributed to the failure at Genoa, and handicapped disastrously the British policy of moderation.

On 15 June the allied delegations met at The Hague to discuss the economic situation in Europe—especially as related to Russia; but on 14 July they decided to have no further meetings with the Russians unless the Soviet representative wished to submit new proposals.

In the meantime, late in May, the question of German reparations became acute. The Reparations Commission fixed the sum at \$33,000,000,000 of which \$12,500,000,000 was to be delivered at once in two series of bonds. At first, Germany refused; but, tempted by conferences among international bankers, decided to withdraw her refusal to comply with the orders of the Reparations Commission and thereby relieved a very dangerous situation which threatened the peace. Early in 1922 she appealed to the Commission for a moratorium which was granted on condition that she reorganize her fiscal system. At first she refused to accede to the conditions, but, under threat of French action and with expectation of obtaining a large international loan, she surrendered and accepted the Commission's ultimatum which was to expire on 31 May. On 31 May 1922 the Reparations Commission, approving the German reply to its ultimatum, unanimously granted a provisional moratorium for 1922. On 12 July Germany requested a moratorium on indemnity payments for a term of three years.

All nations agreed that Germany must make to France such payments as were possible and lay aside the purpose of revenge and reconquest which continued to justify French fears of the future; but Britain and Italy while agreeing that Germany must admit her defeat and accept the consequences thereof especially recognized the vital importance of her recovery and liberality in the adoption of plans to that end provided a way could be devised to protect Germany's neighbors from German attack or to assure Germany's creditors against German default.

The problem of Allied debts to America was closely related to the question of reparations. Early in the year (9 February) Congress, in opposition to the wish of the President passed a bill creating a commission for refunding of foreign (Allied) debts, placing the interest at 4½ per cent—providing for their payment within a period of 25 years and prohibiting their cancellation. This action was regarded in Europe as a postponement of the settlement of the question of reparations and probably a postponement of the return of prosperity. Some hoped for cancellation of the Allied debts due America, although such cancellation would have involved the payment by American tax-payers of an additional \$685,000,000 annually for a period of 25 years. On 30 July, conferences were begun at Washington with a view to the

adjustment of the war debts of France and England. On 1 August Great Britain asked her Allies for payment of a part of their debts equal to what she would be required to pay America, although she preferred a general cancellation if America would join in the plan.

The Balfour note, issued on 1 August, a week before the beginning of the London Conference and addressed to all countries owing debts to Great Britain as a result of war loans, intimated that the United States, by its act of Congress 9 February, was standing in the way of any settlements by failing to cancel the indebtedness of the allied governments. It favored the complete elimination of all inter-allied debts by one general transaction, indicating that there could be no British cancellation of European debts without an American cancellation of British debts. It stated that Great Britain would cancel \$12,000,000,000 due her if America would cancel \$5,000,000,000 due America from Britain. American public sentiment did not seem to recognize any obligation to cancel and appeared rather indifferent to what was regarded as an attempt to stampede it into unreasonable prodigality, although many suggested that American cancellation might be necessary and expedient as a co-operative measure to prevent any collapse of Germany which might result in American disadvantage.

The London Conference of the Inter-allied Council, called to deal with the whole German problem closed on 14 August in disagreement on all points. It accomplished nothing on reparations reduction, nor war claims nor debt cancellation except to emphasize differences in viewpoint between the British and French premiers. It failed because the Balfour note of 1 August excluded the question of inter-allied debts. The whole problem returned to the hands of the Reparations Commission which had to act upon the German application for a moratorium in reparations payments—an application which was denied. British policy, determined largely by British economic necessities requiring the restoration of the German market and the stabilization of German currency, centered in efforts to reduce German reparations and remove French fears. French policy, which had started with the conception that Germany would not pay unless compelled by force, centered on demand for British cancellation of French debts as the first condition to French reduction of the German reparations.

Without some compromise there was apparently no chance that British trade would be restored or that France would receive any considerable reparation, and probably no European country except Great Britain would be able to pay its debts to the United States. Under such conditions, combined efforts to secure the call of a new international conference at Washington to consider reparations and allied debts and to bring peace to a troubled world were expected, and many recognized as the chief prerequisite of the success of such a conference the American cancellation of loans made to the Allies.

In December, at a conference of premiers representing the Allies, England submitted a proposal which granted Germany a moratorium

of several years and in substance would have materially reduced the amount of war indemnity required of Germany, but this proposal and also a compromise proposal offered by Italy was rejected by France and Belgium. Thereafter, under the terms of the treaty with Germany, France (with the aid of Belgium) claimed the right to take steps to force payment from Germany by occupation of rich German territory in order to collect the revenues.

The world situation seemed to grow worse and more threatening. Europe still sitting among her ruins was apparently helpless and almost hopeless. The oppressive menace of the situation found expression in Senator Borah's Senate resolution proposing that the President call a world conference to consider economic and disarmament problems with the hope of breaking the reparation deadlock.

By 15 December the fear of an impending European crisis resulting from final disagreement between the Allies on the question of the German indemnity awakened the American government to the seriousness of the situation and produced forecasts of a new economic conference in which America would participate—forecasts reflected in the American Congress in the proposal of Senator Borah which was intended to bring pressure upon the administration. Apparently Secretary Hughes, recognizing that the adjustment of the reparations question was fundamental to European revival and prosperity and to international peace, had already undertaken by diplomatic moves to exert an influence in the reparations negotiations and to intimate that the American government was willing to consider a plan whereby it might aid in the settlement of the reparations questions in the interest of the general economic situation in Europe; and in a public address on 28 December he recognized that the questions of German reparations are world problems which could not be disposed of by calling them European, and pointedly and significantly declared that the United States "would view with disfavor forcible measures which instead of producing reparations would threaten disaster." By 29 December the purpose of the American government to propose an international inquiry by financiers and economists to determine by a scientific survey the amount of money which Germany could pay seemed certain in case the allied premiers should fail—as eventually they did fail—to agree upon the settlement of the reparations issue at their Paris meeting of 2 Jan. 1923.

On the night of 30 December following the public announcement of Secretary Hughes' plan, the European governments after a month's conference at London prepared to make a last effort to settle their reparations problem at a Paris conference. Great Britain and other powers regarded with favor Secretary Hughes' suggestions but waited to hear from France, the nation which held the key to the whole reparations situation, and which was inclined to reject any plan which did not provide for forcing German payments. The main questions were in regard to whether an extension of the existing brief moratorium would be granted to Germany and upon what terms. France insisted upon seizing production resources as guarantees. The British

disapproved stern methods or penalties. Failure of the conference which had been generally predicted occurred within a week; and the French occupation of Essen,—the first phase of plans for seizure of the rich Ruhr region seemed certain.

At the close of the year there was no movement of greater promise than that of the American government in offering co-operation with Europe for purposes of honest reconstruction.

A new phase of the international problem of peace adjustment in the near East was presented by the military successes of the Turkish Nationals under Mustapha Kemal Pasha who, refusing to be bound by the unratified Treaty of Sevres, and ignoring the Sultan's government, had set up a government of their own at Angora in Asia Minor and had proceeded with a well equipped army to regain the territory lost as a result of the Sultan's defeat in the World War. A crisis was precipitated by their occupation of Smyrna on 9 September and the subsequent expulsion of the Greeks from Asia Minor and advance on the Dardanelles where they found British troops blocking their plans to regain possession of Thrace and the control of the straits. With the Turks back at the straits, all the old intrigue and maneuver of the past two centuries threatened to reappear. For a short time, their action and their demand for the restoration of Constantinople which had been placed under the joint control of England, France and Italy, threatened to result in war with the Allies; but following an armistice an agreement was finally made to hold a peace conference at Lausanne to settle the Near East problems which were not settled at the Paris Conference following the World War, nor by the treaties resulting therefrom.

The Near East Conference at Lausanne developed several surprises. Although a peace conference, it attracted wide attention as a great diplomatic battle between rival powers to determine the control of the Mediterranean and the Near East. It was as nearly representative of all the great world powers as any international conference had ever been. Turkey held the centre of the stage. Distant Japan had a seat, Russia was actively represented. The United States, officially a mere observer, was really an active participant. The only notable absentee was Germany. The conference opened on 20 November. Its "full members" were Great Britain, France, Italy, Turkey, Greece, Rumania, Japan and Yugoslavia. Representatives of Russia, Bulgaria, Georgia and Ukraina were present for discussion of matters affecting the Black Sea. The United States although it declined to participate in earlier conferences and although committed to non-interference in European affairs, was represented by two chief observers, Richard W. Child, Ambassador to Italy, and Joseph C. Grew, Minister to Switzerland, and by an "associate observer" Rear-Admiral Mark L. Bristol at the head of a staff of experts. The American government although it declined to assume responsibility for the "political and territorial adjustments to be effected," or to participate in the final negotiations, recognized its interests in Turkey and insisted upon the right to representation on all commissions and committees arranged by the conference and

the right to be heard both openly and in the secret sessions. Its representation was used as a lever by Turkish representatives in demanding the admission of Russian delegates who although present at Lausanne had not been invited to participate in the deliberations. Its observers played a conspicuous role which aroused both hope and fear of a larger American participation in European affairs. Ambassador Child, especially, stated definitely and forcefully, in Rooseveltian style, the American policy on points of controversy between the Western powers and the new Turkey which had replaced the deposed Sultan. He helped to clarify a real international issue—an issue vitally related to the problem of peace. On 25 November he boldly emphasized the American policy to protect its rights and to assure the open door in Turkey and Mesopotamia. On 1 December he declared America's agreement with the Allies against the abrogation of the Capitulations (concerning extra territorial concessions, etc.). On 6 December he declared in favor of the Allied doctrine of the open Straits (unrestricted access of all nations) between the Black Sea and the Aegean. He also announced America's agreement with Lord Curzon's statement in favor of guarantees of safety for Christian minorities in Turkey. Many thought that the logical consequences of such announcement of policy would be American co-operation in the maintenance of the policy and resumption of a larger participation at the council table of Europe. It was understood that the United States looked with favor on the proposition for an international trusteeship of the Straits by means of an international commission of control or some similar regime. It was suggested at Washington on 6 December that the attitude of the Turks, in making it clear that their national government would be disinclined to accept any sort of international supervision over the Straits in which the United States did not participate, might increase the likelihood of America's accepting membership in a Straits commission.

The conference was a succession of near understandings disrupted by new claims, new proposals or new positions which defeated agreement. By the Turks' continuous opposition to extraterritoriality (consular courts) and to proposals for insuring the freedom of the Straits, and their demand for Mosul which Great Britain could not consider, it was finally brought to a deadlock. The Turks' chief reliance was the division of the Allies and expectation that British public opinion would oppose a new war. The arrival of the Soviet Russian representative, M. Vorovsky, was followed by a series of developments which indicated that the conclusion of the peace conference might be followed by a Turko-Russian alliance. Early in December appeared the press rumors (probably exaggerated) that Germany had concluded a "secret military agreement with Russia" as part of an active plan for a war of revenge, mainly against France, and that the peace of the Near East was hanging in the balance (the pivot of which was the Russian support of Turkey). As the new year opened, although the conference was in a delicate situation, and its success or failure seemed to depend largely upon the developments of the reparations conference at Paris and the new democratic de-

bate in the Turk assembly at Angora, real progress was being made and the co-ordination committee was actively at work drafting a preliminary treaty which was expected to be signed within three weeks. Although war clouds ominously hung over various parts of Europe, leading statesmen stimulated by memories of the bitter experiences of the World war were determined to find peaceful adjustments of questions at issue and they felt encouraged by such incidents as the withdrawal of the Japanese from Shantung and the complete restoration of Chinese rule in Kiaochau (on 10 December).

JAMES M. CALLAHAN,
*Professor of History and Political Science and
Dean of the College of Arts and Sciences,
West Virginia University.*

PEACH BORER. See ENTOMOLOGY,
UNITED STATES BUREAU OF.

PEACHES. According to the United States Department of Agriculture, the 1922 peach crop of the United States totaled 56,705,000 bushels against the 1921 crop of 32,602,000 bushels. California led in 1922 with a crop of 17,500,000 bushels. Georgia produced 4,900,000 bushels; New York, 3,400,000; Missouri, 2,300,000; Oklahoma, 2,070,000; Arkansas, 2,040,000. See also HORTICULTURE.

PEACHMOND. See HORTICULTURE.

PEANUTS. The 1922 peanut crop of the United States was estimated by the Department of Agriculture at 623,507,000 pounds compared with the 1921 crop of 829,307,000 pounds and the 1920 crop of 841,474,000 pounds. The decline in production was attributed to unfavorable weather conditions and to decreased acreage, the area for the three years being 986,000 in 1923; 1,214,000 in 1921, and 1,181,000 in 1920. The yields in the commercial sections of Virginia, Alabama, Georgia and Texas were especially light, that of the first mentioned State being rated at not more than 60 per cent of its normal. Shipments of crude peanut oil, exceeded 20,000,000 pounds. Texas and Arkansas, in 1922, shipped 23,000,000 pounds of Spanish peanuts, an increase of more than 50 per cent over their shipments for 1921. Imports of peanuts into the United States during the fiscal year ended 30 June 1922 totaled 10,803,221 pounds, compared with 47,989,230 pounds for the fiscal year 1920-21. Practically all of the imports came from China. Exports of peanuts during the fiscal year 1921-22 totaled 12,857,722 pounds, compared with 13,149,417 pounds in 1920-21. Imports of peanut oil during the fiscal year 1921-22, amounted to 2,878,076 pounds compared with 18,678,181 pounds in 1920-21. Most of this oil came from Hongkong, France and England. Exports of peanut oil in 1921-22 totaled 1,802,221 pounds compared with 1,594,643 pounds exported in 1920-21. An interesting development during the year was the collapse of the Peanut Growers' Exchange, Inc. of Norfolk, Va.—the so-called peanut trust—and its reorganization under the name of the Peanut Growers' Association. The production of peanuts in Japan during 1922 amounted to 13,228,000 pounds. The amount available for exportation was estimated at 6,614,000 pounds.

PEARS. The Department of Agriculture estimated the 1922 pear crop of the United

States at 17,772,000 bushels, an increase over the 1921 crop of about 7,000,000 and approximately 900,000 bushels in excess of the crop of 1920. With respect to commercial shipments, California, surpasses all other States, averaging around 4,400 cars annually—twice as many as New York and Washington ship. California, also, invariably leads in production while New York and Washington frequently alternate for second and third places. In 1922, California shipped approximately 6,000 carloads, thereby exceeding its average. New York shipped 5,000 cars while Washington dropped to 2,500 cars. Oregon and Michigan shipped 1,800 cars each. These five States supply approximately 90 per cent of all pear shipments. Production of pears in the leading producing States in 1922 was as follows: California, 5,000,000 bushels; New York, 2,883,000 bushels; Washington, 1,760,000 bushels; Oregon, 935,000 bushels; Michigan, 672,000 bushels; Pennsylvania, 576,000 bushels; Illinois, 510,000 bushels; New Jersey, 504,000 bushels; Missouri, 450,000 bushels; Ohio, 450,000 bushels, and Texas, 390,000 bushels. See also HORTICULTURE.

PECKHAM, William Clark, American physicist: b. S. Royalston, Mass., 13 Aug. 1841; d. Brooklyn, N. Y., 3 Oct. 1922. He served in the Civil War from 1861 to 1862 as a private in Company H of the 23d Massachusetts Regiment. He was graduated from Amherst College in 1867; studied at Union Theological Seminary 1871-72 and took the degree of A.M. at Amherst in 1873. From 1875-96 he was professor of mathematics and physics at Adelphi Academy, Brooklyn, and thereafter until his retirement a few months before his death was professor of physics at Adelphi College. For nearly 15 years he was a science lecturer in the Free Lectures for the People given by the Board of Education of New York City. After 1897 he was a member of the editorial staff of *The Scientific American*, contributing editor after 1921. A member of the G. A. R., he was commander of Ulysses S. Grant Post of Brooklyn in 1910, assistant adjutant general of the Department of New York in 1918 and adjutant general from 1921-22. He was a Fellow of the American Academy of Arts and Sciences, of the American Physical Society and of the Brooklyn Institute of Arts and Sciences.

PEEBLES, James Martin, American physician: b. Whittingham, Vt., 23 March 1822; d. Los Angeles, 15 Feb. 1922. After graduation at Oxford Academy, N. Y., in 1841, he studied medicine in the Pennsylvania University of Medicine and Surgery. For four years he was president of the California College of Science and for three years professor in the Eclectic Medical College, Cincinnati. He was also the owner and editor of several newspapers. He circumnavigated the globe five times and lectured in Oriental countries. He was a member of the Indian Peace Commission in 1868; United States consul to Trebizond, Turkey, in 1869; and represented the United States Arbitration League at the International Peace Commission of Europe, Paris. Dr. Peebles was a member of many hygienic, health and psychic research societies; was world missionary at large, from

the United States; was founder and president of Peebles College of Science and Philosophy (1914); of the California Centenarian Clubs (1915) and president of the California Humanitarian League (35 reform associations). He celebrated his 99th birthday, March 1921, and wanted less than 40 days of attaining his 100th year. He considered the chief cause of his long life was abstinence from eating animal flesh: "One cannot strengthen life by living on death." He said he preserved his faculties to the end, and his long white hair worn nearly to his shoulders gave him a venerable appearance. Before the Civil War he had served as pastor of the Universalist Church in Baltimore. Afterwards he became an Episcopalian and later a spiritualist and theosophist. Dr. Peebles's books are: 'Seers of the Ages' (1875); 'Immortality and Our Homes Hereafter' (1880); 'How to Live a Century and Grow Old Gracefully' (1884); 'The Demonism of the Ages' (1902); 'The Christ Question Settled' (1897); 'Vaccination—a Curse' (1905); 'The Spirit's Pathway' (1906); 'Five Journeys Around the World' (1907); 'Buddhism and Christianity Face to Face' (1909); 'Spirit Mates—Marriage and Divorce' (1909); 'Death Defeated' (1910), and 'How to Converse with the Dead' (1911). He also wrote many pamphlets on spiritualism and hygienic subjects.

PEKING UNION MEDICAL COLLEGE. See ROCKEFELLER FOUNDATION.

PENFIELD, Frederic Courtland, American diplomat: b. Haddam, Conn., 23 April 1855; d. New York, 19 June 1922. After graduation from Russell's Military School, New Haven, he studied in Germany and England, and for several years was on the editorial staff of the *Hartford Courant*. His diplomatic career began in 1885 and only ended when the United States entered the World War. He was first appointed vice-consul general at London, 1885; then became diplomatic agent and consul-general agent to Egypt with rank of Minister Resident, 1893-97; and in 1913 he was sent as Ambassador to Austria-Hungary by President Wilson. During the last three years of his residence in Vienna he assumed the diplomatic interests of Great Britain, France, Rumania, Italy and Japan. In the intervals of his diplomatic work he travelled widely in Africa, India, China and Japan. He was a Fellow of the Royal Geographical Society of London, an officer of the French Academy and given the "Palme Académique"; the Sultan of Turkey bestowed on him the Grand Cross of Order of Medjidieh; the Khedive of Egypt made him grand commander in the order of Osmanieh; Pope Pius X gave him the grand cross of Saint Gregory in 1911 (the first American to receive the highest class of this order); and France, the cross of the Legion d'Honneur, in 1904, in recognition "of prominence in discussing the relative merits of canal routes leading to the American government purchasing from a French company all the rights at Panama." Princeton gave him the honorary degree of A.M. in 1907; Hobart, LL.D. in 1914; New York University, and the University of Pennsylvania, LL.D. in 1917; the Catholic University E.H.D. in 1915, and New York Univer-

sity, LL.D. in 1922. He was a member of many clubs including the New York Yacht and the National Democratic Clubs. Mr. Penfield was the author of 'Present Day Egypt' (1899); 'East of Suez' (1907), and many reviews and articles on international subjects for the important magazines in England and America.

PENNSYLVANIA, one of the middle Atlantic States, popularly called the Keystone State, bounded north by Lake Erie and New York, east by New York and New Jersey, south by Delaware, Maryland and West Virginia, and west by Ohio and Lake Erie. Its area is 45,126 square miles and in 1920 it had a population of 8,720,017. The State is 32d in order of size and second in order of population. The population in 1920 included 8,432,726 whites, 284,568 negroes, 2,386 Asiatics and 437 Indians. The foreign-born population of the State in 1920 numbered 1,387,850, of whom 222,764 were Italians, 171,380 Hungarians, 161,124 Russians, 122,755 Austrians, 121,601 Irish, 120,194 Germans, and 90,666 English. The chief cities, with their populations in 1920 are: Philadelphia, 1,823,779; Pittsburgh, 588,343; Scranton, 137,783; Reading, 107,784; Erie, 93,372; Harrisburg, the capital, 75,917; Wilkes Barre, 73,833; Allentown, 73,502; Johnstown, 67,327; Altoona, 60,331; Chester, 58,030; Lancaster, 23,150; Bethlehem, 50,358; York, 47,512; McKeesport, 46,781; New Castle, 44,938; Williamsport, 36,198 and Easton, 33,813. In 1920, 36.7 per cent of the population was rural.

Religion.—The principal Christian denominations have an aggregate membership of 4,114,527, of whom 1,830,532 are Roman Catholics, 427,509 are Methodists, 371,674 Lutherans, 405,493 Presbyterians, 210,978 members of the Reformed Church, 194,262 Baptists, 118,687 Episcopalians and 16,444 Congregationalists.

Education.—Primary education is free and compulsory for all children between the ages of 8 and 14 for the full school term. In 1922 there were 44,862 teachers in the State public schools and 1,617,687 pupils. The State has 954 high schools with 7,160 teachers and 136,081 pupils, and 13 State normal schools with 370 professors and 3,042 students. For higher education the State maintains the Pennsylvania State College and an Agricultural Experiment Station in connection with it. Within the State the chief institutions of higher learning are the University of Pennsylvania, the University of Pittsburgh, Bucknell University, Duquesne University, Lincoln University, Temple University and Susquehanna University.

Finances.—On 1 Dec. 1921 the balance on hand amounted to \$8,172,617.12. Receipts during the ensuing fiscal year amounted to \$97,395,983.95. Disbursements for the same year amounted to \$94,315,790.57, leaving a balance on hand on 1 Dec. 1922, amounting to \$11,252,810.50. The bonded debt of the State in 1922 amounted to \$50,658,320.26. The assessed value of real property amounted to \$8,375,509,467, and of personal property, \$2,048,087,551.

Agriculture.—The census of 1920 gave \$500,000,000 as the value of all crops. The crops vary in different parts of the State, but agriculture, market gardening, fruit growing and horticulture are followed. The greatest agri-

cultural development is in the region around Reading, Lancaster and York, the famous Pennsylvania Dutch Region. The census of 1920 reported 202,250 farms with an aggregate area of 17,657,513 acres and including 11,847,719 acres of improved land. The total value of all farm property that year was \$1,729,353,000. The chief crops, with their acreage, yield and value for the year 1922 were: Corn, 1,573,000 acres, 69,212,000 bushels, \$49,833,000; spring wheat, 14,000 acres, 210,000 bushels, \$231,000; winter wheat, 1,364,000 acres, 25,234,000 bushels, \$27,757,000; barley, 12,000 acres, 306,000 bushels, \$199,000; clover seed, 18,000 acres, 25,000 bushels, \$250,000; oats, 1,213,000 acres, 41,242,000 bushels, \$19,796,000; buckwheat, 248,000 acres, 5,208,000 bushels, \$4,166,000; rye, 220,000 acres, 3,740,000 bushels, \$3,254,000; tame hay, 3,055,000 acres, 4,888,000 tons, \$69,898,000; potatoes, 264,000 acres, 28,512,000 bushels, \$21,384,000; sweet potatoes, 2,000 acres, 280,000 bushels, \$311,000; tobacco, 43,000 acres, 56,760,000 pounds, \$9,082,000; apples, 11,400,000 bushels; peaches, 1,560,000 bushels, and pears, 576,000 bushels. The wool clip in 1921 was 4,191,000 pounds. On 1 Jan. 1923 there were in the State 491,000 horses, valued at \$54,010,000; 55,000 mules, valued at \$6,875,000; 1,071,000 milk cows, valued at \$64,260,000; 506,000 other cattle, valued at \$14,674,000; 477,000 sheep, valued at \$3,387,000, and 1,200,000 swine valued at \$19,200,000.

Mineral Products.—Pennsylvania exceeds all other States in the value of its mineral products. This is in great part due to the State's leadership in the production of coal. Anthracite coal in 1922 was produced to the extent of 52,485,000 tons, and bituminous coal to the amount of 105,000,000 tons. The State also produces petroleum, natural gas, iron, etc. The petroleum output in 1922 was 7,443,000 barrels. In 1922, 776,000 gross tons of iron ore were mined and 780,000 tons of ore were shipped.

Manufactures.—The industries of Pennsylvania depend largely on its great basic minerals, coal and iron. Nearly half of the steel produced in the United States is made in Pennsylvania, whence it is shipped to all parts of the world. The production of pig iron in 1920 was nearly 14,000,000 tons. Pittsburgh is the greatest metal manufacturing centre on the globe. Electrical goods and equipment is another important industry of Pittsburgh. Other great industries are cotton goods, silks and woollens and leather. The State authorities report 26,077 industrial establishments, having 1,614,099 employees, of whom 1,101,500 were whites and 63,565 colored, 449,034 foreign born, 1,373,649 males and 240,450 females, 11,230 boys and 10,420 girls under 16 years of age. Wages paid to males totaled \$2,203,429,800, and to females, \$167,328,600. Capital invested aggregated \$5,799,515,800, while the value of the products aggregated \$11,086,748,300. The lumber industry was once of great importance, but of late years it has been greatly reduced. However, during the term of Gifford Pinchot as State Forester, a great reforestation movement was begun.

Communications.—Philadelphia is the principal port of the State and receives and ships goods to all parts of the world. The city was

the capital of the United States for 10 years. The foreign trade of the port is about \$500,000,000 yearly. Fifty-eight lines of steamships have regular sailings from Philadelphia and 20 lines occasional sailings. Nine coastwise lines make it a port of call and eight oil lines, while there are 12 lines of local and inland steamships calling there. The State has 12,872 miles of steam railways and 4,870 miles of electric railways. It has a port on the Great Lakes and the Ohio, Susquehanna, Delaware, Allegheny and Monongahela are important navigable waterways. There are 5,000 miles of improved State highways built at a cost of \$102,578,993.75.

Legal Holidays.—1 January; 12 February; 22 February; Good Friday; Memorial Day; 4 July; First Monday in September; 12 October; General Election Day; 11 November (Armistice Day); 25 December, and any day appointed or recommended by the Governor of the State or President of the United States as a day of thanksgiving, fast or prayer, or other religious observance.

Charities and Corrections.—The chief State institutions with their locations and number of inmates in 1912 were: Eastern State Penitentiary, Philadelphia, 1,606; Western State Penitentiary, Pittsburgh, 1,206; New Western State Penitentiary, Rock View, 490; Pennsylvania Industrial Reformatory, Huntingdon, 765; Pennsylvania Training School, Morgantown, 700; State Industrial Home for Women, Muncy, 75; State Institution for Feeble-Minded, Spring City, 1,200; State Institution for Feeble-Minded, Polk, 2,000; Pennsylvania Village for Feeble-Minded Women, Laurelton, 140; State Hospital for the Insane, Allentown, 1,323; State Hospital for the Insane, Danville, 1,676; State Hospital for Criminal Insane, Fairview, 594; Pennsylvania State Hospital, Harrisburg, 1,311; State Hospital for the Insane, Norristown, 3,178; State Hospital for the Insane, Warren, 1,718; State Hospital for the Chronic Insane, Wernersville, 1,101; Western State Hospital for the Insane, Torrance, 204, and Pennsylvania Soldiers' and Sailors' Home, Erie, 150.

Recent Political History.—On 9 January 1922 George Wharton Pepper of Philadelphia was appointed United States Senator to fill the vacancy caused by the death of Senator Boies Penrose. Mr. Pepper became a candidate in 1922 for the senatorial term ending 4 March 1927. On 8 Aug. 1922 David I. Reed of Pittsburgh was appointed United States Senator to fill the vacancy caused by the death of Senator William E. Crow, who had been appointed to the vacancy caused by the death of Senator P. C. Knox. In 1922 Senator Reed was a candidate for the unexpired term ending 4 March 1923 and for the full term of six years beginning on that date. Senators Pepper and Reed were elected on 7 Nov. 1922. At the same election Gifford Pinchot, the Republican candidate for governor, defeated John A. McSparren, the Democratic candidate for the same office.

Government.—The executive of the State is a Governor, who is elected for a term of four years and receives a salary of \$10,000. The legislative power is vested in the General Assembly, which consists of a Senate of 50 members, elected for four years and a House of Repre-

sentatives of 208 members, elected for two years. For local purposes the State is divided into counties, cities, boroughs and townships. There are 67 counties. Pennsylvania sends two Senators and 36 Representatives to the Federal Congress. The legislature meets biennially in January of odd years.

Officials.—(1922): Governor, William C. Sproul; Lieutenant-Governor, Edward E. Beidleman; Secretary of State, Bernard J. Myers; Attorney-General, George E. Alter; Auditor-General, Samuel S. Lewis; Treasurer, Charles A. Snyder, and Superintendent of Public Instruction, Thomas E. Finegan. The officials in 1923 are: Governor, Gifford Pinchot; Lieutenant-Governor, David J. Davis; Secretary of State, Clyde King; Attorney-General, George Woodruff; Auditor, Samuel S. Lewis; Treasurer, Chas. A. Snyder and Superintendent of Public Instruction, Thos. E. Finegan.

Judiciary.—Members of Supreme Court: Robert von Moschizker, Chief Justice; Robert S. Frazer, Emory A. Walline, Alexander Simpson, Jr., John W. Kephart, Sylvester B. Sadler and William I. Schaffer.

PENNSYLVANIA COLLEGE FOR WOMEN, a non-sectarian educational institution, founded in 1869 and located at Pittsburgh, Pa. In 1922-23 it had a faculty of 31 members, 221 students, and property valued at \$650,000. Income figures are not available. Dr. Cora Helen Coolidge is president.

PENNSYLVANIA STATE COLLEGE, a co-educational institution, founded in 1855 and located at State College, Pa. In 1922-23 it had a faculty of 631 members—320 in the teaching and administration departments, 311 in the research and extension divisions. Students enrolled during the collegiate year numbered 3,259, and in addition 2,688 attended the summer school during 1922. The institution's property is valued at \$3,088,999.69 and its income for 1922-23 was \$2,307,799.88. John M. Thomas, D.D., LL.D., is president.

PENNSYLVANIA, University of, a non-sectarian institution, coeducational in most departments, founded in 1740 and located at Philadelphia, Pa. In 1922-23 it had a faculty of 1,088 members, 13,577 students, property valued at \$12,008,239.15 and an income, consisting of tuition fees, State appropriations, etc., of \$4,062,202.19. Josiah H. Penniman, Ph.D., LL.D., is provost.

PENSIONS. According to the report of Commissioner of Pensions, Washington Gardner to the Secretary of the Interior, the number of pensioners on the roll of the United States Pension Bureau on 30 June 1922, the end of the fiscal year, was 547,016, a net loss of 19,037 from the total of 566,053 on the roll at the beginning of the year. The amount disbursed in the payment of pensions during the year was \$253,807,583, compared with \$258,720,821 disbursed during the preceding year. The amount appropriated for the payment of pensions during the fiscal year 1922 was \$265,000,000 as against \$279,000,000 for the fiscal year 1921. The number of Civil War soldiers on the roll was 218,775 on 30 June 1921, and 193,881 on 30 June 1922, a decrease of 24,894. The number of Civil War soldiers who died in 1922 was 25,082

as against 24,775 in 1921. The number of Civil War widows, minor children and dependents on the roll was 281,327 on 30 June 1921, compared with 272,194 on 30 June 1922, a decrease of 9,133. Deaths of Civil War widows, minor children and dependents in 1922 numbered 21,259 compared with 19,451 in 1921. The greatest number of Civil War soldiers ever on the pension roll was 745,822 in 1898; the greatest number of Civil War widows on the roll was 304,373 in 1912. Of the War of 1812 there were 49 widows surviving 30 June 1922; of the Mexican War there were 73 soldiers and 1,878 widows surviving 30 June 1922; of the Indian wars from 1817 to 1891, there were on the roll on 30 June 1922, 3,867 soldiers and 2,748 widows; of the War with Spain there were on the roll under the provisions of the general laws 14,445 soldiers and 3,283 widows, minor children and dependents; under the act of 16 July 1918, 5,915 widows and minor children; and under the act of 5 June 1920, 31,510 soldiers, making a total of 55,153. Spanish-American War pensioners on 30 June 1922. By classes the pension roll showed on 30 June 1922, 256,828 soldiers 282,965 widows, 2,106 minor children, 927 help less children, 4,100 dependents and 90 nurses. The names of 374 persons, on 30 June 1922, were on "the Army and Navy medal of honor roll" under the act of 27 April 1916 and receiving the special pension of \$10 a month for life allowed by that act. The unexpended balances of appropriations at the end of the fiscal year were:

For army and navy pensions.....	\$11,340,257 07
For fees and expenses of examining surgeons.....	172,836 39
For per diem and expenses of special examiners.....	4,270 12
For salaries.....	10,599 70
	<hr/>
	\$11,527,963 28

In 1922 there were 3,170 pensioners residing in foreign countries to whom pensions totaling \$1,319,231.39 were paid. During the fiscal year 1922 the amounts allowed as reimbursement for expenses of last sickness and burial of deceased pensioners totaled \$488,248.28; pension certificates issued on admitted claims numbered 64,967; applications of all kinds received and classified totaled 114,251 of which 47,710 were under the act of 1 May 1920 and 39,650 under the act of 5 June 1920. Claims disposed of during the year numbered 130,736 at an average cost of \$12.01 per claim. The average cost per claim disposed of in 1921 was \$17.33. Checks to the number of 2,269,767 were issued in payment of pensions in 1922 against 2,332,939 in 1921. Until 4 Sept. 1922 pensions were paid quarterly; since then payments have been made monthly.

Civil Service Retirement Law.—This law was enacted 22 May 1920, and provides for the retirement of employes in the classified civil service. An act of 17 June 1922 includes in the law certain classes of employes receiving less than \$600 a year and an executive order of 7 June 1922 brought within the purview of the law certain groups of unclassified laborers. At the beginning of the fiscal year 1921-22 there were 7,117 claims of all classes pending under the act of 22 May 1920; claims received during the year numbered 72,829; claims reopened numbered 694; claims disposed of numbered

75,734; claims pending 30 June 1922, 4,906. On 1 July 1921 the "civil service retirement and disability fund" amounted to \$9,672,842.03; the amount added to 30 June 1922 was \$14,853,748.99; disbursements totaled \$6,392,327.11, leaving a balance of \$18,134,263.91. The appropriation to cover the cost of administering this law was \$50,000; expenditures amounted to \$49,515. See also VETERANS' BUREAU, UNITED STATES.

PEPPER, Cayenne. See FOOD STANDARDS, FEDERAL.

PERMANENT COURT OF INTERNATIONAL JUSTICE. See PEACE AND ARBITRATION, INTERNATIONAL.

PERSIA, a state of southwestern Asia now a constitutional monarchy reaching from the Arabian Sea to the Caspian. The capital is Teheran. The area of Persia is about 628,000 square miles, but great portions of its territory are desert areas and the population is scant. The population is estimated at 10,000,000, but some authorities claim it is as high as 16,000,000. There are about 3,000,000 nomads, including 250,000 Arabs, 750,000 Turks, 700,000 Kurds, 225,000 Lurs, and 20,000 Gipsies. There are about 1,500 Europeans resident in Persia. Teheran has a population of 220,000; other cities are: Tabriz, 200,000; Isfahan, 85,000; Meshed and Kerman, each 80,000; Kermanshah and Shiraz, each 50,000; and Hamadan, Barfurush, Kazvin, Kum, Kashan, Resht, each with from 35,000 to 40,000. Nearly all of the inhabitants are of the Mohammedan faith and of the Shi'a sect. There are in the country 850,000 Sunnites, 10,000 Parsees, 50,000 Armenians, 40,000 Jews, and 30,000 Nestorian Christians. The national religion is well endowed and there are many priests or mollahs. The learned clerics are termed mujtahids or doctors of law and are independent of the Shah in their appointments. However, the high priest or Sheik, the chief judge, and the chief of the principal mosque of a city are appointed by the government. The Armenians have two bishops—at Tabriz and Isfahan. There is a Roman Catholic bishop at Isfahan of the Eastern rite and one of the Latin rite at Urumia. There is considerable toleration of the lesser sects in the cities but the Moslems of the lower castes sometimes oppress those of other faiths in regions where Europeans do not reside. In recent years many schools on European lines have been established but education is yet in a backward state. Reforms are in progress and female education has made a beginning. There are about 90 schools in all Persia as Westerners understand schools. There are, however, many colleges in which religion and literature are taught with a modicum of the sciences and also many special schools. Private tutors are common, being employed in every family having the means of doing so. In the capital there is a technical school with several European professors and also a French school supported by the Alliance Francaise. There are two military colleges and a political college to prepare candidates for the foreign service of the government. There are also several medical schools under the supervision of French doctors. The general aim of popular education in Persia appears to be to enable the masses to read the Koran.

Production.—Wheat, barley, rice, cotton, wool, silk, fruits, gums, and drugs are the chief products of the country. Opium is also produced. The wool is of excellent quality and Persian rugs and carpets are known all over the world. The country is relatively rich in minerals but its mines are undeveloped. Iron, copper, coal, borax, marble, lead, manganese, cobalt and nickel are among the minerals found. In recent years oil has been found in great quantities and the Persian fields have attracted the attention of foreign capital. There are rich turquoise mines which are worked in a primitive fashion.

Commerce.—In 1920-21 the value of Persian exports was £14,728,246 and of the imports £18,892,492. The table following shows the values of the chief imports and exports for the fiscal year 1920-21:

IMPORTS	
(Kran equals about 20 cents)	
	Krans
Cottons.....	219,273,000
Sugar.....	119,121,000
Tea.....	35,949,000
Rice.....	6,824,000
Yarns.....	18,257,000
Petroleum.....	11,739,000
Gold and silver coin.....	27,719,000
Copper and nickel.....	12,696,000
Animals.....	18,860,000
Haberdashery.....	10,051,000
Flour.....	5,543,000
Spices.....	5,840,000
Woolens.....	4,036,000
Tin, zinc and lead.....	3,719,000
EXPORTS	
Petroleum.....	180,778,000
Cottons.....	30,826,000
Fruits.....	29,939,000
Carpets.....	29,709,000
Opium.....	24,166,000
Rice.....	11,622,000
Gums.....	8,889,000
Wheat and barley.....	5,451,000
Gold and silver coin.....	5,177,000
Cotton.....	4,571,000
Tobacco.....	4,184,000
Skins.....	2,800,000
Drugs.....	2,553,000
Silk.....	1,954,000
Wool.....	1,408,000
Cocoons.....	1,226,000

In the year under consideration the British Empire had 53 per cent of the entire foreign trade. Russia was the second nation on the import list followed by Egypt, Turkey and Afghanistan in the order named. Egypt was first on the export list, taking more Persian goods than any other country, followed by the British Empire, Russia, Turkey and the United States in the order named.

Communications.—The total rail mileage of Persia is 350 miles. As yet there is no trunk line through the country, the lines for the most part being extensions of foreign lines across the frontier. There are great trade routes—the chief of these are the Western from the capital to Bagdad, from Julfa to Tabriz, from Astara to Ardebil, from Enzeli to Teheran, from Hamadan to Enzeli, from Bandar to Shahrud and from Askabad to Meshed, from Bandar Abbas to Kerman, from Bushire to Shiraz, from Bandar to Yazd, from Duzdab to Meshed, from Qum to Kashan, from Harun to Isfahan, and from Teheran to Qum. The Karum is navigable from the Gulf to Ahwaz.

Defense.—There was to be a uniform military force under the command of British officers according to the agreement of 1919, but the agreement not being ratified it lapsed in 1921 and all British officers and men were withdrawn. No systematic organization has since taken place. The navy has two boats used for customs purposes.

Government.—The ruling sovereign is called the Shah. In 1906 he consented to the establishment of a National Assembly or Mejlis. The latter drew up a constitution which the Shah approved. The assembly sat in 1909 and in 1915 and was reopened by the present Shah on 22 June 1921. The government is in the hands of a cabinet which as constituted on 21 Jan. 1922 was as follows: Premier and Minister of the Interior, Mushir-ed-Dowleh; Minister of Foreign Affairs, Hakim-ul-Mulk; Minister of War, The Sardar Sepah; Minister of Education, Mayer-ul-Mulk; Minister of Finance, Mudir-ul-Mulk; Minister of Justice, The Sardar Muazzam; Minister of Posts and Telegraphs, Ettela-es-Saltaneh; Minister of Public Works, Adib-es-Saltaneh. The reigning Shah in 1922 was Sultan Ahmad Shah, who succeeded his father 16 July 1909. The country is divided into 33 provinces, each under a governor-general who is directly responsible to the central government. Some of the local officials are elected by the citizens and practically all subjects have the right of suffrage.

History.—As the result of a protest lodged with the government by the labor office of the League of Nations an order was issued for the protection of the women and children working in the carpet factories of Persia. The order contemplates freedom of contract between employer and employee, the eight hour day, the prohibition of the employment of boys and girls under age of 10 years, a noon-hour rest period, sanitary working quarters, seats for women and children so as to permit working in normal posture, and the regulation of wages. For the first time in nearly 50 years Persia was defended by a purely Persian force with Persian officers because of the withdrawal of the British in 1921. The Bolsheviks also withdrew from Enzeli and Resht and Persia found herself free from foreign influence as regarded her armies. A rebellion of small proportions broke out in Tabriz but was speedily put down. The Shah visited Europe and during his absence anxiety was caused by the appearance of a Bolshevik war vessel in Persian waters. The Premier resigned 9 May and a new Cabinet was formed 19 June headed by Ghavan-es-Sultaneh. The Persian National Council selected the cabinet and the Shah telegraphed his approval from Europe. The improvement of economic conditions was the first concern of the new ministry which requested the United States to suggest the names of Americans to serve as financial and other advisers. The efficiency of the Shuster regime was recalled by the request for American experts. The United States supplied the names of 18 advisers. On 3 August it was announced that the National Council had approved the engagement of Dr. A. C. Mills-nough, an American, as Director-General of Finance for five years. He will draft the

budget and will be consulted in the matter of concessions. In the closing months of the year serious popular unrest developed from a series of causes. The empty treasury, with the slender prospect of adequate revenue collections, strife between the Minister of War and the National Council and Bolshevik agitation were among the causes of the unrest. Peace was made between the War Minister and the National Council when the former promised to cease from appropriating all revenues for his department and to place himself under the control of the Finance Minister. He also recalled the military governors placed in office by him except the governor at Tabriz where there appeared a necessity for such governorship. Despite these concessions a new crisis developed in the capital toward the beginning of November when a mob tried to force entrance to the government buildings but were driven off by the police. The arrival of two mullahs expelled from Bagdad by the British High Commissioner there was the cause of a huge anti-British demonstration at the mosque of Shah Abdul Azim near Teheran.

PERU, a Latin-American republic of South America, occupying the Pacific littoral of the continent between Chile and Ecuador. It has an area of 722,461 square miles with an estimated population of 4,620,201. Of the population, about 14 per cent are whites, 58 per cent Indian, 2 per cent negro and 25 per cent mestizos (cholos or Zambos), and the remainder Asiatic, mostly Chinese. Lima, the capital, has a population of 176,467. The other large cities of the republic, with their populations are: Callao, the port of Lima, 52,843; Arequipa, 40,000; Cuzco, 14,500; Ayacucho, 14,000; Iquitos, 12,000, and Hauras, 7,600. The republic is divided into 19 departments and three provinces.

Religion.—There is full and complete religious liberty. The Roman Catholic religion is the religion of the state. This church has an archbishop, 13 bishops, two vicars apostolic, and two prefectures apostolic. The churches and monasteries are the property of the state. In 1920, the sum of \$91,436 was voted for public worship and about \$4,000 for missions.

Education.—Primary education is free and compulsory between the ages of 7 and 14 years. There are in the republic 3,338 primary schools with 5,059 teachers and 194,701 pupils; 29 government high schools with 372 teachers and 6,669 pupils. Many of the secondary schools are vocational. For higher education there are the University de San Marcos, founded in 1551, with 1,308 students in 1920, the universities of Arequipa, Cuzco and Trujillo. There is also the newly founded University of Technical Schools (1921), for engineering, commerce, the industrial arts, and the training of teachers.

Production.—Agricultural products of Peru include cotton, sugar, coffee, wools, hides and skins and rice. Cotton production in 1919 amounted to 33,588 tons from 222,160 acres. The crop the following year and in 1921 and 1922 upheld this average. Difficulties of transportation in the tropical forest regions are retarding the development of the coffee-growing districts. The sugar industry is mostly along

the coast, where about 125,000 acres are devoted to cane cultivation. The annual production is about 300,000 tons. Cocoa growing is being extended, 200,000 trees having been planted recently in the Perene region. Wheat in 1919 was planted on 373,546 acres and the yield was 71,647 tons. Rice is extensively grown in the northern part of the republic, being planted to 72,555 acres, yielding 63,790 tons in 1919. There are at least 20 rice mills in the country. The country also produces tobacco, wines and spirits, olives and Indian corn. Sericulture is being tried out in the coast districts. There are several cocoa estates in the Department of La Libertad and cocaine is manufactured at Lima and many other cities. The country also produces cinchona and other medicinal plants. Alpaca, sheep and llama wool are exported. The mineral production in 1920 was as follows: Petroleum, 373,280 metric tons valued at £2,494,570; copper, 32,982 tons, value £2,358,243; silver, 286,043 kilos, value £1,853,221; vanadium ore, 9,700 tons, value £897,840; coal, 378,237 tons, value £276,988; gold, 1,952 kilos, value £265,972; lead, 562 tons, value £10,959; salt, 27,172 tons, value £21,655; tungsten ore, 69 tons, value £5,316; zinc, 22 kilos, value £94; bismuth, 7,820 kilos, value £6,882; borates, 261 tons, value £4,698; molybdenum ore, 2,415 tons, value £550, and antimony ore, 13 tons, value £109.

Commerce.—Imports for the year 1920 were valued at £17,956,758 and exports at £35,322,226. Sugar, cotton, copper, petroleum and wool were the chief items of the exports, sugar representing one-half of the total with cotton accounting for £11,190,061 and copper for £3,625,280 and petroleum £2,983,060. The United States took exports in 1920 to the value of £12,000,000. The total exports for the first six months of 1922 were valued at £7,929,220, the port of Talara leading with the majority of shipments. Imports for the same period were valued at £4,780,000. Of the total imports for the first six months the United States supplied 41 per cent; Great Britain 18 per cent and Germany 10 per cent. Total imports for the last six months of 1922 were valued at £5,800,000; exports during the same period had a value of £10,700,000. Of the imports for the last six months, the United States supplied 36 per cent, Great Britain 19 per cent, and Germany 12 per cent.

Finance.—In 1920 the revenue amounted to £8,087,297 and the expenditures to £7,481,303. The budget for the year 1922 provided for an expenditure of 6,000,000 Peruvian pounds. In 1922 a new budget law further regulating national expenditures was submitted to the Congress and the Federal government sought a foreign loan of \$50,000,000 from American bankers. The total debt of the republic at the beginning of 1922 amounted to £7,837,774. There is another foreign debt contracted by Peru for which the Peruvian Corporation has assumed responsibility in return for various concessions, such as rights over mines and lands and control of the state railways.

Defense.—There is universal and compulsory military service. The peace establishment of the army is 11,000, but there are in addition

about 8,000 police and gendarmerie and 176 state-aided rifle clubs under military control with 16,000 members. The navy consists of two cruisers, one light cruiser, one destroyer, and five submarines; also a river flotilla of seven vessels on the Amazon.

Communications.—There are in the republic 1,984 miles of railway, of which 1,385 miles are state lines at present under the control of the Peruvian Corporation. There are five main lines. There are about 500 miles of improved roads with many more contemplated. The posts, telegraphs, and wireless services are administered by the Marconi Company under a 25-year contract with the government from 1 May 1921. There are 19 wireless stations; 326 telegraph offices and 723 post offices.

Shipping.—The Peruvian merchant marine consists of 15 steamers of 14,248 tons and 37 sail vessels of 23,368 tons. The clearances at the port of Callao in 1920 numbered 740 vessels of 1,720,030 tons.

Government.—The executive power is vested in a President elected for five years and ineligible for immediate succession. There are two Vice-Presidents. The legislative power is vested in a Senate of 35 members and a Chamber of 110 members, both elected by direct vote. The personnel of both houses is renewed in toto every five years. The President in 1922 was Senor Augusto B. Leguia, who is elected for the term 1919-24.

History.—In June 1922 Peru created the National Bank of Peru, for the purpose of doing a general banking business for the government, for the nation and for the emission of national paper currency. The latter is guaranteed by taxes and certain government reserves. Peruvian currency based upon the libra, nominal value equal to the British pound, maintained a premium during the World War; but the general international slump in business following the close of the war affected Peru as it did the other South American countries. The issue of paper currency on the basis of one sol to fifty cents American money, or ten soles to the libra, caused a decline in the par value of the latter, which ranged around \$4.20 American money during 1922. But the abundance of circulation medium helped business which, slow at the beginning of the year, began to show signs of strong revival toward the end. New railway lines aided the exploitation of copper and iron; and the proximity of the latter to extensive coal beds promoted the steel industry thus compensating for business dullness in other directions. Fine wools, of which Peru makes a specialty, maintaining good prices, also helped business. Strenuous efforts were made during the year to extend and improve the Peruvian railway system. The Juancayo-Cuzco and Hoya-Amazon lines were nearing completion. It was decided to fill in the gaps necessary to complete Peru's part of the proposed Pan-American railway to which the above-mentioned lines contribute in part. Another railroad, from the northern Peruvian coast to navigation headquarters of the Marañon, was planned to complete through transportation from the Atlantic to the Pacific by way of the Amazon.

The government devoted the tobacco tax

valued at \$3,000,000 to the improvement and extension of the railways; and the Chimbote line, extended into the interior through this provision, has greatly helped mining. Certain other moneys were also devoted to the extension and improvement of the national railways. At the close of 1922 the Peruvian government had entered into arrangements with foreign capitalists for the extension and improvement of her Pacific ports with a view to facilitating the expansion of trans-Pacific and long distance coast trade. Steps were taken, during 1922, to reorganize and increase the effectiveness of the national army and the police, both urban and rural. Two French generals who had made records for themselves during the world war were engaged by the government. General Pellegrin was made Inspector General with very extensive powers and head of the National Military School; while General Clement was given charge of the reorganization of the army. Experienced Spanish officers were entrusted with the reconstruction of the police organization; and more especially of that of the rurales or rural guards, along the same lines as the famous Spanish rural police. These Spanish officers also founded a modern police-training school. Special attention was given to public instruction; the number of government schools and colleges were increased and those in existence were improved. Two treaties were arranged in 1922, one with Colombia and the other with Ecuador, with the object of defining the boundaries between the Peruvian national territory and that of each of the countries mentioned. Efforts were made to settle the long-standing difference between Peru and Chile over the possession of the three provinces, Tarata, Tacna and Arica, lying to the south of Peru. The ambassadors of Chile and Peru considered the question in detail and resolved to ask the United States to arbitrate the matter. The latter requested the interested parties to meet in Washington, where a provisional agreement was entered into which, it was hoped, would pave the way to a final settlement.

PETROLEUM. The year 1922 in the petroleum industry was characterized by record high production and by almost record imports. In the crude petroleum field this record production and

the large imports resulted in the already large accumulation of stocks being increased to the highest quantity on record. Another result was observed in unsettled and low prices of crude oil. The above table summarizes the statistics of the crude petroleum industry in the United States for the years 1921 and 1922.

During the period 1918-22 production increased 55 per cent; imports, 229 per cent; exports, 109 per cent; consumption, 42 per cent; and stocks, 106 per cent. More than 23,000,000 barrels of crude petroleum were withdrawn from storage in 1918, whereas in the following four years stocks were increased, more than 62,000,000 barrels being added to storage in 1921 and almost 79,000,000 barrels in 1922. On 31 Dec. 1922, net pipe-line and tank-farm stocks of domestic petroleum plus stocks of Mexican petroleum held in the United States by importers amounted to 264,578,000 barrels, a supply sufficient to meet current needs of consumption for 143 days. It is of interest to compare these figures with those for stocks of crude oil held on 31 Dec. 1915, at the time of oversupply consequent to the development of the Cushing field, when stocks amounted to 194,185,000 barrels. On account of the small consumption at that time, however, the supply was sufficient to last 244 days.

Preliminary figures show that 551,197,000 barrels of petroleum were transported from producing properties during 1922. To these figures, which were compiled from monthly reports of pipe-line and other companies to the United States Geological Survey, will be added to constitute final figures of production (when the annual canvass of some 14,000 producers is completed) the quantity of petroleum consumed on the leases for fuel and the net increase during the year of stocks held on producing properties. The production for 1922 was by far the greatest quantity of petroleum ever produced in the United States in any one year, exceeding the production of 1921 by almost 17 per cent, more than doubling the production of the country in 1914, and approximating the entire production in the world in 1919. The increased production for the year was due chiefly to the bringing in of prolific new fields in California, Oklahoma, Texas, Louisiana, and Arkansas. Among the more important recently developed pools that contributed to the increased production of 1922 are Long Beach, Santa Fe Springs, and Huntington Beach in California; Burbank, Bristow, and Tonkawa in Oklahoma; Mexia, Kosse, Currie, South Electra, Bunker, Pioneer, and Mirando in Texas; Maynesville and Bellevue in Louisiana; and El Dorado and Smackover in Arkansas. Increased development of the Salt Creek pool, Wyoming, the bringing in of a number of small new pools, the extension of old ones, results of more efficient methods of development in all the fields, and last but not least the sustained production of approximately 275,000 wells throughout the country contributed to the total production for the year. The new production came from about 17,400 new wells reported to have been completed during 1922.

Regarding world production of petroleum in 1922 preliminary estimates indicated a total not far from 850,000,000 barrels as compared with 765,000,000 barrels produced in 1921.

Indicated consumption of domestic and imported crude petroleum (deliveries to consumers), amounting to 586,000,000 barrels in 1922, was 35,000,000 barrels greater than domestic production. The difference was made up by imports, which, however, amounted to 124,000,000 barrels. Imports of Mexican petroleum during the first half of the year were maintained at record high amounts but fell off considerably during the last half of the year, following the depletion of the prolific southern fields of Mexico.

The year 1922 opened with prices of crude petroleum at the high point of the upward reaction which began in the summer of 1921, following the drastic drop during the first half of 1921, when the price of Oklahoma-Kansas grade crude oil fell from \$3.50 to \$1 a barrel within a period of a few months. In January, 1922, the price of Oklahoma-Kansas grade crude oil was \$2 a barrel, which price was maintained until the middle of July, when it dropped to \$1.50 a barrel, and in August the price was cut to \$1.25 a barrel. In November prices of Mid-Continent crude oil were put on a gravity basis, but the \$1.25 (maintained for oil having a range in specific gravity between 33 and 34.9 degrees) remained unchanged until the end of the year. Relations of monthly fluctuations in price of Oklahoma-Kansas grade crude oil, the wholesale price supply (production plus imports plus stocks at the beginning of the month), and demand (consumption plus exports) are shown in the foregoing diagram.

The year closed with a distinct change in conditions that had persisted for more than two years. Beginning in November and being more pronounced in December, total pipe-line and tank-farm stocks of domestic petroleum plus stocks of Mexican petroleum held in the United States by importers, which month by month had been accumulating since May, 1920, registered a decrease due to the fact that production plus imports was less than consumption plus exports.

Petroleum Production by Fields.—The fol-

lowing table shows the production of the large United States oil fields for the years 1921 and 1922:

FIELD	1922	1921

*Part estimated.

Stocks.—Stocks of crude petroleum are classified as follows: Producers' stocks—petroleum held on the producing properties (lease storage); pipe-line and tank-farm stocks, petroleum that has been removed from the producing properties but not delivered to refineries or to other consumers and is held on tank farms, in tanks along pipe lines, and in the lines; refinery stocks and stocks held by other consumers—petroleum that has been delivered to refineries or to other consumers. Pipe-line and tank-farm stocks constitute by far the greater part of the petroleum held in storage in the United States. For the States east of California such stocks are reported monthly to the Geological Survey as

gross stocks, including the total contents of tanks and pipe lines, and as net stocks, which are gross stocks minus B—S—and water. Stocks for California, prior to August 1922, are those published in the Standard Oil Bulletin; since July, stocks for California are those compiled by the Pacific Coast office of the American Petroleum Institute and include producers', pipe-line and tank-farm stocks (see note below).

STOCKS OF PETROLEUM ON LAST DAY OF YEAR
(Barrels)

SOURCE BY FIELDS		31 Dec. 1922
A. Domestic petroleum: Pipe-line and tank-farm stocks east of California:		
Gross.....		214,319,000
Net.....		199,038,000
California†.....		49,375,000
B. Mexican petroleum held in the United States by importers:		
At Atlantic coast stations:		
Crude.....		6,028,000
Topped oil topped in Mexico.....		2,642,000
At Gulf coast stations:		
Crude.....		6,059,000
Topped oil topped in Mexico.....		1,436,000
Total Mexican.....		16,165,000
Total domestic net pipe-line and tank-farm stocks east of California, California stocks as defined above, and stocks of Mexican petroleum held in the United States by importers.....		264,578,000
Number of days' supply.....		143

† California stocks, which since July, 1922, have been reported by the Pacific Coast office of the American Petroleum Institute, have been revised. From July to November, refinery stocks of crude oil were included in the total reported by the Institute, but, in order to secure uniformity with the statement of stocks as published in the Standard Oil Bulletin prior to August and with crude oil stocks as published for the States east of California, refinery stocks have been segregated by the Institute which now reports producers', pipe-line and tank-farm stocks of crude oil separately from refinery stocks.

Consumption.—Below will be found the indicated consumption (deliveries to consumers) of domestic and imported crude petroleum for the year 1922, according to the preliminary summary of the United States Geological Survey (in barrels of 42 United States gallons).

Domestic petroleum: (Source by fields):		1922
Appalachian.....		27,188,000
Lima-Indiana.....		2,530,000
Illinois and Southwestern Indiana.....		7,270,000
Mid-Continent.....		256,123,000
Gulf Coast.....		270,665,000
Rocky Mountain.....		28,773,000
California.....		125,318,000
Consumption and exports.....		474,867,000
Exports.....		10,069,000
Consumption in the United States and territories.....		464,798,000
Imported petroleum:		
Consumption in the United States and territories.....		121,561,000
Consumption of domestic and imported petroleum in the United States and territories.....		586,359,000

REFINERY STATISTICS FOR 1922

There were 311 refineries reported to the Bureau of Mines operating in the United States on 31 Dec. 1922, with an aggregate daily indicated capacity of 1,900,560 barrels of crude oil. At the close of the year these plants were operating at 79.28 per cent of their capacity

based on the crude oil run to stills. On the same basis refineries were operating at 72.85 per cent of their capacity on 31 Dec. 1921. According to figures compiled by the United States Geological Survey the indicated domestic consumption of crude oil in the United States during 1922 was 586,359,000 barrels of 42 gallons. Of this amount 500,706,000 barrels of crude oil (both foreign and domestic) was run to refinery stills; thus 85 per cent of the indicated consumption of crude oil was refined, most of the remainder being used as fuel without refining. Refineries operating during the year had an aggregate capacity 12 per cent greater than the total consumption of crude oil. This does not take into consideration the numerous inoperative refineries.

Gasoline.—The December production of gasoline was the largest month's output recorded, amounting to 585,049,677 gallons and exceeding the previous record of last July by over 15,000,000 gallons. This brought the total for the year to 6,202,234,613 gallons, an increase of 20 per cent over the 1921 output.

The 31 December stock of gasoline, 883,792,861 gallons, lacked only about 9,000,000 gallons of the peak stocks of 1 May 1920 with a probable four months of increasing stocks before reaching the peak in 1923. Based on the rate of consumption these stocks represented 64 days' supply. Following out the trend of gasoline stocks with expectation of the customary increase during the early months of the year, the stocks were expected to increase between 300,000,000 and 350,000,000 gallons by 1 May 1923, thus probably totaling about 1,200,000,000 gallons. The indicated domestic consumption of gasoline during 1922 amounted to 5,366,423,822 gallons, an increase of only 200,000,000 gallons as compared with the preceding year and an increase of over 1,000,000,000 gallons in production during 1922 over 1921. Domestic consumption amounted to 86.52 per cent of domestic production.

Kerosene.—The production of kerosene for 1922 was 2,306,326,489 gallons, an increase over 1921 of about 360,000,000 gallons, but slightly below the figures for 1919 and 1920.

Gas and Fuel Oil.—Gas and fuel oil output for 1922 hit a high mark in the industry amounting to 10,706,226,570 gallons, an increase of about 1,000,000,000 gallons or 11 per cent over the production during the preceding year. Stocks on hand at the end of the year were 1,304,727,850 gallons as compared with 1,331,265,439 gallons the first of the year.

Lubricating Oils.—The production of lubricating oils in 1922 was 978,752,469 gallons. This output was exceeded only in 1920 when it was 68,000,000 gallons greater.

The detail of refined products produced during 1922 and reported in total on refinery reports as "Miscellaneous" is as follows (in gallons): Distillates, 835,493,016; tops, 287,577,980; unfinished, 375,251,855; roofers' wax, 101,213; wax tailings, 4,652,753; tar, 746,052; sludge products, 31,556,420; flux, 17,770,328; road oil, 116,235,063; petrolatum, 13,050,657; medicinal oils, 1,568,369; paint products, 4,448,747; total miscellaneous products, 1,688,452,453 gallons.

ANALYSIS OF THE PRODUCTION, CONSUMPTION AND STOCKS OF THE CHIEF PETROLEUM PRODUCTS IN 1922.

	Production (gallons)	Imports (gallons)	Exports (gallons)	Stocks, 31 Dec. 1922 (gallons)	Domestic consumption (gallons)
Gasoline.....	6,202,234,613	56,471,436	594,576,498	883,792,861	5,366,423,822

Gas and fuel oil.....	10,706,226,570	Data incomplete	776,133,643	1,304,727,850	9,956,630,516
Lubricating oils.....	978,752,469	Data incomplete	333,483,821	235,734,787	626,299,377

Capitalization of United States Oil Companies.—The petroleum industry of the United States represents a capital investment of approximately \$8,000,000,000. Of this total, about 40 per cent is invested in the companies composing the Standard Oil group and 60 per cent in the independent companies. Although the balance is in favor of the independents, figures were presented at the investigation of the industry held in Washington early in 1923 showing that the Standard group continues to hold the dominating position. This, it was alleged, is because the Standard companies control the larger part of the pipe line facilities. New oil companies formed in 1922 numbered 784, representing a total capitalization of \$1,639,693,000, as compared with 936 new companies formed in 1921 with a total capitalization of \$1,255,657,000.

Developments in 1922.—The Mosul oil fields were the cause of protracted international negotiations during the year. The question was complicated by the fact that Mosul was claimed by the Turks at Lausanne. This district has so far not produced any oil but there is every indication that the fields are very prolific. Mosul being in mandated territory, all nations, including the United States, have equal opportunities to obtain oil rights there.

The so-called Chester Concession, granted to Rear Admiral Colby M. Chester and confirmed by the Angora Assembly early in 1923, involves the construction of a railroad covering 2,400 miles of Asia Minor, with mining and mineral rights for 20 kilometres on each side of the right of way, a total territory of 96,000 square miles, ports on the Gulf of Alexandretta and at Samsun on the Black Sea. Along with these lines goes the right to construct canals, roads, telegraphs and telephones, factories, banks, hotels. Most important of all are the oil rights in the Mosul region which are included in the grant. The announcement of the grant at once provoked the opposition of France who put forward rival claims. Great Britain also evinced opposition to the Chester grant. The grant overshadowed the second Lausanne Conference, which met 23 April 1923.

One of the largest deals in Mexican oil history took place in 1922, when a group of Los Angeles promoters obtained from the Mexican government a concession in the oil district of the East coast involving 11,000,000 acres of land. The concession provided that 40 per cent of the gross production is to go to the Mexican government; that a deposit of 400,000 pesos be paid and that 200,000 pesos be invested in works and exploration within a year. Two years are granted for exploration and the concession runs for 20 years with privilege of renewal. Another huge concession obtained

by Americans in Mexico covers the greater part of the State of Nayarit. This concession is held by the Pacific Petroleum Company, and covers oil, mineral and other rights. The discovery of two oil lakes near Point Barrow, Alaska, was announced in November. The oil situation in Russia remained confused throughout the year. The amount available for export was negligible but it was felt that production sufficient to allow of large exports could be had under expert management. Members of the Soviet administration sought to secure the assistance of the Standard Oil, the Shell and the Anglo-Persian companies to work the oil resources of Russia to full capacity.

Prospecting for oil in Australia met with some success, especially in Western Australia and Queensland. The Commonwealth government also bought out the British Government oil properties in New Guinea for £25,000. Poland legislated as to the terms on which she would grant leases for the exploitation of her 800 square miles of oil lands. In February American engineers announced that Japan's oil resources were vastly greater than she had led the world to believe. It was stated that Japan has 300 years of supply at the present rate of consumption, while the United States has only 20 years of probable oil reserve. During 1922 the Persian wells of the Anglo-Persian Company produced over 50,000 tons monthly. This output was delivered to tidewater at Abadan at the head of the Persian Gulf through a 10-inch pipe line 200 miles long. During the year ended 31 July 1922, 607,248 tons of crude oil passed through the Suez Canal on its way to the company's refineries at Swansea, Wales.

Prospecting for new sources of supplies of oil went on in many lands during the year. The Spanish government began the drilling of two 2,000 metre wells, one in Burgos and the other in Viscaya. The discovery of a large oil field in southern France was reported but at the close of the year active operations had not begun there. About 70,000 tons were produced in the Pechelbroun (France) fields. In South America prospecting met with some success in Ecuador, Argentina and Venezuela. Actual boring was begun in the Guayas district of Ecuador and a company was floated in London for the exploitation of the Argentine fields. In Trinidad, British West Indies, 20 companies brought up 82,000,000 gallons of crude oil and three refineries supplied the total local demand for gasoline. Operations in the Mexican fields were limited in the greater part to fields already proved and very little was done in new districts.

Continued oil production in the Red Sea region of Egypt was reported by the Egyptian Minister of Finance. The Burghada and Gem-sah fields of the Anglo-Egyptian Oilfields Com-

3. Oil loading rack, East Chicago, Ind.

pany were producing at the rate of 200,000 tons a year from 22 wells.

In Italy the Royal Mining Corporation continued prospecting for oil. Drilling apparatus to the value of 13,000,000 lire was imported from Germany and deep boring operations begun in the Gaeta district and in the Abruzzi, also in Piacenza province.

In the United States the Teapot Dome oil Wyoming lease almost precipitated a political crisis. The major issues involved in this controversy were the importance of an adequate oil reserve for the Navy in time of emergency and whether the Teapot Dome could be drained by wells in the adjoining Salt Creek area, also the propriety of leasing the Dome to the Sinclair interests. Senators and Representatives demanded an investigation of the oil policies of the Government which was undertaken and proceeded during 1922 and in the early months of 1923, the report of the Committee being made in the closing days of the 67th Congress. The report was characterized as very unfair by leading men in the industry in that it charged that one group dominated the industry and virtually fixed prices of both the crude and refined products.

The problem of evaporation losses in oil storage tanks had assumed such proportions that leaders in the industry redoubled their efforts to eliminate it. The only effective scheme was developed during the year by the Standard Oil Company of New Jersey. This company brought out a product called "Sealite," a composition of glycerine, glucose and glue, which floats as a foam on the surface of even the lighter oil products in the tank and is airtight, thereby reducing evaporation about 75 per cent.

The Department of the Interior of the United States government adopted a stricter policy against the granting of rights in oil lands in the United States to citizens of other countries which do not grant similar privileges to Americans. The last official act of Secretary Fall prior to his retirement 4 March 1923, was to hand down a lengthy decision denying the application of the Roxana Petroleum Corporation for approval of the assignment to it of certain oil land leases on the ground that said application came from a company under foreign control. The Secretary based his decision on the findings by the Federal Trade Commission in a report to the Senate in which discrimination against American interests was alleged. See also CHEMISTRY. Subsection ORGANIC AND BIOLOGICAL.

PHARMACOLOGY. See MEDICINE AND SURGERY, ADVANCEMENT OF.

PHILIPPINE ISLANDS, the largest group of the Malay archipelago, extending north and south from Formosa almost to Borneo. The area of the group is 114,400 square miles. There are in all 7,082 islands, of these 2,441 are named and 4,642 are not. The chief islands, with their areas, are: Luzon, 40,814 square miles; Mindanao, 36,906 square miles; Samar, 5,124 square miles; Negros, 4,903 square miles; Palawan, 4,500 square miles; Panay, 4,448 square miles; Mindoro, 3,794 square miles; Leyte, 2,799 square miles, and Cebu, 1,695 square miles. The population in 1918 was 10,350,730, mostly Malays. Of the

entire population 91.5 per cent are Christians and 8.5 per cent (886,999) are Moros and Pagans. The chief city is Manila with a population of 283,613. This number, according to the census, included 257,356 Filipinos, 17,856 Chinese, 3,124 Americans, 1,955 Spaniards, 1,611 Japanese, 635 English, 236 Germans and 160 French. Other large towns, with their populations, are: Iloilo (Panay), 48,000; Cebu (Cebu), 46,000; Albay (Luzon), 43,000; Zamboanga (Mindanao), 30,000; Batangas (Luzon), 41,182, and Ormoc (Leyte), 38,247. In the entire archipelago there were in 1918, 5,776 American, 43,802 Chinese, 7,806 Japanese, 3,945 Spaniards and 1,148 English.

Religion.—The principal religion of the islands is the Roman Catholic, of which in 1918 there were 7,815,242 members, almost 80 per cent of the entire population. The Independent Filipino Church, founded in 1901, has 1,361,740 members. This church is identical in dogma and polity with the Roman Catholic excepting that it rejects the authority of Rome. Protestant denominations have 118,845 members. In Mindanao and Sulu there are many Mohammedans and in the more remote regions there are many tribes of Pagans.

Education.—Primary education is free. Teachers are secular. The chief aim of the primary system is the spread of literacy on the basis of English as a common language. There are 791,626 pupils in public schools. Special schools for the special benefit of non-Christian populations are maintained by the Government. For higher education there is the University of the Philippines and the University of Santo Tomas, founded in 1611. There are in the islands 262 private schools of various kinds with 28,838 pupils. The latest census of periodicals reported 21 newspapers and periodicals in English, 15 in English and Spanish, 22 in Spanish, 9 in Spanish-native dialects, 3 in English-native dialects, 25 in native dialects 2 in Chinese and 1 in English-Spanish-native dialects.

Finances.—The revenues of the central government in 1921 amounted to \$84,289,932. The expenditures during the same period amounted to \$83,549,778. The debt service in 1921 amounted to \$3,459,281.

Production.—The chief products of the islands are rice, hemp, cocoanut, sugarcane, tobacco, Indian corn and maguay. In 1919 these crops occupied 7,513,305 acres, of which 3,453,000 acres was planted under rice. The total production of rice was 2,533,623,664 liters. Cocoanuts and their products the same year were valued at \$37,200,000, and sugar and its by-products were valued at \$38,000,000. In 1922 hemp (abacca) production was estimated at 1,200,000 bales. There are 73,000,000 acres of public lands. The forest lands cover about 40,000 square miles and furnish various gums and rosins, rattan, and bamboo, tan barks and dye woods. Mineral deposits of the Philippines include gold, iron, silver, copper, coal, limestone, clays, asbestos, gypsum, gas, petroleum, asphalt, alum, manganese, salt and some gems and precious stones. The chief manufacturing industry is hat making.

Commerce.—Imports into the Philippines in

1922 registered a total value of 160,395,000 pesos—a decrease of 71,282,000 pesos from 1921—and exports in 1922 amounted to 191,167,000 pesos, or an increase of 14,936,000 pesos over exports of the previous year. In 1922 exports exceeded imports by 30,771,000 pesos, compared with an adverse balance of trade of 55,446,000 pesos in 1921. "It is," says the United States Department of Commerce, "highly significant of the basic economic soundness and recuperative powers of the Philippines that 1922 (the first year after the period of greatest depression in the history of the islands) should have witnessed a favorable trade balance far in excess of any previous year other than the three specific years of the war-period boom—1916, 1917, and 1918."

Compared with 1913, imports in 1922 increased 50 per cent and exports about 100 per cent. The principal items of export are shown in values and quantities for 1922 in the following table:

EXPORTS FROM THE PHILIPPINES

ARTICLES	1922	
	Quantity	Pesos ¹
Sugar, kilos.....	362,072,000	51,165,000
Abaca (Manila hemp), kilos.....	172,027,000	39,082,000
Coconut oil, kilos.....	107,208,000	31,469,000
Copra, kilos.....	173,052,000	28,206,000
Cigars, number.....	300,485,000	11,602,000
Embroideries.....		6,515,000

All others.....		9,038,000
Total.....		191,167,000

¹ One Philippine peso = \$0.50.

Sugar exports, while in value practically the same in 1922 as in 1921, were in quantity much greater in 1922 than in 1921, the quantity in the latter year having been 289,876,000 kilos (value, 51,037,000 pesos). The decrease in value in 1922 was attributed to the enforced sale by many planters early in the year, at extremely low prices because of the immediate need of funds.

The decrease in imports in 1922 was the natural result of overstocks brought on by the heavy arrivals in 1921 of many goods ordered during the boom period. The values of the principal imports during the two years are given in the table in the next column.

Exports to the Islands from the United States in 1922 amounted to \$43,298,142, against \$46,516,049 in 1921, the principal decrease being in iron and steel. Imports from the Philippines are estimated at approximately \$60,700,000 against \$52,161,812 in the previous year.

Communications.—Manila is the chief seaport and through it the bulk of the overseas commerce of the islands passes. Over 400 vessels are engaged in the coastwise inland trade. During the year there entered 740 ocean-going vessels having an aggregate net tonnage of 1,711,981. There are 818 post offices, 318 money order offices, 5,471 miles of telegraph lines, 986 miles of cables and 315 telegraph and cable

offices on the islands. The 388 postal savings banks have 68,860 accounts. There are 778 miles of railways on the islands and 6,200 miles of roads. In addition to this there are 1,941 miles of trails, passable for horses only.

Government.—The chief executive of the islands is a Governor-General, who represents the sovereign power of the United States. He is appointed by the President of the United States by and with the consent of the Senate. He is aided by six secretaries of executive departments—interior, public instruction, finance, justice, agriculture and natural resources, and commerce and communications. All the secretaries are Filipinos with the exception of the vice-governor, who is also secretary of public instruction. The legislature consists of a Senate and a House of Representatives. The Senate consists of 24 members and the House of Representatives of 91 members. Members of both houses are elected by popular vote with the exception of nine representatives and two senators, who are appointed by the Governor-General to represent certain districts. The executive and legislative departments are connected by a Council of State composed of the Governor-General, as president, the president of each house of the legislature and the secretaries of the departments. The Department of the Interior exercises supervision over the provincial and municipal governments. Each province has a provincial governor. Justice is administered through a supreme court, the court of first instance, the municipal court of the city of Manila and the courts of the justices of peace. The Governor-General in 1922 was Maj.-Gen. Leonard Wood, who assumed office 5 Oct. 1921.

PHILIPPINES, University of the, a State-supported co-educational institution, founded in 1908 and located at Manila, Philippine Islands. In 1922-23 it had a faculty of 310 members, 4,839 students, and property valued at 3,342,464.18 pesos (a peso is equivalent to 50¢ American money). Its income in 1922 was 188,735.86 pesos. Guy Potter Benton, LL.D., is president.

PHILLIPS UNIVERSITY, a coeducational institution belonging to the Disciples of Christ, founded in 1907 and located at University Station, Enid, Okla. In 1922-23 it had a faculty of 43 members, 1,203 students, property valued at \$1,051,177.74 and an income of \$174,792.54. Isaac N. McCash, A.M., LL.D., is president.

PHILOLOGY. Classical.—The student of linguistic history assuredly owes a debt of gratitude to the untiring zeal of the scholars not only of our own American universities, but likewise to those of British and foreign schools of learning who by their erudition and research continue to bring to light new and hidden treasures of classical lore. Nor should he consider himself less beholden to those other indefatigable bands of American, British and Italian archaeologists who for so many years past have been devoting themselves with a persevering unselfishness to the unearthing of precious relics and records each one of which serves as a gem for the enhancement of the glory of philological science. Within the necessarily narrow space allotted to this present summary we are able to deal *seriatim* with articles from a limited number only of the many important philological publications. Such a resumé however, it is hoped, will amply serve to indicate the nature of the subjects and the value of the articles which have appeared in those other learned journals which we are restricted to mentioning only by name. It is with sentiments of genuine regret that at the outset of this article we find ourselves recording the deaths of Charles E. Bennett, Samuel Ball Platner, John M. Burham and Francesco Flamini, late professor of Italian literature at Pisa. The loss of these brilliant writers to classical scholarship will be long and keenly felt. Accounts of their careers are to be found in *The American Journal of Philology* (1922), and in *The Romanic Review* (1922). The *London Mercury* (November 1922), itself an able and brilliant literary monthly, draws attention to 'The Year's Work in Classical Studies' edited by W. S. Jones at Bristol, England. In this learned review are to be found summaries of books and articles dealing with Italian Archaeology and Excavation, Latin Palæography, Latin Literature, Greek and Roman Religion, Grammar, Lexicography and Metric. (It is little wonder that the editor states that he finds it increasingly difficult to get his kind of work done!) By means of such excellent summaries, which no thoughtful student should miss, one is able to keep more or less *au courant* with the divers articles scattered here and there throughout numerous periodicals. Similar useful abstracts and reviews are to be met with in the American university classical journals and others of especial mention such as *The Classical Weekly* (under the heading, 'Classical Articles in Non-classical Periodicals'), *The Classical Review*, *The Classical Quarterly* and the *Philologische Wochenschrift*. This last mentioned periodical is of exceptional value by reason of its exhaustive and detailed summaries and reviews of German, French, Italian and American writings.

Besides the rich additions in classical trans-

lation for which the Loeb Library is justly noted, equally valuable work in this same direction is being done constantly by writers in the various classical journals, particularly in America and England.

In the *American Journal of Philology* (Vol. XLIII, 1922) were published the following articles, "Some Roman Elements in the Tragedies of Seneca," by R. B. Steele, in which the writer shows how the tragedies are in reality political essays, the Greek characters being employed by Seneca to present his personal views in regard to actual Roman conditions; "Secare Partis—The early Roman Law against a Debtor," by M. Radin (an article reminiscent of Shylock's "pound of flesh"); "Illustrations of Tibullus," by W. P. Mustard; "Horace Epistle I. xix:28-9," by M. B. Ogle, another of those passages needing elucidation for the better appreciation of Horace's literary theories; "Sex Determination and Sex Control in Antiquity," by Eugene S. McCartney—a most enthralling article, in which amusing instructions regarding this subject are quoted from Hippocrates' *De Sterilitate*; "A Misunderstood Syrian Place-Name," by W. F. Albright; "Notes on Two Inscriptions from Sinope," by David M. Robinson. These inscriptions are deposited in the Museum of Constantinople, in both of which reference is made to Homer; "Saint Augustine's Method of Composing and Delivering Sermons," by Roy J. Deferrari—an article of absorbing interest and proving from the inherent style of the discourses as well as from the words of the Saint himself that they were delivered *ex tempore*; "When is Generic *Mh* Particular?" by A. G. Laird; "Single Word *versus* Phrase," a discussion on a question of semantic equivalence, by Edward W. Nichols; "Two Passages in Pindar," by F. A. Wright; "Origin of the Name Cilicia," by W. F. Albright; "Imprisoned English Authors and the 'Consolation of Philosophy' of Boethius," by Guy Bayley Dolson (Sir Thomas More wrote an imitation of it—"A Dialogue of Comfort against Tribulation"); "The Derivatives of the Sanskrit *eka*," by Edwin H. Tuttle.

In the third number of this volume other articles of interest appearing were: "Die Entstehung des Absoluten Infinitive im Griechischen," by Arnold Roseth; "Virginia Georgics," by Herbert C. Lipscomb; "Biblical Studies," by Paul Haupt, in which are discussed among other questions the nature of the Sixth Plague of Egypt, and the etymology of Manna (*Aramaic*—*mān-hū*) and "The Fasti of Ovid and the Augustan Propaganda," by Katherine Allen.

Important reviews are also to be found in this volume, chief of which are those of G. C. Fiske, 'Lucillus and Horace,' by A. I. Wheeler; of Ludwig Traube, 'Vorlesungen und Abhandlungen,' by E. K. Rand; of Carl Robert, 'Die Griechischen Heldensage,' by D. M. Robinson; of Dr. Eduard Stemplinger, 'Horaz im Urteil der Jahrhunderte,' by W. P. Mustard; of Professor John A. Scott, 'Unity of Homer' by S. E. Bassett; of Jerome Carcopina, 'La Loi de Hieron' by Pierre Lepaulle; of F. G. De Pacheterre, 'La Table Hypothé-

caire de Veleia,' by Tenney Frank; of Harold H. Bender, 'A Lithuanian Etymological Index' by Carl D. Buck. An especially appreciative review is that of Major D. Lorimer's valuable book, 'Phonology of Bakhtiari, Badakshani and Madaglashti' (dialect of modern Persian), by A. V. Williams Jackson. In this volume also helpful summaries and reports are to be found of the following foreign periodicals, *Romania* (Vol. XLVI, 1920) by George C. Keidel; *Revue de Philologie* (Vol. XLIV 1920), W. P. Mustard; *Rivista di Filologia* (Vol., XLIX, 1921), W. P. Mustard; *Glotta* (Vol., XI, 1920-21), by Franklin Edgerton; *Philologus* (Vol., LXXVI, 1920), by George Dwight Kellogg; *Hermes* (Vol., LV, 1920) 3 and 4, by Herman Louis Ebeling. A further array of equally brilliant articles and reports similar to those above quoted, and displaying the same scholarly acumen and captivating style of presentment will be found in the pages of the following classical periodicals: *The Proceedings of the American Academy of Arts and Letters*, the *Harvard Studies in Classical Philology*, *The Classical Journal*, the *University of Illinois Studies in Language and Literature*, the *University of Missouri Studies*, the two well-known English periodicals, the *Journal of Hellenic Studies* and the *Journal of Roman Studies* together with the *Philological Quarterly* published at the University of Iowa and edited by Prof. Hardin Craig and an able coterie of confrères, the first number of which appeared in January 1922. Among the numerous classical works of ecumenical interest which were published during the year 1922 we particularly note: 'Seneca and Elizabethan Tragedy,' by F. L. Lucas (Cambridge University Press), a summary of Greek and Roman tragedy with an account of English drama and its beginning, written in a light and interesting vein free from adherence to statistics which so often bore; 'Sortes Vergilianae or Vergil and Today,' by Prof. D. A. Slater (Oxford) with an introductory poem giving Vergil's message to the present age; 'Etruscan Tomb Paintings,' by F. Poulsen (Oxford Clarendon Press), translated by G. C. Richards; a monograph of first rank; 'Greek Vase Painting,' by Ernest Buscher, translated by G. C. Richards (Chatto and Windus, London), "A work," remarks Professor Gardner in his preface, "not likely to be superseded for some time to come"; 'Notes on the Text of Aeschylus,' by E. S. Hoernle (Oxford). Evidence of great care and close study is shown by this author who succeeds in picking holes in "good texts"; 'Babylonian Problems,' by Lt. Col. W. H. Lane, of the Indian Army (Murray, London). This enthralling study has twenty appendices containing translations of a large number of the cuneiform inscriptions of the Neo-Babylonian period, and extracts from the classical, post-classical and Arab historians and certain modern writers; 'The Reed of Pan,' by A. C. Benson (Murray). This well known author makes a new departure in this entertaining volume which consists of 140 epigrams from the Greek anthology done into English lyric verse; 'La Légende Socratique et les Sources de Platon,' par Eugene Dunreel (Oxford University Press); 'Aristotle on

Coming-to-be and Passing-away' (De Generatione et Corruptione), a revised text with commentary by Harold H. Joachim; 'De Coelo' (Works of Aristotle) translated by J. L. Stocks (Oxford Clarendon Press); 'Lucreti de Rerum Natura,' libri sex recognovit, C. Bailey (Editio, altera, 1922, Oxford Classical Texts); 'Aeschylus Persae,' partly in the original and partly in translation, by M. R. Ridley (1922, Clarendon Press); 'Herodotus, Book VII,' partly in the original, partly in translation, edited by C. E. Robinson; 'Flosculi Latini' "tam filo quam colore praestantes quos non sine lappis tribulisque congestis," Arturus Blackburne Poynton; 'Die Griechische Heldensage,' von Carl Robert (Weidmannsche Buchhandlung, Berlin 1920). No one who is eager to sift down to the bottom of Greek mythology or to become an expert on the Greek epic, lyric, and tragic poetry can afford to ignore this volume; 'An Economic History of Rome,' by Tenney Frank, Latin Professor at Johns Hopkins University, a work already acknowledged as standing alone in its completeness as a study of the governing center of ancient civilization; 'Negotium Perambulans in Tenebris,' Etudes de Démomologie Greco-Orientale, par Paul Perdrizet, 'Publications de la Faculté des Lettres de l'Université de Strasbourg' (Oxford University Press, London); 'The Wrath of Achilles,' translated from the Iliad into Quantitative Hexameters by George Emle (Oxford University Press). The translator apologizes for his choice of quantitative hexameters by claiming that the accentual hexameter of Kingsley, Clough and Longfellow is clumsy, monotonous and unworthy of its classical prototype; 'Seneca, the Philosopher and his Modern Message,' by Richard Mott-Gummere, a volume emphasizing our debt to Greece and Rome; 'Rome, La Grèce et les monarchies hellénistiques au troisième siècle avant Jesus Christ,' par Maurice Holleaux, (Bib. des Ecoles Françaises d'Athènes et de Rome); 'Martial the Epigrammatist and other Essays' by Kirby Flower Smith—an instructive volume in which are to be found beside the title subject the following sketches: 'The Poet Ovid,' 'Propertius, a modern lover in the Augustan Age,' 'Pupula Duplex,' 'The Classics and our Vernacular,' 'The Future Place of the Humanities in Education,' 'Original Verse and Translations.'

Facility in Latin verse and Latin prose is constantly evidenced in the work of the younger generation of American classical scholars. Doctoral dissertations (published by the Library of Congress) likewise bear witness to the recondite nature of the classical theses expounded by the alumni of American universities when presenting themselves as candidates for the Doctorate in Philosophy. At this point we draw attention to a remarkable triumph in original classical epigraphy achieved by Professor Wilamowitz-Moellendorf. The inscription he has written is placed on the monument erected to the students of Berlin University who fell in the World War, and consists of this striking phrase: *Inuictis Victi Victuri*. In the whole realm of inscriptional literature nothing more comprehensively brief has been written. Three distinct words express the lightning flash of genius recording

a single fact in Caesar's traditional "Veni, Vidi, Vici." In Professor Moellendorf's epigram we have conjured up before our minds a tremendous sweep of vision by the power of *one* word in three forms, which in its superb simplicity records a nation's honor, humility and hope. No legend that was ever placed on a triumphal arch in the most victorious days of ancient Rome can surpass in terseness, dignity and strength this superb and stately epitaph of modern times.

In the field of palaeography are to be found two valuable contributions worthy of especial notice: 'A History of the Art of Writing,' by W. A. Mason—a comprehensive undertaking in which the author shows that he has availed himself of recent archaeological research and which is written in a style at once easy, entertaining and convincing; The 'Codex Sinaiticus,' reproduced in facsimile by Helen and Kirsopp Lake. The discovery of the 'Codex Sinaiticus' by Tischendorf in 1844 is one of the most absorbing stories in the history of palaeography. A description of the finding of the Codex is given by Kirsopp Lake as an introduction to the document. (Published by Humphrey Milford, Oxford University Press, New York).

In the field of archaeology two important discoveries are to be recorded—one is that of the City of Ur of the Chaldees, birthplace of the patriarch Abraham, excavated after four thousand years by American and British archaeologists. Records have been found that ante-date the dawn of history. The other is the epochal disclosure of the tomb of Tutankhamen at Luxor, Egypt, by members of the archaeological expedition under the direction of Lord Carnarvon. This Pharaoh has been from existing records one of the best documented in the long line of Egyptian kings.

Modern.—One of the most significant phases of the aftermath of the World Conflict has been especially among European nations, the removal of discordant racial elements which has left groups of homogeneous peoples to work out their own salvation. Equally significant is the revival of interest in the study of language by which many of these seek to make stable their self-determination and to cement their newfound racial unity. Hence it is that the knowledge of this national trend of thought among these various unities has given an impetus to scholars to examine further and more closely the basic principles underlying comparative linguistics. In so doing, they are following the new French school of philologists, who with their brilliant leader, M. Meillet, recognize that linguistic progress and change are bound up with political and social movements of civilization: "Le changement linguistique est lié à des faits de civilisation." Thus the study of philology itself has assumed a new phase of development. Methods heretofore for the most part eschewed have now been resolutely adopted, while others already in use have been improved and extended in this vast region of research whose paramount import to mankind has been but emphasized by the welter of conflicting national interests and the cataclysmic confusion which the World War has left in its trail. By such broad methods and principles of investigation will the future progress of philology be

secured. A work well worthy of reference in connection with the foregoing statements is that of Wilhelm von Humboldt, 'Ueber die Kawi-sprache auf des Insel Jawa,' and the introduction to the same, 'Ueber die Verschiedenheit des menschlichen Sprachbaues und ihren Einfluss auf die geistige Entwicklung des Menschengeschlechts.' (On the Difference in the Construction of Language and its Influence upon the Intellectual Development of the Human Race").

General.—The general output of work in the province of modern philology during the year 1922 proved as rich and abundant as that in the classical. Whether the matter dealt with has practical bearing on modern education or whether it be a topic abstruse and profound requiring the application of diagnosis or synthesis, the treatment almost invariably is characterized by solid learning, much research and attractiveness of exposition. Where so much is excellent there is perplexity of choice. Among subjects of a general nature we note: 'Language, its Nature, Development and Origin'; by Otto Jespersen in the *Journal of Education and the School World* (London 1922); 'The Place Names of Middlesex' (Including those parts of the City of London formerly contained within the boundaries of the old county), by J. E. B. Gover (Longmans, Green & Co., London); 'The Newton Stone and other Pictish Inscriptions,' by Francis C. Diack (Gardner, Paisley, Scotland); 'Das Alphabet in Mystik und Magie,' by Franz Dornseiff; 'A short History of the International Language Movement,' by Albert Guérard. A sober and able treatment of this vexed question. This problem is neither a fad nor a Utopian dream but a fact. British and American officers during the war found it pressed upon them every day with tragic insistence. A book deserving of serious consideration.

Noteworthy contributions in relation to various languages herewith mentioned may be chronicled as follows:

Sanskrit.—'The Madhyama Vyayoga-Adra-na by the poet Bhasa from the original Sanskrit,' with notes, Ernest Paxton Janvier; 'The Life and Story of Jaina Savior Parcvanatha,' by Maurice Bloomfield, Prof. of Sanskrit, Johns Hopkins University; 'A complete English-Persian Dictionary,' compiled from original Sources, by Sir Arthur N. Woollaston, K.C.I.E. (2nd edition reprinted); 'Siksha Samuccaya, a compendium, of Buddhist Doctrine,' compiled by Santideva, translated from Sanskrit by Cecil Bendall, M.A. late professor of Sanskrit, University of Cambridge, and W. H. Rouse, M.A. Headmaster of the Perse School, Cambridge.

Celtic.—'An Elementary Welsh Grammar,' Part I. Phonology and Accidence, by Sir J. Morris-Jones, (Clarendon Press, Oxford); the 'Bulletin of the Board of Celtic Studies, University of Wales' (published by Humphrey Milford, Oxford University Press, New York).

Spanish.—Revista de la Facultad de Letras y Ciencias, (Vol. XXXI. Nums. 3 y 4. Julio-Diciembre 1921, universidad de la Habana; Español (Vol. V, Nums. 4 y 5); Inter-América (Noviembre 1921, Enero 1922, Vol. V. Num. 6. Marzo de 1922, Vol. VI, Num. I. Mayo de 1922).

French.—'Grammaire Elementaire,' 2ième

année, by Emma C. Armand (Boston, New York, Chicago); 'Le Langage: Introduction linguistique à l'histoire,' par J. Vendryes; 'Les diminutifs de noms propres de lieux,' par Auguste Vincent, (*Revue Belge de Philologie et d'Histoire*. Tome I. No. 2., Avril 1922); 'Archives Berbères et Bulletins de l'Institut des Hautes Etudes Marocaines,' (*Hesperis*, Tome I. Année 1921).

Italian.—'Le Origini del Romanzo-Greco,' by Bruno Lavagnini; 'Dizionario italiano-inglese e inglese-italiano,' by G. Richieri; 'Dizionario navale-italiano-inglese e inglese-italiano' for naval engineers and architects, by W. T. Davis.

Slavic.—'Early Jug-Slav Literature' (1000 A.D.-1800), by M. S. Stanoyevich; *Revue des Etudes Slaves*, ed. par A. Meillet et Paul Boyer.

Gothic.—'Contributions toward a History of Arabico-Gothic Culture' (in Vol. IV. *Physiologus Studies*, Philadelphia).

English.—Both useful and interesting works are the following: 'A Middle English Vocabulary,' by J. R. R. Tolkien, designed for use with Sisam's 'Fourteenth Century Verse and Prose' (Clarendon Press); 'Fourteenth Century Verse and Prose,' by Kenneth Sisam (Clarendon Press); 'Some Contributions to the English Anthology,' a garland from little unfamiliar books of the seventeenth century; by John Drinkwater, (British Academy). 'An Anglo-Saxon Reader,' by Henry Sweet, in prose and verse, with Grammar, Metre, Notes and Glossary (Clarendon Press), 'Language: An Introduction to the Study of Speech,' by Edward Sapir; 'A History of Modern Colloquial English' by Professor H. C. Wyld, (Liverpool University); 'A Bibliography of the English Language and Literature,' (Modern Humanities Research Association); 'A Senior English Grammar,' by R. B. Morgan, M.Litt., Inspector of Schools to the Croydon Education Committee and H. A. Treble, M.A.

Germanic.—Two important works in lexicography are 'Deutsches Wörterbuch,' by H. Paul (Halle) and a new edition of 'Wörterbuch der deutschen Sprache' (Berlin), published for the first time over forty years ago.

Miscellany.—'The Nighantu and the Nirukta,' the oldest Indian Treatise on Etymology, Philology and Semantics, translated for the first time into English by Lakshman Sarup, (Oxford University Press, London); 'Evolution of Māghadī,' by Anantaprasad Banerji-Sāstri (ib.), of interest to students of Indian linguistics; 'The Bantu and Semi-Bantu Languages,' a comparative Study by Sir Harry H. Johnston (Vol. II, 1922, Clarendon Press); 'The Legend of Ulenspiegel,' by Charles de Coster, translated by F. M. Atkinson, the first complete English translation of this great Flemish Masterpiece; 'Anthologie des Ecrivains Belges,' by L. Dumont-Wilden; 'Les grands Ecrivains de la France,' (33ième Vol. ed. par A. de Boislisle), based on original manuscripts with notes of impeccable erudition; 'French Terminologies in the Making,' by Harvey J. Swann, Ph.D.; 'Infinitive Constructions in Old Spanish,' by Wilfred A. Beardsley, Ph.D.; the American edition of 'Pequeño Larousse Ilustrado,' based on the latest edition of the 'Diccionario de la Real Academia Espanola,' and comprising over

9000 Americanisms in use among Spanish-Americans and in the Philippines; 'Modern Provençal Phonology and Morphology studied in the language of Frederic Mistral,' by Harry E. Ford, Ph.D. (Columbia University Press, New York); 'Toulouse and the Renaissance,' by J. C. Dawson, Ph.D. (ib.); 'Spanish Literature': A Primer, by James Fitzmaurice-Kelly, (Clarendon Press); 'The Rig-Vedaprātishākhya with the Commentary of Uvata,' English Translation and several appendices by Mangal Deva Sastri, (Oxford University Press); 'The Book of Kindred Sayings' (Sanyutta-Nikāya or 'Grouped Suttas') Part II. Translated by Mrs. Rhys Davids, assisted by F. H. Woodward, (Oxford University Press); 'Histoires de lettres françaises de Belgique,' by Maurice Gauchez, (édition de la Renaissance d'Occident).

In the *Romanic Review* (Vol. XIII) appeared the following articles and reviews, the titles of which sufficiently indicate the nature of their interest: 'The Floral Games of Toulouse,' by J. C. Dawson; 'Chaucer and Medieval Hunting,' by Oliver F. Emerson; 'A Bibliography of Peruvian Literature,' (1821-1919), by Sturgis E. Leavitt; 'Doña Maria de Zayas y Sotomayor,' by Lena E. V. Sylvania; 'Deux Poèmes de Peyre Cathala,' by C. Fabre; 'La Aparición que Hizo Jesu Christo a los Discipulos que Yvan a Emaus,' an early sixteenth century play, by Joseph E. Gillet; 'American Travellers in Spain,' 1777-1867, by C. Evangeline Farnham; 'Two Commedie dell'Arte on the 'Measure for Measure' Story,' by Winifred Smith; 'Bernard de Poey, Contemporary of the Pléiade,' by J. C. Dawson; 'The Chronology of the Earlier Works of Chrestien de Troyes,' by Lucy M. Gray; 'The Original Version of Torres Naharro's Comedia Tinellaria,' by Joseph E. Gillet; 'Storm-Making Springs: Studies on the Sources of 'Ivan,' by George L. Hamilton; 'Old French 'Trover en escrit,' by Julian E. Harris; 'The Missing Lines of 'La Estrella de Sevilla,' by S. Griswold Morley; 'A Bibliography of Bolivian Literature,' by Sturgis E. Leavitt; 'The Old French 'Lai de Nabaret,' by Gertrude S. Loomis; 'An Examination of Some Sources of 'Don Alvaro,' by E. A. Peers; 'Alessandro Manzoni-Beccaria, Romanticist,' by Mary V. Young; 'The Italian Sources of Antonio Scoppa's Theory of French Versification,' by P. S. Zampière.

Interesting reviews in this volume were of: 'F. F. Communications,' (Nos. 32-41) edited by the Folklore Fellows; 'Norske Folkeminne utgjevne av den Norske Historiske Kildeskritikk-kommission' (II. Norske Eventyr); 'Antologia Portuguesa organizada por Agostinho de Campos,' by T. F. Crane; and of Alfred Franklin, 'Paris et les Parisiennes au Seizième Siecle,' by Hélène Harvitt.

In Volume XI of the 'University of California Publications in Modern Philology,' dedicated to Charles Mills Gayley, are to be found the following engrossing articles: 'The Accentuation of the Research-Group of Words,' by Cornelius B. Bradley, M.A.; 'James, Bergson, and Determinism,' by Evander Bradley McGilvary, Ph.D.; 'Some old French Miracles of Our Lady and Chaucer's 'Prioresses Tale,' by Walter Morris Hart, Ph.D.; 'The Art of Nar-

rative in Autobiography," by Chauncey Wetmore Wells, A.B.; "Twelve Andamanese Songs," by Benjamin P. Kurtz, Ph.D.; "The Transmission of Folk Tales," by Stith Thompson, Ph.D.; "English and American Appreciation of Rabelais," by George Rupert MacMinn, A.B.; "Coleridge's Estimate of Fielding," by Frederic T. Blanchard, B.L., M.A.; "Blake, Carlyle, and the French Revolution," by Harold Lawton Bruce, Ph.D.; "Poe's Doctrine of Effect," by George F. Richardson, Ph.D.; "Psychoanalysis and Literary Criticism," by Herbert Ellsworth Cory, Ph.D.; "Androcles and The Lion," by Arthur Gilchrist Brodeur, Ph.D.; "The Litany in English," by Jane Gay Dodge, A.B., M.A.; "The Lady from the Sea," by Sigurd Bernard Hustvedt, Ph.D.; "An Essay on Gaelic Ballads," by William W. Lyman, Jr., M.A.; "A Method of Studying the Structure of Primitive Verse Applied to the Songs of the Teton-Sioux," by Guy Montgomery, M.A.; "A List of the Published Writings of Charles Mills Gayley from 1881 to 1920."

From the foregoing epitomized survey of the work done in the realms both of classical and modern philology during the year 1922, may be gathered the varied trend and gradually expanding scope in linguistic research, the resulting possibilities of which in the near future may well be regarded as incalculable. The student who would become efficient in this important branch of language study has ample facilities of so doing if he but avail himself of the rich treasure-troves constantly placed at his disposal.

PHYSICS. Investigators in Physics are chiefly engaged at present in testing the various striking and more or less speculative theories and hypotheses to which the world of science fell heir in the years just before the war and in applying these theories to increasing our knowledge of the properties of matter.

Proposed tests of the Einstein theories.—The solar eclipse of 21 Sept. 1922 afforded a new opportunity of determining whether the bending of rays of light in passing the immediate environment of the sun corresponds to that demanded by the mechanics of Newton or accords with the equations proposed by Einstein. The astronomers have reported favorable conditions and the results are said to confirm the prediction of Einstein, but the definite results will not be known for several months. In the meantime laboratory tests, conceded to be crucial have been carefully discussed and very elaborate and exacting experiments are actually in progress. The conclusions will interest especially the not inconsiderable school of physicists who regard the Einstein theories as effective but artificial mathematical devices for overcoming some of the difficulties with which modern science is confronted.

Disintegration of the Elements.—Sir Ernest Rutherford and his co-workers at the

University of Cambridge are continuing their investigations upon the breaking down of certain elements such as boron, nitrogen, fluorine, sodium, aluminum and phosphorus under bombardment by alpha rays. It is found that particles which can be identified as hydrogen nuclei are driven off from the surface of the bombarded substance. No other element tested, and this included all those of atomic number up to 19, was found to suffer loss of hydrogen nuclei under the conditions of the experiment. Rutherford¹ suggests that the hydrogen nuclei liberated from these six elements "probably exist as satellites circulating around the main nucleus" of the atom. Upon collision with an alpha particle the satellite acquires sufficient momentum to be expelled from the atomic structure. It is further inferred that elements such as lithium, chlorine, etc., which are unaffected by bombardment, have no positive hydrogen particles as satellites, or only such as are more closely bound to the system. This sort of disintegration is not quite the same thing as the much talked of transmutation of metals. It is more closely related to the transformations which are continually breaking down the radio active elements.

Quantum Theory, The.—Among the newer theories to find fruitful applications in the work of today the quantum theory is conspicuous. Silberstein² in a discussion of the photographic process, for example, has cleared up one of the chief difficulties in the photo-chemical theory. It has been hard to understand how, under the continuous application of light, occasional grains in the sensitive film should be completely exposed while neighboring grains seem to be immune. This well established but hitherto unexplained fact becomes an almost necessary result of the quantum theory, according to which light is split up into discreet particles each carrying a quantum (or unit quantity) of energy. Instead of being submerged in a uniformly acting beam of light, which would affect each particle of the photographic film equally, the film is supposed to be subjected to a bombardment by individual light-darts which reach only here and there a grain and miss the intervening ones. Every grain, be it large or small, which is struck is fully exposed; those untouched remain unchanged. This is in fact the actual state as revealed by the microscope. Similarly Bridgman,³ by the use of the quantum theory, has been able to correlate the effects of the enormous pressures, to which in his experiments he has subjected various materials, to the corresponding effects of temperature. It is the quantum theory, again, which explains one of the most perplexing questions of modern physics, that of the varied structure of spectra, a subject elucidated by Foote and Mohler⁴ in their fundamental work on the 'Origin of Spectra.' The distinction between the Balmer series of lines in the spectrum of hydrogen and the so-called secondary spectrum is finely illustrated in an experiment⁵ by R. W. Wood. He

⁴ Monographs of Am. Chem. Soc. (1922).

⁵ *Phil. Mag.* (6) XLIV, p. 538.

confirms the accepted view that the former occurs when the hydrogen molecules are broken up into atoms and the secondary spectrum only when the gas is in the molecular state.

Filling the gap between ultraviolet light and X-rays.—It was definitely established some years ago that X-rays differ from light only in wave length. The gap, however, was enormous. Lyman, it is true, had extended the boundary of the known region of the ultraviolet to wave lengths somewhat under one thousand Ångström units. The longest known wave lengths of X-rays were, however, scarcely more than ten Ångströms. Within the year, however, Dember's demonstration of the existence of X-rays of several hundred Ångströms within the walls of vacuum tubes has been confirmed by several observers and Millikan's discovery of lines in the ultraviolet not exceeding 233 Ångströms has been strengthened by Hopfield's measurements of the oxygen spectrum.*

Luminescence of Incandescence, The.—Wide departures from the recognized laws of incandescence have been frequently ascribed to luminescence, i. e., to radiation due to some other agency than the disturbances brought about by temperature. With two or three exceptions, however, such statements have been based on assumption rather than on measurement. In two recent papers by Nichols and Howes it is shown that certain oxides when heated radiate selectively and at some definite temperature far exceed the brightness of a perfect radiator.[†] This extra glow, superimposed upon the ordinary temperature radiation has all the well known characteristics of luminescence. Luminous flames whose brightness is commonly supposed to be due to chemi-luminescence, are found by the same authors to be excited to increased brightness by violet and ultraviolet and reduced in brightness by the longer wave lengths of the spectrum.*

Audition, Advances in.—The physics of vision has always been more advanced than that of hearing and consequently the faulty eye has ever been better served than the ear. The quantitative analysis of sound has lagged far behind spectrum analysis and the measurement of the intensity of sound has been found more difficult than that of light. In the matter of aids to deafness the only important step since the invention of ear trumpets has been the introduction of microphones as amplifiers of sound. The advantage of thus magnifying sounds has, however, been largely annulled by distortions which render speech, thus enhanced, almost unintelligible. At the present time vacuum tube amplifiers, with their countless adjuncts of high ingenuity, extend the range of telephonic communication almost indefinitely. This has been accomplished by magnifying the complex wave systems which constitute speech without modifying the relative intensity of the overtones.

Amplification without distortion likewise greatly facilitates the accurate study of audition. It is now possible, as Donald MacKenzie[‡] has

done with his *alternation phonometer*, to balance tones differing in pitch and to say when they are of equal loudness. Thus he has been able to gauge the sensitiveness of the ear at different loudness levels throughout the entire audible range. The work just mentioned and such studies as Minton's¹⁰ "Physical Characteristics of Abnormal Ears"; Lane's¹¹ "Determination of the Minimum Sound Energy for Audition"; Crandall and MacKenzie's¹² "Analysis of the Energy Distribution in Speech"; Wente's¹³ "Electrostatic Transmitters for Measuring Sound Intensities" and Fletcher and Wegel's¹⁴ "Sensitivity of Normal Ears," all of which notable contributions have appeared within the current year, constitute a veritable renaissance in a neglected domain. We shall presently know as much about the ear and its needs as is now known about the eye and the practitioner will be able to prescribe for deficiencies of hearing with the same certainty as now does the oculist and to fit the ear with sound amplifiers as the eye is now fitted with glasses.

Application of Acoustics to the Measurement of Depths at Sea.—Some of the very delicate and ingenious methods which were developed during the war at the naval experiment station in New London, Conn., and which were primarily intended for the detection of submarines, are now finding useful and interesting applications in quite other fields. Dr. H. C. Hayes, for instance, in a paper read before the National Academy of Sciences on 16 Nov. 1922 describes the measurement of marine depths by means of the reflection of sound waves from the bottom. In shallow waters sounds produced at the stern of a vessel are caught at the bow after oblique reflection from the bottom of the harbor or channel. The detector used is one of the so-called "multiple-variable" receivers invented in the course of the naval experiments and given over to the public for general purposes. With these instruments the direction of a sound can be determined with great precision. The depth of the water is found from the angles of incidence and reflection of the sound waves. In this way it has been found possible to conduct a ship in a dense fog through the Bay of Fundy to St. Johns. The run was made without soundings and without any of the usual means employed by navigators under such circumstances. In deep water sound waves are sent vertically downward from the vessel and a set of standing waves are set up between the hull and the bottom of the sea. In this way estimations of depth are made which are said to equal the best of deep-sea soundings. The United States Navy and the Carnegie Institution of Washington are jointly exploring the bottom of the Pacific along our coast and southward, by this method, to determine the location and nature of the earth faults which cause such disasters as the recent earthquake and tidal wave along the coast of Chile.

Among some of the new books on Physics are: Aston, F. W., 'Idiotopes'; Bingham, E. C., 'Fluidity and Plasticity'; Bragg, W. H., 'The World of Sound'; Bridgman, P. W., 'Dimensional Analysis'; Carstow, H. S., 'Conduction of Heat'; Crehore, A. C., 'The New Physics'; Einstein, A., 'The Meaning of Relativity'; Fleming, J. A., 'Fifty Years of Electricity'; Foote and Mohler, 'Origin of Spectra'; Glazebrook, R. T., 'Dictionary of Applied Physics' (Vols. 1 and 2); Kaye, E., 'Practical Applications of X-Rays'; Kraus, C. A., 'Properties of Electrically Conducting Systems'; Mills, J., 'Within the Atom'; Price, E. S., 'Atomic Forms'; Sabine, W. C., 'Papers on Acoustics'; Silberstein, E., 'Theory of General Relativity and Gravity.'

EDWARD L. NICHOLS,
Professor Emeritus of Physics, Cornell University.

PHYTOGEOGRAPHY. See BOTANY.

PIEDMONT COLLEGE, a coeducational institution, founded 10 Sept. 1897 and located at Demorest, Ga. Though connected with the Congregationalists, it is, nevertheless, non-sectarian. In 1922-23 it had a faculty of 30 members, 265 students and property valued at \$550,000. No figures as to its income given. Frank E. Jenkins, D.D., is president.

PIERRE UNIVERSITY. See HURON COLLEGE.

PINE, John B., American lawyer: b. Dubuque, Iowa, 2 Feb. 1857; d. New York City, 28 Oct. 1922. Having received his bachelor's degree from Columbia University in 1877, he afterwards studied at the law school there, was admitted to the bar and had practiced in New York City since 1879. For 32 years he was a trustee of Columbia University and at the time of his death was secretary of the board. He was also attorney for the university. From 1907-09 he was a member of the Art Commission of the city of New York. He was a member of the New York Bar Association, and a manager of Saint Luke's Hospital, New York City. In 1908 he was made chairman of the committee on character, being appointed by the Supreme Court; was trustee of the American Academy in Rome; and trustee and founder of the University Settlement Society of New York. One of the founders of the Columbia University *Quarterly* and an editor after 1897, he had compiled a volume of historic university documents entitled 'Acts and Charters of Columbia University.'

PITTSBURGH, University of, a non-sectarian coeducational institution, located at Pittsburgh, Pa. It was founded as Pittsburgh Academy in 1787, in 1819 the name was changed to the Western University of Pennsylvania, and in 1908 the name was again changed to University of Pittsburgh. In 1922-23 it had a faculty of 608 members, 8,000 students, property valued at \$4,582,132.10 (cost less depreciation), and an estimated income of \$1,359,368. John Cabbert Bowman, LL.D., is chancellor.

PIUS XI (AMBROGIO ACHILLE RATTI) Pope: b. Desio, Italy, 31 May 1857. It was only when he died that the world seemed to realize what an important part Pope Benedict XV played in

its affairs. He was then proclaimed a great and good Pope. He ruled the Church in a most trying time. His constant effort was to lead men's thoughts away from strife and from the horrors of war. He did much to prepare the way for peace. He did still more to alleviate the sufferings of war's victims. When he died Mussulman, Jew and Greek united in this inscription on the pedestal of a statue erected to his honor in Constantinople: "To the great Pontiff of the world tragedy, Benedict XV, benefactor of the peoples without regard to their nationality or creed."

The world watched eagerly and waited anxiously for the election of the successor of this great pontiff. People had not ceased to mourn Benedict XV when, within two weeks, grief gave way to joy as Rome sent forth the news to the waiting world: "We have a Pontiff in the person of Ambrogio Achille Ratti, who takes the name of Pius XI." That joy was increased when later it was learned that he took the name of Pius because "Pius is the name of peace."

The press of the world knew but little of the new Pope. Hence it seized eagerly on two items: that the new Pope was a mountain climber; that the new Pope is a great scholar and linguist. There was much repetition of the story of his ascent of Monte Rosa, and writers enlarged on his love of the out of doors. Side by side with this, much was said of his love of books and devotion to research and his evidences of scholarship in the Ambrosian and Vatican libraries. Both showed the man: a man who could spend a lifetime in a library, examining, deciphering, cataloguing manuscripts; but at the same time a man who loved nature, who delighted in a hard climb and could spend a night on the mountain side. When his life was examined more closely we saw that in Poland and Milan he showed these characteristics. As the diplomat in Poland he evidenced knowledge of the Polish people and their history. He had besides the broader understanding that comes from sympathy with legitimate human aspirations. As priest and archbishop in Milan, he could leave his library to instruct little children, and his palace to interest himself in the settlement of a strike. Such is Pius XI: a man of profound learning, and a man of broad human sympathies.

Ambrogio Achille Ratti was the third of six children. One brother and one sister are still living.

F. Marion Crawford wrote: "Peasant and Prince have an equal chance of wearing the triple crown, but in history it will be found that it has been more often worn by peasants than by princes, and most often by men issuing from the middle classes." This is verified in the present case. The Ratti family is of the sturdy middle class from which most of the popes have come. His father was a weaver, but able to give his children a good education, even before Italian law made education obligatory. To Achille Ratti there came an exceptional opportunity. In Desio a town of 9,000 inhabitants about eight miles north of Milan, at that time there lived a priest, Don Giuseppe Volonteri, who conducted a private school. Don Giuseppe seems to have been a school-master

of unusual ability and a school-master of unusual methods. It is said, he accepted pupils for one year only. If at the end of that time they showed special talent he retained them. If not they were dismissed. As a consequence his school was in the best sense select. Achille Ratti was admitted and retained.

Under Don Giuseppe's guidance he laid the foundation deep and firm of a splendid education. The venerable priest also helped to mold his character and to turn his thoughts to ecclesiastical studies. So rapid was his progress that at the age of 10 he was able to enter the gymnasium of Saint Peter Martyr.

Achille Ratti did not forget his old teacher. When Don Giuseppe died in 1884 his former pupil then a priest in Milan went to Desio, preached the funeral sermon and wrote the epitaph for his teacher's tomb.

From the school at Desio the future Pope went to the seminary at Monsea, and later to the College of San Carlo in Milan. Thence he passed to the Seminario Maggiore, and at the age of 16 he went to Rome to enter the Lombard College and follow the courses of the Gregorian University. The Gregorian is a famous Jesuit University in Rome. It is attended by the students of the different national colleges as well as by members of religious orders. Amid the many students young Ratti soon distinguished himself, and received his degree in philosophy, theology and canon law. He was ordained priest in Rome on 20 Dec. 1879.

Father Ratti returned to Milan in 1882, and was appointed professor of theology in the diocesan seminary. In 1886 Monsignor Ceriani chose him as his assistant in the Ambrosiana Library. And in 1888 he was made member of the College of Doctors of the Library.

The Ambrosiana, founded in 1609, is one of the historic libraries of the world. It was meant to be not only a collection of books and manuscripts and a museum of the arts, but also a college of savants. In Monsignor Ceriani the future Pope met a scholar worthy of his surroundings. They worked together in harmony and to mutual advantage till the death of the monsignor in 1907. Father Ratti succeeded him, and was prefect of the Ambrosiana from 1907 to 1914.

During these years Father Ratti showed an enormous capacity for work, and devoted much of his time to a variety of interests. He was chaplain to the nuns of the Cenacle and found time for the instruction of the young, especially of the smaller boys who roamed the streets of Milan. He was mainly instrumental in organizing the school-teachers, and was interested in many efforts for social as well as religious betterment. In the meantime he became favorably known as a librarian abroad as well as in Italy.

He was now Monsignor Ratti. His work as prefect of the Ambrosiana necessitated his going to Rome, from time to time, for research in the Vatican Library. Pope Pius X was impressed by the industry and ability of Monsignor Ratti and wished to have him in Rome for the Vatican Library. Monsignor Ratti was not anxious to leave Milan. But when the Pope insisted he first assisted and in 1914 succeeded Father Ehrle, S. J. (now Cardinal Ehrle), as prefect of the Vatican Library. For two years

he divided his time between Rome and Milan, but finally he was persuaded to devote himself entirely to the Vatican Library.

This was not an easy task during the war. Men of different nationalities and sympathies had access to the library. Books and documents were eagerly searched for a word in favor of one side or the other. With admirable tact and prudence the prefect avoided favoring or offending either side.

In the meantime Benedict XV had ascended the Papal throne. He soon discerned in Monsignor Ratti qualities that marked him for other work than scholarship. His linguistic ability, his calm judgment of men and affairs, his scholarly habit of weighing well his words, of thinking before acting, indicated other fields of usefulness. Benedict XV was a keen judge of men, and he estimated accurately the capacity of his librarian.

About that time ecclesiastical affairs in Poland caused no little anxiety at the Vatican. Russian invasion and German offensive had wrought havoc and reduced the people to misery. Russia had now collapsed; the German army occupied Russian as well as German Poland. The spiritual needs of the people called for immediate action. Numerous Sees were vacant or suppressed. Yet little could be done without offending the sensibilities of the Germans or the national aspirations of the Poles. To get first hand information, the Pope determined to send an apostolic visitor to Poland, and he selected Monsignor Ratti for the post. The appointment is dated 25 April 1918.

While the Polish mission had no political significance it was generally acknowledged to be a difficult one. It was particularly difficult for a man not experienced in diplomacy. But Monsignor Ratti approached his task not as a diplomat but as a priest. He insisted that his mission was ecclesiastical. He came to provide for the spiritual needs of the people. This he did with such tact that he won the confidence of the Poles and the respect of the Germans.

With the Armistice came new problems. Poland was once more an independent nation. Monsignor Ratti was made Nuncio, and consecrated archbishop in the Cathedral of Warsaw, 28 Oct. 1919. There were difficulties pressing for solution. Some German bishops resigned and their places had to be filled. The Church had to be organized almost anew in former Russian territory. Amid these difficulties revolution broke out, followed by Bolshevik aggression. There was a popular movement for the division of landed estates. The churches possessed lands and were immediately affected. Archbishop Ratti solved these difficulties. He organized the dioceses in a way that won the approval and gratitude of the Polish nation. He stood by Poland when the Russian Reds were hammering at the gates of Warsaw, and by word and example helped to bring to Poland a most remarkable victory. He met the popular demand for division of the land by conceding the principle and assenting to division of the Church lands, provided the Holy See was consulted.

On the occasion of the famous plebiscite in Upper Silesia the Papal Nuncio was appointed high ecclesiastical commissioner at the request

of Germany, Poland and the Inter-Allied commission. Passions ran high in those days. Each faction accused the other of intimidation and fraud. Yet the Nuncio fulfilled his task with a firmness and a fairness that won the approval of all. And in the midst of the turmoil he was able to bring about the liberation of many who had been held prisoners by the Bolsheviks.

It was on account of his success in Poland that Archbishop Ratti was made cardinal in a secret consistory 13 June 1921, and appointed to the See of Milan, his native diocese. On that occasion, speaking of Cardinal Ratti, Pope Benedict said: "Behold the students of the schools of diplomacy bowing before the former prefect of the Ambrosiana Library of Milan, and of the Vatican Library of Rome, praising the zeal with which he always favored them in their search for the hidden treasures in ancient documents; behold these students of diplomacy, and with them their masters, bowing also before the Apostolic Nuncio of Poland who with firmness and yet with exquisite tact and imperturbable calmness has known how to establish concord between the State and the Church in times that were most difficult and under circumstances most dangerous."

Less than a year after these words were spoken the Cardinal was elected successor of the Pope who spoke them. The election took place 6 Feb. 1922 and the coronation on 12 February following. Most people will subscribe to the words of Cardinal Bonzano, then Apostolic Delegate to the United States, "With erudition he combines an experience in practical affairs obtained under most trying circumstances. He thus brings to the Papal throne those qualities most needed at the present time for the government of the Church. We may be sure that under our present Holy Father the Church throughout the world, and especially in America, will reach a high degree of prosperity and continue the work of pacification."

Professor of Moral Theology and Canon Law, Saint Joseph's Seminary, Dunwoodie, N. Y.

PLANT INDUSTRY, United States Bureau of. The Bureau of Plant Industry conducts those features of the work of the Department of Agriculture which have directly to do with the production problems of all plants except forest trees. Its work covers a wide range of activities, including the investigation of the causes of all plant diseases such as those affecting fruits, forest and ornamental trees and shrubs, cereals, cotton, truck and forage crops and tobacco; the breeding of improved and disease resistant varieties of these and other crops, the prosecution of agricultural exploration work in foreign countries, and the introduction to this country for testing of such foreign seeds and plants as promise to possess economic or ornamental value under our conditions. It investigates, both in laboratory and field, problems of soil fertility, including the determination of the relative and actual value

of fertilizing materials and other soil amendments; methods of culture of various crops, including the determination of crop rotations best suited to the less thoroughly understood dry land and irrigation agriculture of the semi-arid and far Western regions; the cultural inter-relationships of crops involved in crop successions and numerous physiological problems requiring solution in the effort more fully to understand the biological processes involved in plant growth and fruition. Special attention is paid to problems encountered in the development of new plant industries in various parts of the country. Considerable attention is devoted to investigations looking toward more effective utilization of perishable crops, such as vegetables and fruits, to the end that effective methods of conserving temporary surpluses of production may be developed, thus preventing waste of valuable raw products and reducing the even more destructive results to the producer, from the financial standpoint, of excessive gluts of such products.

In addition to the research activities, which constitute the chief portion of its work, the Bureau is charged with the conduct of three large scale cooperative service activities having to do with the eradication or control, through practical measures, of three destructive plant diseases which have proved serious in certain parts of the country. These are the bacterial disease of citrus fruits known as citrus canker, which is being eradicated from the commercial citrus districts of the five Gulf States; the white pine blister rust disease, which menaces the growing stands of this valuable timber tree in the New England and Great Lakes States, the control of which, in the sections where pine has attained the status of a commercially important crop, is being accomplished through the eradication of both wild and cultivated bushes of the several species of *Ribes* (currants and gooseberries) which constitute the host plants that transmit the disease from pine to pine; and the control of the black stem rust of wheat and other cereals which in occasional years, when climatic conditions favor, develops in epidemic form, working serious damage, especially in the great interior winter wheat and spring wheat regions of the Mississippi Valley and Northern Great Plains. This last is being brought under control by eradicating the common barberry bush from that region, it being the host plant responsible for that early start of the disease in the spring which makes the destructive epidemics of black stem rust possible in certain seasons.

The work of the Bureau is organized on the project basis, comprising at the present time some 125 group projects which cover some 325 distinct phases of work. The appropriations for the work of the Bureau for the fiscal year 1923 total approximately \$3,770,000, of which approximately \$2,500,000 is devoted to research; \$860,000 to service work, and the remainder to such features as \$40,000 for specific extension work on the government reclamation projects; \$10,000 to regulatory work (administration of the Import Seed Law); and \$360,000 for the purchase, packing and preparing for distribution of vegetable and flower seeds allotted to

Senators and Representatives under a mandatory appropriation, generally known as the Congressional Seed Distribution. The personnel comprises approximately 1,700 permanent employees, about one-third headquartered in Washington and two-thirds at various points in the field, mostly at independent or cooperative field stations, at locations where suitable soil and climatic conditions for the study of the special problems under investigation are found. Approximately 900 of the personnel are scientifically and technically trained men. The work is administered by the Chief and Associate Chief of Bureau and an Assistant in Charge of Business Operations, the specific research and service projects being organized on the group plan, each with a trained and experienced specialist in charge. The new publications of the Bureau issued during the fiscal year 1922 numbered 127, containing 3,114 pages, 280 full-page plates and 627 text figures, issued in first editions aggregating 1,165,650 copies. These comprised department bulletins, farmers' bulletins, circulars and miscellaneous documents, with contributions to the Department "Yearbook" and to the *Journal of Agricultural Research* covering a wide range of subjects. Outside publication in technical journals of a large number of technical articles by the specialists of the Bureau staff occurred during the year.

Some typical instances of results of the research work of the Bureau are:

Soil Permeability.—It has been demonstrated by investigational work, both in the laboratory and in the field, that the permeability of the soil to water is influenced by the quality of the irrigation water with respect to its dissolved salts. When the dissolved salts are chiefly salts of calcium and magnesium, the effect on the soil is to keep it permeable to water and thus to prevent the accumulation of salts in harmful quantities if sufficient irrigation water is applied to leach the surface soil, at least occasionally. On the other hand, if the dissolved salts in the irrigation water are chiefly salts of sodium, the effect on the soil is to make it colloidal, in which condition it absorbs water so slowly that the leaching out of the dissolved salts is difficult or impossible. In the light of these results it has been possible to recommend the treatment of irrigated land to prevent injury when the irrigation water is deficient in calcium and magnesium salts and to correct conditions of impermeability that have developed.

Soil Solutions.—In the field study of the comparative effects of different crop plants on the yields of other crops following in the rotation, some notable differences have been obtained in the "carry over" or residual fertilizing effects of hairy vetch, crimson clover, cowpeas, and soy beans on the small grains when tobacco, potatoes, and corn are the intervening crops. Moreover, in these and in other cropping combinations the generally unfavorable effect of corn, as compared with potatoes and tobacco, on the yields of crops following in the rotation has been a striking feature. These "crop effects" do not seem to be fully explainable on the basis of relative draft on the soil's supply of plant-food elements. For example, the tobacco crop removes much larger quantities

of the plant-food elements than the potato crop, but better yields of potatoes are obtained after tobacco than after potatoes themselves.

Magnesium Deficiency.—In further work on the significance of magnesium as a constituent of fertilizers for tobacco and other crops it has been found that corn, like tobacco, develops characteristic pathological symptoms on certain soils when magnesium is omitted from the fertilizer. It has been discovered also that a proper balance between the supply of magnesium and sulphur in the fertilizer or soil is a factor of importance in plant growth and that this balance is likely to be greatly affected by the amount of the seasonal rainfall. In relatively dry seasons symptoms of sulphur deficiency are more evident, while in wet seasons magnesium deficiency becomes more acute, probably because of the sulphur brought into the soil by rain in conjunction with the loss of magnesium by leaching. As a result of field-plat tests carried out in most of the important tobacco-growing sections, in which chemically pure salts were used instead of the usual commercial-fertilizer materials, it has become evident that under certain conditions magnesium deficiency may result in serious damage to tobacco, even on newly cleared land, and the crop is subject to injury from this cause in various localities. It has been demonstrated that the necessary quantity of magnesium for correcting this deficiency may be readily supplied by using in the fertilizer potash salts containing appreciable quantities of magnesium or by the application of magnesium limestone to the soil. It is obvious, therefore, that the element magnesium must be taken into account both in the general problem of liming and in the proper choice of commercial-fertilizer materials, particularly in the use of highly concentrated fertilizer formulas.

Effect of Borax in Fertilizers.—Investigations of the effect of borax on different crops and in different quantities under a variety of soil conditions and climatic factors have been concluded. The results show that the injuries reported during the war were primarily due to the borax contained in the fertilizer in proportions exceeding .10 pounds per acre, although in many experiments much smaller quantities often caused some of the symptoms of borax poisoning to appear. Under moist soil conditions or rains following the application of the fertilizers the effect of the borax is much less than where dry conditions obtained. The potash sources which carried this borax into the fertilizers are now so purified that the quantity of borax contained in them is negligible. The elimination of borax from fertilizers to a safe limit has been accomplished, and no further damage need be feared from this source.

Citrus-Canker Eradication.—As a result of the vigorous campaign conducted by the Gulf States in cooperation with this Bureau it was thought that the bacterial disease of citrus trees known as citrus canker had been completely eliminated from areas of commercial citrus-fruit production, but this canker was again discovered in Florida on 20 May 1922, in a grape-fruit orchard in an isolated citrus section near Davie, and since that time 14

near-by properties have been found infected, with a total of about 750 trees. Since the disease is easily spread from orchard to orchard by workmen engaged in cultivating or picking, a rigid inspection is necessary, and a large corps of men experienced in canker control is now at work in Florida.

In addition to this outbreak in Florida a few infected spots were found in Alabama and Mississippi, which emphasized the necessity of continuing the inspection work on a more adequate scale. Louisiana has apparently eradicated canker from the commercial producing area, but many scattered, infected trees are being found in isolated places. Effective eradication activities are now under way in Texas, and it appears that by far the larger part of the infected trees have been located and destroyed. Occasional outbreaks of canker occur in the lower Rio Grande Valley and at present major efforts are being devoted to the thorough eradication of canker from the entire Rio Grande district.

White-Pine Blister Rust.—The outstanding feature of the white pine blister-rust situation during the past year was the discovery of this destructive disease in southwestern British Columbia and the Puget Sound region of Washington. This bureau, in co-operation with State and Canadian authorities, has taken prompt action to determine the extent of the infected area and, if possible, to control or eradicate this new outbreak of the disease. The age of infections found on pine trees proves that the disease was present in British Columbia in 1916, prior to the enactment of the Canadian blister-rust quarantine, and the rust has extended its range into the State of Washington.

The appearance of the blister rust in the Northwest directly menaces seven different species of five-needled pine that are native to the Rocky Mountain and Pacific Coast States, all of which are susceptible to the white pine blister rust. The present total merchantable stand of Western white and sugar pine, the principal commercial species, is estimated at over 57,000,000,000 board feet, with a stumpage value of \$228,400,000, about half of which is owned by the Federal government. Even more important from the standpoint of future forest production are the 12,000,000 to 13,000,000 acres of second growth in which Western white and sugar pine will form an important part of the timber crop.

Barberry Eradication.—The campaign for the eradication of the common barberry in order to control the black stem rust of wheat was begun in the spring of 1918 and is now in its fifth year. The eradication area comprises 13 of the north-central wheat-growing States, namely: Colorado, Illinois, Indiana, Iowa, Michigan, Minnesota, Montana, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin and Wyoming. All of these States now have enacted legislation requiring the removal of common barberry bushes. The campaign is conducted in co-operation with the State agricultural college in each of the States, with the State department of agriculture in most of them, and with the Conference for the Preven-

tion of Grain Rust. Investigations of the time, rate, and manner of spread of rust from barberries, made during the summer, give additional evidence of the enormous losses directly traceable to individual bushes and hedges.

From the beginning of the campaign to 30 June 1922, almost all cities, towns, and villages in the 13 States included in the eradication area were surveyed. The original survey has been completed in Montana, Colorado and Wyoming and a resurvey made for finding and eradicating sprouts and seedlings appearing since the original survey was completed. In the other 10 States the original survey has covered an area of approximately 330 counties. A resurvey of each property on which barberries have been found is being carried forward and areas in the vicinity of large hedges or large bushes, either cultivated or escaped, which are old enough to bear seeds have been designated for a more careful resurvey.

During the entire campaign a total of 5,625,289 bushes has been located on 50,287 properties. Of these, 3,296,378 were escaped areas in the States of Wisconsin, Illinois and Michigan. These areas cannot be cleared immediately because of their extent and the difficulty of eradication.

Sugar Cane Mosaic.—Mosaic has been found on sugar cane in each of our cane States, and every field has been inspected and the degree of infection, if any, has been determined and recorded. Some of the States are co-operating in the control of the mosaic in the cane areas. The disease has been reduced practically to the point of elimination in parts of Porto Rico and in the eastern and peninsula part of Florida, where the roguing advocated by the Bureau has been practiced according to directions. The immune variety of cane, Kavangire, imported by the Bureau from Argentina in 1919, is being rather generally planted in Porto Rico and in badly diseased areas promises to displace the susceptible varieties.

Potatoes.—From the high Andes of Colombia and Ecuador a considerable series of interesting potatoes has been introduced for the use of North American plant breeders who are working with this crop. This series includes a number of varieties of the "chaucha" group, a very early maturing type from Ecuador; the yellow-fleshed potato, a variety of remarkably rich flavor from Colombia; and one or two wild forms closely allied to the cultivated potato and of possible value for hybridizing with the latter.

About 5,000 new potato seedlings obtained in the breeding work are under test, together with a considerable number of the most promising selections made from earlier breeding work. In this phase of the work the difficulty is to get in a single combination high yield, high table quality, resistance to disease, and the other important characteristics of shape, smoothness of surface, etc. In many instances seedlings that are highly resistant to disease have proved to be light-yielding sorts and have lacked in table quality or in some other particular, while other seedlings which have had great promise in some other line have proved susceptible to disease. The work is continued in the expecta-

tion that through a combination of varieties or seedlings having desirable characteristics in the largest degree seedlings will eventually be secured in which these characteristics are all combined in a satisfactory measure.

Cotton.—Experience with cotton has shown that the utilization of superior varieties is a fundamental problem, requiring careful study. On account of the present organization or lack of organization in the cotton industry, most of the seed is inferior, and there is no assurance of any general utilization of good varieties. Methods of breeding and acclimatization have been developed and demonstrated, but other requirements must be met if a full utilization of superior varieties is to be secured. The discovery and development of a series of superior varieties, including Lone Star, Trice, Columbia, Meade, Durango and Acala, make it possible to place the different regions of the Cotton Belt on new planes of improved production, and all these varieties are being grown as extensively as the available supplies of good seed will permit; but the inadequacy of the present systems of providing annual supplies of planting seed is also being recognized and methods of improvement devised. Efforts are being made, therefore, to avoid the general mixing of seed at the public gins and the crossing of the different varieties in the fields, which undoubtedly are responsible for the rapid and general deterioration of seed stocks that tend to keep our producing industry on a low plane of efficiency.

Red Clover.—Tests have been continued to determine the value of imported red-clover seed. Field tests were carried on co-operatively with the agricultural experiment stations of Wisconsin, Michigan, Ohio, Pennsylvania, Tennessee, Idaho and Oregon, as well as with individual farmers in these States and at the Arlington Experiment Farm. The results obtained confirm previous conclusions and establish beyond doubt the fact that red-clover seed imported from Italy is not reliably hardy north of the Ohio River. At Arlington it was also found that while the imported red clovers passed the winter without appreciable mortality, a large percentage of the plants died after the first cutting the following season, while plants from domestic-grown seed made a vigorous second growth.

Wheat.—Two new wheats developed in the breeding experiments in co-operation with the agricultural experiment station of Cornell University have been named Forward and Honor. These now are being grown commercially, and seed is offered for sale by seedsmen and farmers in New York State. A mass selection of the purple straw variety developed at the Arlington Experiment Farm is being widely grown in eastern North Carolina and is giving good results.

Kota, a bearded, hard red spring variety, discovered in 1918 to be especially resistant to stem rust, was grown in 1921 at 30 experiment stations to determine its value in comparison with adapted commercial varieties of both common and durum wheats. During the past three years its resistance to stem rust has proved nearly equal to that of the most resistant durum varieties. The commercial stocks of Kota seed

were increased to about 6,000 bushels in 1921, and nearly all of this was sown in 1922.

Durum wheats have continued to outyield common wheats, including Marquis, in the spring-wheat belt of the northern Great Plains and prairie areas. Some of the high-yielding rust-resistant durum varieties developed co-operatively by this department and the State agricultural experiment stations unfortunately do not produce a first-class quality of macaroni and other alimentary pastes. Preliminary experiments show, however, that Arnautka, Kubanka, Peliss, and Mindum make semolina products of satisfactory quality. The acreage of Kubanka has been rapidly increasing throughout the durum-growing sections, because it is more rust resistant than Arnautka. Peliss has been increased in Montana and Mindum in Minnesota.

Grapefruit.—Because of the fact that the great bulk of the grapefruit crop is marketed during a comparatively short period and because of certain serious difficulties which have been experienced in holding this fruit in cold storage, considerable work has been done in an effort to determine satisfactory methods of handling the fruit and to learn the limits of storage. Successful storage obviously has large possibilities, in view of the fact that by holding the fruit in cold storage for a considerable length of time the marketing period would be extended, thereby making grapefruit available to the consumer over a longer period and at the same time tending to eliminate gluts in the market which are likely to result from the present necessity of disposing of the crop in a limited time.

The results of the work have been very promising. The procedure has been to procure fruit from individual trees at different times and to handle comparable lots differently, both during the pre-storage period and while in storage. Chemical analyses of the fruit have been made from time to time in order to determine the biochemical effect of different methods of handling and storing, as well as for the purpose of gaining information in regard to the biochemical processes that go on in different fruits from the time they are harvested until they are consumed. The chemical analyses show that grapefruit behaves very much like deciduous fruits when in cold storage so far as chemical changes are concerned. The acids seem to break down, while the sugar content remains about the same. In warm storage, however, the sugar seems to disappear and the acids to increase to some extent. One of the serious problems in the storage of grapefruit is the development of what is commonly called "pitting." This is the breaking down of certain cells in the skin of the fruit which results in the formation of brown-colored pits that may be very numerous and may increase in size until many of them coalesce. This produces a very unattractive appearance. It has been determined as a result of this line of work that grapefruit cured at a temperature of 60 degrees to 65 degrees F. in a humidity of about 55 per cent, the curing being continued from 10 to 20 days, and then placed in a storage temperature of 32 degrees F. may be kept in good

condition for two months, thereby materially extending the marketing period. Fruit so handled does not suffer from pitting and comes from storage in an attractive condition with excellent dessert quality.

Bud Selection.—Several outstanding and important facts have been brought out clearly during the past year in connection with the investigational citrus progeny performance-record work. Buds taken from the normal branches of the parent tree where that tree has a sporting branch or branches bearing abnormal fruits or foliage produce trees which have been found to be extremely variable and undesirable for commercial propagation. In other words, parent trees which have sporting branches as the result of bud variation have been found to be undesirable for propagation, even though the buds for propagation are taken from the normal branches of such trees. The variable branches in the trees indicate inherent instability. On the other hand, buds taken from productive and normal trees bear fruits uniformly good and without marked deviation from the normal type of fruits and foliage. This discovery, confirming similar investigations during previous years, has demonstrated that in the selection of parent trees for propagation it is essential that only those trees which produce uniformly good fruits be used.

WILLIAM A. TAYLOR,
Chief, Bureau of Plant Industry.

PLANT PATHOLOGY. See BOTANY.

PLANT PHYSIOLOGY. See BOTANY.

PLATINUM. During the first nine months of 1922 the imports of crude and unmanufactured platinum amounted to 72,410 ounces, which is nearly 11,000 ounces more than the imports during the whole of 1921. Colombia supplied about half the crude platinum that reached the United States, and some Russian platinum came in through England and other countries. As the domestic supply of platinum and related metals is now almost completely dependent on imports it is reasonable to expect a considerable increase in the quantity of new metals recovered by refiners. Stocks of platinum at the beginning of the year were about normal, amounting to 64,547 ounces. As the jewelers had a better year in 1922 than in 1921, the recovery of secondary metals was estimated at least 50,000 ounces. James M. Hill, of the United States Geological Survey, therefore estimated that about 200,000 ounces of platinum metals were available for consumption in 1922. The large supply was reflected in the price of refined platinum, which throughout most of the year was from \$87.50 to \$90 an ounce but which early in the fall advanced to \$108. Palladium remained at \$55 to \$60 an ounce without fluctuation. The price of iridium was fairly regular at \$160 to \$175 an ounce until fall, when a shortage of supply caused a considerable advance in price.

PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA. An organization founded in 1906 in the interest of the children who because of the rapidly growing cities and towns were fast being driven into the streets to play. It was a move to bind to-

gether in a national movement the efforts growing up in various parts of the country to provide children with places where they could have real play and safe play. From this beginning the Association has grown into a nationwide work in promoting public recreation for people of all ages and a clearing house for information on all phases of the recreation movement. The principles on which the work is based are these:

1. Wholesome recreation is a community responsibility just as education and health are. It should, therefore, be administered by the municipality and supported through taxation.

2. Recreation should be conducted the year round. There should, therefore, be playgrounds and neighborhood recreation centers open throughout the year in schools and other meeting places, and community recreation activities of all kinds in which all the people can participate.

3. Leadership is the most important factor in recreation. There should be at the head of a municipal system a secretary or superintendent of recreation with assistants employed throughout the year.

4. There must be an official body in charge of the system.

Through its field secretaries this organization helps cities to conduct campaigns for municipal appropriations for recreation and to organize systems of recreation. Through its employment service officials in charge of recreation departments are put in touch with workers and through its information service cities not only in all sections of this country but in all parts of the world are given information. An important part of the work in recent years has been the National Physical Education Service maintained in Washington to promote State and Federal legislation for compulsory physical education in the schools.

The Association has its headquarters at 315 Fourth Avenue, New York City, and its officers at the beginning of 1923 were: President, Joseph Lee; first vice-president, John H. Finley; second vice-president, William Kent; third vice-president, Robert Garrett; treasurer, Gustavus T. Kirby; secretary, Howard S. Braucher.

PLUMB, Glenn Edward, American lawyer: b. Clay, Washington Co., Iowa, 1 Sept. 1866; d. Georgetown, D. C., 1 Aug. 1922. After taking the degree of Ph. B. at Oberlin College in 1891, he studied at Harvard Law School 1891-92 and took the degree of LL.B. in Northwestern University in 1893. He was counsel for the city in *Blair vs. City of Chicago*, known as the "99 year case." In 1919 he went to Washington to urge upon Congress the plan for tripartite control of the railways of the country, placing them under a commission of 15, five to be railway employees. In 1920 he offered to Congress a plan for all American industries modeled after the Plumb plan for the railroads. The Plumb plan had wide publicity. About seven years ago Mr. Plumb was retained by the railroad brotherhoods to represent them in wage negotiations of the locomotive engineers in which the values of certain railroad properties were in question; and on several other occa-

sions in after years he acted as counsel for the brotherhoods.

PLUM CURCULIO. See ENTOMOLOGY, UNITED STATES BUREAU OF.

POISON GAS, Use of. See WASHINGTON CONFERENCE.

POLAND, a republic of Europe, formerly partitioned between Austria, Germany and Russia. Capital, Warsaw.

Geography, Area, Population, Religion.—The ancient Polish State was reconstructed as a result of the World War. It comprises the territory formerly divided among Austria-Hungary, Prussia and Russia after the three partitions of Poland in 1772, 1793 and 1795. Its boundaries have been defined as regards Germany and Austria-Hungary by the treaties of Versailles and Neuilly, and the Boundary Commission, acting under these treaties. As regards Russia, the boundary on the east was laid down in general terms by the Treaty of Riga (signed 18 March 1921). A boundary treaty with Lithuania was negotiated also in 1921, while in Upper Silesia the Supreme Council of the League of Nations defined the boundaries there in the autumn of 1921.

According to these several treaties, awards, etc., Poland has an estimated area of 149,042 square miles. Of this area "Congress Poland," (the part granted to Russia by the Congress of Vienna 1815) has the greater number of inhabitants as the table shows:

Congress Poland.....	12,789,226
Galicia.....	8,257,505
Former Prussian Poland.....	3,225,618
Territory ceded by Russia by Treaty of Riga....	3,683,568
	<hr/> 27,955,717

The density of population in the whole country in 188 per square mile. The racial percentage is as follows: Poles, 65.3 per cent; Ukrainians, 16.7 per cent; Jews, 7.4 per cent; Germans, 5.2 per cent; White Russians, 3.1 per cent; Ruthenians, 0.5 per cent; Lithuanians, 0.4 per cent; Aborigines, 0.6 per cent; others, 0.8 per cent. The latest table of vital statistics gives for one year: 172,144 marriages; 898,819 births; 488,193 deaths; surplus of births over deaths, 410,626.

Before the war great numbers emigrated chiefly to the United States, where, it is estimated, that the Polish population is about 4,000,000.

The chief cities of Poland, with their populations in 1921, are as follows: Warsaw, the capital, 931,176; Lodz, 451,813; Lwow, 206,113; Vilna, 205,000; Cracow, 176,463; Posen, 156,691; Sosnowiecz, 86,452; Czestochowa, 81,823; Bialystok, 76,971; Lublin, 99,917; Radom, 61,627; Kattowitz, 45,422; Bromberg, 57,696; Przemyśl, 54,078; Grodno, 34,916; Kalisz, 44,753; Thorn, 39,419, and Kielce, 41,357.

Religion.—The Roman Catholic is the dominant religion of Poland; having 66.8 per cent of the population within its fold. Greek Catholics number 12.1 per cent; Greek Orthodox, 9.3 per cent and Jews 11.0 per cent.

Political Life.—The provisional legislature of the Republic of Poland was elected 26 Jan. 1919 and met for the first time on 10 February following. There was no foundation of law

and government, no constitution and no provisional organization.

It was necessary to provide for the whole country a new constitution. But before that was enacted the legislature, through itself assuming the sovereign power, entrusted Joseph Pilsudsky with the office of Chief of State and commander-in-chief of the armed forces. The constitution was finally adopted 17 March 1921 and is considered one of the most democratic and liberal in the world (for text see *New York Times Current History* for May 1921, Pages 358-367). In the meantime steps have been taken to co-ordinate the organization of the three parts of Poland by creating new territorial divisions (Wojewodztwo) and by giving these a reasonable measure of home rule.

The Polish Legislature at once began to democratize the franchise and to introduce a unitary system of organization. A commission was appointed to draw up a Polish system of law in place of the four systems prevailing, the Austrian Civil Code of 1811, in the Austrian part; the German Civil Code of 1896 in the German part; the Code Napoleon in Russian Poland around Warsaw (the Congress Kingdom) and the Russian Civil Law in other parts of Russian Poland. The commission of codification, composed of leading professors, judges and practicing lawyers, has been holding frequent meetings and is working out a new legal code.

Education.—Elementary instruction has been made compulsory in the whole of Poland. A law was also passed organizing on a liberal basis the universities and other academic schools. There are in Poland five universities, two polytechnic schools, a mining academy, two veterinary academies, two agricultural academies, an academy of forestry and two academies of commerce. The system of secondary schools was unified and laws have been passed fixing in a liberal way the status and income of professors, teachers, judges and other public servants.

Relations with Neighbor States.—In the early months of 1922 relations between Poland and Soviet Russia were marked by charges and counter charges of support of hostile propaganda. Poland, 8 Nov. 1921, in a note to Moscow, demanded that the terms of the Riga Treaty be finally carried out. Drastic anti-communist legislation was enacted the same month. Poland and the Free City of Gdansk signed an agreement on 25 Oct. 1921, under which goods between Poland and Gdansk now circulate freely back and forth under a common customs regime. On 7 Nov. 1921 a treaty was signed with Czechoslovakia, each nation guaranteeing benevolent neutrality in case the other was attacked. The relations with Rumania and France are fraternal.

Defense.—On 10 Jan. 1922 the Minister of War presented a bill in Parliament for a peacetime army of 250,000 men, deemed by him necessary in view of Poland's lack of strategic boundaries, exclusive of the Carpathians in the South. The army was increased to 300,000 on 18 Aug. 1922.

Economic Life.—Poland has large mineral deposits, but the main production of the country

is agricultural. Most of the land in Poland—iron 60 to 70 per cent—belongs in free hold to owners whose shares do not exceed 200 acres and are sometimes as small as a quarter of an acre. The remainder forms estates and belongs to the State, to various public and private corporations and to private individuals. Since the population is very dense (188 to the square mile) there is a strong demand for land. According to a statute of 1920, large estates are to be broken up, leaving a prescribed maximum for individual cultivation, the rest being sold in small plots.

About 85 per cent of the total area of Poland is productive. Of the productive area, about 25 per cent is forest. All forests are the property of the State. A livestock census of a few years ago showed 2,847,000 horses, 6,918,000 cattle, 2,389,000 sheep and 5,185,000 pigs.

The six chief crops of Poland are wheat, rye, barley, oats, potatoes and sugar beets. The production of each of these during 1922 exceeded the production of 1921, according to figures made available by the Polish Chief Statistical Office.

The following table shows the principal crops of Poland in 1922 compared with 1921.

Crops	Area sown		Total yield ¹	
	1921	1922	1921	1922
	Hectares ²	Hectares	Metric tons	Metric tons
Wheat.....	846,920	1,037,200	960,222	1,150,000
Rye.....	3,512,474	4,380,700	4,247,508	5,132,000
Barley.....	991,725	1,113,600	1,160,598	1,297,000
Oats.....	1,923,800	2,314,300	2,174,188	2,655,000
Potatoes.....	1,951,300	2,146,400	15,040,900	19,102,900
Sugar beets.....	79,600	106,000	1,549,600

¹ Exclusive of Polish Upper Silesia.

² One hectare equals 2.47 acres.

Uncultivated land in 1922 was estimated at 370,000 hectares (of which 300,000 was in the eastern districts, 40,000 in Congress Poland, and 30,000 in Galician Poland), as against 1,130,000 in 1921 and 2,500,000 in 1920.

Industry.—Warsaw, Lodz, Cracow, Czeszochowa and Dabrowa are the great industrial centres of the republic. Poland produced 6,408,664 tons of coal in 1920 and 250,000 tons of brown coal. Ore production totaled 820,000 tons in 1920. Eight furnaces have a capacity of 10,000 tons of iron and steel monthly. Mineral salt was produced in 1920 to the extent of 282,673 tons. Rock oil production has fallen off in recent years in Galicia, being only 831,703 tons in 1919 and 764,818 tons in 1920. The textile industries employ 46,000 hands in 485 factories with 750,580 spindles and 12,922 looms. Paper manufactures of various grades are important, especially the paper-bag products. In 1922 Poland produced 713,100 metric tons of petroleum as compared with 704,874 tons in 1921 and 765,004 tons in 1920.

Commerce.—During the first six months of 1922 the volume of Polish exports increased materially, reaching 61 per cent in weight of the volume of imports as against 42 per cent for the entire year 1921. It is substantially certain that exports gained also in value relatively to imports. However, only since 1 Jan.

1922, have statistics of the values of exports and imports been available. For the first six months of the year, imports were valued at 223,804,000,000 Polish marks and exports at 100,108,000,000, the latter being equal to 45 per cent of the former. The excess of imports (124,000,000,000 Polish marks) was met chiefly by remittances to Poland from emigrants abroad and in part by foreign credits accorded against the security of Polish property. On applying the average monthly rate of exchange to import and export values for each month, the above import values amount to \$58,164,000 and the exports to \$25,810,000.

The following table compares the quantity of Polish imports and exports by half-yearly periods from January, 1920, to 30 June 1922:

ITEMS	First half year	Second half year	Total year
1920:	(tons)	(tons)	(tons)
Imports.....	1,907,992	1,621,819	3,529,811
Exports.....	209,109	411,183	620,292
1921:			
Imports.....	2,470,190	2,427,803	4,845,046
Exports.....	878,317	1,149,821	2,028,044
1922 (first half):			
Imports.....	2,313,149	(¹)	(¹)
Exports.....	1,415,695	(¹)	(¹)

¹ Figures not yet available.

Finance.—The total expenditures of the Polish government in 1921 amounted to \$115,000,000 and those of the first six months of 1922 to about \$65,000,000 (on basis of 1 Polish mark = 1/20 of one cent in 1921 and 1/40 of one cent during first six months of 1922).

This decided improvement in the budget situation was due chiefly to the collection of the extraordinary direct taxes known as the "budget balancing contribution." Of the total receipts from all sources (191,458,000,000 marks) about three-fourths (146,864,000,000) were from taxes, and of these taxes, two-fifths (58,473,000,000) were from the extraordinary contribution. However, there was also a considerable increase in the revenues from indirect taxes and monopolies. The revenue from these sources during 1921 had been 41,386,000,000 marks, while during the first six months of 1922 it amounted to 67,781,000,000—or, after allowing for the decline in the value of the currency, a sum equal to about four-fifths of that for the 12 months preceding.

The Polish financial situation during the latter six months of 1922 was extremely unsatisfactory. Internal political conditions prevented the passage of needed tax legislation. The extraordinary contribution had been a once-for-all levy, with no provision for repetition. While about 80 per cent of the entire sum expected from this source was actually collected the bulk of the collections had fallen during the first half year.

No official statistics of actual expenditures and receipts subsequent to 30 June have been made public. The expenditures in terms of paper money, however, increased very greatly as compared with the first six months of the year, and the total expenditures for the year may have reached nearly twice the amount fore-

cast in the March budget. There is no reason to suppose that the sound-money value of the expenditures during the second half year was materially higher than during the first half, but owing to the decline in the revenues (again in terms of sound money) and the inability to float further short-term obligations, large emissions of paper currency were necessary, so that more marks had to be paid out month by month as salaries, wages, and payments for supplies.

The total domestic debt of Poland on 1 Jan. 1922 was \$128,000,000 and the total foreign debt on the same date was \$284,042,961, of which \$166,257,965 was due the United States Government and \$18,200,000 to citizens of the United States on private loans.

Communications.—There are in the republic 7,295 miles of railways and 30,070 miles of highways. The railways are the property of the state. There are 1,005 post and telegraph offices exclusive of Prussian Poland and 545 telephone exchanges. There are 1,880 miles of navigable waterways. A merchant marine is projected to reach 220,000 gross tons, including 30 vessels of over 8,000 tons and smaller vessels for the coast trade.

History.—The controversy over Vilna was one of the chief obstacles confronting Polish statesmen at the beginning of the year. In April the union of Vilna with Poland was consummated despite opposition offered by Lithuania. The Genoa Conference was productive of new friction with Russia through the signing by Poland of the Allied joint note to Germany, after the announcement of the Russo-German Treaty of Rapallo, in which the Allied powers reserved the right to nullify any section of the Rapallo Treaty which violated the Treaty of Versailles. In a note to M. Skirmunt, the head of the Polish delegation to Genoa, M. Tchitcherin, the Soviet Foreign Minister, declared that the action of Poland conflicted with the Polish pledge made at Riga on 30 March to support the Soviet delegation at Genoa and gave Russia the right to abrogate the peace treaty made between Russia and Poland on 18 March 1921. The electoral bill was placed before the Provisional Parliament in May. According to it the legislature is to consist of two chambers—a lower House of 408 members and a Senate of 102 members. On 15 May the treaty between Germany and Poland regarding the status of Upper Silesia was signed at Geneva. Before its clauses could be put into execution a period of unrest developed in the region accompanied by race riots. On 29 June a new cabinet was formed with Arthur Sliwinski as Premier. This was understood to be a transition body pending the election of the new legislature but it fell prematurely on 7 July when confronted by a parliamentary bloc of the groups favorable to former Premier Ponikowski. Poland attached the greatest seriousness to the danger of Bolshevik propaganda and invasion on her eastern frontier. Special measures were taken from time to time for economic and administrative protection. The cabinet crisis continued throughout the month of July but on the 29th of that month Dr. Julian Nowak, Rector of the University of Cracow, was chosen Premier and succeeded in

forming a cabinet. Late in August new tension developed in regard to Upper Silesia when 6,000 Poles fled from the German area into the Polish part, bringing with them reports of German terrorism aimed at influencing the vote to be taken 3 September to determine whether German Silesia should be an autonomous state or remain a province of Prussia. The vote was 10 to 1 in favor of remaining with Prussia. The Minister of Finance late in September announced to the Diet his plans for a thorough reform of the finances, including a complete monetary reform to be finished in from three to five years and the increase and simplification of taxes. The political situation was very favorable at the close of the pre-election period. One of the last acts of the Provisional Diet was the passage of a Home Rule bill for Eastern Galicia granting local autonomy and proportional representation in the Central Government. The general election for the Lower House of the Diet was held on 5 November and for the Senate on 12 November. The results for both houses were as follows: Senate: 51 Christian Unionists; 17 Populists (Witos Group); 8 Populists (Liberation Group); 7 Socialists; 2 National Laborites and 26 Bloc of National Minorities and East Galician Zionists. House of Deputies: 163 Christian Unionists; 6 Centre Parties; 70 Populists (Witos Group); 49 Populists (Liberation Group); 2 Radical Peasants' Party; 41 Socialists; 18 Nationalist Laborites; 2 Communists; 15 East Galician Zionists; 5 Radical Ruthenians; 1 Jewish Populist; 2 other Jews; and 66 of the bloc of National Minorities. On 9 December Gabryel Narutowicz, the Foreign Minister was elected President of the Polish Union by the National Assembly, receiving 289 votes on the fifth ballot against 228 for M. Zamowski, the Minister to France. The new President was born in Telsze (now in Lithuania) in 1865; studied at Libau and at the Technical Institute of Petrograd and the Institut Polytechnique of Zurich. He had an international reputation as a waterways engineer in France, Spain and Switzerland and in 1908 was made professor at the Institut Polytechnique of Zurich. He served in this capacity until summoned by Premier Grabski in 1920 to become Minister of Public Works. He was continued in the two Witos cabinets, in the Ponikowski cabinets and took the Portfolio of Foreign Affairs in the Sliwinski cabinet and later the same in the Nowak cabinet. He was a delegate to the Genoa Conference and visited Rumania in September. Rioting of serious proportions marked his inauguration on 11 December when 20,000 Nationalists, mostly students and schoolboys, sought to prevent the ceremony. The President took up the duties of his office on 14 December and on the 16th visited an exhibition of paintings. He had just concluded a short address when he was shot by an artist named Niewodomski and died within a few minutes. M. Rataj, the speaker of the House of Deputies, who, in conformity with the Constitution, became President ad interim of the Republic, at once summoned General Sikorski to form a new cabinet. The President ad interim summoned the National Assembly for the election

of a new President, and it chose Stanislas Wojciechowski.

POLITICAL AND SOCIAL SCIENCE, American Academy of. An organization established about 30 years ago as a forum for the scientific discussion of social, civic, industrial and economic subjects. During 1922 the Academy published six special volumes, each devoted to some important national or international problems. These volumes were: 'The Federal Reserve System—Its Purpose and Work'; 'Russia Today'; 'The Determination of Wage Rates'; 'American Intervention in Haiti and the Dominican Republic'; 'Ethics of the Professions and of Business'; 'America and the Rehabilitation of Europe'; 'Industrial Relations and the Churches'; 'Western Europe and the United States.'

During the year the Academy held a number of special sessions in addition to the annual meeting which was held in May. The topics to which the six sessions of the annual meeting were devoted are as follows: 'The Industrial and Financial Situation in Europe and its Remedies'; 'To What Extent is America's Prosperity Dependent on the Rehabilitation of Europe?'; 'America and the Debts of Europe'; 'America and the Political Situation in Europe'; 'Is America's Co-operation Indispensable to European Rehabilitation?'; 'America's Relation to the European Situation.'

In 1922 the Academy entrusted Prof. Carl Kelsey, of the University of Pennsylvania, with a special mission to undertake a study of economic, social and political conditions in Haiti and San Domingo. The results of this investigation were published in a special publication of the Academy entitled: 'The American Intervention in Haiti and the Dominican Republic.' The officers of the Academy are: President, L. S. Rowe; Vice-Presidents, Carl Kelsey, Herbert C. Hoover, David P. Barrows; Secretary, J. P. Lichtenberger; Treasurer, Charles J. Rhoads. The Academy has its headquarters at West Philadelphia Station, Philadelphia, Pa.

POLITICAL SCIENCE, Academy of, an international organization, founded in 1880 and having its headquarters in Kent Hall, Columbia University, New York City. At the close of 1922, the membership was 5,076. Meetings are held semi-annually. The first meeting in 1922 was held on 30 April and took the form of a national conference on 'Railroads and Business Property.' Over a thousand persons attended each of the sessions. The Academy publishes *The Political Science Quarterly*; the 'Record of Political Events,' and 'The Proceedings.' The officers of the Academy are: President, Samuel McCune Lindsay; Vice-Presidents, Albert Shaw and Paul M. Warburg; Secretary, Parker T. Moon; Treasurer, George A. Plimpton; Assistant Treasurer and Executive Secretary, Ethel Warner.

POLITICS, Institute of. The Institute of Politics was projected in 1913 by the president and trustees of Williams College, Williamstown, Mass., and was made possible by the generosity of Bernard M. Baruch, of New York City, who

provided financial support for three years, 1921, 1922 and 1923.

The purpose of the Institute of Politics as set forth by Dr. Harry A. Garfield, president of Williams College, is "to advance the study of Politics and to promote a better understanding of international problems and relations." The Institute is a non-partisan forum where persons well informed on various subjects of international interest may exchange ideas.

Membership is open to men and women connected with the faculties of colleges and universities, especially in the departments of history, economics, and government; to writers on foreign politics; to persons engaged in or who have been engaged in the direction of foreign commerce or banking; to diplomatic and consular officials; to officers of the army and navy, and specialists in the employ of the government; to editors, editorial writers, foreign correspondents of the press; current events lecturers; and to those who receive invitations on account of their training and experience in the field of international law and politics.

International Relations was the subject of the First Session, 1921, and in treating this subject two quite different courses were pursued,—public lectures and round-table conferences. Six scholars of international reputation including the late Viscount James Bryce of England, Signor Tommaso Tittoni, president of the Italian Senate, and Count Paul Teleki, former Prime Minister of Hungary, were invited to come to the Institute as guests of the college, to deliver courses of lectures. These lecture courses were open to the members of the Institute and to the general public. The round-table conferences, open to members of the Institute only, were conducted by the foremost American authorities in their respective subjects.

At the Second Session, 27 July to 26 Aug. 1922, "International Relations" was again the general topic of discussion, and was treated in its historical, political, legal, economic and institutional phases, special emphasis being placed upon the problems of Central and Eastern Europe, the Far East and Latin America. Lectures were delivered by The Honorable Lionel Curtis, London; the Honorable Philip Henry Kerr, London; Dr. Rikitano Fujisawa, Tokyo, Japan; the Honorable Manoel de Oliveira Lima, Washington, D. C.; M. Raymond Recouly, Paris; Dr. Josef Redlich, Vienna.

At the round-table conferences addresses were delivered by the following: Dr. Alfred L. P. Dennis, Washington, D. C.; Prof. Robert H. Lord, Harvard University; Dr. Adam Shortt, Ottawa, Canada; Prof. Jesse S. Reeves, University of Michigan; Prof. George Grafton Wilson, Harvard University; Dr. Leo S. Rowe, Director General, Pan-American Union; Dean John H. Latané, Johns Hopkins University; Prof. George H. Blakeslee, Clark University; Dr. Stanley K. Hornbeck, Washington, D. C.; President David P. Barrows, University of California; Rear Admiral Austin M. Knight, United States Navy, retired; B. M. Anderson, Jr., New York City; Paul D. Cravath, New York City; David F. Houston, New York City;

Paul M. Warburg, New York City; Mr. Oscar T. Crosby, former Assistant Secretary of the Treasury; Hon. W. S. Culbertson, Vice-Chairman of the Tariff Commission; Arthur S. Draper, London; Walter S. Rogers, Washington, D. C.

The publications of the Institute cover the lecture courses and the round-table conferences.

The 1923 Session of the Institute of Politics will be held from 26 July-25 August and again "International Relations" will be the general subject of discussion. In addition to certain geographical areas like the Near East, and Latin America, the League of Nations will be discussed. The administration officers of the Institute are: Harry Augustus Garfield, Chairman; Walter Wallace McLaren, Executive Secretary; Willard Evans Hoyt, Treasurer. See also PEACE AND ARBITRATION, INTERNATIONAL.

POLO. See SPORTS.

POMONA COLLEGE, a non-sectarian co-educational institution, founded in 1888 and located at Claremont, Calif. In 1922-23 it had a faculty of 69 members, 778 students, a normal income of \$254,358.58 and an extraordinary income of \$154,293.28. Its property in 1922 was valued at \$3,167,925.11. James Arnold Blaisdell, D.D., is president.

PORTLAND CEMENT. See CEMENT.

PORTO RICO, the fourth largest of the Greater Antilles, an insular possession of the United States, bounded on the north by the Atlantic Ocean and south by the Caribbean Sea. The island of Santo Domingo lies about 45 miles to the west. Included in the territory are the small islands of Culebra and Viequez. The area of Porto Rico is 3,606 square miles and in 1920 it had a population of 1,299,809. The population in 1920 included 948,709 whites, 49,246 negroes, 301,816 mulattoes, 32 Chinese and 4 Japanese. The chief cities, with their populations in 1920, are: San Juan, the capital, 70,707; Ponce, 41,561; and Mayaguez, 19,069.

Education.—In 1899 the elementary school system was reorganized and education was made compulsory. There are on the island 1,911 school buildings, in which 193,269 pupils are taught. In addition there are a number of private schools. Night schools and kindergartens are well attended. For higher education there is the University of Porto Rico at Rio Piedras, seven miles from the capital. When the United States took over the island the percentage of illiteracy was 83. In 1920 this had been reduced to 55 per cent.

Finances.—The revenues of the insular government are derived from customs and excise duties. There are also a general property tax, income tax, a collateral inheritance tax, and various licenses and fees. The revenue for the fiscal year 1921-22 was \$10,183,500. Expenditures aggregated slightly less than this amount, leaving a cash balance on 30 June 1922 of \$72,936.24. The outstanding bonded indebtedness at the end of 1922 was \$12,146,000. The assessed valuation was \$286,461,677.

Production and Industry.—The soil of the island is extremely fertile and the greater part of it has been brought under cultivation. In 1920 the cultivated area in 41,078 holdings was

2,022,404 acres, of which 1,303,547 acres was improved land. The value of all farm property the same year was \$151,283,818. Irrigation is practised in the south of the island, largely under Government initiative. The chief products of the island are sugar, pineapples, oranges, grapefruit, tobacco and coffee. The sugar crop of 1921 was 490,000 tons. The tobacco crop was 14,000,000 pounds; and coffee, 27,000,000 pounds. Salt deposits on the island are worked, but mineral production is in an incipient stage. Stock raising is assuming important proportions.

Commerce.—Porto Rican imports in 1921 aggregated in value \$105,479,703. Exports the same year amounted to \$112,278,575, of which \$103,388,227 went to the United States, and \$8,890,348 to other countries. Of the imports, \$97,074,399 were purchased in the United States and \$8,405,304 were purchased in foreign countries.

Communications.—In 1921, 1,986 American and foreign vessels, aggregating 5,347,723 tons, entered Porto Rico. The chief port is San Juan. The island has over 1,100 miles of road and 339 miles of railways. The railway system connects the towns on the west coast and now almost penetrates all the interior part of the island. There are 1,848 miles of postal telephone and telegraph wire, served by 67 telegraph stations. There are 91 postoffices.

Government.—Porto Rico was ceded by Spain to the United States under terms of the Treaty of Paris signed 10 Dec. 1898. It was first administered under the Foraker Act of 12 April 1900. This act was amended 5 July 1909. The constitution of the island was finally determined by the "Organic Act," known as the Jones Act of 2 March 1917. The main features of this act are the granting of American citizenship to all Porto Ricans and the granting of adult suffrage, the separation of executive and legislative functions, creation of an elective senate and a reform of the judiciary system. Porto Rico has representative government. The executive power is vested in a Governor, appointed by the President of the United States. The legislative power is vested in a legislature which consists of a Senate of 19 members and a House of Representatives of 39 members. The members of both houses are elected for terms of four years by direct popular vote. There are six heads of departments who form a governor's council, known as the Executive Council. The judiciary comprises an Attorney-General, and staff, and the United States Court appointed by the President of the United States. Eight district courts are appointed by the Governor, as are the minor courts. Porto Rico sends a resident commissioner to Washington, who has a voice but no vote in the Federal House of Representatives. The Governor of Porto Rico in 1922 was E. Mont Reily. Governor Reily's administration was marked by bitter political strife from its beginning. In his inaugural address, delivered in the island capital, 30 July 1921, the Governor declared that there was neither sympathy nor hope in the United States for independence for Porto Rico. Immediately thereafter the Independence Party leaders fomented a movement for the Governor's removal from office. They made representations to Congress,

to the War Department and to the President of the United States, and in November 1921 a delegation of the Governor's opponents visited Washington to lay their case before the United States government. In the following month Governor Reily appeared in Washington to defend himself and shortly after returned to his task in San Juan. Throughout the entire year 1922 bitter assaults were launched in Porto Rico against Governor Reily. The charges ranged all the way from that of mere tactlessness to the alleged misuse of public funds. No act of the Governor that could possibly be construed to his disadvantage was overlooked by his enemies. The quarrel reached even the Congress of the United States. Through all these attacks President Harding retained confidence in the Governor, and all efforts to induce him to remove that official were unavailing. The political origin of the attacks was clear to all, and the failure of specific evidence to support the broad general accusations was generally acknowledged. The Governor's health broke down in the latter part of 1922 and on 16 Feb. 1923 he cabled his resignation to President Harding, the same to become effective 1 April 1923. He was succeeded, 6 April 1923, by Horace M. Towner of Iowa.

PORTO RICO, University of, a non-sectarian co-educational institution founded in 1903 and located at Rio Piedras, Porto Rico. In 1922-23 it had a faculty of 90 members, a student enrollment of 1,265 (468 collegiate, 797 secondary), property valued at \$350,000 and an income of \$240,000. Chancellor, Juan B. Huyke.

PORTS AND HARBORS. See **RIVERS AND HARBORS.**

PORTUGAL, a Republic of western Europe, with Spain occupying the Iberian Peninsula and a monarchy until 1910. It has an area of 35,490 square miles, including the Azores and Madeira, and a population of 5,957,985 in 1911, the date of the last census. The rural population is 67.6 per cent of the total. The chief cities with their populations are: Lisbon, the capital, 489,667; Oporto, 203,981; Setubal, 30,346; Funchal (Madeira), 24,687; Coimbra, 20,581; and Ponta Delgado (Azores), 16,179.

Religion.—The prevailing faith is the Roman Catholic. There is nominal toleration of all denominations, but the Republican government is avowedly anticlerical and hostile to the national church. There are about 5,000 Protestants and 500 Jews in the Republic. There are three archbishops and 23 bishops in Portuguese territory, including the homeland.

Education.—Elementary education is compulsory. There are 7,007 primary schools with 170,415 pupils; 32 secondary schools with 11,791 students. There are three universities—Lisbon, Coimbra and Oporto. There are also a technical school at the capital, special schools of art and music at Lisbon and Oporto, commercial schools, and military and naval schools.

Production.—Of the total area of Continental Portugal 26 per cent is cultivated or under pasture, 17 per cent is under forest, 3½ per cent is under vineyards, 4 per cent is under fruit trees and 43 per cent is waste land. Cork is the chief forest product, the annual output being about 176,000,000 pounds. In the north Indian corn is grown and cattle are raised, while

sheep, goats and the cultivation of rye occupy the mountainous sections. Wheat production in 1919 was 4,767,665 bushels; rye, 1,785,838 bushels; oats, 3,037,831 bushels; and barley, 1,009,780 bushels. The vintage of 1919 was 96,641,160 gallons. Olive oil was produced to the extent of 12,760,000 gallons. The wool clip in 1919 amounted to 6,244,684 pounds. Other products are figs, tomatoes, potatoes, oranges and onions.

The country has considerable mineral wealth, but lack of coal and transport render workings unprofitable. Wolfram, iron, copper, manganese, lead, tin and gold are among the minerals found. The fisheries are a large source of wealth, giving employment to 36,673 persons with 11,922 vessels of 37,609 tons. Sardines and tunny fish form the basis of this industry. The total value of the catches averages 20,000,000 escudos yearly. Other important industries are the making of porcelain tiles, chinaware, lace and embroideries.

Commerce.—Portugal exports manufactured cork, raw cork, raw hides, olive oil, rosin, wool, sardines, lumber and chemicals. The chief imports are coal, cotton, codfish, coffee, fertilizers, rice, rubber and animal fats.

Finance.—In the fiscal year 1921 the revenue amounted to £26,913,445 and the expenditure to £52,802,831. There was a large deficit also in 1922. In the autumn of 1922 the exchange situation grew continually worse. The exchange value of the escudo dropped from 6.77 cents to 4.78 cents, with no prospect of improvement. The general lack of confidence in the financial stability of the Portuguese government, manifested in the falling exchange, was accounted for by the continued deficit in the Government administration and the great increase in the issue of paper currency. The deficit for 1922 was estimated at 400,000,000 escudos. The budget for 1923-24, proposed expenditures of approximately 813,402,000 escudos, an increase of 240,089,000 escudos over 1922-23. Receipts were estimated at 674,076,163 escudos leaving an anticipated deficit of 139,325,837 escudos. The total Portuguese note circulation on 15 Sept. 1922 amounted to 840,000,000 escudos, showing an increase of 127,500,000 since the beginning of the year. The reserve against these notes amounted to 8,750,000 gold escudos.

Defense.—The armed forces is a militia raised by conscription. The peace establishment consists of 2,800 officers and 35,000 men of all arms. The navy consists of three protected cruisers, four gunboats, four transports, two training ships, a minelayer, five destroyers, seven torpedo boats, four submarines and six former Austrian torpedo boats for police and customs duties. The Naval personnel is about 6,000.

Shipping and Communications.—The Portuguese merchant marine has 66 steam vessels of 70,193 tons and 259 sailing vessels of 43,844 tons. The clearances at the ports average annually 9,500,000 tons. The Republic has a total railway mileage of 2,128 miles, of which 733 miles are the property of the state. The five privately owned lines have a mileage of 1,314 miles. There are 4,266 postoffices and 628 telegraph offices with 5,945 miles of line and 13,415 miles of wire.

Banking.—The Bank of Portugal is the Government financial institution. There are 18

other banks registered in the Republic, with an aggregate capital of 47,000,000 escudos and deposits of 331,465,000 escudos. The monetary unit is the gold escudo, of 100 centavos, worth in normal times \$1.05 in American currency, but in 1922 depreciated to about 4.78 cents.

Government.—The Constitution of the Republic, adopted 20 Aug. 1911, provides for a bicameral legislature. The Upper Chamber of 71 members is elected by the Municipal Councils and is renewed half at a time every three years. The Lower Chamber has 164 members elected by direct suffrage for three-year terms. The President of the Republic is elected by both houses for a term of four years and is ineligible for re-election. The President appoints the Ministers of the Cabinet, but these are responsible to the Parliament. The Constitution may be revised every ten years. The president of the Republic in 1922 was Dr. Antonio Jose de Almeida, elected 6 Aug. 1919. The composition of the Upper Chamber in 1922 was: 33 Democrats, 9 Liberals and 15 of other parties. The Lower Chamber had 73 Democrats, 30 Liberals and 46 of other parties.

History.—The political situation at the opening of 1922 was very critical. Efforts were being made to bring to justice the murderers of Premier Granjo who with others of his party was shot down by his political adversaries on 19 Oct. 1921. The Cunha Leal Ministry resigned 3 February after a brief period of existence menaced on all sides by rival political parties. It was reported that guns were missing from the State arsenals and only the presence of an English squadron in Lisbon Harbor prevented a new revolution from getting under way. The new cabinet of Maria da Silva came into office on 7 February and one of its first acts was to arrest six persons—all officers—on a charge of complicity in the October murders. As a consequence of these arrests a new revolutionary outbreak was feared and President Almeida and the entire Cabinet took refuge in the fortress of Cascais and troops were brought to the capital from the provinces. The President and Cabinet returned to Lisbon on 23 February, the threatened outbreak not having occurred. The next step of the Government was to clip the wings of the Republican Guard whence arose most of the disaffection. This was accomplished by reducing its numbers and dispersing it throughout the country to do purely police work under the Department of the Interior. The finances now received attention and for the first time since 1918 a budget was introduced showing estimated revenues amounting to \$25,000,000 and expenditures amounting to \$31,000,000. Despite the deficit it was an earnest of the desire for retrenchment and reform. A loan for \$15,000,000 was secured from Great Britain, the first the Republic had ever received from any country. For a time all petty internal strife was forgotten and the Nation turned its gaze on the two intrepid aviators who left Portugal for Brazil in April and arrived in Rio after many adventures on 5 June. In Portugal the attempt recalled the nation's early period of glory as a pioneer in discovery. The Government showed no signs of weakening in its aggressive policy towards the revolutionaries and

the fact that the Da Silva cabinet had endured for many months was pointed out as a good index of its strength. Colonel Pinto, commander of the Republican Guard, was arrested late in June and deported to the Azores on being convicted of sedition. The reception accorded the Captains Sacadura and Coutinho on the completion of their Transatlantic flight to Brazil was the source of great satisfaction in Portugal. On 23 October the Government was violently attacked in the Chamber for having temporarily suspended certain opposition newspapers. On 4 November the Silva cabinet resigned because of criticism of certain departments by the Opposition. After three weeks of futile effort the former Premier Da Silva was asked to form a ministry and he reconstructed his cabinet on 30 November. The political stability established during the nine months of his former ministry was a factor in moderating Parliamentary opposition. At the close of the year general attention was being diverted from petty politics to questions of national interest and the country was settling down from its long period of unrest although signs were not wanting that the Monarchists were preparing to take advantage of any and every opportunity to press their claims.

PORTUGUESE EAST AFRICA. See MOZAMBIQUE.

PORTUGUESE GUINEA, a colony of Portugal on the coast of Senegambia, West Africa and entirely surrounded on the land side by French possessions. Its area is 13,940 square miles and its population is estimated at 289,000. Bissau is the chief port. The colony produces hides, ivory, seeds, oil seeds, rubber and wax. There are 100 miles of telegraph lines. Imports in 1920 were valued at 15,659,751 escudos and exports at 9,540,517 escudos.

PORTUGUESE WEST AFRICA. See ANGOLA.

POSTAL SERVICE, United States. According to the annual report of the Postmaster General, the revenue of the United States Postal Service for the fiscal year ended 30 June 1922, including fees from money orders and profit from postal savings business, amounted to \$484,853,540.71, an increase of \$21,362,266.01 over the receipts for the preceding fiscal year which totaled \$463,491,274.70. Audited expenditures for the year amounted to \$545,644,208.54, a decrease of \$75,349,465.11 as compared with the expenditures for 1921. Nevertheless, expenditures in 1922 exceeded receipts by \$60,790,667.83, to which sum should be added losses due to fires, burglaries and other causes of \$24,732.53, thereby making the total deficit for the year \$60,815,400.36. The principal source of the postal revenues is the postage paid on mail matter, which in 1922 amounted to \$432,562,020.15. The average per capita expenditure for postage during the year was \$3.92. Audited sales of postage stamps and other stamped paper during the year amounted to \$422,108,842.15; sales of war-savings and Treasury savings issues totaled \$58,570,645.96. Documentary revenue stamp sales amounted to \$11,377,307.17; proprietary revenue stamp sales to 31 Dec. 1921 (time of discontinuance) to

\$3,007,852.65. Requisitions filled during the year called for 14,261,948,813 adhesive postage stamps; 57,401,250 special delivery stamps; 62,263,827 postage-due stamps; 1,111,124,439 postal cards; 2,364,372,708 stamped envelopes; 38,158,226 newspaper wrappers; 496,440 international reply coupons; 734,400 postal-savings stamps; 400,248 war-savings stamps; 575,495 one dollar Treasury savings stamps; 613,775 twenty-five dollar, 564,760 one hundred dollar, and 77,035 one thousand dollar Treasury savings certificates; 114,876,990 documentary and 116,458,400 proprietary internal revenue stamps. The total units issued amounted to 18,130,065,806. Stamp books issued totaled 37,763,903 and stamp coils, 4,052,472.

A new design for the ten-cent special delivery stamp was approved and the new stamp placed on sale 12 July 1922. The six-cent international reply coupons were discontinued and a new 11-cent denomination was placed on sale 1 Jan. 1922. For many years the design on stamps had been confined to portraits of Washington and Franklin. During the year new designs for all denominations of stamps were decided upon. These new designs include portraits of various individuals prominent in the history of the country as well as a number distinctly national in character. The subjects selected for the new series are as follows: 1-cent, Franklin; 2-cent, Washington; 3-cent, Lincoln; 4-cent, Martha Washington; 5-cent, Roosevelt; 6-cent, Garfield; 7-cent, McKinley; 8-cent, Grant; 9-cent, Jefferson; 10-cent, Monroe; 11-cent, Hayes; 12-cent, Cleveland; (13-cent discontinued); 14-cent, Indian; 15-cent, Statue of Liberty; 20-cent, Yosemite; 25-cent, Niagara; 30-cent, buffalo; 50-cent, Arlington Amphitheatre; \$1, Lincoln Memorial; \$2, Capitol; \$5, America. There were 7,492 presidential postmaster appointments confirmed by the Senate and 5,219 fourth class postmasters commissioned during the year. On 1 July 1922 there were 51,947 postoffices in the United States and its possessions compared with 75,924 on 30 June 1902. Extension of the rural delivery service is largely responsible for this reduction. There were, on 30 June 1922, 54,201 money order offices in the United States which during the year issued 154,076,407 domestic money orders, having a total value of \$1,211,784,679.24, and 883,740 international money orders having a value of \$14,192,840.10.

Postal Savings.—The total liability of the Government to postal-savings depositors at the close of the fiscal year was \$140,430,167.93 as compared with liabilities totaling \$155,007,543.65 at the close of the preceding fiscal year. On 15 Dec. 1921 the Department inaugurated at the larger postoffices for the protection of both depositors and clerks handling such deposits a finger-print system which has resulted, it was stated, in thwarting numerous attempts to obtain cash on stolen certificates.

Air Mail Service.—The only air mail service operated by the Department during the fiscal year was the transcontinental route from New York to San Francisco, 2,680 miles in length. The round trip (5,360 miles) is covered each day, Sundays and holidays excepted, necessitating an annual flying schedule of approxi-

mately 1,800,000 miles. The service consists of a relay advance of mail from New York across the continent, and vice versa; that is to say, no particular mail is taken for a complete trip across the continent. Certain mail which misses the late trains out of New York is advanced to Cleveland; other mail, which ordinarily would go into Chicago too late for delivery in the afternoon, is taken from Cleveland to that city. This process is repeated in relays across the continent with the result that approximately 12,000 pounds of letter mail is advanced each day some three or four hours. The planes used are remodeled De Havillands acquired from the Army. At the close of the year there were 70 such planes in flying condition. Liberty motors are used. There were no fatalities or serious accidents on mail trips during the fiscal year, but on 16 July 1921 a pilot who was ferrying a plane from San Francisco to Reno fell and was killed.

Railway, Rural and Star-Route Service.—On 30 June 1922 mails were being carried over 231,981 miles of railroad; the actual expenditure for railway transportation during the year was \$87,288,293. During the railway shopmen's strike in 1922, 1,297 mail trains were annulled. Mails were being carried over 8,359 miles of electric railways, the annual rate for the service being \$558,500. Power-boat mail service covered 47,271 miles, the annual rate of expenditure being \$1,367,908, exclusive of freight and express service to and from Alaska and from Porto Rico. During the year 434 new rural routes were established bringing the total number of rural routes in operation up to 44,186 which supplied approximately 29,742,542 individuals. The cost of this service was estimated at \$84,575,696. On 30 June 1922 star-routes numbered 10,715, aggregating 153,566.17 miles. The cost of this service was \$12,585,110.62.

Parcel Post.—From the Postmaster General's report it would seem that complete statistics showing the number of Parcel Post packages handled during the fiscal year were not available. However, during the period 1-15 Oct. 1921 statistics were taken at all first and second class offices and at a representative number of third and fourth class offices. These statistics show that during the statistical period the total number of parcels mailed at all postoffices was 44,051,083; that the postage on such parcels was \$5,737,299.87, or an average of 13 cents per parcel and that the total weight of such parcels was 180,547,744 pounds.

Registered and Insured Mail.—A total of 74,021,013 pieces of mail were registered during the year bringing in fees totaling \$7,402,101.30, exclusive of postage. In addition, 7,439,642 pieces of mail were registered upon which no fees were paid. Insured parcels handled during the year totaled 120,333,881 and fees received, exclusive of postage, amounted to \$6,538,641.55. Parcels sent collect-on-delivery numbered 30,941,570 and fees collected amounted to \$3,152,150.60.

Mail Robberies.—For one year preceding 1 April 1921, losses due to mail robberies amounted to \$6,346,407. From April 1921 to the end of the fiscal year, 1922, they were reduced to \$2,616,333, including the New York loss of

\$1,346,150. On 9 Nov 1921 marines were detailed to guard mail trains with the result that, during the seven ensuing months, mail robberies were reduced to \$705,000 of which amount \$651,791 had been recovered by the end of the fiscal year. In March 1922, in an effort to clean up the New York postoffice, nine men were arrested and confessed. Most of them were ex-employees who had been dismissed from the service. Four hundred and sixty employees in the Registry Division of the New York postoffice were finger-printed with the result that 49 were found to have criminal records.

Foreign Mail Service.—The total cost of the foreign mail service of the United States during the fiscal year 1922 was \$6,011,439.58. Letters and post cards transported totaled 3,904,932 pounds; other articles, 52,683,515 pounds. According to an announcement made by the Postoffice Department, 27 Sept. 1922, the postal rate on letters to each of the following countries is now two cents for each ounce or fraction of an ounce: Argentina, Bahamas, Bermuda, Bolivia, Brazil, British Guiana, British Honduras, Caicos Islands, Canada, Cayman Islands, Colombia, Costa Rica, Cuba, Dominican Republic, Dutch, or Netherland, West Indies (Arubam, Bonaire, Curacao, Saba, St. Eustatius and the Dutch part of St. Martins), Ecuador, England, Haiti, Honduras, Ireland, Jamaica, Leeward Islands (Antigua with Barbuda and Redonda, St. Kitts or St. Christopher, Nevis with Anguilla, Dominica, Montserrat and the British Virgin Islands), Martinique, Mexico, Newfoundland, New Zealand, Nicaragua, Panama, Peru, El Salvador, Scotland, Spain and her colonies (Balearic Islands, Canary Islands and Spanish possessions on the north coast of Africa), Turks Island, Wales, Western Samoa, Windward Islands (Barbados, Grenada, the Grenadines, St. Lucia, St. Vincent, Tobago and Trinidad), United States Naval vessels (stationed abroad) and United States Naval Hospital, Yokohama, Japan. The rates on postal cards to the above named places vary, being one cent in some cases and two cents in others. Local postmasters should be consulted for rates on other classes of mail addressed to any of the foregoing countries.

POTASH. One of the most important recent events bearing upon the potash industry was the discovery, by the United States Geological Survey, of rich potash beds in the greensand marl belt of New Jersey,—a result of work begun in the fall of 1918, as part of the systematic search for potash conducted by the United States Geological Survey since 1910. Several companies have attempted to produce potash from New Jersey green sand, and some of them have marketed small quantities, but, according to the Geological Survey, none is now actually producing. It has generally been considered commercially impracticable to extract the potash from the green sand, owing to the relative insolubility of the glaucosite (a silicate of iron and potassium) in which the potash is locked up. Of recent years, however, many experiments have been conducted with a view to finding some process of extracting potash from silicates. The greensand marls have received

attention in this connection, because of their accessibility and abundance, and the comparative ease with which they can be mined. This New Jersey belt extends across the state, from the vicinity of Sandy Hook, at the northeast, to the Delaware River, near Salem at the southwest. It is about 100 miles in length, and varies in breadth from 14 miles to one mile or less. The supply that has been discovered is officially estimated to be at least 256,953,000 short tons of potash (K_2O) that could be mined by open-pit methods. This would be sufficient to supply the needs of the United States for about 1,000 years, since the average annual importation of potash for five years immediately preceding the World War (including 1914) was 257,143 short tons. The development of a potash industry from the New Jersey greensands will depend on the ability of the manufacturers to compete not only with foreign, but also with American producers. Details concerning the New Jersey investigations can be found in Bulletin 727, Department of the Interior, United States Geological Survey (1922).

Other data of special and immediate interest, relative to the potash industry, are the following: The crude potash produced in the United States in 1920 totaled 166,834 short tons; in 1921, only 25,485 short tons. Of the total for 1921, the tonnage by States was, California, 13,075; Pennsylvania, 1,257; other States, 11,153. This output was the product of 18 companies, operating 20 plants. Information regarding exports is meager. As a matter of fact, comparatively small quantities of potash salts are exported from the United States. In 1920, potassium salts to a total value of \$3,562,015 were exported, including 1,410 short tons of chlorate salts, valued at \$445,243. In 1921, the total value of such exports was \$335,993, and of this total \$49,709 represented 188 short tons of chlorate salts.

Imports of potash (K_2O) for consumption in the United States for the nine-year period, 1913–1921, were the following, in short tons: 270,720 in 1913; 207,089 in 1914; 48,867 in 1915; 7,885 in 1916; 8,100 in 1917; 7,957 in 1918; 39,619 in 1919; 224,792 in 1920; and 81,017 in 1921. Until 1915 practically all the potash brought into the United States came from Germany; from 1916 until 1920 it came from many different countries; in 1921 it came chiefly from Germany, France, and Belgium. The United States Geological Survey, the authority for these figures, estimates, however, that the potash from Belgium probably originated in Germany. The total output of the German mines in 1921 was 921,186 metric tons of actual potash (K_2O). Of this amount, 768,565 metric tons were consumed in Germany, and 152,621 metric tons exported. The French mines in 1921 produced a total of 903,134 metric tons of crude material, containing 146,355 metric tons of potash (K_2O).

The German output of potash in 1922 was estimated at 1,250,000 tons; the consumption at 850,000 tons. Because of the shortage of phosphoric acid there has been an increased use of potash in fertilizers for German soil. In 1921 only 268,000 tons of phosphoric acid were applied, as against 630,000 tons in 1913. The

yield of former German potash mines in Alsace amounted in 1922, according to estimates, to 120,000 tons.

The estimate of the 1922 Alsatian export capacity is 50,000 to 60,000 tons; the German export capacity, 400,000 tons. Officers of the German Potash Syndicate have denied the reported accord between German and Alsatian potash groups to form a monopoly and raise prices. According to figures published in Berlin, Germany exported 917,000 double centners (double centner equals 200 pounds) of potash to the United States, during the first nine months of 1922, as compared with 114,000 double centners for the same period in 1921. Estimates place the 1922 total German production at nearly 13,000,000 double centners of pure potash, about 3,800,000 double centners more than in 1921. In 1913 occurred the greatest pre-war annual production, 11,103,000 double centners. The 1922 production was achieved in spite of the loss of mines in Alsace-Lorraine, which now compete with the German syndicate, and which produced, in 1921, 1,106,000 double centners. Germany's consumption of potash rose from 5,300,000 double centners in 1921 (first three quarters), to 7,500,000 for the same period of 1922. The explanation probably is to be found in the increased demands made upon the agriculturists in connection with the feeding of the population. The United States Department of Commerce in December, 1922, announced that, according to official information from Berlin, German potash prices effective 1 December, were about 145 per cent higher than on 1 November. Export sales also increased, and orders were received from countries that had not previously been purchasing.

POTATOES. According to the Department of Agriculture, the 1922 potato crop of the United States was the largest on record. It totaled 451,185,000 bushels, as compared with the 1921 crop of 361,659,000 bushels, the 1920 crop of 403,296,000 bushels and the ten-year average crop for the years 1911-20 inclusive of 368,169,000 bushels. The acreage harvested was 4,331,000 in 1922; 3,941,000 in 1921, and 3,657,000 in 1920. The average yield per acre was 104.2 bushels in 1922; 91.8 bushels in 1921, and 110.3 in 1920. The total farm value of the crop based on 1 December prices was \$262,608,000 in 1922; \$398,362,000 in 1921, and \$461,778,000 in 1920. The average farm price of potatoes per bushel on the 1 December of each of the years mentioned was 58.2 cents in 1922; 110.1 cents in 1921 and 114.5 cents in 1920. Minnesota led the States in production in 1922 with a total output of 43,740,000 bushels as compared with 32,250,000 bushels in 1921, and 31,581,000 bushels in 1920. Wisconsin came next with a yield of 40,672,000 bushels in 1922, as compared with 21,420,000 bushels in 1921, and 33,264,000 bushels in 1920. Michigan was third, with 37,842,000 bushels in 1922 as compared with 27,200,000 bushels in 1921, and 36,225,000 bushels in 1920. New York was fourth with 37,400,000 bushels in 1922, as compared with 33,990,000 bushels in 1921, and 40,625,000 bushels in 1920. Production in other States in bushels in 1922 was as follows: Penn-

sylvania, 28,512,000; Maine, 21,600,000; Colorado, 18,460,000; North Dakota, 17,820,000; Virginia, 16,585,000; New Jersey, 16,435,000; Idaho, 15,910,000; Ohio, 11,214,000; California, 10,260,000; Washington, 9,425,000; Nebraska, 11,676,000; Illinois, 7,497,000; Iowa, 8,460,000; Missouri, 5,400,000; Montana, 5,796,000; Oregon, 5,145,000; Indiana, 5,624,000 and Maryland, 5,151,000. The estimated per capita production of white potatoes in the United States in 1922 was 4.16 bushels. This average, it was stated, was exceptionally high, having been exceeded only six times in the 57 years during which the Department of Agriculture has been keeping crop records. The highest per capita production was in 1895, when the average was 4.56 bushels.

Idaho led with a per capita production of 35 bushels, followed by Maine with 27.9 bushels; North Dakota with 27 bushels; Colorado with 19.1 bushels; Minnesota with 17.9 bushels and Wisconsin with 15.1 bushels.

The Department of Agriculture gives the following statistics with reference to the 1922 world crop of potatoes: Acreage for 24 countries, 20,261,000; production in 17 reporting countries (estimated) 3,130,000,000 bushels. It is further stated that in 16 countries from which comparable reports for 1921 were available, the production in 1922 was estimated at 675,000,000 bushels more than the 1921 crop and 40,000,000 bushels more than the average production of the five years 1909-13. See also PLANT INDUSTRY, UNITED STATES BUREAU OF.

POTATO WEEVIL. See ENTOMOLOGY, UNITED STATES BUREAU OF.

POULTRY AND EGGS. As estimated by the Department of Agriculture, the combined farm value of chickens raised and eggs produced in the United States in 1922 was \$854,207,000 as compared with \$900,820,000 in 1921. About 543,000,000 chickens with a farm value of \$354,199,000 were raised on farms in 1922 as compared with 510,000,000 chickens valued at \$362,253,000 raised on farms in 1921.

Egg production in 1922 totaled 1,962,356,000 dozen valued at \$500,008,000 as compared with 1,837,486,000 dozen valued at \$538,567,000 produced in 1921. Expressed in individual eggs instead of in dozens the chicken eggs produced on the farms of the United States in 1922 was nearly 24,000,000,000. However not all of the 1,962,356,000 dozen chicken eggs produced during the year were consumed as food, nor were all of those consumed as food utilized as eggs apart from other materials. Large quantities were consumed in industries, in the manufacture of other than food products and about 113,000,000 dozens were used in the raising of chickens.

The farm value of chickens reached its peak in 1920 with an average of about 86.5 cents per fowl. In 1921 the price declined to 71 cents per fowl and in 1922 there was a still further decline to 65 cents per fowl. Likewise the farm price of chicken eggs dropped from an average of 44.4 cents per dozen in 1920, to 29.3 cents per dozen in 1921 and then down to 25.5 cents per dozen in 1922.

It was estimated that there were 412,000,000 chickens on farms on 1 Jan. 1922, a time of the year when the number of chicks is low. There

were 385,788,000 chickens on farms 1 Jan. 1921, and 359,537,127 on farms on 1 Jan. 1920.

Figures showing the number of other fowls (ducks, geese, guinea fowls, pigeons and turkeys) on farms in the United States in 1922 were not available but in 1921, the estimate was 24,000,000. The estimated value of these fowls was as follows: Ducks, \$4,900,000; geese, \$7,000,000; guinea fowls, \$1,900,000; pigeons, \$1,400,000; turkeys, \$12,900,000; total \$28,100,000. The estimated value of the eggs of such fowls was: duck, \$500,000; goose, \$500,000; guinea fowl, \$400,000; turkey, \$1,600,000; total \$3,000,000.

PRESBYTERIAN CHURCH IN THE UNITED STATES. Commonly known as the Southern Presbyterian Church, this denomination includes within its territory all States south of the Mason and Dixon line and the Ohio River and east of the Mississippi. West of the Mississippi it includes Missouri, Arkansas, Texas, Oklahoma and New Mexico. While not one of the largest churches in the United States, few, if any, are stronger in proportion to numbers. The Church is composed of 17 Synods and 88 Presbyteries. In 1922 it had 3,492 organized churches, a net increase of 17 over the number in 1921. It had 2,056 ministers, 30 more than it had in 1921. Office holders in churches numbered 13,849 ruling elders and 14,632 deacons. Candidates for the ministry numbered 470, an increase of 104 over the number in 1921. During the year the net increase in the membership of the churches was 14,796 making the total number of members at the beginning of 1923, 411,854. New members added on profession of faith during the year numbered 24,002. The Sunday School enrollment in 1922 was 396,850, an increase of 26,010 over the 1921 enrollment. During the year the churches gave for their own support \$6,271,402 and for outside benevolences \$5,472,323. This shows per capita gifts to these causes of \$13.28 and \$15.22 respectively or a total of \$28.50 for each member of the churches. The women of the church are splendidly organized in the Woman's Auxiliary with 2,108 local auxiliaries, having a membership of 89,000. Their contributions for all causes in 1922 amounted to \$1,143,318, or an average of \$12.85 per member. The men and the young people have not yet been so well organized as the women, but there was at the beginning of 1923 great activity among each of these classes and it was assured that soon there will be great success in this direction. The Home Mission work of the church was pressed vigorously during 1922 in all parts of its territory with very gratifying results. People of all classes and many races were reached. The Gospel in this work was being preached in more than a dozen languages. The Foreign Mission work—the greatest work this church is doing—is being carried on in seven foreign countries: Mexico, Cuba, Brazil, China, Japan, Korea and the African Congo by 463 missionaries sent out

from this country, assisted by 1,340 native workers. In these fields there were at the close of 1922, 49,694 members. There were added to the mission churches during the year on profession of their faith 4,731. The number enrolled in the Sunday schools was 76,857. The gifts of the native Christians for all religious purposes totaled \$82,268. There were in the mission day schools, 36,640 students. This Church has always laid great stress upon education. During the past year several million dollars were raised for its educational institutions, and nearly all of these during the 1922-23 school year were full to overflowing with students. The Church is active and aggressive in all departments of its work, but it remains, as it has always been, very conservative in its doctrines. It stands for the old fundamental principles, and there is little deviation from these on the part of either ministers or members.

(REV.) WM. S. CAMPBELL,

Editor of the Presbyterian of the South.

PRESBYTERIAN CHURCH OF THE UNITED STATES OF AMERICA. The one hundred and thirty-fourth General Assembly of the Presbyterian Church of the United States of America met at Des Moines, Iowa, 18-25 May. The Rev. Calvin C. Hays of Blainsville, Pa., was elected moderator. Among the hundreds of commissioners present, 21 foreign missionaries were delegated to the Assembly by their respective missions. The Assembly took a decisive stand on the "widespread and growing and—in many instances—boasted violation of law, in particular of the Eighteenth Amendment to the Federal Constitution." A call was made "upon all members of the Church and upon all Christians for continued and increased activity in behalf of the maintenance of all laws." A strong plea was made "for a better support of the ministry," although the Presbyterian Church of the United States of America ranks among the highest in this matter. The Assembly voiced great sympathy with "world-alliance for international friendship" and also with the plan of organic union between various Evangelical churches. The most important change made in the policy of the Church was the adoption of a report, by which the 16 boards and agencies of the Church were reduced to four, with the establishment of a General Council. The four boards are to be a Board of Foreign Missions, Board of National Missions, Board of Education and Board of Ministerial Relief and Sustentation. Women, for the first time in the history of the Church, are to be given a place on these executive agencies. The General Council is an absolute innovation. It replaces the Executive Commission and the New Era Committee and is to consist of 27 members, of whom the moderator of the Assembly and his two immediate predecessors are to be ex-officio members. It is to have a permanent chairman, appointed for five years. Each of the four boards will be represented on the council, whilst 18 members are to be elected from the Church at large. As has been pointed out by many critics, it virtually establishes a House of Bishops in the Presbyterian Church. This matter comes up for final settlement at the Assembly at Indianapolis in 1923.

Under another vital change in the policy of the Church women hereafter may be elected as deacons, by a change in the Form of Government Ch. 13, S. 2. This matter also is to be settled by the Assembly of 1923. From the printed statistics of the minutes of the Assembly I call the following information:

Presbyteries 304; ministers, 9,965. (There were 172 deaths reported among the ministry; the ages of the deceased ranging from 24 to 90 years, whilst the average age attained was 60 years.) Licentiates, 246; local evangelists, 151; candidates, 1,087; churches, 9,710; elders, 4,654; deacons, 8,362; received on confession, 93,259; received on certificate, 65,324; restored, 11,195; dismissed, 54,179; suspended, 55,050; died, 19,919; net total, 1,756,918; baptized on confession, 35,327; infants baptized, 42,311. The Special Committee on Life and Work supplies the following statistics: Pastors, 4,103; Sabbath school superintendents, 1,349; professors and teachers, 488; retired ministers, 540; evangelists, 280; ministers without charge, 1,850; miscellaneous, 153; home missionaries, 76; foreign missionaries, 251; in transit, 157; secretaries, 252; superintendents, 87; chaplains, 48, whilst the attendance on the Sabbath school totals 1,502,616. A comparative study of the statistics of 1920 and 1922 shows an increase in the synods from 40 to 47; in presbyteries from 288 to 304; in candidates for the ministry from 1,012 to 1,087; in evangelists from 133 to 151 and in ministers from 9,924 to 9,965. Of all the churches 4,606 are supplied with pastors and 2,932 with stated supplies, whilst 2,024 are vacant. Manses for the pastor are supplied by 4,614 churches. The value of all the church property, in the entire Church, is not given in the statistics but it runs up into the millions of dollars. Some of these churches are very small, which explains the large number of vacancies. There are 587 churches which have less than 10 members; 1,127 with less than 25 members; 1,618 with less than 50 members; 1,223 with less than 75 members; 800 with less than 100 members whilst 4,406 churches have a hundred and more members.

In 3,185 of the churches no additions were reported, while only 78 reported additions of 100 and over. Additions in the entire Church totaled 9,770. New churches organized numbered 109; 114 were disbanded; 133 ministers were received from other denominations; 56 were dismissed to other denominations, 10 churches were received from other denominations and 13 were dismissed to other denominations. Contributions reported were as follows: For home missions, \$3,867,184; for foreign missions, \$3,746,359; for education, \$1,230,533; for publication and Sunday school work, \$442,412; for church erection, \$345,621; for ministerial relief and sustentation, \$543,382; for freedmen, \$347,892; for temperance, \$197,019; for evangelism, \$207,726; for men's work, \$42,687; for Sabbath observance, \$39,919; for general assembly, \$269,509.93; for congregational purposes, \$32,739,714; for miscellaneous purposes, \$3,271,377, a grand total of \$47,341,334.93.

HENRY ELIAS DOSKER.

Professor of Church History, Presbyterian Theological Seminary of Kentucky.

PRESBYTERIAN CHURCH, United.

This church is composed of 13 synods and 69 presbyteries. The Rev. Dr. David F. McGill, of the department of church history in the Pittsburgh Theological Seminary, has supplied the following statistics relative to the Church in 1922: ministers, including those without charge, 959; licentiates, 32; students of theology, unlicensed, 47; congregations in America, 929, in foreign fields, 174; mission stations in America, 26, in foreign fields, 337; Church membership in America, 162,780; increase during the year—on profession of faith, 8,727, by certificate, 6,756; baptisms—infant, 3,910, adult, 2,290, membership of the entire Church, 216,048; increase during the year—on profession of faith, 11,048, by certificate, 10,145; baptisms, infant, 6,606, adult, 3,171; Sabbath-school enrollment, 173,238; Sabbath-school contributions, \$405,780; missionary societies, 1,638; young people's societies, 977 with a total membership of 32,438; contributions of denomination: for salaries of ministers, \$1,248,415; for congregational purposes, \$1,784,196; for the budget, \$660,572; specials to work abroad, \$632,939; specials to work at home, \$761,816; benevolences to work outside the denomination, \$185,782; to women's work, \$291,460; total contributions, \$5,565,180; average per member, \$34.18; average salary of pastors in America, \$2,092.

PRESBYTERIAN COLLEGE OF SOUTH CAROLINA, an educational institution for men, founded in 1880 and located at Clinton, S. C. In 1922-23 it had a faculty of 12 members and 190 students. Information regarding the value of institution's property and its income not given. Davison McD. Douglas, D.D., is president.

PRESERVING. See CANNING AND PRESERVING.

PRINCE EDWARD ISLAND, a Maritime province and the smallest in the Dominion of Canada, lying at the south of the Gulf of Saint Lawrence. Its area is 2,184 square miles and in 1921 its population was 88,615. Charlottetown, the capital, has a population of 12,347; Summerside, 3,228 and Souris, 1,094. The provincial budget is balanced at \$750,000. The province is administered by a lieutenant-governor and a Legislative Assembly of 30 members, elected for four years—one-half by holders of real property and the remainder by adult general suffrage. The lieutenant-governor in 1922 was Murdock McKinnon; premier, John H. Bell. See CANADA.

PRINCETON UNIVERSITY, a non-sectarian educational institution for men, founded in 1746 and located at Princeton, N. J. In 1922-23 it had a faculty of 214 members, and 2,367 students. Figures as to value of the university's property not given, but its income for 1922-23 was \$1,372,870.28. John Grier Hibben, LL.D., is president.

PRINTING INDUSTRY. In its broadest sense the printing industry includes pulp and paper manufacture, publishing of books, newspapers and periodicals and the mechanical operations of printing and binding. This article deals only with the latter, actual printing and binding. This industry has developed very

largely into a manufacturing activity, rather than a job printing business. Or, rather, the larger printing houses have become factories, and only the small concerns continue to be job printers. The business of turning out a half million copies a day of a great newspaper, or two million copies a week of a popular weekly, is entirely different from that of the printer who prints "anything from a visiting card to a poster." The development of the industry has been more and more specialized, until there were at the beginning of 1923 about 2,500 newspaper plants for manufacturing the daily and Sunday newspapers, probably 500 plants classed as periodical printers, which make a specialty of printing periodicals and magazines, about 14,500 newspaper printeries, often denominated country printing offices, the main business of which is printing a weekly or other newspaper, usually with a job printing department. The census lumps together over 13,000 plants as "book and job printing and publishing plants." Perhaps 500 of these are really book printers, manufacturing bound books; perhaps 1,000 are primarily catalogue printers, making a specialty of manufacturers, catalogues, price lists, and ornate circulars. Perhaps another 1,000 specialize in loose leaf work, and blank forms. Music printers are known to number 160. The 500 label printers include some very large concerns, as do the paper box printers. Others specialize in railroad work, ticket printing, druggists' printing, theatre printing, bank printing, political printing, etc.—each of these has its scores of printing establishments. And there might be mentioned a hundred other specialties which tend to separate printing plants into distinct manufacturing units. The lithographing, binding, electrotyping and engraving branches of the printing industry are treated separately in compiling census figures, but the great mass of these special manufacturing printeries are unknown to the reading public because not separated in census statistics.

The printing industry, as a whole, was prosperous in 1920, and suffered a severe relapse in 1921, with only slight gains in 1922. The year 1923 opened with a production perhaps 85 per cent of the normal, and very few printers making any material profits. The few which have returned to normal business and profit-making are located mainly in the Middle West, for there has been a sharp trend of business away from New York City as an Eastern center. The cause of this is high costs. The printers of the metropolis have become so burdened with high wages, high taxes, prohibitive rents, and all such exactions as come with modern city politics and perfected unionism, that they have had to charge prices much higher than are charged in the smaller cities and towns of the East. And they experience the further handicap that the Middle West is a better mailing point for periodicals, mail-order catalogues, and all large volume printing that is subject to the zone rates of the post office. At least 150 periodicals have left New York in the last three years. The great DeVinne Press, long known as the finest printing house in America, built up by Theodore L. DeVinne, acknow-

ledged dean of the industry for 25 years before his demise, was forced to close its doors for lack of trade, and went into voluntary liquidation in 1922. Zeese-Wilkinson Company, among the largest color-printing houses, moved to Long Island City to escape Manhattan rental. So did the large printing department of the Metropolitan Life Insurance Co. The Carey Printing Company, one of the largest in New York, moved the bulk of its printing plant to a suburb of Bethlehem, Pa. Harper & Brothers moved their plant to Camden, N. J., and the American Book Company to a suburb of Bloomfield, N. J. Other large printers are known to be contemplating removal to country locations, whereas the failures of small printing concerns have been numerous. The printing that has left New York has been in part distributed in the smaller cities, and a great quantity has gone to Chicago and Pittsburgh.

Chicago bids fair to become the center of the printing industry of the United States within another decade. In the census year of 1919 the State of New York turned out \$149,000,000 of commercial printing, as compared with \$110,000,000 for Illinois. In each case it is fair to estimate that three-fourths of the production came from the great cities of these States, so that Chicago has to go only about \$25,000,000 to catch up with New York. And as the great volume of printing on the Hearst magazine publications went to Chicago from New York since these statistics were gathered, it is apparent that the great center of Illinois is already close to New York printing production.

The census of 1919 shows a large gain in values for the book and job branch of the industry since 1914, but the gain is not real, being simply the result of marking up prices and values in the period of war inflation. Since 1919 there has been no advance. Here are the figures:

BOOK AND JOB PRINTING.

	1919	1914	Per cent increase, 1914-19
Number of establishments.....	13,089	12,115	8.0
Persons engaged.....	171,199	152,908	12.0
Proprietors and firm members.....	12,185	11,717	4.0
Salaried employees.....	36,009	28,070	28.3
Wage earners (average number).....	123,005	113,121	8.7
Primary horsepower.....	131,961	115,233	14.5
Capital.....	\$405,554,984	\$247,282,409	64.0
Salaries and wages.....	207,196,883	113,419,236	82.7
Salaries.....	65,720,640	35,005,536	87.7
Wages.....	141,476,243	78,413,700	80.4
Paid for contract work.....	32,243,303	17,658,478	82.6
Rent and taxes.....	19,853,046	10,278,667	93.1
Cost of materials.....	211,067,174	96,453,232	118.8
Value of products.....	597,663,228	307,330,861	94.5
Value added by manufacture.....	386,596,054	210,877,629	83.3

PROHIBITION. On 17 Jan. 1923, the United States completed three years of prohibition. For such an edict, applied on so vast a scale, there is no precedent in history, except the similar command of Mohammed, which however is imperfectly enforced even among the faithful. The subject is thus highly controversial. It is generally agreed that the disappearance of the saloon with its regrettable

associations has been a benefit. Also, the 18th Amendment, which prohibits the manufacture, import, distribution and sale of liquor, has to be accepted as a judgment of the people, approved by the Supreme Court despite all appeals, and in practical politics irreversible.

The battle between "the wets" and "the dries" thus rages around the Volstead Act under which the amendment is enforced. By this act, all liquor is held to be intoxicating which contains more than one-half of 1 per cent of alcohol. What "the wets" demand is a less rigid statute which would permit the import, manufacture, distribution of light wines and beers, not in saloons, but for private consumption and in restaurants, doubtless with meals. The dries oppose any such measure because they consider that it is bad in itself and certain to open the door to a much wider consumption of liquor than that so legalized.

Neither of the political parties, in announcing a platform at the Presidential election of 1920, included a wet plank, nor has legislation, modifying the Volstead Act, come before Congress as an issue. But there is, none the less, an evasion of the law, among some classes and in some areas, which has aroused widespread comment. President Harding himself in December, drawing attention to it at a conference of governors, called for the purpose. On the extent of this evasion must depend a sound estimate of the success of prohibition.

Broadly, it may be said that beer has been suppressed. It is too bulky to be made, carried and sold in defiance of the law. For a time, there may have been some home-brewing. This is, however, a troublesome process, the results are often not palatable, and the practice seems to have declined.

Wine may also be omitted from the larger calculation. Before the Amendment came into force, the wealthy stocked many large and valuable cellars. Large stocks may also be found in the neighborhood of some restaurants and cabarets, situated in cities which have always been wet. But wine has been, in the main, a beverage of the well-to-do; it has to be smuggled, if at all, across the ocean; and enhanced prices render it even more of a luxury than it was in the past.

The real struggle is over spirits. The moonshiner is the man who distills spirits in secret. The rumrunner seeks to smuggle spirits, either across the border of Canada or Mexico or by sea from Europe or the Bermudas. The quality of such spirits is now often unreliable. Labels can be counterfeited and are not the guarantee of sound distillation, that they used to be. As a consequence, there have been numerous cases of violent alcoholism, which contrast strongly with the general sobriety of the nation. Some thousands of persons have been poisoned by wood alcohol which causes blindness and death. These occurrences deter the public from illicit purchase of liquor but they also serve as an argument in favor of an authorized light intoxicant.

According to the dries, the demand for liquor is confined to persons of more or less advanced years and settled habits, who, in the course of nature, will die out. The wets,

on the other hand, point out that, in universities and colleges, there have been outbreaks of consumption among male students who previously abstained. Even young women, anxious to be in the fashion, take liquor and carry it, who, prior to the 18th Amendment, would not have thought of so doing. This attitude of mind is provoked by an idea that the Constitution of the United States was not intended to be a vehicle for sumptuary legislation, imposed on the individual. The somewhat irresponsible mood of the more comfortably situated young people, who have money for such vagaries, does not affect any appreciable proportion of the nation and time will show how far this mood is permanent. The contention that "anybody can get it" means anybody with the required cash; and while this fact suggests that the law is enforced more strictly on the poor than the rich, it also implies that the poor, being the majority, do not often obtain liquor in large quantity. The number of persons who can be said to take liquor in any appreciable quantity is difficult to estimate. Apparently, it lies between 5 and 10 per cent of the population. And the amount of liquor thus consumed per head, if compared with consumption in wet countries like Britain or France, is small. An important factor in the case is the attitude of women. In past years, they avoided the saloon and to-day, they seem to be aware that expenditure on liquor, being essentially a luxury of man diminishes the share of the family income which falls to the wife and the home.

It must be confessed that support of Prohibition, on the part of employers and politicians, is sometimes tinged with a certain inconsistency. Many a master believes in abstinence for his employees who does not himself abstain and not all Congressmen who have voted for the Volstead Act, themselves obey it. On the honesty of the agents who have to enforce the statute, this atmosphere of what has been harshly termed hypocrisy puts a severe strain. By the illegal release of spirits, immense sums of money may be made—sums quite sufficient to enrich an official or his accomplice for the rest of his life. In New York and elsewhere, flagrant cases of forged permits have been exposed. Similar inducements to graft are reported from custom houses and even from some of the less prominent legations at Washington where import is allowed under diplomatic privilege. The Province of Quebec has derived large profits and a considerable public revenue from the sale of liquor for transference across the border. It is held that this traffic has been restricted by an increasingly rigid vigilance on the part of the authorities.

There is no evidence that Prohibition has accentuated the evils which accompany the use of narcotic drugs. Few if any cases are alleged of individuals, cut off from liquor and taking to such drugs—the reason being simple. Of drugs and liquor, when both are prohibited, it is obvious that drugs will always be the more difficult to obtain. The man who is accustomed to liquor applies to his bootlegger before he risks addiction to opium.

Nor is there serious danger of the abuse

of the privilege allowed to religious communions which make use of sacramental wine. One or two irregularities have been reported but the volume of liquor, so misused, is almost certainly infinitesimal.

The permission to doctors to prescribe liquor is carefully safeguarded. Roughly, there are 150,000 doctors in the United States. About 40,000 of these live in the 24 States of the Union in which the prescription of liquor is forbidden. Of the remaining 110,000 doctors, not one-third have taken out permits so to prescribe. Each such doctor can only release 25 gallons of alcohol a year. It is thus safe to say that the whole volume of medical prescriptions do not equal 1,000,000 gallons annually—or less than a gallon a year for every 100 of population. By statute, doctors are forbidden to prescribe beer.

Evasion is thus due to smuggling and to the fact that liquor is retained in warehouses and is allowed to "leak," rather than to detailed causes like medical and sacramental provisions. Prohibition Commissioner Haynes stated, at the end of 1922, that, in his judgment, the demand for illicit liquor had diminished by one-half.

In the legal and authorized consumption of liquor, the reduction has been sensational. In the year ending 30 June 1917, the beer produced and consumed was 1,915,750,000 gallons. The figure for 1922 was nil. In 1917, the wine consumed as beverage was 47,587,000 gallons, which figure, for 1922, was again nil. In 1917, the spirits consumed as beverage amounted to 137,073,000 gallons, which figure, again, is nil for 1922. The stock of spirits on 30 June 1917 was 195,600,000 gallons. In 1922, it was 38,924,000 gallons. The spirits and alcohol used in that year of review for manufacturing and medicinal purposes was 19,462,000 gallons, of which as we have seen, not more than a million gallons was medicinal.

It is claimed by the dries that these severe restrictions in the release of alcohol have been of great benefit to the country. Savings banks deposits are increasing, the crimes and offenses due to liquor are diminishing, rescue and relief missions have less to do with the down-and-outs; and the evils of unemployment have been, it is said, greatly mitigated. The health of the nation is also excellent.

During the year 1922, the World League for Prohibition held a convention at Toronto. The first country to go dry was Iceland, in 1915. Owing to the fact that Spain threatened to decline a renewal of her trade treaties with the island which would have meant the ruin of the Icelandic fish trade, the import of Spanish wine has been again temporarily permitted.

In Finland, prohibition would have been adopted in 1907, had it not been for the Tsar's veto. In spite of trade treaties with France and Spain, it is maintained.

Norway adopted war-time prohibition of spirituous liquors and strong wines. In 1919, a national referendum authorized permanent prohibition which came into force in 1921. Under the pressure of a trade treaty, France has forced Norway to buy 500,000 litres of

wine from her, and Spain has obtained admission of a similar import.

In August 1922, Sweden held a referendum on prohibition, the result being—against, 919,579 votes; in favor, 889,311 votes; adverse majority, 30,268 votes. The city of Stockholm gave a wet majority of 117,057 while the rest of Sweden gave a dry majority of 90,000. Men were against prohibition by 60 per cent to 40 per cent; women were in favor, by 57 per cent to 43 per cent. The referendum thus shows that in Sweden as elsewhere, the dry sentiment is strongest among women and in rural areas.

Germany remains wet. In Russia, there appears to be a severe restriction on intoxicants and especially on spirits. Denmark is wet, chiefly because of the attitude of Copenhagen. In Italy, thousands of saloons are being closed. Switzerland, in 1908, prohibited absinthe and local veto is there under consideration. France is still a convinced "wet."

In the British Empire, Newfoundland and Canada prohibit liquor, with the exception of British Columbia and Quebec, where there is government control.

In Britain herself, there is only one declared Prohibitionist member of Parliament, nor is there any likelihood at present of legislation in that direction. In 1921, the Drink Bill amounted to £402,700,000 or two billions of dollars, compared with £166,000,000 for 1913. For 1922, the Drink Bill is estimated at a lower figure—say, £320,000,000—the drop being due to a diminished purchasing power among the people. It is fair to state that nearly half the Drink Bill is represented by taxation. Even in 1921, the quantity of beer actually consumed per head showed a decline from 27,600,000 barrels in 1913 to 18,500,000 barrels.

Over the right to search shipping, there has been some difference of view between the United States and Great Britain. The British decline to admit such right beyond the three mile limit. The United States desired the limit to be 12 miles. It has been laid down that (6 Oct. 1922), liquor is illegal on American vessels and that foreign vessels entering United States ports may not carry liquor even under seal (21 Oct. 1922). Against this latter decision, given by Judge Learned Hand in New York, an appeal was entered by the shipping companies concerned.

PHILIP WHITWELL WILSON.

PROHIBITION ENFORCEMENT. The United States Department of Justice, on 9 Jan. 1923, issued a summarized report in which it stated that 58,862 liquor cases had been reported to the 88 Department of Justice offices in the United States between July 1921 and December 1922. Convictions, it was asserted, had been secured in 27,301 of these cases with the result that jail sentences aggregating 2,045 years, 11 months and 24 days and fines totaling \$5,220,558.02 had been imposed. There were pending on the dockets of the Federal courts 21,850 cases undisposed of on 1 Dec. 1922, while over 3,000 new cases were developing each month. It was suggested that States that were dry before the Prohibition Amendment went into effect had less crowded court dockets than former wet States.

This was attributed to the fact that most of the liquor prosecutions in the dry States are made under local State prohibition laws. The reports would seem to indicate, said the Department of Justice's summary, "that the crowded condition of the Federal dockets was due for the most part to the fact that the prohibition burden was not being shared by the State courts, except in one or two States, notably Kansas and Wisconsin. It seemed possible that other States could reduce the number of pending cases if they so desired. In Kansas, where the State laws are being enforced in preference to the National Prohibition Act because they provide more severe penalties, the Federal courts have the cleanest dockets. The southern district of New York, which includes New York City, shows the heaviest congestion, and to Maryland the credit is due for having brought to trial and disposed of the largest percentage of prohibition cases in any Federal district. In the case of Maryland, however, it is pointed out that no prosecutions are had in the State courts and that the whole burden of enforcing the dry laws is put on the Federal courts." According to the report of the Commissioner of Internal Revenue, the prohibition force under the Federal Prohibition Commissioner increased during the fiscal year 1921-22 from 2,321 to 3,477 while the total payroll of the unit on 30 June 1922 was \$6,045,073, an increase of \$2,015,943 over the preceding year. Alcohol produced during the year amounted to 79,906,101.51 proof gallons, a decrease of 5,162,674.82 gallons as compared with the quantity produced during the preceding year. Alcohol withdrawn from the warehouses on payment of tax amounted to 16,363,301.85 proof gallons; tax-free withdrawals (that is, withdrawals for denaturation, for export, and for use of the United States hospitals, laboratories, colleges, and other educational institutions) totaled 63,147,767.22 proof gallons. Distilled spirits, including brandy (other than alcohol), withdrawn during the year amounted to 2,724,363.4 gallons, a decrease of 6,352,782.1 gallons as compared with the withdrawals of the preceding year. During the year 550 dealcoholizing plants were in operation as compared with 454 operated during the preceding year. Cereal beverages produced totaled 196,781,781 gallons, a decrease of 89,044,049 gallons compared with the preceding year. Withdrawals from bond, of alcohol and rum free of tax, for denaturation amounted to 59,549,919.6 gallons as compared with 38,812,138.7 gallons withdrawn for the same purpose the year before. During the year 33,345,747.91 wine gallons of denatured alcohol were produced. Of this amount 16,193,523.60 wine gallons were completely denatured and 17,152,224.31 wine gallons were specially denatured, as compared with 22,388,824.92 wine gallons of denatured alcohol produced during the previous fiscal year. Of the 1921 production 12,392,595.02 wine gallons were completely denatured and 9,996,229.90 gallons were specially denatured. Revenue taxes on wines and cordials totaled \$1,306,249.72 in 1922 as against \$2,001,779.87 in 1921; \$4,017,596.82 in 1920; \$10,521,609.14 in 1919; \$9,124,368.56 in 1918 and \$5,164,075.03 in 1917. The total wine production, in 1922, was 5,827,917.90 gallons. To 2,791,971.50 gallons of this wine, containing not more than 14 per cent

alcohol, was added brandy to produce 3,194,516.81 gallons of sweet wines with alcoholic contents varying from 14 to 24 per cent. During the year 3,014,364.88 gallons of wine were removed for medicinal and sacramental purposes (alcoholic content from 14 to 21 per cent). On 30 June 1922, 27,069,539.90 gallons of wine were on hand at bonded wineries and storerooms of which amount 19,105,926.30 gallons had not over 14 per cent alcoholic content.

PROTESTANT EPISCOPAL CHURCH.

Reports for 1922 show that in that year the Protestant Episcopal Church had 1,143,801 communicants, an increase of 39,772 over 1921. The smallest relative increase was in the New England States, the highest in the middle Atlantic, the average for the country $3\frac{1}{2}$ per cent. The total contributions of the Church were \$35,748,625.20, an increase of \$875,404.47 over the previous year. There were 6,924 clergy, an increase of barely 13. Ordinations to the priesthood were 139 and to the diaconate 89. Candidates and postulants for Holy Orders increased each about 10 per cent.

The outstanding event in the life of the Church in 1922 was the General Convention, 6 to 23 September inclusive, at Portland, Oregon. The general impression produced by that triennial gathering was that the Church keenly realized its duty in the matter of social betterment, a note forcibly struck by the pastoral letter issued by the House of Bishops, and the necessity of greater adaptability to changed conditions and new demands. As has been observed in recent meetings of the General Convention, the House of Bishops proved more progressive than the House of Deputies, where the lay delegates were more conservative than the clerical. The freer action of the House of Bishops may have been due to the fact that the bishops met and worked informally for a week before the General Convention. "The Presiding Bishop and Council" was partly reorganized and renamed "The National Council" by the General Convention. Its legitimate functions were defined as the co-ordination of the work of the Church especially in those large activities in which the Church as a whole was engaged. To it fall the general missions of the Church, the Nation-Wide Campaign for the raising of funds for the general work of the Church, educational work and social service and less important lines of activity. Bishop Gailor of Tennessee, was re-elected its president.

Prayer Book revision occupied a large part of the General Convention's time. Final action upon previous proposals for revision, all of which must be placed in two successive General Conventions, was small, but many important changes were proposed for final action in 1925. Hardly any service was left without important changes, enriching them and giving greater flexibility to the Book of Common Prayer. For the first time since the Reformation prayers for the dead were formally recognized, meeting a practice of all sections of the Church, especially since the Great War. From the baptismal services the statement that "all men were conceived and born in sin" was omitted, not for doctrinal reasons but because of widespread misunderstanding. The use of the burial service was no longer to

be forbidden in the case of suicides and unbaptized persons. Mistranslations and obsolete expressions were corrected in the Psalter. These changes are indicative of the spirit of the revision which would seem to be approaching a termination. Marriage and divorce received attention from the General Convention in an important canon forbidding members of the Church to enter upon a marriage in which either of the contracting parties is the husband or wife of any other person then living from which he or she has been divorced for any cause arising after marriage. Hitherto the clergy were forbidden to solemnize such marriages. Further regulation had been indefinite and variable, but a strong feeling had grown up that such marriages were forbidden by the Church. The canon was passed on the assumption that nothing new was thereby added to the discipline of the Church.

The ministry of healing was presented to the General Convention by a conservative report. It was generally felt that the matter called for a pronounced statement and that the practice of healing by spiritual methods was a part of the work of the ministry and should be recognized, encouraged and regulated. The matter was continued. Relation with other churches and communions in the direction of church unity have become more definite. Here the outstanding event was the recognition by the Orthodox Ecumenical Patriarch of Constantinople and his Holy Synod of the validity of Anglican Orders, a fact formally announced to the General Convention by the presiding bishop. This very important adjustment of the relations of the two communions is a result of the growing fraternization of the two, and especially of the personal contact of the Patriarch Meletios with the Church in England and in America during his exile from Greece and immediately before his election. The General Convention failed to come into affiliation with the Federal Council of the Churches of Christ. The bishops had favored such affiliation. It was lost in the House of Deputies by the narrowest possible majority on the part of the laity. The so-called concordate with the Congregationalists was advanced and episcopal consecration was made possible for those seeking it and wishing to continue to work outside of the Protestant Episcopal Church.

The place of women in the councils and governing bodies of the Church has been discussed in many quarters. In some dioceses they are admitted as members of the diocesan convention. Attempts were made to extend this practice, but proposals met defeat in Pennsylvania and Western Massachusetts. The General Convention refused to admit women. But by a new canon as to lay readers, women might be licensed to officiate as lay readers in churches in the same way as male communicants have long been licensed. The intellectual life of the Church was marked by no controversies nor trials for heresy. The organization of the Modern Churchmen's Union, an association of "liberal" churchmen, was of some significance. The appearance of the organization seemed opportune in the case of a party hitherto intensely individualistic when some more extreme members were taking positions widely felt as ultra-radical, e. g. "The Confessions of an Old

Priest" by the Rev. S. D. McConnell, D.D. During the year elections to the episcopate took place in seven dioceses; Alabama, Massachusetts, Tennessee, North Carolina, Pittsburgh, and South Dakota.

JOSEPH CULLEN AYER,

Professor of Ecclesiastical History, Protestant Episcopal Divinity School, Philadelphia, Pa.

PROTHERO, Sir George Walter, English editor: b. Wiltshire, England, 14 Oct. 1848; d. London, 11 July 1922. He was the son of Canon Prothero, Whippingham, Isle of Wight, and was educated at Eton, Kings College, Cambridge, and Bonn University. He was assistant master at Eton; lecturer under university extension scheme; tutor at Kings College, 1876-94; professor of history at Edinburgh, 1894-99; Rode lecturer, Cambridge, 1903; Lowell lecturer Boston, and Schouler lecturer, Johns Hopkins, Baltimore, 1910; Chichele lecturer, Oxford, 1920; governor of Holloway College, 1916, and member of the British peace delegation, 1919. He was made officer of the Crown of Belgium in 1919, was created knight commander, Order British Empire, 1920, and received the degree of LL.D from Cambridge, Edinburgh and Harvard. Sir George was a member of many learned societies, the author of many school histories and edited Voltaire's 'Life of Louis Quatorze,' with notes (1879); 'Sir J. R. Seeley's Growth of British Policy' (1895); 'Cambridge Historical Series,' of the Series of 'Peace Handbooks,' issued by the Foreign Office (1920); and was co-editor of the 'Cambridge Modern History.' He was the author of 'Life and Times of Simon de Montfort' (1877); 'Memoir of Henry Bradshaw' (1889); and 'Select Statutes and other Documents bearing on the reigns of Elizabeth and James I.' (1894).

PROUST, Marcel, French author: b. Paris, 1871; d. there, 19 Nov. 1922. His father was a professor of medicine and his mother a Jewess and from them he inherited a fortune of about \$15,000 to \$20,000 a year. This enabled him to indulge his tastes. He lived in Paris and went much into society. His book 'Plaisirs et les jours' (Pleasures and Days) impressed a select circle in France, including Anatole France, who dedicated a book to him. A little before the outbreak of the World War he began to publish his extraordinary work. 'A la recherche du temps perdu' (Memories of Times Past). As it stands it is in five books (one of which consists of three volumes): 'Du côté de chez Swann'; 'À l'ombre des jeunes filles en fleur'; 'Côté de Guermantes I et II'; and 'Sodome et Gomorrhe I et II,' 'Sodome et Gomorrhe III Ct IV' and 'Temps retrouvé' were in press at the time of his death. Much of Proust's writing has the feeling of improvisation. He was a psychologist and has often been compared to Balzac and to Huysmans. Proust's style is very unequal. J. Middleton Murry considers 'Memories of Times Past' the most important book written in this century and that his "new sensibility" makes him the harbinger of a fresh literary movement. Proust societies have been formed in England and Holland as well as in France.

PROVIDENCE COLLEGE, a non-sectarian educational institution for men, founded 14

Feb. 1917 and located at Providence, R. I. In 1922-23 it had a faculty of 16 members, 387 students, property valued at \$850,000, and an income of \$59,000. William D. Noon, O.P., S.T.M., is president.

PRUSSIA, officially Freistaat Preussen, one of the states of the German republic, until 1918 a kingdom since when it has been a republic. The area of Prussia is 113,852 square miles with a population of 37,075,240 in 1919. As a result of the Treaty of Versailles Prussia lost 20,377 square miles and a population of 3,705,898. The chief cities, with their populations, are: Berlin, the capital, 3,803,770; Cologne, 633,904; Breslau, 528,260; Essen, 439,257; Frankfurt-on-Main, 433,002; Dusseldorf, 407,338; Hanover, 392,805; Dortmund, 295,026; Magdeburg, 285,856; Konigsberg, 260,895; Duisburg, 244,302; Stettin, 232,729; Gelsenkirchen, 168,557; Cassel, 162,391; Elberfeld, 157,218. Education is compulsory between the ages of six and 14 years of age. About 7,200,000 are attending the educational institutions of the state, of whom 6,572,074 are in the elementary schools, and 38,050 in the universities. The last religious census showed 24,830,547 Protestants, 14,581,829 Roman Catholics, 415,926 Jews among the population. Agriculture is well developed, the chief crops being wheat, rye, barley, oats, potatoes and hay. Livestock on 1 Dec. 1920 were: 2,498,430 horses; 9,157,945 cattle; 4,017,950 sheep; 9,383,133 swine; and 2,651,422 goats. Coal is the chief mining product, the output being 112,028,796 metric tons in 1919, and 127,057,135 tons in 1920. Lignite production amounts to about 90,000,000 tons yearly and iron ore to about 5,500,000 tons yearly. Prussia has 24,196 miles of railways. The main lines are being electrified. Under the constitution of 1920 there is adult suffrage. There is a Diet or Landtag and also a State Council elected by the provincial assemblies. The latter body may reject legislation passed by the Diet. The Diet elects the Premier, who appoints the other members of the cabinet. Members of the Diet are elected for four years and the ministry has all the powers of the former King. The Premier in 1922 was Otto Braun. See GERMANY.

PSYCHOLOGY. The field of psychology was dominated during 1922 by the same interests, conflicts and preoccupations that governed it in 1921 and in the three preceding years. That is, the movement of thought and investigation in this field came during 1922 to nothing terminal or definitive. It is an undistinguished phase of the dramatic reintegration of interest which the World War caused among the psychologists. It remains on the whole, involved in the same problems and issues and presents the same indeterminateness of outcome. Progress, in so far as there can be said to have been any, has been progress toward clearness of statement of the over-ruling problems, toward a sharper drawing of the lines among the psychological sects, and toward a non-sectarian consensus regarding the character, the technique and factual implications of psychological data.

Prior to 1917, the course of psychology was only accidentally and whimsically determined by the problems of business and the needs of the

daily life. Its subdivisions and branches had their origins and carried with them the implications of the metaphysical and epistemological subsoils whence they sprang. The methods and problems of the laboratories were determined by them, and the practice of psychology as an art in the solution of the problems of business, government, or war was regarded—except in the case of advertising—as somewhat contrary to true scientific interest. The demands of the war gave patriotic sanction to such a practice. It drew large numbers of psychologists into the army; it turned their academic discipline overnight into a relevant and important instrument in the organization of victory. The hearing, the vision, the morale of aviators, of artillerymen and others, on which so much depended, became items for psychologists to test out, in the attempt to select only those best adapted for a special service. Intelligence, mental health, capacity to learn, and all the other qualities necessary in the officering and manning of an army, it became the task of the psychologist to determine and to evaluate. The major work of psychologists during the Great War was the work of uncovering, measuring and defining the qualities of men in order to determine who fitted where, and how, and how soon. The conditions of the problems were obviously objective; the adjustment of men to those conditions was equally objective; and the statement of the results of tests prophesying the degree of the adjustment needed, under the circumstances, to be of a comparatively simple mathematical character. Thus, so far as practical military ends were concerned, men ceased to be spirits with a consciousness; they were living organisms making observable and measurable adjustments to situations, adjustments that could be given a numerical value and could be stated objectively, as a sequence of behavior, without reference to consciousness at all. The organization of warfare served thus to give psychology in America a behavioristic and objectivist direction which it continued to follow in 1922.

At three points, however, objectivism failed to eventuate. One of these points was in the use of psychology as an art of healing the mind in that heterogeneous aggregation of disturbances that went by the name of "shellshock." In this field, which was much more highly elaborated in the British Isles and on the European continent than in the United States, it was found that the technique and conceptions of psychoanalysis were the most helpful. Underlying these there is, however, a mysterious, non-objective hypothesis of "unconscious mind." The implications of this hypothesis are conservative of the traditional view of the nature of consciousness and of the conception that man has a spirit and a subjective life. Much of the argument in the field of psychology since the war has been involved in the natural attempt of the objectivist trend to divert the psychoanalytic stream into its own courses. It was variously pointed out that psychoanalysis is deterministic, that it seeks to identify the causes of human behavior, that it treats the causes as controllable, that all the complicated mechanism of "the unconscious" the complexes and so on, are in the end reducible to a situation involving response to a stimulus;

that the complication of such a situation into a complex can be treated effectively as special and often intricate instance of the "conditioned reflex." The tendency in 1922 continues this absorption and restatement of Freudian psychology in behaviorist terms.

Another point where, during the war, objectivism failed to eventuate in social psychology. The passions of warfare had everywhere consolidated and personified the multitudinous diversities of nations and nationalities into psychological individuals, with unchangeable uniquely characteristic traits. What these traits were depended on whether they were attributed to friend or enemy, to groups feared, hated, despised, admired, etc. The practice was old. The war enormously increased its volume and intensity. It carried over into peace-times in special ways. These special ways made extensive use of the conception of instinct and the conception of intelligence. Both were conceived of as hereditary and immutable, and as independent of time, place and circumstances. Both were used extensively after the war—even by professional psychologists—in the service of group hatreds, fears and other passions to glorify one group and damn another.

Against the background of this usage there arose in the psychological field a controversy over the existence and character of instincts and a controversy over the nature and implications of the army and other intelligence tests. The year 1922 was particularly signalized by this controversy. The social and political implications of the reality of instincts and the hereditary character of intelligence were in the background of both sides of the controversy. Those who believe in democracy, in the power and value of education and the possibility of progress held that experience has shown that human nature is constitutionally flexible and changeable, that it is really able to learn, and that habit—which is the result of learning—rather than instinct, which is an unlearned power, is most characteristic of it. The same people urged that intelligence, assuming that an abstract quality, so nameable, exists and can be identified, cannot be fixed by heredity; that intelligence tests cannot reveal or measure hereditary intelligence; that on the contrary man has not one intelligence but many intelligences, determined to and by time, place and circumstances and that learning plays a large and progressive part in their articulation and definition. Those, on the other hand, who believe in predestined inferiors and superiors hold, on the whole, the opposite views both regarding instinct and regarding intelligence. The line between them and their opponents has been drawn more sharply in 1922. The effect of this on the whole, has been to throw more emphasis on objectivity, on the expansion and elaboration of the technique of psychological measurement, on the attempt to describe psychological events in terms of specific, measurable causes and to apply psychological conceptions to the specific problems of more and more departments of social life. In a word, in 1922 the winds of psychological doctrine were still blowing steadily toward behaviorism.

H. M. KALLEN.

PUBLIC HEALTH SERVICE, United States. History.—The United States Public Health Service is that branch of the Federal government charged directly with matters pertaining to public health, in so far as the Federal government has jurisdiction in these matters. It is a bureau in the Treasury Department, and is essentially a corps of commissioned and non-commissioned medical officers, aided by scientific and other classes of employees. The medical officers are secured in the same manner as are the medical officers of the Army and Navy, that is, by competitive examinations, open to graduates of reputable medical colleges. The origin of the Public Health Service dates back to the creation of the Marine Hospital Service, first authorized by an Act of Congress, 16 July 1798, providing medical services for sick and disabled seamen of the American merchant marine, either in hospitals maintained by the United States or in contract institutions. The duties imposed by Congress have increased and changed from time to time until the work of the Public Health Service has become almost entirely of a public health nature. This evolution in function is indicated in the evolution of its name, first, the Marine Hospital Service, later the Public Health and Marine Hospital Service, and finally the Public Health Service.

Functions.—While the ultimate control of purely local sanitary conditions has been construed under the Constitution to reside in the several States, being part of the police powers not delegated to the Federal government, the Public Health Service has a broad field in which it can actively engage in sanitary work. In general, it is charged with preventing the importation of disease from foreign countries, medical examination and treatment of arriving aliens; preventing the spread of disease from State to State; assisting the States, when requested, in times of epidemic, and in the solution of their various health problems, acting as their common agent; and with carrying out research work and investigation. More specifically, the Public Health Service operates all of the maritime quarantine stations of the United States and its insular possessions; it co-operates with State and local health authorities in suppressing epidemics, making sanitary surveys, and conducting studies of public health administration; it makes special investigations of diseases, such as tuberculosis, influenza, pneumonia, anthrax, pellagra, plague, trachoma, and typhoid fever; it supervises and controls the manufacture and sale of biologic products, such as viruses, vaccines, therapeutic serums, toxins, antitoxins, and analogous products, used in the prevention and treatment of diseases of man; and it disseminates public health information by means of various popular and scientific publications.

Organization.—The Bureau of the Public Health Service consists of a corps of commissioned officers of various grades, and of technical and clerical personnel. The activities of the Service are under the immediate supervision and in direct charge of the Surgeon-General, who administers its affairs through seven administrative divisions established by law, namely: Marine Hospitals and Relief, Domestic Quarantine, Foreign Quarantine, Personnel and Accounts,

Sanitary Reports and Statistics, Scientific Research, Venereal Diseases. There is also a General Inspection Service and a Section on Health Education.

ACTIVITIES FOR THE YEAR 1922.

Marine Hospitals and Relief.—The Division of Marine Hospitals and Relief furnishes hospital and dispensary treatment to Federal beneficiaries as provided by law, such as seamen of the merchant marine, patients of the Coast Guard, United States Employees' Compensation Commission, etc. On 31 March 1919, Congress authorized the Public Health Service to furnish hospital care and treatment for the World War veterans, patients of the War Risk Insurance Bureau. The magnitude of the operations involved in this work is shown by the records. At this time the Hospital Division had under treatment only about 1,500 patients. Two years later, March, 1921, there were 26,000 patients, an increase of over 1,600 per cent in two years.

In all, 264,000 patients were cared for by the Public Health Service, 14,397,500 hospital relief days furnished, 2,042,000 out-patient treatments given, and 1,459,200 physical examinations made. The hospitals for veterans, 57 in number (but not the marine hospitals) were turned over to the newly organized Veterans' Bureau, 29 May 1922. They contained an aggregate of 17,500 beds, 13,000 of which were occupied. The personnel included 900 physicians and dentists, mostly medical officers in the Reserve Corps of the Public Health Service, 1,400 nurses, and a total aggregate of about 11,500 hospital personnel.

The United States marine hospitals are not to be confused with hospitals belonging to the United States Navy or the United States Marine Corps. Although they are open to all veterans of the World War and certain other classes of beneficiaries prescribed by law, they were originally designed and are still operated chiefly for seamen from American merchant ships, their history dating back to 1798. At the close of the calendar year 1922 the Public Health Service was operating 24 marine hospitals and 119 out-patient offices or dispensaries. The hospitals are located at the following places:

Portland, Me.; Boston, Mass.; Vineyard Haven, Mass.; Stapleton, N. Y.; New York, N. Y.; Ellis Island, N. Y.; Baltimore, Md.; Norfolk, Va.; Savannah, Ga.; Key West, Fla.; Mobile, Ala.; New Orleans, La.; Carville, La.; Fort Stanton, N. M.; San Francisco, Calif.; Port Townsend, Wash.; Saint Louis, Mo.; Chicago, Ill.; Detroit, Mich.; Cleveland, Ohio; Buffalo, N. Y.; Pittsburgh, Pa.; Louisville, Ky.; Memphis, Tenn.

The marine hospital at Fort Stanton, N. M., is reserved for tuberculous merchant seamen and coast guardsmen, and has a patient population of over 200.

The marine hospital at Carville, La., is the National Lepers Home. Of the 1,200 lepers in this country, 176 men and women were, on 1 Jan. 1923, at Carville, all accommodations being filled to capacity. If appropriations pending in the Congress become available, the institution will be enlarged to accommodate additional lepers, of whom there is a waiting list of more than 100 who desire to enter the institution. A farm and dairy are conducted here and the lepers are

supplied with diversional occupation and recreation. There is a Catholic chapel at this hospital, and a Protestant church will soon be constructed.

The marine hospital on Ellis Island is used principally for immigrants, men, women, and children, detained on account of illness. It contains over 600 beds.

Domestic Quarantine.—The Division of Domestic Quarantine was established in 1910 for the purpose of administering service work in the control of interstate spread of communicable diseases and the suppression of epidemics under the quarantine laws of 27 March 1890, 15 Feb. 1893, and 19 June 1906. Included in the work of the Division are the following activities: (1) Enforcement of the interstate quarantine regulations of the United States. (2) Development of State departments of health, especially divisions of communicable diseases and sanitary engineering. (3) Control over water supplies used for drinking and culinary purposes on railroads, vessels, and other interstate carriers. (4) Sanitation of the national parks, in co-operation with the National Park Service. (5) Measures for the control and prevention of trachoma. (6) Studies of and demonstrations in rural sanitation. (7) The Annual Conference of State and Territorial Health Authorities with the Public Health Service. (8) Other contacts with State and Territorial Health Officials relating to health administration.

Little restriction of interstate travel was necessary during 1922. Operations of this nature were limited almost entirely to the supervision of the interstate travel of persons suffering from communicable disease. Approximately 2,500 water supplies used by interstate carriers (trains and vessels) were certified as free from the danger of conveying disease. Control measures to prevent spread were instituted in 40 outbreaks of typhoid fever among seamen. An advisory committee on official water standards was created. Through co-operative measures, sanitary engineering divisions were created in two States and services rendered to similar divisions in other States. Sanitary work in connection with water supplies and sewage disposal in national parks was continued. Six hospitals for the treatment of trachoma, a chronic and a very destructive disease of the eye, were in operation and other measures taken to reduce the prevalence of this disease. Bubonic plague has been present at intervals in California since 1900; in the State of Washington since 1907 (until 1916). In New Orleans since 1914. In 1920 the disease appeared in Pensacola, Florida, and in Galveston and Beaumont, Texas. Active anti-plague measures have been continued during the year.

Rural Sanitation.—During the period 1906 to 1917, the Public Health Service made intensive studies of sanitary conditions and disease prevalence in a number of cities and in certain selected rural districts. From these studies was developed the present co-operative work in rural sanitation. In this work the Public Health Service, the State health departments and the local authorities combine their

resources to establish and maintain an efficient county or district health service. The program includes general sanitary work, acute communicable disease control, the prevention of tuberculosis, malaria control, infant and maternity hygiene, school hygiene, and all other salient branches of health work. During the fiscal year 1922, the Public Health Service co-operated in demonstration projects in 56 counties distributed in the following States: Alabama, Georgia, Iowa, Kansas, Kentucky, Louisiana, Massachusetts, Mississippi, Montana, New Mexico, North Carolina, Oklahoma, Vermont, Virginia and West Virginia.

The following table gives a summary of the work in rural sanitation performed in 1922:

Persons reached by public lectures.....	277,000
Sanitary inspections of premises.....	104,000
Physical examinations of school children.....	142,000
Number found defective.....	91,000
Visits by nurses to cases of communicable disease.....	7,882
Visits by nurses to expectant mothers.....	3,094
Visits by nurses in the interest of child hygiene.....	9,629
Cases of dangerous communicable diseases quarantined.....	5,876
Examination of adults with advice as to health conservation.....	2,299
Treatments effecting correction of defects in school children.....	16,645
Inoculations against typhoid fever.....	25,540
Vaccinations against smallpox.....	38,241
Children immunized against diphtheria.....	3,887
Treatments of hookworm disease.....	2,240
Treatments, persons suffering from venereal diseases.....	23,985
Installations of sanitary devices for sewage disposal.....	13,964
Sewer connections made.....	2,301
Homes provided with wholesome water supply where contaminated water existed.....	2,950
Improved public milk supplies.....	539

Foreign and Insular Quarantine.—The operations of the Division of Foreign and Insular Quarantine consist principally in the enforcement of the United States quarantine laws and the medical inspection of aliens. The Public Health Service administers 64 quarantine stations in the United States and Alaska, and 29 in its insular possessions. Thirty-nine officers were on duty at 39 American consulates at foreign ports in Europe, Mexico, South America, and in the Orient.

During the fiscal year 1922, 18,985 vessels and 2,081,236 passengers and crews were inspected at the continental maritime stations. At foreign and insular stations there were inspected 10,322 vessels and 1,010,496 passengers and crews. A total of 8,889 vessels were fumigated or disinfected, and 7,823 were detained, either because of disease on board or because the vessel came from an infected port.

Yellow Fever.—Yellow fever foci were reported in a widely scattered area on the east and west coasts of Mexico, the east coast of Central America, and on the Atlantic and Pacific coasts of South America. During the fiscal year, cases were reported on five ships arriving at ports in the United States. All were detected in quarantine and the disease was kept out.

Plague.—Bubonic plague continued to be reported from practically every section of the globe, and in many of the important seaports having commercial relations with the United States. The spread of plague is the most difficult to prevent of all the quarantinable in-

fections, since it is primarily a disease of rats and may exist undetected in a port, confined to the rodent population, with only occasional human plague, its presence unknown to the authorities, or publicity deliberately suppressed to avoid commercial prejudice against the port. Despite the arrival at ports of the United States of a large number of vessels from plague infected ports, the infection was successfully excluded. This result can be attributed to the effective fumigation of vessels, either at the port of departure or at the port of arrival in the United States, by, or under, the supervision of the Public Health Service.

For the prevention of the introduction of plague, 6,721 vessels from foreign ports were fumigated at the United States quarantine stations, and 2,090 under the supervision of Public Health Service representatives at foreign ports.

Typhus fever.—This disease prevailed in many sections of the world, and cholera in Eastern Europe and in the Orient. Both diseases were successfully excluded.

Smallpox.—A virulent type of smallpox, continued to prevail in Mexico; and to prevent its introduction into the United States, incoming travelers from that section were vaccinated unless presenting evidence of immunity by recent vaccination or a previous attack of the disease. During the year, 74,833 persons were vaccinated at different ports on the Mexican border. A rather serious epidemic of smallpox also broke out in the Orient and necessitated the enforcement of vaccination, at ports of embarkation, of travelers destined to the United States or its insular possessions. For many years vessels have been fumigated with sulphur gas. It is safe, but not as effective as cyanide, which latter is dangerous to life during the process of fumigation. During the year, in co-operation with the United States Army, a new fumigant was developed which promises to be as efficient as cyanide, but which, owing to its lacrimatory and irritating characteristics, will warn of its presence, rendering it much safer than cyanide gas.

During the fiscal year ended 30 June 1922, there were examined by medical officers of the Public Health Service, 551,454, immigrants for the purpose of detecting physical or mental defects or diseases, as provided for in the United States immigration laws. In addition to the immigrants examined, there were inspected 783,193 alien seamen, as provided for in the act of 5 Feb. 1917.

The total number of immigrants certified as having some defect or disease was 25,815. Five hundred and forty-one were found to be suffering either from mental defects or from tuberculosis, 1,243 as being infected with "loathsome contagious" or "dangerous contagious" diseases, 17,172 as having some physical defect which would interfere with their ability to earn a living, and 6,859 to possess minor physical defects. Of the alien seamen found defective, 68 were certified for tuberculosis or mental conditions, 2,423 as being afflicted with "loathsome contagious" or "dangerous contagious" disease, 1,805 for conditions that would affect their ability to earn a living, and 418 for minor defects.

Of a total of 282,000 immigrants examined at Ellis Island (Port of New York), approximately 16,800 or five per cent were certified to. Of the 708 cases afflicted with "dangerous contagious" or "loathsome contagious" disease (including 490 certified to during the year plus 218 cases pending on 1 July 1921), somewhat less than one-half were deported. Of the 16,204 found to be suffering from physical defects, 585 were deported. Of the grand total of 16,828 immigrants certified to at Ellis Island as being mentally defective, tuberculous, afflicted with "dangerous contagious" or "loathsome contagious" disease or physical defects, 709 altogether were debarred from entry. Ninety-nine certificates were rendered at Ellis Island for mental defects.

Division of Personnel and Accounts.—

This division, as the name indicates, is concerned with the internal administration of the details of duty of the officers and employees of the service and the technical disposition of the records of expenditures and other financial transactions.

The following table gives the numerical distribution of the personnel by designation and activity as of 30 June 1922:

ACTIVITY	Regular corps	Reserve corps	Acting assistant surgeons	Attending specialists	Internes	Administrative assistants	Pharmacists	Scientific personnel	All other employees	Collaborating epidemiologists	Total
Divisions of bureau.....	12	2					2		232		248
Hospitals and dispensaries.....	37	78	71	65	20	18	19		1,895		2,203
Quarantine and immigration.....	50		144			6	4		648		852
Venereal disease control.....			48	3					29		80
Prevention of epidemics.....	6		43					11	131	4,166	4,360
Field investigations of public health.....	41	3	21				7	20	304		393
Purveying service.....	1					2	2		90		95
Veterans' Bureau.....	19	884									903
Second and third class stations.....	8	8	101	8					50		179
United States Coast Guard.....	1	8	4								17
Waiting orders.....	17										17
Miscellaneous.....	10	4									14
Total.....	202	987	432	76	20	26	38	31	3,379	4,166	9,357

Division of Sanitary Reports and Statistics.

Among the more important duties of this division may be mentioned the following.

(a) Collection, comparison and publication weekly of morbidity and mortality statistics of contagious and other diseases throughout the United States.

(b) Development of standardized records of illness in industrial establishments.

(c) Intensive field studies of morbidity in selected populations in co-operation with other divisions.

(d) Intensive statistical studies of specific diseases.

(e) Co-operative studies in child hygiene and in venereal diseases.

(f) Public health education. Among the educational activities of this section may be mentioned the following: During the fiscal year ended 30 June 1922, 116 new publications were issued, compared with 120 during the pre-

ceding year. The total number of copies of these publications and of reprints of previous documents distributed aggregated 949,460, as compared with 859,808 copies distributed during the preceding fiscal year. The 949,460 leaflets sent in response to 48,624 public requests do not include the publications printed and distributed by the division of venereal diseases. During the fiscal year 33 issues of mimeographed bulletins were prepared and issued by the public health service to newspapers, publishing agencies, and individuals. These dealt largely with the results of studies and investigations made by the Public Health Service. The section received 96 requests for stereopticon slides, and in response to these requests loaned 7,200 slides. The work of the stereopticon library has been greatly hampered, owing to the shortage of slides and to the lack of funds for making new slides. The section has received many requests for the loan of exhibit material, posters, and motion pictures, but compliance with most of these has been impossible because of the lack of funds.

(g) Compilation and publication of State and municipal laws and regulations relating to public health.

(h) Collection and publication of reports of

cases and deaths from quarantinable diseases in foreign ports. These reports are received from the following sources: Consular officers through co-operation with the State Department of the United States; officers of the Public Health Service stationed abroad; and foreign health officials through international Sanitary Bureaus.

Division of Scientific Research.—This Division conducts scientific field and laboratory studies, and in addition to these studies, has supervision of the manufacture and sale of viruses, serums, toxins, and analogous products, including arsphenamine and neoarsphenamine, in interstate traffic. The following outlines the activities of the Division during the calendar year 1922:

Industrial Hygiene.—Studies and Demonstrations: (1) Study of the occupational health hazards in the glass industry relating to the physical defects of glass workers, especially

those groups working in high temperatures. (2) Study of the character of physical defects among post office employees. (3) Survey of actual illumination conditions in certain Government departments, consisting of the study of various types of illuminating units, the degrees of illumination, the effects of improved illumination on production, and the relationship of eye defects to the character of the work and the degree of illumination. (4) Study of the physical defects of cement workers, the relationship of these defects to their occupations; the amount, character, and chemical constituents of the dust in different parts of the industry, and a comparison of the sickness records of these workers to workers in other trades, especially as relating to diseases of the respiratory organs. (5) Study of the physical defects among glass bevelers and mirror workers. (6) Study of the sickness records of employees of the Public Health Service as to the character of the illnesses, and the amount of time lost as compared to lost time from sickness of employees in private industry. This comparison brought out the fact that an average of 8.2 days was lost per year by each employee of the Public Health Service, as compared with 8.15 days in a private industry.

Laboratory Investigation.—(1) Investigation into the chemical and physiological aspects of fatigue. This work was carried on by the Office of Industrial Hygiene and Sanitation in co-operation with the Department of Physiology, College of Physicians and Surgeons, Columbia University, New York City. (2) The study of the physiological changes caused by varying degrees of temperature, ranging from body temperature to approximately 145° with relative humidity of 30 per cent, 60 per cent and 100 per cent, with and without air motion, at rest and while at work. (3) In co-operation with the Bureau of Mines, a comparative study of the relative efficiency of certain instruments used for collecting dust, and special tests of the new instrument devised by the Public Health Service and the Bureau of Mines. (4) In co-operation with the Bureau of Mines, a study of the health hazards of the petroleum industry, especially as relating to the poisonous fumes generated in the refining processes. (5) In co-operation with the Chemical Warfare Service of the War Department and the Foreign Quarantine Division of the Public Health Service, a study of new gases for use in ship fumigation, leading to the development of a simple process for generating cyanogen chloride, a gas which combines the efficiency of hydrocyanic gas with the warning effect of a tear gas. (6) In co-operation with the Yale University Medical School Laboratory, the study of the flow of air through orifices and the efficiency of various types of ventilating apparatus, especially as concerned with the distribution of air through straight and tapered ducts for suction currents both with and without branch pipes.

Malaria Studies and Demonstrations.—Fifty years ago malaria was a common occurrence throughout the entire Mississippi Valley, extending as far north as southern Canada, and on the Atlantic Coast to Massachusetts, but following agricultural development and im-

proved living conditions, the habitat of endemic malaria has been greatly restricted, until now the disease is of serious sanitary importance only in the South Atlantic States, the lower Mississippi Valley, the Gulf States, and in the Sacramento and San Joaquin valleys of California. During 1922, many problems bearing upon the transmission and eradication of malaria, were investigated by the service both in the laboratory and in the field.

Stream Pollution Investigations.—In the study of stream pollution, which the Public Health Service has pursued for a number of years, the chief work carried on in 1922 was a study of the pollution and natural purification of the Illinois River, which receives the sewage of the sanitary district of Chicago through the Chicago Drainage Canal.

That polluted streams undergo, more or less, natural purification, tending to render their waters less dangerous and offensive, has long been known. The studies of the Ohio and Illinois rivers have now afforded a fairly exact measure of the extent of such purification, demonstrating, for example, that the sewage bacteria present in the Ohio River above Louisville (600 miles below Pittsburgh) are about 20 per cent in winter and in summer usually less than 2 per cent of those discharged into the river and its tributaries from all the sewered communities above.

Survey of Sewage Treatment Plants.—During 1920 the Public Health Service began a critical study of the construction, operation, and efficiency of 15 municipal sewage-disposal plants, selected as representative of the various types in most common use in this country. The conclusion of most general interest indicated by the study is that the plants surveyed, representing quite diverse methods of treatment, are, with few exceptions, showing considerably higher and more uniform efficiency than has been commonly supposed. It appears that considerable improvements can be made in operation, and in details of design, but that the basic principles of the processes represented are sound.

Studies in Child Hygiene.—Research and educational work has been conducted in eight States. In two counties in Florida 10,000 school children were examined. Particular attention was given to a study of the influence of local conditions influencing growth and development of children, child morbidity and mortality. Valuable information was obtained regarding the effect of hookworm, extent to which vaccination was practiced, age-grade status of children and value of health scoring records. Studies of posture in relation to nutrition, physical defects, school grade and physical training were included in a survey made in one city in the State of Indiana. Co-operative studies of health conditions of 12,000 school children in Maryland were continued. Mouth surveys to determine the presence of dental caries and septic mouth conditions were made in four States, 10,000 children being examined. Studies were made of the physical condition of children residing in heavily infected malarial districts as compared with that of children of similar stock residing in more healthful locations within the

same State. Associated with this study were special investigations to determine the relative values of enlarged spleens and blood smears as indices of chronic malarial infection, and the practical utilization of the information acquired in this manner for the eradication of malaria. As a result of these activities, popular interest in school health supervision has been stimulated and large numbers of children found suffering with remediable defects have obtained relief.

Hygienic Laboratory.—The Hygienic Laboratory of the Public Health Service, one of the foremost research institutions of the world, has, since its beginning, been occupied with the study of diseases of man, carrying on pathological, zoological, pharmacological, bacteriological, chemical, and physiological work. It also has charge of maintaining the purity and potency of biologic products sold in the United States. Following are some of the accomplishments of the Hygienic Laboratory during 1922:

1. The further study of tularæmia has shown that this new disease of man is transmitted from rabbits to human beings either by means of insects or more directly by the handling of contaminated rabbits. Regardless of how the disease is acquired, the result is a prolonged illness which incapacitates the individual for several months. By showing the avenues through which the disease is carried, it becomes possible to inaugurate effective protective measures. A number of officers and employees of the Hygienic Laboratory who have engaged in work on tularæmia have acquired the disease and passed through the long illness which always ensues.

2. Research on Rocky Mountain spotted fever has not shown any particular advance, but it is necessary to record the death of Laboratory Assistant William E. Gettinger at Hamilton, Mont., which is the second fatality occurring in the Public Health Service in connection with the study of this disease, the first having been that of Dr. T. B. McClintic, who died in 1912.

3. The first epidemic of Malta fever which has occurred in the United States was investigated, and its relation to contaminated goats' milk was clearly established.

4. The practical usefulness of the current strains of smallpox vaccine in preventing smallpox has been thoroughly established in connection with the serious and fatal outbreak which occurred in Kansas City, Mo.

5. A preparation which appears to have a promising field in the treatment of syphilis and certain other diseases has been carefully investigated, and a method of preparation worked out which it is believed will make this material available to a much larger number of persons than heretofore.

Investigations which have yielded useful, but not immediately important results, are: Studies of pneumonia, in which new methods of immunization have been developed. These procedures, while experimentally satisfactory, may or may not lead to workable measures applicable to man. Poliomyelitis and meningitis have been studied, but no noteworthy advance has been accomplished. A method of standardizing pituitary extract, an important drug, has been practically completed.

Food Poisoning Investigations.—As a result of these investigations made during the

period 1919-1922, definite information has been collected in regard to the conditions of manufacture which were responsible for recent outbreaks of food poisonings and intoxications, and it has been possible to formulate exact directions which should be observed in commercial canning in order that the product may be reasonably safe.

Research has been continued in botulism and other forms of food poisoning; in the travel of bacteria underground; in pellagra; and in the treatment of leprosy.

Division of Venereal Diseases.—This division was created in the United States Public Health Service by the Act of 9 July 1918. The duties of this Division as stated in the organic act are as follows: (1) to study and investigate the cause, treatment, and prevention of venereal diseases; (2) to co-operate with State boards or departments of health for the prevention and control of such diseases within the States; and (3) to control and prevent the spread of these diseases in interstate traffic.

The same act created the Interdepartmental Social Hygiene Board as a war-time organization to co-operate in the control of venereal diseases. At the end of the fiscal year 1922, it was the opinion of the Interdepartmental Social Hygiene Board that its function had come to an end, owing to the return of the United States to a peace-time basis, and, consequently, no appropriation was asked for its continuance for the fiscal year 1923.

The Division of Venereal Diseases of the United States Public Health Service, however, was created as a permanent organization, and its work has continually gone forward since its creation in 1918. The general plan for the control of venereal disease as carried on by the Division is grouped under three headings: (1) Medical, (2) Educational, and (3) Law-enforcement Measures, all of which are carried on in active co-operation with the various State boards of health.

Under medical measures are included the establishment of clinics, conducted under the supervision of State boards of health where persons infected with venereal disease can secure treatment at nominal cost or free of charge. More than five hundred such clinics are now in operation.

Another feature of medical activities is the securing of co-operation of physicians throughout the nation. Such co-operation includes the agreement to report cases of venereal disease to the State boards of health and through them to the United States Public Health Service, as it was felt that a knowledge of the incidence of syphilis and gonorrhea was necessary in order to intelligently continue a campaign for their control; and effecting arrangements with private practitioners whereby they would treat at nominal cost persons who were unable to make full payment for treatment. Arsphenamine for the treatment of such persons infected with syphilis is furnished in many cases without cost either by the State board of health or by the United States Public Health Service. This co-operative work is progressing very satisfactorily.

The aim under educational activities has been largely (1) to enlighten the public to a

knowledge of the venereal diseases and their inherent dangers, and to impress the people with the urgency of prompt and efficient treatment; and (2) to prevent the spread of these diseases by creating a public opinion to minimize opportunity of contact between infected persons and those not yet infected. A large number of pamphlets and some sets of slides, card exhibits and motion picture films have been prepared as instruments in this educational work. More than 36,400 lectures, attended by 5,464,000 persons have been given, and 6,400 motion picture showings have been given to more than 2,159,000 people. The State boards of health and the United States Public Health Service have distributed 28,640,000 educational pamphlets.

Under the law-enforcement section the following activities have been carried out: (1) Assisting in securing the passage of State laws and city ordinances having for their aim the control of venereal diseases, and urging the enforcement of laws which have been so passed; and (2) an active campaign has been conducted against the open house of prostitution and a large number of States have adopted the so-called "Injunction and Abatement" laws directed at owners of property the tenants of which engage in prostitution.

A great many municipal ordinances have been passed supervising the conduct of public dance halls; licensing hotels and rooming houses, with provisions for forfeiture of the license of any establishment tolerating immoral acts; and prohibiting the use of taxicabs for purposes of prostitution. By vigorous enforcement of the White Slave law, the Federal Government has to a great extent broken up the interstate traffic in women and girls.

Laws have been advocated also against the sale of nostrums, or so-called "quack" remedies, for the treatment of syphilis and gonorrhea, as it was recognized that in most cases such nostrums are of absolutely no value and the false sense of security given to an infected person by their use would restrain him from securing advice and treatment from a competent physician or specialist or at an official clinic for the treatment of venereal disease.

An important feature of the work of controlling venereal diseases in the United States has been the Federal appropriation for allotting funds to State boards of health for this work. A total of approximately \$3,000,000 has been appropriated to be made available to such States as conform to certain rules and regulations promulgated by the Secretary of the Treasury, for the control of these diseases.

One clause of these regulations requires that each State, in order to secure its allotment of the Federal appropriation, must set aside at least an equal amount for venereal disease control work. As a result of this continued stimulating aid by the United States Public Health Service, State appropriations for this work are steadily increasing so that for the fiscal year 1923 while the Federal appropriation amounted to \$225,000, the State appropriations amounted to \$818,135.96, or a total of \$1,043,135.96 available for this work. Every State in the Union has met the requirements of these regulations and it is felt that this one

method has been the most valuable means of effecting proper standardization of State board of health activities in venereal disease control.

While it is too early to attempt to place a proper value upon this work in actually controlling the venereal diseases, yet with the State boards of health efficiently organized and actively working on this problem as they now are, and with the more than 500 official clinics into which have been admitted 467,250 new cases, and which have given 6,105,566 treatments, there can be no doubt that the activities of the United States Public Health Service in co-operating with the State boards of health will be made evident as a most potent force in venereal disease control.

HUGH S. CUMMING,
Surgeon-General, United States Public Health Service.

PUBLIC SCHOOLS. See EDUCATION, PROGRESS IN.

PUBLISHING. According to *The Publishers' Weekly* there were 5,998 new books published in the United States during 1922. New editions numbered 865; pamphlets, 1,775. The same authority quotes *The Publishers' Circular and Booksellers' Record* as stating that 7,212 new books, 266 translations, 1,276 pamphlets and 2,088 new editions were issued in Great Britain in 1922. Among the books published in the United States during the year, fiction stood first at 758; religious books, second at 568; children's books, third at 462; poetry, fourth at 446, while sociology and history tied at 403. In Great Britain fiction was first with 1,046; religion, second, with 557; sociology, third, with 523; juvenile books, fourth, with 501; poetry, fifth, with 442. *The Publishers' Weekly* gave the following book production figures of other countries for the year 1921: Czechoslovakia, 5,838; Denmark (1921-22), 3,673; France, 7,683; Germany, 34,252 (includes 22,145 new books); Holland, 4,431; Italy, 6,293; Luxemburg, 92; Norway, 1,033; Spain (copyright registrations), 2,528; Switzerland, 1,332; Uruguay, 539.

PUGET SOUND. College of, a Methodist co-educational institution founded in 1903 and located at Tacoma, Wash. In 1922-23 it had a faculty of 18 regular members and 8 more in the Conservatory of Music; 309 students, property valued at \$195,000 and an income of \$72,000. President, Edward Howard Todd, D.D.

PUGILISM. See SPORTS.

PULITZER SCHOOL OF JOURNALISM. This school at Columbia University was founded and endowed by the late Joseph Pulitzer. It was opened in 1912 and in 1922-23 had an enrollment of 140 students. Dr. I. W. Cunliffe is director. The following is a list of the prize and scholarship awards announced in May 1922.

For the most disinterested and meritorious service rendered by any American newspaper during the year, a gold medal costing \$500. The *New York World*, for articles exposing the operations of the Ku Klux Klan, published during September and October 1921.

For the best history of the services rendered to the public by the American press during the preceding year, \$1,000. No competition.

For the best editorial article written during

the year, the test of excellence being clearness of style, moral purpose, sound reasoning and power to influence public opinion in the right direction, \$500. Frank M. O'Brien for an article entitled "The Unknown Soldier," published in the *The New York Herald* on 11 Nov. 1921.

For the best example of a reporter's work during the year, the test being strict accuracy, terseness, the accomplishment of some public good commanding public attention and respect, \$1,000. Kirke L. Simpson of the Washington staff of the *Associated Press* for articles on the burial of "The Unknown Soldier" published on 9, 10 and 11 Nov. 1921.

For the best cartoon published in any American newspaper during the year, the determining qualities being that the cartoon shall embody an

idea made clearly apparent, shall show good drawing and striking pictorial effect, and shall be helpful to some commendable cause of public importance, \$500. Rollin Kirby of the *New York World*, for a cartoon "On the Road to Moscow," 5 Aug. 1921.

Traveling Scholarships: Robert Arthur Curry, Nassau, N. P., Bahamas; Zilpha Mary Carruthers, Denver, Col.; Robert Henry Best, Spartanburg, S. C.

PURDUE UNIVERSITY, a State co-educational institution, founded in 1864 and located at West Lafayette, Ind. In 1922-23 it had a faculty of 298 members, 3,000 students, property valued at \$3,214,760 and an income of \$1,608,765. Edward C. Elliott, Ph.D., is president.

Q

QUAKERS. See CHURCHES IN THE UNITED STATES, STATISTICS OF THE.

QUANTUM THEORY. See PHYSICS.

QUEBEC, a Province of the Dominion of Canada lying between Ontario and New Brunswick and to the north of the United States. It has an area of 703,653 square miles and in 1921 had a population of 2,361,199. Quebec, the capital, has a population of 95,193. Other cities are: Montreal, 618,506; Hull, 24,117; Verdun, 25,001; Sherbrooke, 23,515; Three Rivers, 22,367; Westmount, 17,593; and Lachine, 15,404. The finances of the Province for the fiscal year ended 30 June 1922 show a surplus of \$5,033,420, which exceeds that of all the other Provinces for the last five years. The government announced its intention to use this surplus for education, for the construction of highways, for public charity and for other development. Ordinary receipts were \$21,609,396 and ordinary expenditures were \$16,575,976. The Government is vested in a Lieutenant-Governor and a responsible Ministry, assisted by a Legislative Council of 24 members, who are appointed for life, and a Legislative Assembly of 81 members elected for five years. Women are not enfranchised and are ineligible for election to the legislature. The Lieutenant-Governor in 1922 was Sir Charles Fitzpatrick. Premier, L. A. Taschereau. See CANADA.

QUEENS COLLEGE, a Presbyterian educational institution for women, founded in 1857 and located at Charlotte, N. C. In 1922-23 it had a faculty of 24 members, 275 students, and property valued at \$600,000 approximately. Income figures not given. Rev. W. H. Frazer, D.D., is president.

QUEENSLAND. See AUSTRALIA.

QUICKSILVER. Preliminary figures showing the production of quicksilver in the United States in 1922, compiled by F. L. Ransome, of the United States Geological Survey, give a total of 6,497 flasks, of 75 pounds net, as compared with 6,339 flasks in 1921, which was the

smallest annual output in the 72 years of recorded production of domestic quicksilver. In 1922 California produced 3,494 flasks, Texas 2,725 flasks, and Nevada and Oregon 278 flasks. In California 4 mines were productive, but the output from all but the New Almaden group was very small. The New Idria mine continued non-productive but the old Redington or Boston mine at Knoxville, Napa County, which has lain idle for many years, yielded some quicksilver and will probably be a larger producer in 1923, as a rotary furnace has been installed. In Texas the Chisos mine, in the Terlingua district, Brewster County, yielded more quicksilver than any other mine in the United States. The Mariscal mine, near McKinney Springs, in the same county, was also productive. Prospecting was in progress at the Waldron mine, in the Terlingua district, 95 miles south of Alpine. In Nevada the only production recorded was made from deposits in the Pilot Mountains, east of Mina, in Mineral County. The output from Oregon was practically negligible. The average price of quicksilver in 1922 per flask of 75 pounds, as calculated from quotations by the *Engineering and Mining Journal-Press*, was \$58.95 for New York and \$57.78 for San Francisco. The price declined from \$51 New York, and \$50 San Francisco, early in January, to \$48 New York, and \$47.30 San Francisco in February. From the first of March the rise was fairly steady to \$74 New York, and \$71.30 San Francisco at the end of the year. The Tariff Act of 1922, which went into effect on 21 September, placed a duty on imported quicksilver of 25 cents a pound equivalent to \$18.75 a flask. At the end of the year the directors of the great Almaden mine, in Spain, where extensive improvements have been in progress, reduced the price of quicksilver at the mine to the equivalent of about \$45 per flask. No important additions to known resources of domestic quicksilver were made during 1922, but the effect of the new import duty will probably be seen in a moderate increase in production in 1923.

R

RABIES. See VETERINARY MEDICINE AND SURGERY.

RADCLIFFE COLLEGE, a non-sectarian educational institution for women, founded in 1879 and located at Cambridge, Mass. In 1922-23 it had a faculty of about 150, all members of Harvard University faculty, 728 students, property valued at \$3,000,000 and an estimated income of \$375,000 (estimate based on 1921-22 income). Le Baron R. Briggs, LL.D., is president.

RADIO TELEPHONY AND TELEGRAPHY. During the past eight or ten years a number of important refinements have been added to the wireless telegraphic and telephonic arts, notably the three electrode vacuum tube, the invention of Dr. Lee De Forest, and improvements to that instrument by several inventors, also improvements in the circuits in connection with the said tube by Armstrong in the addition thereto of the so-called regenerative circuits.

Prior to the introduction of the three electrode vacuum tube (termed the audion by Dr. Forest, from audible and ion) there were in existence many amateur wireless transmitting and receiving stations throughout this country. Practically all of these stations employed crystal detectors of various kinds as receivers, although the Fleming valve, or two electric vacuum tube, was also employed. Indeed government and commercial wireless stations as well, were then also limited to the use of the Fleming valve, and to crystal or electrolytic detectors. Even to-day crystal detectors are in extensive use in radio, especially by amateurs. While fair results were obtained by the use of such detectors it was really not until the arrival of the audion or three electrode tube, acting as a wireless detector and amplifier of incoming currents, together with the said improvements in that tube and the local circuits, that the important, indeed revolutionary, advances now achieved, both in wire and wireless telegraphy and telephony were made. Thus long distance land telephony, as from New York to San Francisco, was made practicable only by the employment of a modified form of the audion as a repeater from point to point across the continent. (See article TELEPHONY, in THE AMERICANA.)

The extensive and successful use of the three electrode vacuum tube as a receiver and an amplifier of wireless signals in the new art of broadcasting also has contributed largely to the amazing success and popularity of that new art. Some idea of the growth of amateur wireless stations in this country will be derived from the fact that while in, say, 1919 there were perhaps 100,000 such stations in operation, it is estimated that to-day there are probably over 880,000 such stations.

Not only has the audion largely displaced all other types of receivers in wireless telegraphy and telephony, but it and the two electrode

vacuum tube are also in a fair way to displace all other types of radio transmitters, including the generator type, since these tubes have been found to provide an economical, reliable and efficient transmitter of continuous waves (C.W.) for telegraph, telephone and power circuits. Indeed it is perhaps not too much to say that the utilization of the vacuum tube, acting as a generator of continuous waves for radio transmission, is only second to the use of that instrument as a detector and amplifier in receiving. It will therefore be largely, but not exclusively, to the use of the vacuum tube and to the apparatus used as radio transmitters and receivers in broadcasting and otherwise that the present article will be devoted. The ramifications of this general subject however are now so varied and extensive that anything like a complete discussion thereof is entirely beyond the scope of an encyclopedic article. This indeed would require treatment of text book dimensions. Fortunately the subject has received such treatment and many excellent text books are now available to the student, a number of which will be mentioned in the bibliography at the end of this article.

Electrons.—In the practical development of vacuum tube receivers as used in radio, it became obvious that the successful operation of this tube was due to the ability it possesses of releasing electrons from the heated filament within the tube. Some place therefore will be given to this vitally important subject in this relation. It may be of passing interest to note that in the preparation of the book entitled, 'Wireless Telegraphy,' by the present author, the first edition of which was written in 1900, it was conceived at that comparatively early date in the art that the electron would ultimately be found to play an important part in the electrical arts and especially in wireless telegraphy and telephony. A section captioned "The Electronic Theory" was therefore introduced in the book in which what was then known of the electron was very briefly set forth, and from that section extracts bearing on the theory of the electron will now be drawn.

From time immemorial it has been generally assumed that the atom of matter is indivisible—a body, as Clerk-Maxwell tersely put it, "that cannot be cut in two"; but within a comparatively recent period (1896) a new theory has been evolved, according to which the material atom is made up of electric units or corpuscles termed electrons. Helmholtz and others contended that the existence of electrical atoms followed from Faraday's laws of electrolysis; and Johnstone Stoney (to whom is due the term "electron") showed that each chemical ion of the decomposed electrolyte carried a definite and constant quantity of electricity; and since these charged ions are separated on the electrodes as neutral substances, there is an instant, however brief, when the charges must be capable of existing separately as electrical atoms. To ac-

count for the phenomena of current electricity, etc., by the electronic theory, it was supposed that there are many so-called free electrons intermingling and interchanging with the electrons of the atoms, and which under the influence of an electric force, are capable of moving comparatively freely through metals or other good conductors; whereas, the structure of non-conductors is such that the electrons cannot move freely through them. Assuming that an action is constantly taking place in which the atoms of metals are split up into negatively and positively charged corpuscles which again recombine to form neutral atoms, Dr. J. J. Johnson noted that in the normal state the number of such electrons that recombine in the neutral atom will equal those that have been set free. Consequently, swarms of these electrons, moving in all directions, gain or lose energy by colliding with the atoms of the metal and acquire a high average velocity (about 10,000,000 centimeters per second). This swarm of electrons under an electric force, will be sent drifting along in a direction opposite to that force, thus constituting the electric current. Assuming also that these electrons are moving in a metal at said average velocity it might be expected that some of them would escape into the surrounding air, but to do so, Thomson states that the electrons would require to possess a certain definite amount of energy, for they are attracted by the positive electrons and probably by the neutral atoms as well which suffices to keep them within the metal. *It is known that the electrons escape from an incandescent wire, from a cold metal when exposed to ultra-violet rays, and from radium.* The freedom with which the electrons move depends upon the average velocity of the electrons, since if they are moving with very great velocity they cannot move very far before they come into collision with an atom of the metal, and thus the effect produced by the electric force is neutralized. The average velocity of the electron increases with the temperature, hence electric conductivity decreases with increased temperature. By the electronic theory, alternating current is due to a to-and-fro motion, or vibration, of electrons under the influence of a comparatively slow alternating electric force, while a very rapid oscillation of the electrons in a conductor sets up, by reason of their intimate connection with the ether, a disturbance in the latter in the form of the so-called electric-magnetic waves. It may be remarked that although the electrons under the influence of the rapidly oscillating force vibrate at a very rapid rate it does not follow that they traverse a large portion of the metal. It is assumed that the electrons of an atom are in stable orbital relation around one another, that they possess inertia, are mutually attracted and repelled, and in short, that each atom is a miniature solar system, in which the orbits of the various parts are calculated to be relatively as great as are those of the planets of that system. It is further assumed that the number and arrangement of the positively and negatively charged electrons in an atom are different for each element; the hydrogen atom having the smallest number, the uranium atom the largest. It is thus apparently by the number of electrons in an atom and by the particular manner in which they are

arranged therein that one atom is recognizable from another; analogously, perhaps, as different chemical combinations of molecules form different substances.

In general the foregoing epitome of the electronic theory corresponds fairly well with the existing views on the subject. In present day parlance it is said that the atom is composed of a certain number of negative electrons which surround a nucleus of positive electricity, termed the proton, this positive electricity attracting and thereby preventing the escape of the negative electrons. Normally, the electrons and the positive electrons in the atom are equal (that is, the positive and negative charges in the atom are equal) and therefore the atom itself is neutral. If one or more electrons are removed from the atom there is then an excess of positive electrons and the atom is positively charged, the extent of the charge depending on the number of electrons removed. If one or more electrons are added to an atom it is then more or less negatively charged. An atom negatively charged is termed a negative ion, one with a positive charge is termed a positive ion. As noted by Scott-Taggart, a number of the positive electrons of the atom affect its chemical nature. These positive electrons cannot be removed from the central core. The atom also possesses a number of electrons which may be withdrawn from the atom without affecting its physical properties. These are free electrons and are the electrons which take part in electrical phenomena. There are at least two views as to the cause which retains the electron in the atom: the one just given, namely, that the positive charge (the proton) or nucleus at the center of the atom is fixed; the other that there is a force at the surface of the conductor or filament that normally prevents the escape of the electrons from the filament, but when the energy of the electrons is sufficiently increased, by heating the filament, the electrons overcome the surface force and escape. In the vacuum or thermionic tube therefore as used in radio the results obtained are due to the fact that the heating of the filament in that tube increases the energy or velocity of the electrons to the point where they escape from, or are expelled from the filament, the number of electrons so released or expelled depending on the temperature of the filament which temperature increases with the current, of which fact advantage is taken in the use of this tube in the wireless arts.

With the foregoing brief discussion of the electronic theory, the practical operation of the vacuum tube in wireless telegraphy and telephony will now be considered.

The Fleming Two Electrode Vacuum Tube or Valve.—This valve was used in wireless telegraphy before the introduction of the three electrode valve. It performs, but in a different way, a similar function to that of the crystal detector, in that it rectifies the incoming alternating current waves from the aerial, thereby producing audible signals in the telephone receiver. A short digression may be made to add that the operation of the crystal detector (which followed the filings coherer detector in early wireless telegraphy), depends on the fact that such detectors are unidirectional, that is, they allow current through them in one direction only, or suppress one polarity of current in so much

greater volume than in the other direction that the result is a practically one direction current.

The Fleming detector and its circuits are shown theoretically in Fig. 1. In this figure A' is the aerial. $p.s.$ are the primary and secondary of the receiving tuning transformer, (vario coupler). VT is the Fleming valve or two electrode vacuum tube, consisting of the bulb, shown by a circle, the plate W, and the filament F. The variable condenser C and the secondary s form the usual tuning circuit. As previously stated, when a filament is heated to redness by the battery A (6 or 8 volts), it gives off electrons and it is found that if an outside source of alternating currents is attached to the tube at this time only negative currents will pass from the filament to the plate. In other words the space between the filament and the plate now possesses a unilateral conductivity and negative electricity will pass from the filament to the

FIG. 1.—Fleming Valve or Two Electrode Vacuum Tube.

plate, but not in the opposite direction. When therefore alternating currents (spark transmission) arrive at the tuning circuit s from a transmitting station, only currents of negative polarity will pass through the circuit, FWsT, in the direction indicated by the arrows. This gives a unilateral current in that circuit which is heard as a tone in the telephone that in practice is broken into dots and dashes by a telegraph key. The Fleming valve detector in a modified form to that shown in Fig. 1 was at one time used by Marconi and others as a detector in wireless telegraphy, but it is no longer regarded as of commercial value in that capacity.

The Three Electrode Tube or Audion.—De Forest's great addition to the two electrode tube was the introduction of what is termed the grid, placed between the filament and the plate, which was found to largely amplify the incoming signals. This proved to be a device the importance and value of which in wire-

less telegraphy and telephony, and in other branches of electricity cannot be over stated. As one writer has well said: "The audion was first used as a radio detector (in 1906), but was subsequently found to be capable of performing a number of other important functions. In fact the addition of the grid to the two electrode tube resulted in a device of tremendous potentialities, and that can justly be placed in the same category with such fundamental devices as the steam engine, the dynamo and the telephone."

The great importance of this device was not fully realized at first and the theory of its operation was more or less a mystery to the inventor, as well as to other scientists of that time. (See the discussion of De Forest's paper on the audion, presented to the American Institute of Electrical Engineers, 1906. A. I. E. E. Proceedings, Vol. XXV.)

The three electrode audion tube circuit in simple form is indicated theoretically in Fig. 2. VT is the audion consisting of the bulb represented by a circle. G is the grid, P the plate and F the filament. A' is the usual

FIG. 2.—Simple Audion Circuit—Loose Coupler.

aerial. LC a loose coupler with primary p and secondary s . C is a tuning condenser. B is the potential or plate battery. A is the filament battery, r is a potentiometer for regulating the heating battery A. HT is the head telephone receiver.

The operation of the tube is virtually as follows: When the filament is rendered incandescent by battery A electrons are emitted from F. This makes the space in the tube conducting and the positive pole of battery B attracts the emitted electrons. This produces a current in the circuit PBF including the head telephone, but as this current is uniform the telephone is not affected. Assume now that the distant station transmits a radiofrequency alternating current wave of constant amplitude, termed a continuous wave, CW, (q.v.). When a positive polarity arrives at the variable tuning coil s the grid G receives a positive charge which attracts a greater stream of electrons from the filament, thereby increasing the current flow from battery B. The next polarity arriving at s is negative and the grid is now charged negatively. This retards or stops the flow of electrons from the filament and the current flow in circuit PBHTF is decreased or ceases. As alternating electromotive forces of radio frequency continue to arrive at the aerial the foregoing actions upon the grid produce in the said

circuit a pulsatory unidirectional current, too rapid to affect the telephone diaphragm. When, however, the continuous wave is modulated by voice waves spoken into a suitable microphone transmitter at the distant station, these modulations, being of audio frequency, on reaching the circuit P, B, H, T, F, in which the unidirectional current is flowing are reproduced as speech in the telephone receiver. In such cases the radio frequency wave acts as a "carrier" for the voice modulated waves set up by the transmitter at the distant station. It may, for possible clarity, be suggested that the foregoing result is the practical equivalent of what takes place in ordinary telephony between subscribers during an interchange of conversation. Thus when the telephone receivers are removed from their hooks the central exchange automatically places a battery current on the subscriber's telephone circuit which, however, being a constant direct current, is not heard in the telephones. When now a subscriber talks into the transmitter the battery current becomes a carrier current and, being varied according to the voice waves set up by the speaker, reproduces the voice of the speaking subscriber in the receiver as in the case of the radio circuit just cited.

The De Forest audion acting only as a single wireless detector was and is a pronounced advance over all previous radio detectors, and its scope of amplification by the addition of other amplifying detectors is greatly broadened.

The utility of this detector did not end here. In Fig. 2, the oscillating circuit SGF, is called the input circuit. The circuit PTF is termed the output circuit. It was found that the current in the output circuit is greater than in the input circuit due to the available increase in the potential on the grid. This is primarily due to the fact that by varying the potential on the grid it virtually gives that element control of the flow of electrons from the filament and therefore control of the current from the filament to the plate. This increase is also due to the fact that the grid is closer to the filament than is the plate and consequently with a given potential will repel or attract a greater number of electrons than will the plate. Thus Taggart found by experiment that with a certain tube, six volts negative potential at the grid completely neutralized 35.5 positive potential at the plate. Hence, if a means could be devised whereby the potential at the grid or plate could be varied from an extraneous source a still greater amplification of current could be obtained in the three electron tube. Such extraneous variation of potential at the grid or plate to be of utility must obviously come synchronously with and at the same rate (hundreds of thousands per second) as the variations due to the incoming radio frequency currents from the aerial; otherwise, the desired object would be defeated. It fell to E. H. Armstrong to discover a means by which this object could be attained. It will be noted that in the audion circuits the input or "tuned grid circuit" and the output or "plate circuit" are interlinked by connecting the hot filament of the audion at the point X with the tuned grid and the plate circuit. Armstrong rearranged these circuits so that resonance is imparted to

the plate circuit making it capable of sustaining oscillations corresponding to the oscillations of the tuned grid circuit. He also provided means supplementing the electrostatic coupling of the audion to facilitate the transfer of energy from the plate circuit to the grid circuit thereby reinforcing the high frequency oscillations in the grid circuit. These and other devices produce the "feed back" and reinforcement features of the Armstrong regenerative principle. (See Armstrong U. S. Patent No. 1,113,149—1914). One arrangement of the Armstrong device consists of an extra circuit and a coil termed the "tickler" placed in inductive relation to the secondary of the loose coupler LC as indicated in Fig. 3, and connected directly with plate P of tube VT. The currents from the aerial via the loose coupler set up corresponding currents in the tickler coil which falling on the plate are returned to the grid circuit by the feed back action of the tube. (See TELEPHONY, WIRELESS, in 'The Americana'), and thereby increase the strength of the signals in the tele-

FIG. 3—Armstrong Regenerative Circuit—Tickler Coil.

phone receiver. In Fig. 3, in addition to the apparatus referred to, C is the tuning condenser, *gc* is termed the grid condenser which is shunted by a high resistance, *lr*, usually of several million ohms (megohms). This is termed a leak resistance, the general purpose of which is to allow a slow discharge of the grid condenser thereby preventing overcharges of the grid. For further information on the foregoing the reader may consult text books mentioned in the bibliography.

It has been claimed by certain writers that the regenerative device in the hands of experts will increase the original currents many times. Numerous possible variations of this regenerative circuit are described in text books and periodicals devoted to radio subjects. Indeed almost every amateur expert has his own regenerative circuit and "hook up" as the manner of arranging wireless circuits is popularly termed, examples of which hook ups will subsequently be given.

The Armstrong Super-Regenerative Circuit.—This arrangement of the three electrode circuit, also due to Armstrong, requires very skillful handling. Its amplifying power is great, so much so that the device cannot be used with the ordinary aerial, inasmuch as extraneous currents due to statics, etc., are also exaggerated to a high degree. Recourse is therefore had to the "loop" arrangement for ingathering the passing electro-magnetic waves of radio, by means of which super-experts are able to obtain excellent results. In the tuning of the ordinary regenerative circuit it is known that if the exci-

tation of the tube is pushed beyond a certain point the tube will oscillate and become inoperative for signaling. The inventor conceived that if a means were devised to stop the oscillations of the tube at its usual maximum output, amplification might be limited only by the capacity of the tube. Briefly, this result is obtained by the addition of an extra oscillator to the ordinary regenerative circuit by which means that circuit is alternately allowed to oscillate, and prevented from oscillating, at a frequency determined by the extra oscillator. For details of this device the reader may consult text books on this subject. (See Bibliography.)

Vacuum Tubes.—The tube or audion originally employed by De Forest was what is termed a "soft" tube, that is, one in which the exhaustion or vacuum is low and in which some gas remained. In some forms of tube detectors "soft" tubes are still employed. In tubes used for other purposes in wireless "hard" tubes are utilized. A vacuum is normally a poor conductor of electricity, but as already stated by taking advantage of the ability to release electrons from the filament of the tube the space within the tube becomes conducting, or ionized, and under proper conditions current or electrons flow from the filament. By suitable means such as are utilized in the audion, this current can be varied by varying the temperature of the filament, and in the other ways that constitute the audion a wireless detector. The exhaustion in a hard tube is not less than 1/600000 millimeter of mercury. (See Taggart's "Thermionic Tubes," p. 64.)

The general appearance of a three electrode tube is shown in Fig. 4, one type of which called the "radiotron," a trade name, much used in amateur wireless telegraphy and otherwise. Like other three electrode tubes the radiotron has three elements,—a filament, a grid and a plate. In the radiotron the filament is of tungsten; the grid consists of a special wire surrounding the filament, but is not in metallic contact therewith. Sometimes the grid consists of a small perforated metal plate. The grid controls the electrons within the tube in the manner previously noted. The plate in the radiotron is a metallic envelope that surrounds the grid and the filament. It serves also as a terminal of the potential or plate battery. These three elements are sealed in the glass tube. Four wires from the elements are hermetically sealed in the glass stem of the tube which wires lead out to four prongs on the base of the tube which connect to a suitable holding socket. One form of the radiotron, designed as a detector, is of the gas content type, or partly soft, experience having demonstrated that soft tubes are best for this purpose. In common with nearly all makes of tubes the most satisfactory results are obtained with this tube by a proper selection of the voltages of the plate and filament battery. Ordinarily, this particular design of tube is only intended to act as a detector, but by careful manipulation of the voltage of the plate and filament batteries the tube can also be used as an amplifier. Tubes of general similar appearance externally but completely exhausted or "hard" are used as radio and audio amplifiers. A modified form of the two electrode vacuum

tube (the original Fleming tube) is now employed under the trade name kenotron, as a rectifier of alternating current and as a power tube. One such two electrode tube is illustrated in Fig. 5. It is especially designed to rectify

FIG. 4—Three Electrode Vacuum Tube — Radiotron.

FIG. 5—Two Electrode Vacuum Tube — Kenotron.

alternating pulsatory currents for use with a radiotron transmitter (similar in external appearance to Fig. 4) delivering 5 watts for use in continuous wave telegraphy and telephone sets.

The possibilities of the vacuum tube as a source of electric power are enormous. Already power tubes are made that require 250 horse power to keep them supplied with electrical energy. Also a million watt vacuum tube has been developed in Schenectady, having an output of 40 amperes at 25,000 volts which serves as a rectifier to change alternating current to direct current and also to change direct to alternating current of any frequency, or to convert low frequency alternating currents to high frequency. It is expected that one such tube will be sufficient to carry radio telephonic signals across the Atlantic Ocean. It is not pretended that the foregoing mentioned apparatus exhausts the possibilities of the vacuum tube. It is indeed predicted that this tube will eventually displace many of the largest electrical apparatus now in use.

Until recently the current for heating the regular vacuum tube filament to a desired temperature has been supplied by a storage battery of six to eight volts. A storage battery requires comparatively frequent charging and its original cost, weight and upkeep have been virtually prohibitive of its use in many cases. The advent of vacuum tubes, such as the WD-11 and the UV-199, for use as radio detectors and amplifiers and capable of operation by dry cells has brought about remarkable economies, especially in amateur operation. These tubes function efficiently on a very weak current strength. Tests have shown the UV-199 tube to be very efficient as a radio frequency amplifier. One dry cell has been found sufficient to supply current to the WD-11

tube filament for 100 hours as a detector. This is about the same period that a six-volt storage battery will supply the ordinary vacuum tube filament with current on one charging. No doubt further improvements in this direction will follow.

Continuous and Interrupted Continuous Wave.—These terms are symbolized respectively in radio literature by the capital letters CW and ICW. The terms are employed to differentiate between the damped and undamped waves. (See article TELEGRAPHY, WIRELESS in *The Americana*.) The former are the waves developed by the spark gap method of generating high frequency oscillations. The latter are those established by the Poulsen and other arc generators of high frequency alternating current, and by machine generators such as the Alexanderson.

generator gave successful results. But as previously stated the vacuum tube transmitter is now the best known means of producing continuous waves. Fig. 6 shows a radio circuit in which two three-electrode vacuum tubes VT, VT are utilized as generators of continuous waves suitable for radio telephony; or these waves may be used for radio telegraphy by means of the rapid circuit breaker or "chopper" shown, for converting the continuous waves into an interrupted current wave in the manner described later. In the figure the plate electromotive force of, say, 350 volts is supplied by a 100 watt motor generator MG. By the "feed back" action between the elements of the tubes, VT, VT, oscillations automatically begin on the application of the plate voltage and high frequency oscillations are established in the circuit, which oscillations

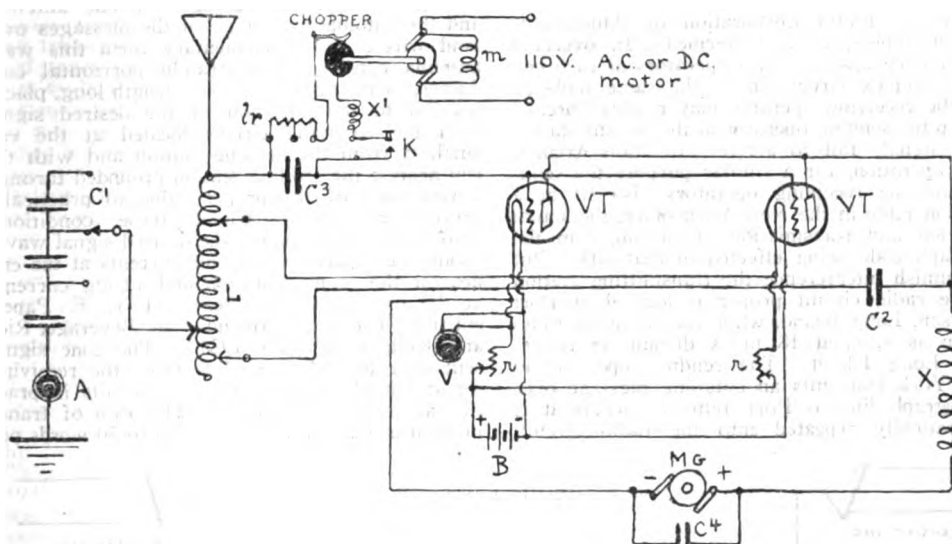

FIG. 6—Three Electrode Vacuum Tube Transmitters—CW and ICW Circuits.

(See article TELEPHONY in *'The Americana'*), also by vacuum tube oscillators. In the spark gap method of setting up radio frequency waves the oscillations are only maintained during a brief interval between the spark discharges, leaving a period between the discharges when there are no oscillations in the oscillation circuit at which time no waves are radiated from the aerial. In wireless telegraphy these intermittent oscillations are heard in the telephone as a tone which is broken into dots and dashes of the telegraph alphabet by a telegraph key. Radio telephony can not be carried on by such intermittent oscillations. (See TELEPHONY, WIRELESS in *'The Americana'*.) For telephony it is essential that practically continuous waves be maintained, that is, alternating current waves whose amplitude is uniform, in order that the wave itself shall give no sound in the telephone, but which wave may be modulated by the microphone in such manner that the voice or music shall be reproduced by the receiving telephone. In the setting up of such continuous waves by the arc generator fairly successful radio telephony was accomplished over short distances. And for long distance wireless telegraphy the Alexanderson

through the coupler L are thrown upon the aerial. In the figure X and X' are radio frequency choke coils, used for protective purposes. C' is the grid condenser. C' are aerial condensers. C' is a protector condenser. rr are potentiometers for the control of the filament battery B. A is an ammeter. V is a voltmeter. Ir is the grid condenser leak resistance. As before stated a continuous wave of radio frequency is not heard in a telephone receiver. To transmit telegraph signals by continuous waves therefore these waves are interrupted in such manner as to produce a tone in the telephone receiver, which tone is in turn broken into dots and dashes by the telegraph key K shown. The chopper, as shown in the figure, consists of an insulating disc on the periphery of which are placed metal segments. The chopper is rotated at a desired speed by a mechanical connection to a motor m. The grid leak circuit is made part of the chopper. Hence, when Key K is closed the rotating chopper rapidly opens and closes the grid resistance circuit, varying or modulating the continuous wave and producing the tone mentioned. When key K is open the tone ceases and by manipulation of the key telegraph signals

are transmitted. By means of a telephone transmitter suitably placed in the oscillating circuit, or by properly attaching a microphone to the antenna circuit between the ammeter A and the aerial condenser C, speech may be transmitted.

Wireless Telegraphy.—Only a few years ago wireless telegraphy was virtually unknown, with its scope as to distance comparatively limited. To-day world wide telegraphy is a fact accomplished. For instance, the Radio Corporation of America has stations in Massachusetts, New Jersey, Long Island and California which are in regular radio communication with England, France, Germany, Norway, Japan, and Hawaii, and thousands of commercial messages are exchanged daily between these stations which service will shortly be extended to South America.

Trans-Atlantic wireless telegraphy as carried on by the Radio Corporation of America is worked duplex, as it is termed. In overland duplex telegraphy the two operators at each end of the duplex circuit sit at the same table so that the receiving operator may readily "break" or stop the sending operator at the distant station when signals fail to arrive. In trans-Atlantic radio operation, for a similar purpose the sending and the receiving operators also sit at a common table in the New York office, the actual reception and transmission of messages in the telegraph code being effected in that city. But to diminish interference the transmitting station of the radio circuit proper is located at Port Jefferson, Long Island, while the receiving radio station is situated 18 miles distant at Riverhead, Long Island. The sending operator in New York transmits an outgoing message over a telegraph line to Port Jefferson where it is automatically repeated into the radio circuit.

France, Germany and Norway "are disentangled from the congested ether, amplified, converted into current of telephonic frequency and automatically relayed telegraphically over two telephone wires to the Broad Street office in New York, where the receiving operator takes the messages by sound, or automatic ink recording machines mark the dots and dashes on tape."

The latest form of aerial employed at Riverhead is termed a wave antenna. It consists of two copper wires on a pole line running from the receiving station along a country road and ending at a stream, nine miles remote. This form of antennae, suitably arranged, gives a marked improvement in reducing interference and statics. It also is strongly aperiodic, and effective as an energy collector. These features have made possible the simultaneous reception of a large number of messages by one antenna, and the automatic relaying of the messages over land wires. In its elementary form this wave antenna consists of a straight horizontal conductor, of the order of a wave length long, placed parallel to the direction of the desired signal with the receiving circuit located at the end furthest from the sending station and with the end nearest the sending station grounded through a resistance of the proper value to practically prevent reflection. Under these conditions, among other advantages, the desired signal waves produce comparatively feeble currents at the end nearest the sending station and strong currents at the receiver end. (See A. I. E. E. Paper, entitled "The Wave Antenna," by Beverage, Rice and Kellogg, 16 Feb. 1923.) The tone signal sent over the telephone line from the receiving set at Riverhead gives the best results in practice at about 1,500 cycles. The rate of transmission at high speed is from 40 to 50 words per

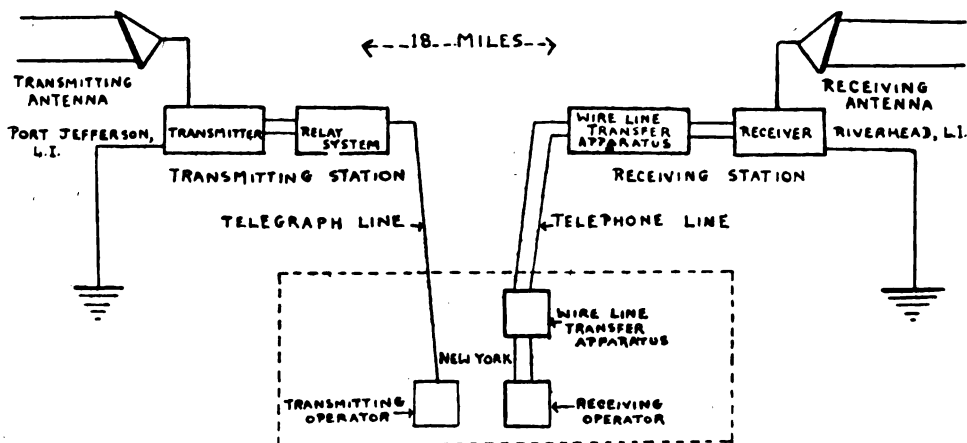

FIG. 7.—Transatlantic Radio Telegraphy. Centralized Operation.

The receiving operator in New York receives the signals from the receiving apparatus at Riverhead by means of a telephone line, as outlined in the accompanying sketch, Fig. 7. The transmitting and receiving apparatus is all handled by engineers at the respective radio stations in Long Island.

The telegraph messages picked up by the antennae at Riverhead from Great Britain,

minute by hand. A speed of 100 words per minute or automatic transmission is attainable under favorable conditions. For further details on this point, see *Wireless Age*, May 1922, p. 54, also TELEGRAPHY in 'The Americana.'

It may be noted that in overland telegraphy, duplex operation, that is, two way operation, or the sending of two messages simultaneously, one in each direction on one wire, is obtained by

devices which prevent the operation of the home transmitting key from affecting the receiving relay at the home station. (See 'The Americana,' TELEGRAPHY.) In radio telegraphy, Goldsmith and Weinberger have devised a method of duplex radio, following generally in principle, the overland duplex telegraph, by which duplex it is expected that the radio transmitting and receiving apparatus may be operated at one station. (See *Wireless Age*, May 1922, p. 68.)

Trans-Atlantic and other long distance wireless telegraphy has been made commercially possible very largely by means of the Alexanderson generator. (See 'The Americana,' TELEGRAPHY, WIRELESS.) This generator it is understood is being supplanted for this work by vacuum tube transmitters. (See Fig. 6 and text.)

Ship to Shore Radio.—Messages from ship to shore are sent to a coastal station of the Radio Corporation or otherwise, whence they are forwarded to their destination by land wires, and reversely, messages from shore to ship are sent by land wire to a coastal station from which the message is sent by radio to the desired ship. In practice the wireless operator on ship board tunes his apparatus for a pre-determined length, say, 600 meters. When he answers a call designed for his ship he may then arrange with the shore station to tune to a different wave length, if advisable, to avoid interference. This wave length is usually from 300 to 450 meters. Certain wave lengths above 1,800 meters are also assigned to this service.

Trans-Atlantic Radio Telephony.—In 1915 wireless telephone communication was effected one way between Arlington, Va., to the Eiffel Tower in Paris. During the same year a telephone message was transmitted from Arlington to the Hawaiian Islands where it was heard by the engineers of the American Telegraph and Telephone Company. More recently, 15 Jan. 1923, by means of improved apparatus, speech was transmitted from the Broadway office of the same company to the Southgate telephone station of the British postal system, London via wire from New York to the Rocky Point, Long Island station of the Radio Company, whence the voice was transmitted by radio to London. The voices of the speakers in New York were recognized by the listening engineers in London. This successful test was the culmination of months of preparation and co-operation between the engineers of the American Telegraph and Telephone Company and the Radio Corporation of America. It will be recalled that commercial trans-Atlantic telegraphy was accomplished only after years of experiment. No doubt trans-Atlantic radio telephony and even further distances will be equally successfully accomplished in due time.

It is worthy of note, as showing the widespread interest in long-distance radio that 11,000 amateurs participated in the recent trans-Atlantic radio tests of the American Radio Relay League. In these tests an amateur station operated by F. E. Newkirk, Los Angeles, Calif., was heard by amateurs in France, this being the first time the feat of crossing the American continent and the Atlantic Ocean by wireless was accomplished.

Broadcasting — Transmission, Reception.—Wide-spread as the use of radio was among amateurs in this country before the World War,

the recent advent of broadcasting by radio telephony evoked an immediate and unprecedented interest in the subject. Manufacturers were utterly unable to keep up with the demand that arose for radio apparatus wherewith to "listen in" to this latest marvel, and the demand is still maintained, almost unabated.

To-day "listening in" to the various forms of free entertainment and information now sent out by the multitudinous broadcasting radio stations in existence in this country is in some respects a fad on the part of many radio amateurs. But even so it is a source of pleasure and profit to millions of people. In the near future it may not only be a source of pleasure, but also a source of education, as colleges are a source of education. Indeed, already college and university authorities are giving careful thought to this possibility and the time may not be remote when college professors and instructors will send out by radio to countless thousands of students in city and country, the lessons that are being simultaneously delivered in the college and university classrooms. Broadcasting by radio will in the future no doubt be utilized also to bring the messages of the great men of the world, directly and personally, not only to the cities but also to the rural districts, to every little school-house in every part of this and other countries. Even at the present rate of development of wireless an authority on the subject states that the President of the United States will soon be able to address a large portion of the population of this country by means of the radio. Indeed, it will be recalled that on the occasion of the opening of the Radio Central Station on Long Island, 5 Nov. 1921, President Harding, by pressing a button in Washington, D. C., automatically started the transmission of a radio telegraph message of greeting which was simultaneously and instantaneously received in 28 different countries and continents, among them, New Zealand, Australia, Japan and South America.

Up to the present time radio broadcasting from private stations has been rendered gratis, the expense being met largely by the manufacturers of radio apparatus as a means of creating an interest that will lead to increased sales, and by large department stores as a species of advertisement.

All wireless transmitting stations are under control of the Federal government which licenses such stations. It is known that the simultaneous operation of two or more nearby transmitting wireless stations, each using the same wave length, will produce a mixing of signals in any stations attempting to receive them. This fact limits the number of transmitting wireless stations that can be operated in a given territory at one time, since the number of suitable wave lengths is also limited. (See TELEPHONY, WIRELESS, in 'The Americana.')

Indiscriminate broadcasting therefore only leads to confusion, to avoid which nearby broadcasting stations are required to use different wave lengths, one, say, 300 meters, another 360 meters. This, however, does not provide for simultaneous broadcasting by many stations. To increase the number some stations are assigned certain hours during which they will be allowed the use of the ether. To provide broadcasting entertainment or education, on a large scale without this confusion, it has been sug-

gested "that the Government should license five or six properly located, powerful stations capable of covering this continent. These stations should be assigned separate wave lengths, or bands of waves, to which they would have an exclusive monopoly so that interference with those stations would be impossible. These stations would extend over broad stretches of country and would supply over this territory information concerning all worth-while activities of interest to the public. For local purposes there should be established a net work of low-power stations with non-interfering wave bands and capable of relaying the large stations service for their immediate neighborhood. These should be able also to furnish for their locality matters of local interest. Such licensed stations, properly protected and organized, would doubtless become a matter of such great value that government aid would be invoked and doubtless granted for the proper upkeep and development of such a service."

Broadcasting; Transmission.—Broadcasting on the large scale now conducted for its successful operation obviously requires the employment of powerful apparatus and the making of many special arrangements. The general principle on which radio telephony is operated is analogous to that of wire telephony. In both cases a telephone transmitter is employed to set up electric undulations corresponding to the sound waves set up by the voice or by musical instruments; and telephone receiving apparatus is availed of to reproduce the articulate speech or music. In one case a wire is employed as the medium of communication, in the other the ether of space is utilized. In the first case the electric waves are confined to or guided by the wire, in the second case the electric waves are thrown, as the term implies, broadcast upon the ether. Apropos of this fact it is frequently suggested by laymen that radio telephony will in time supplant wire telephone communication in cities, thus displacing telephone exchanges, etc. Briefly, this suggestion is not feasible, if for only one reason, namely, the difficulty of preventing interference between the multiplicity of waves of virtually similar lengths that would be set up in the ether in an attempt to displace wire telephony by wireless methods. On the other hand, in wire telephony every wire between a central exchange and the various subscribers' homes and offices acts practically as do speaking tubes within buildings, that is, each particular telephone message is confined to the given wire. Hence, no tuning is necessary and the number of adjoining or parallel telephone wires that may be used in wire telephony is practically unlimited. On the other hand, for the general broadcasting of information of any kind, wireless communication is unrivalled.

In radio telephone broadcasting a series of radio waves of a given frequency or length, say 400 meters, is established by the oscillating circuit at the transmitting station, which waves are thrown upon the ether. These waves duly arrive at the receiving aerial wire, but by reason of their high frequency are not heard in the telephone receiver. The amplitude of the high frequency waves, however, can be varied or modulated, as it is termed, at the transmitting station, by impressing upon the high frequency waves, the variations of current set up by a telephone trans-

mitter in transmitting articulate speech or music. These variations obviously occur at an audible rate and the speech and music so transmitted are reproduced by the telephone receiver at the receiving station. (Electric waves of a frequency above audibility are termed radio frequency waves; those within audibility, audio frequency waves.) In this case the electric waves caused by the voice or musical instruments are said to be superimposed on the radio frequency waves. In other words, the radio frequency wave, so to speak, carries the superimposed wave of audio frequency and hence the wave of radio frequency is called the carrier wave. (See TELEPHONY, WIRELESS, in 'The Americana'.)

Broadcasting Transmitters.—It may be noted that the diaphragm of the ordinary telephone transmitter (microphone) possesses certain natural periods of vibration which will act resonantly with sound vibrations of corresponding pitch from an external source, thereby increasing the impressed vibrations, thus causing undesirable variations in the received note or tone. Ordinarily, the vibrations due to speech do not coincide with the natural periods of the diaphragm and thus speech transmission is not affected. But owing to the wider range of vibrations accompanying the transmission of music the action of the natural periods is found to be detrimental. To meet this defect and to provide generally for a more efficient transmitter for loud speaking purposes several special transmitters have been designed. One of these consists of a thin steel membrane or plate stretched to the elastic limit. On opposite sides of the steel membrane are symmetrically placed variable resistance granular buttons, operated in push and pull fashion. At the back of this steel plate or diaphragm, a flat plate is suitably fixed. These plates are set about .001 inch apart. Around the edge of these plates several small openings lead to the outer air. This device gives a quickly damped high frequency diaphragm which together with the well balanced granular buttons give high efficiency in practice. In the ordinary carbon transmitter the air waves set up by the voice fall upon the diaphragm and by the variations of pressure due thereto upon the carbon granules of that transmitter cause variations in their electrical resistance, which in turn cause variations in the current of the local circuit of the transmitter, thereby eventually reproducing at the telephone receiver the articulate speech originally set up at the transmitter. In the granular button transmitter the voice or music similarly causes vibrations of the diaphragm which in turn vary the resistance of the granular buttons. Hence, currents are set up in the local transmitter circuit corresponding in period to the said vibrations of the diaphragm and ultimately produce the transmitted speech or music at the receiving station. This granular button transmitter responds very readily to a speaker's voice or to music, but the electrical energy produced is small, since the vibrations of the diaphragm are very minute. It therefore becomes necessary to amplify very largely the output of this transmitter in order to obtain a sufficient amount of modulating energy in the oscillation circuit at the aerial. This in brief is accomplished by means of the transmitter placed in the primary of a special transformer, a special amplifying tube,

a modulation amplifying tube, and a power amplifying tube connected with the oscillation circuit, which impresses the amplified speech and music vibrations upon the aerial, from which they are broadcasted.

Broadcasting Stations.—A brief description of one of the best-known broadcasting stations, that known as WJZ in Newark, N. J., will suffice as an example of broadcasting stations in general, although each station differs to a greater or less degree from the others. The aerial of this station is located in the top of a building (The Westinghouse Electric and Manufacturing Plant) on masts 120 feet high and about 150 feet long. The aerial has six wires between the masts, forming "flat top" aerial. Suitable wires lead to a "counterpoise" on the top of the building, below the flat top, and to the transmitting room. The counterpoise is not grounded. The natural wave length of the aerial and counterpoise is about 450 meters, which is reduced to the broadcasting wave length of 360 meters by condensers in series with the aerial leads. All the details for successful and non-distorted transmission of the voice and music in broadcasting have been thoroughly planned and carried out in this station and nightly musical programs, run from seven o'clock to 10:15 o'clock. The ten o'clock signals from Arlington observatory are also transmitted. It may be noted that in radio transmission there is no time lag as there is in wire transmission due to the static capacity of the wire. Consequently all wireless stations within range of broadcasting stations may rely on the accuracy of the time signals thus transmitted from the Naval Observatory, Arlington. In the WJZ station the complete radio transmitter is enclosed in metal screening and glass, and a blower is provided to maintain the tube at the best operating value. A switchboard is mounted on the right of the transmitter so that the set may be connected to the station microphone for announcements, etc., to the shielded pick-up device used for phonographic reproductions, or to the studio on the first floor of the building. The studio is specially designed for concert work. A grand piano and other instruments form part of the equipment. (See illustration, Fig. 8.) The walls and ceilings, as in all such studios, are hung with heavy curtains to deaden echoes and eliminate outside sounds. Different types of microphones are used for various kinds of entertainment, such as solos, quartets, and lectures. An interlocking system of light signals and switches connects this room with the transmission station on the roof. One or more small "pick-up" instruments termed microphones, mounted on standards, are usually the only pieces of electrical apparatus to be found in this room. Wires from these convey the voice or music into another room, which in many cases is at quite a distance from the studio. The latter resembles a laboratory with its various pieces of electrical apparatus, transmitting vacuum tubes, panel boards (for switching), storage batteries, etc. Here the music or speech is put through a number of steps of amplification by means of vacuum tubes which increases the volume of the sound waves thousands of times. The amplified speech currents then enter another bank

of vacuum tubes, termed modulators of the electric waves sent through the ether. Vacuum tubes, generally similar to those employed in ordinary receiving, but much larger and stronger and therefore capable of transmitting more elec-

"Westinghouse" Photo.

FIG. 8.—Program announcer speaking into a special transmitter.

tric power are utilized in broadcasting. The electric power employed in some of the larger broadcasting stations amounts to 500 watts of radiated energy, that is, the electrical power delivered to the aerial.

Wired Wireless Broadcasting.—This method of broadcasting, which is not strictly wireless, is due to General Squier. The method consists of attaching a wireless receiver to an electric light circuit by the insertion of a plug in the usual lamp socket. The telephone is separated from the electric light circuit by a condenser securely placed in the plug. The electric light current acts as a carrier for the electromagnetic currents picked up by the electric light wire. For general broadcasting by this method it is proposed that the entertainment or news be supplied by the electric light company from its own headquarters. Such form of broadcasting would not interfere with or add to the congestion of the ether due to the regular radio broadcasting stations.

Loud Speaking Apparatus and Circuits.—A very important recent addition to broadcasting consists in means whereby the voices, music,

etc., of lecturers or performers can be conveyed by wire to a distance and then delivered to audiences in auditoriums or broadcasted. The "loud speaker" referred to in the following description, prepared by the makers of the apparatus, may also be employed to magnify directly a speaker's voice in a hall or in the open air. Again, the outfit may be utilized in two more or less widely separated auditoriums in such a manner that a joint discussion may take place between the audiences in the respective auditoriums as if the participants in the discussion were in the same room. An instance of this kind occurred, 14 Feb. 1923, between two sections of the American Institute of Electrical Engineers, one section in Chicago, the other in New York. While this joint discussion was in progress it was also broadcasted from a radio station. This equipment is generally known as the Bell loud speaker. It consists of a sensitive microphone for picking up the voice of the speaker; a voice-current amplifier for increasing the magnitude of the voice currents; loud speaking receivers with projectors for reproducing the sounds; and current supply apparatus and suitable circuits and control devices. The microphone, or distance talking transmitter, is mounted in a suitable housing about six inches in diameter, with special supports to insure freedom from mechanical vibrations which might impair the quality of the sounds to be transmitted. No collecting horn or mouthpiece is required for the microphone, which is sensitive to the voice of a speaker three to eight feet away, even though he may not be standing at all times in a position directly in front of the microphone. The purpose of the microphone is to convert the sound energy of the speaker's voice into electrical energy. The energy thus produced is very small, considerably less than that produced in the transmitter of the ordinary commercial line into which one talks directly. Hence it is obvious that the electrical energy must be greatly amplified in order to give the desired volume of sound in the loud-speaking receiver. For this purpose a multi-stage vacuum tube amplifier is employed. First, there is a single stage called the transmitter amplifier, from which the circuit passes to the power amplifier. At this point a connection is made to the long distance lines if the speech is to be sent to distant audiences. The second stage of amplification, the first of the power amplifier, is relatively simple, but in the third stage, a push-pull arrangement of tubes is used, and in the fourth stage there is a double push-pull set of high power tubes. Briefly, the push-pull is an arrangement of the tubes, with special transformers, whereby in one stage of amplification one tube is inoperative while the other is assisting. In the long distance circuits in addition to the terminal amplifiers, smaller amplifiers or telephone repeaters are used at intervals of 200 or 300 miles to make up the line losses. (See 'Americana,' TELEPHONY). The transmitter amplifier consists of a single five-watt vacuum tube arranged in a circuit which receives the output of the double-button granular microphone transmitter and delivers the amplified current to the long distance telephone line, or, should the speaker be talking directly to the assemblage, into the main or the

first power amplifier. The preliminary stage of the power or main amplifier, which may be cut in or out by means of switches, uses a five-watt tube. In the intermediate stage, two power tubes are connected in parallel and the current through both filaments is controlled by a single rheostat, the same as for a single tube. In the final, or power, stage four 50-watt tubes are utilized in a parallel push-pull arrangement. The four filaments of the tubes are connected in parallel in two pairs, the current for each pair being controlled by separate switches. These power tubes are worked at high potential, 220 volts on the preliminary and 750 volts on the power stages. The transmitter amplifier is usually operated from storage and dry batteries. The sound projectors are generally the part of the loud-speaking apparatus most in evidence. Wooden projectors, rectangular or pyramid shaped and usually about ten feet long, serve to direct and distribute the sound emitted from the receiver diaphragm. The receiver element contains a powerful magnet. The vibrating steel armature is suspended near the center on a slightly flexible reed, while one end is coupled to a linen diaphragm through a small rod. At each end of the armature a pair of magnetic pole-pieces work, push-pull fashion, upon opposite sides. The coils through which the speech current flows have the armature for a simple core and are almost surrounded by the pole pieces. The diaphragm is of very special construction, impregnated with a plastic material which gives the proper degree of resiliency and with circular corrugations to further the acoustic qualities. The coil and magnet system is contained in a small and compact metal housing which also provides attachment for the horn which directs and distributes the sound. The loudness of the sound emitted by individual projectors is controlled by means of a special transformer with a separate dial switch for each group of projectors. The most natural and pleasing results are obtained with the projectors grouped in a cluster rather than distributed about the area to be covered.

Hook-Ups.—The great influx of amateurs into the radio ranks, following the coming of broadcasting, naturally led to a great demand for information as to the best methods of arranging apparatus and circuits for all around results and this information was presently forthcoming from every side. It may quite truthfully be said that the possible arrangements of aërials or loops, and of the local receiving circuits or "hook-ups," as they are generally termed by amateurs, are legion. To-day almost every more or less expert amateur has several hook-ups of his own design, the use of which he is ever ready to urge upon his neighbor. It must be said in all fairness that the technical aptness and ability shown by thousands of men and women in all walks of life who have taken up with radio, in the construction and operation of their radio outfits, is nothing short of marvelous. The present writer with an experience of many years in the practical operation of large and small electrical systems can recall nothing in any way comparable to it. To cite only one instance. A young man engaged as a traveling salesman for a business not in the remotest de-

gree connected with the electrical arts, and without any previous electrical or mechanical experience, undertook the construction of a wireless receiving set described and illustrated in a book for amateurs. The set is designed for two stage audio amplification with tickler method of regeneration and the necessary parts are

formation concerning sliding contact coils, or tuners, variometers, condensers, etc., pp. 235, 269, 283.) The object of the sliding contacts, of course is to vary the inductance of the coils for tuning purposes. Fig. 10 shows a two contact tuning coil which is more efficient than the single contact slider coil. This coil is illustrated

FIG. 9.—Single Slide Tuning Coil.

FIG. 10.—Double Slide Tuning Coil.

given in detail. The amateur, really a novice, procured these parts in the rough, laid out the places for holes in the panels and had the holes bored, soldered every joint, fixed and set up the transformers, vacuum tubes, condensers, etc., and in a short time had a wireless outfit with which he is able to receive the output of a number of broadcasting stations, near and remote, with a facility not surpassed by the owners of regularly manufactured complete radio outfits of equal power.

Amateur Hook-Ups for Receiver Circuits.—As just stated the possible hook ups for radio receiving circuits are without number. Naturally some of these hook ups are better than others, and for the information of beginners, several well tried out circuit connections will be given, somewhat in the order of their simplicity. In Fig. 9, A is the aerial or loop. d is a crystal detector. LC is a tuning coil with single sliding contact. HT is the head telephone receiver. C is a variable condenser, one in

in Fig. 11. It is about nine inches long and will respond to a wave length of 1,000 meters. In Fig. 12, LC is a loose or vario coupler tuning coil, with sliding contacts. By tight and loose coupling is meant respectively the more or less direct connection or inductive relation of one electrical circuit to another; in this case the aerial circuit to the receiving oscillation circuit. This two-coil or vario coupler arrangement is really a variable transformer and obeys the laws governing transformers. The coils are usually arranged so that the primary and secondary coils can be readily put in greater or less proximity. This vario coupler is much more efficient in tuning and in cutting out interference than the single contact coil. The other letters of reference in Fig. 11 represent apparatus similarly lettered in other figures. No local batteries are shown in Figs. 8, 9, 11 as the rectified or uni-directional current that operates the telephone receiver is supplied by

FIG. 11.—Double Slide Tuning Coil.

FIG. 12.—Loose Coupling with Crystal Detector.

which the capacity can be altered by variations in the number or position of its plate. C' is a fixed condenser, that is, one in which the capacity is not variable. The term 'fixed condenser' was perhaps first applied in this sense by the present writer. (See 'MAVER'S WIRELESS TELEGRAPHY AND TELEPHONY' for detailed in-

formation concerning sliding contact coils, or tuners, variometers, condensers, etc., pp. 235, 269, 283.) The object of the sliding contacts, of course is to vary the inductance of the coils for tuning purposes. Fig. 10 shows a two contact tuning coil which is more efficient than the single contact slider coil. This coil is illustrated

arranged, however, and may consist of two honeycomb coils, one fixed, the other movable on suitable supports—duo laterally, so that any desired inductance within the scope of the instrument may be obtained by varying the distance of one coil from the other. The terms "honeycomb" and "spider web" coils are shop words arising from the appearance of the winding of the wire of the coil, which is designed

FIG. 13.—Loose Coupler.

for compactness and to provide high efficiency with respect to distributed capacity and inductance per unit of resistance of the coils. An illustration of such honeycomb coils suitable for mounting for the foregoing purpose is given in Fig. 14. Three spider web coils are shown mounted in Fig. 15. In the latter the coils are

FIG. 14.—Honey Comb Coils.

placed on three doors. The middle door is fixed, the outer door is movable. The circuit is tuned by moving the doors which remain where placed. In this way a close adjustment is obtainable. The tuning range of this instrument is 180 to 450 meters when used with two variable condensers of .0005 mf capacity.

FIG. 16.—Loose or Vario Coupler with Three Electrode Detector.

Fig. 16 is a loose or variable coupler hook up. It is similar to Fig. 13 except that it utilizes the audio vt, the heating battery A and potential battery B, a potentiometer regulates the temperature of the filament F by varying the resistance r . G is the grid, P is the plate, gc is the grid condenser of tube VT.

Fig. 17 represents a vario coupler and variometer regenerative receiving circuit. This is a hook up for short wave lengths ranging from 150 to 700 meters. gc is the grid condenser and leak cl. v v' are variometers, to be described. For best results in practice the variometers are placed about eighteen inches apart in the usual wireless receiver cabinet, with the coupler between them as indicated in a subsequent illustration, Fig. 22. This circuit is perhaps the one most generally used for short wave regeneration and is very popular with amateurs. Both variometers give regeneration thereby augmenting the received signals. With well selected variometers a wave length of 150 to 400 meters is found to give satisfactory results.

Variometer.—The value of this instrument in wireless practice warrants giving it further description. The variometer makes possible a continuous and accurate variation of the frequency of the receiving circuits in which they may be used, in contradistinction to the step-by-step, or sliding contact tuning coils, which latter have disadvantages where accurate tuning is required, due to the introduction of resistance and noises at the sliding contacts. In its operation the variometer (illustrated in Fig. 18 detached from the receiving cabinet) employs the

FIG. 15.—Spider Web Coils.

principle of the Ayrtton and Perry standard of induction. It usually consists of two coils, one (the stator) fixed, the other (the rotor) movable. The coils are connected in series. When at right angles to one another the coils give their minimum inductance, the maximum when they lie in the same plane. When turned to

FIG. 17.—Vario Coupler, Variometer Regenerative Receiving Set.

the point of minimum inductance or zero point the coils may be automatically short circuited to prevent loss due to resistance of the coils. The scale shown indicates the wave length in given positions of the coil. Sometimes several variometers or other forms of inductance coils are connected in series in a circuit to obtain greater

or a more variable inductance. (See Fig. 14.) In Fig. 17, variometer v is connected with the grid of vt and is termed the grid variometer. Variometer v' is connected to the plate of vt and is called the plate variometer. When variometer v is adjusted by gradually varying its movable coil relatively to its stationary coil it is very effective in tuning since its operation by thus varying the induction of the circuit in-

FIG. 18.—The Variometer.

creases or decreases the wave length and consequently the frequency of the circuit, the wave length decreasing as the frequency increases and vice versa. It is this general arrangement of the circuits and apparatus in Fig. 17 that permits regenerative action by the variometers, inasmuch as the Armstrong principle of regeneration is availed of, namely, an arrangement of circuits through which some of the energy from the output or plate circuit will be returned to the input or grid circuit. This may be done with inductive, capacitive or resistance coupling between the grid and the plate circuit. The plate variometer in this figure may be termed the primary, the grid variometer the secondary of the circuit. In tuning in a signal by this arrangement the plate variometer is first varied and then the grid variometer is adjusted for best results, both adjustments being made as nearly simultaneously as possible. Then the plate circuit is adjusted to obtain the best regenerative effects. This point is reached when, as the adjustment proceeds, the signal becomes louder and louder, until if the adjustment is still further pushed, oscillation of the set takes place and signals are lost. Adjustment for regeneration therefore is stopped just before oscillation begins. In practice the increase of current derived by thus tuning the plate circuit is very noticeable.

So sensitive are many wireless regenerative receiving sets that even the approach of the operator's hand, arm, or body will vary the capacity of a set and upset the tuning. To avoid this effect many outfits are supplied with sheets of copper suitably placed, for instance, at the back of the supporting panel and between the variometer and coupler.

Audio and Radio Amplification.—It is known that the strength of current in the telephone receiver used with the audion detector tube may be further amplified by the addition of a transformer and an amplifying tube to the circuit. A hook-up for this purpose is shown in Fig. 19, in which LC is a loose coupling. VV' are variometers. vt is a detector tube. t is a small transformer. vt' is an amplifying tube. Transformer t and tube vt' together constitute one step or stage of audio amplification. By adding more stages to the circuit still greater amplification may be obtained, but in practice the number of such stages is usually limited to two by the fact that extraneous noises, statics, etc., are also amplified to a harmful degree. The foregoing arrangement is termed audio amplification since it is the waves of audio frequency that are amplified. Increasing the audibility may not increase the distance at which signals can be picked up. This, however, may be accomplished by amplifying the incoming waves at the aerial or before the waves reach the detector. For instance, as in Fig. 20. If the incoming signals from a distant station are too weak to charge the grid condenser gc , Fig. 19, the vacuum detector tube will not respond. If, however, the grid condenser is removed, as in Fig. 20, and an amplifying tube vt is placed in the circuit next to the aerial or loop, the signals will be amplified by vt . These amplified signals are further increased in strength by passing them through a transformer of suitable construction, t . If these signals are not sufficiently strengthened by vt and t to operate the grid condenser gc in Fig. 20 another tube and transformer may be placed in the circuit with the secondary coil of t . This would constitute a two stage radio frequency amplification and

FIG. 19 — One Stage Audio Frequency Amplification with Vario Coupler Variometer Regenerative Receiving Set.

more stages could be added as desired. In radio frequency amplification the audibility of the signals in the head telephones HT is not increased, hence this arrangement does not increase the static or other extraneous noises in the telephone receiver but it increases the distance from which signals may be received. A loud speaker can take the place of HT in Figs. 19, 20, if required.

FIG. 20 — Standard Vario Coupler, Variometer Regenerative Hook Up with One Step Radio Frequency Amplification.

Fig. 21 illustrates the general external appearance of many of the popular makes of wireless receiving cabinets. This particular outfit is arranged as a short wave regenerative receiver,

FIG. 21.— Wireless Receiver Cabinet, Variometer Tuning.

covering a wave length of 150 to 450 meters. Variometers are used exclusively for tuning in this set thus reducing adjustments to a minimum. The arrangement of these instruments and cir-

FIG. 22.— Three Stage R. F. and Detector Receiver Set.

cuits is indicated on the front of the cabinet. The knob in control of the grid variometer is seen at the left, that in control of the plate variometer at the right. The knob controlling the adjustment of the coupler is in the center.

The antennæ inductance is varied by a step-by-step adjustment. The vacuum tubes and sockets are contained within the cabinets. Contact posts are provided on the framework for the necessary connections for antennæ, ground, batteries, etc.

The receiving outfit shown in Fig. 22 is designed for radio frequency amplification and is equipped with a three-stage radio frequency amplifier and detector unit. This receiver has a continuous range of from 175 to 600 meters. Tuning is obtained by a single unit, a variable condenser connected right across the input terminals of the set. This is not a regenerative set in the usual sense. The interior details of the foregoing receiver are outlined in Fig. 23. The bayonet sockets for the detector tube and the three tubes for the three stage amplification are seen in the figure. The wiring shown is known as the bus bar wiring and follows the well known bus bar arrangements employed in light and power stations where clearly exposed

FIG. 23.— Inside Wiring of Figure 22.

circuits are desirable. One type of the small air core transformers used in wireless receiving sets is illustrated in Fig. 24.

For radio frequency amplification, as against regenerative amplification, it is claimed, because

of the sensitivity of the apparatus, that it is well adapted to use with small coil or loop aeralis giving as it does strong signals when so employed.

FIG. 24.—Air Core Radio Transformer.

The Loop.—This arrangement is now much employed with sensitive receivers as it dispenses with need of an outside aerial. The loop, Fig. 25, consists of a continuous wire, wound serially in nine turns, more or less, over a diamond shaped or square wooden frame about three feet

FIG. 25.—Loop Aerial.

six inches square. This loop may be collapsable for portability. The frame work of the loop may be pivoted so that it may be rotated as desired. This is to take advantage of the directive action of the loop. In certain positions of this loop aerial signals of maximum strength are received due to the fact that the wires of the loop are in their most effective position to be cut by the incoming electro-magnetic waves. Conversely, in other positions of the loop no waves will be cut and no signals received. (For information on directive action of electro-magnetic waves on aerial wires see 'Encyclopedia Americana'—TELEGRAPHY WIRELESS.) The use of a loop reduces interference from undesired waves and gives virtual freedom from statics.

Rotary Variable Condenser.—One type of variable condenser in which one set of plates is stationary, the other rotary, is illustrated in Fig. 26. For best results in wireless receiving, condensers of high excellence are imperative. This is true in all branches of the electrical art where condensers are necessary, but is especially true in the radio art. In many cases where receiving sets do not give the results expected it is probable that the cause might be traced to defective condensers. According to the manufacturer's description, condensers of the type illustrated in the figure, made up with 43 plates, have a capacity of .0008 microfarad. Another condenser having 17 plates has a capacity of .0003 microfarad. The position of the rotary plates in relation to the fixed plates

FIG. 26.—Rotary Variable Condenser.

is varied by means of the handle shown and readings are indicated on a dial on top of case containing the plates which are visible through a glass cylinder.

Loud Speaker.—This apparatus is used when sounds louder than those directly reproduced by the head telephone receiver are desired. The loud speaker in a simple form consists of a sensitive telephone receiver with a socket or other suitable device near the diaphragm of the receiver in which a horn is placed. By this device when the incoming signals have been suitably amplified the voice

and music may be heard throughout a fair sized room. The employment of a two stage amplifier with at least 60 volts on the plate of the second tube is recommended. There are many loud speaking devices on the market. One such as that illustrated in Fig. 27 gives satisfactory results and by the addition of a special power amplifier, not shown, reproduces the voice, music

FIG. 27.—Loud Speaker.

and telegraph signals so loudly as to be heard over a broad area.

Amateur Transmitting Stations.—A transmitting station cannot be operated legally without a license if the signals set up by the station can be heard in another State or if the signals are of sufficient strength to interfere with the reception by a neighboring licensed station of signals from an outside State. The United States Department of Commerce will grant licenses to amateurs for transmitting stations without charge, under certain conditions, among which are the following. The license will be granted only to a citizen of the United States who will be held responsible for the conduct of the station. All stations are required to use only the minimum power necessary to carry on successful communication. Willful interference on the part of any radio station or the transmission of false or fraudulent distress signals or calls is punishable by severe penalties.

Special Amateur Stations.—These stations, known as "L" class stations, are usually permitted to transmit on wave lengths not to exceed approximately 375 meters. Licensed stations, classed as "General Amateur Stations," which are within five miles of a government radio station are permitted to use a power

input of 1 kilowatt and are not permitted to transmit on wave length in excess of 200 meters. More specific information relative to all classes of radio licenses can be obtained from the radio inspector in the various districts. First District, Boston, Mass., Second District, New York, N. Y., Third District, Baltimore, Md., Fourth District, Norfolk, Va., Fifth District, New Orleans, La., Sixth District, San Francisco, Cal., Seventh District, Seattle, Wash., Eighth District, Detroit, Mich., Ninth District, Chicago, Ill. Licenses are not required for the operation of radio receiving stations.

American Radio Relay League.—This league (amateurs) has for its principle object the relaying of messages to all points of the country without charge. The members of this league include the majority of the most expert amateurs of the "National Amateur Association" who have shown a remarkable aptitude for radio operation and have many excellently equipped radio stations. By means of these stations, carefully selected as to routes, messages are relayed across the continent in a comparatively short time. This league also conducts many tests in connection with trans-Atlantic and other long distance radio transmission.

The Future of Radio.—With the all pervasive medium employed by radio, the ether distance is annihilated. In radio operation to cover any distance it is therefore only a question of setting this ether into a given rate and amplitude of vibration by means of suitable transmitters, together with the proper selective apparatus and amplifying devices at a remote receiving station, capable of detecting and reproducing the voice or other signals set up at the transmitting station. Even with the present methods of obtaining the necessary power at the transmitting station and the existing means of obtaining selectivity and sensitivity at the receiving station it is already possible to transmit and receive speech across the Atlantic Ocean. With the greater advances in the wireless art that may be confidently expected in the near future, it would be unwise to place a curb on one's imagination as to what may occur in the next decade or less. Even may be realized the dream of that philosopher who, a quarter of a century and more ago, predicted that the time would come when a man sitting in his library in far off Sydney, Australia, by the manipulation of a small instrument held in the palm of his hand would be able. Aladdin-like, to place himself instantly in communication with a friend in London. And we still have to reckon with telepathy, which will require no instrument in its accomplishment.

According to the Department of Commerce there were 581 radio broadcasting stations in the United States on 6 March 1923 while the number of receiving stations in use at that time was estimated at between 1,500,000 and 2,500,000. Some of the best known broadcasting stations include WEAf, New York, 400 meters; WJZ, Newark, N. J., 360 meters; WGY, Schenectady, N. Y., 370 meters; WGR, Buffalo, N. Y., 360 meters; WGI, Medford Hillside, Mass., 360 meters; WIP, Philadelphia, Pa., 400 meters; KDKA, Pittsburgh, Pa., 360 meters; KYW, Chicago, Ill., 400 meters; WHW, Tarrytown,

N. Y., 360 meters; WOR, Newark, N. J., 400 meters; WSB, Atlanta, Ga., 400 meters; WRAP, Fort Worth, Texas, 400 meters; KHJ, Los Angeles, Calif., 400 meters; WKAQ, Porto Rico, 360 meters; WBZ, Springfield, Mass., 422 meters; WWJ, Detroit, Mich., 400 meters; WNAC, Boston, Mass., 360 meters; NAA, Arlington, Va., 710 meters; WLW, Cincinnati, Ohio, 360 meters; KSD, St. Louis, Mo., 400 meters.

RADIUM. Owing to the discovery in the Belgian Congo of what are believed to be enormously rich deposits of radium ore, the price of radium, it was announced in November 1922, had dropped from \$120,000 to \$70,000 a gram. At the same time the statement was made by one of the three radium-producing companies of the United States that because of the richness of the Belgian Congo ores, the probabilities are that the extraction of radium from American ores will cease. Until the Belgian Congo deposits were discovered, the carnotite ores of Colorado were considered the richest radium yielding ores in the world. Early in 1922, it was announced that a relatively rich radium-bearing field had been discovered in the summer of 1921 on Valdez Island, British Columbia and preparations were begun for its working in 1922. It is estimated that the American production of radium to date is about 3½ ounces. Current stocks are estimated at about 3 ounces in America and 5 ounces in the entire world. In November 1922, there was effected at Brussels a consolidation of Belgian and American radium-producing interests. At the same time it was disclosed that the Société Générale de Belgique had erected, at a cost of 3,500,000 francs, a plant, which was already in operation at Oolong, Belgium, for refining radium ores brought from the Belgian Congo.

RAILROAD LABOR BOARD, United States. Organized 16 April 1920, under Title III, Transportation Act, 1920, to hear and decide any dispute involving grievances, rules, or working conditions, in respect to which any adjustment board (which might be formed by agreement between any carrier, group of carriers, or the carriers as a whole, and any employees or subordinate officials of carriers, or organization or group of organizations thereof), for any reason, fails to reach a decision; or, in the absence of such adjustment board, to assume jurisdiction over and decide disputes, (1) upon the application of the chief executive of any carrier or organization of employees or subordinate officials whose members are directly interested in the dispute, (2) upon a written petition signed by not less than 100 unorganized employees or

subordinate officials directly interested in the dispute, or (3) upon the Labor Board's own motion if it is of the opinion that the dispute is likely substantially to interrupt commerce.

In determining the justness and reasonableness of wages and salaries or working conditions the Board is required by law to take into consideration, so far as applicable, among other relevant circumstances:

(1) The scales of wages paid for similar kinds of work in other industries; (2) the relation between wages and the cost of living; (3) the hazards of the employment; (4) the training and skill required; (5) the degree of responsibility; (6) the character and regularity of the employment; and (7) inequalities of increases in wages or of treatment, the result of previous wage orders or adjustments.

The Board is composed of nine members, appointed by the President, by and with the advice and consent of the Senate: three representing the employees and subordinate officials of the carriers, appointed from nominations made by employees and organizations of employees; three representing the carriers, appointed from nominations made by the carriers; and three representing the public, appointed directly by the President. Of the original members of the Board one from each group was appointed for a term of three years, one for two years, and one for one year. Their successors are appointed for five years. The central offices of the Board are located in Chicago, Ill., but it may, whenever it deems it necessary, meet at such other place as it may determine.

Since its organization and up to 28 April 1923, the Board has published 1,801 decisions, ranging in importance from questions of minor grievances affecting individual employees to general revisions of rates of pay and rules covering all classes of employees and subordinate officials. Among the more important decisions rendered are:

Decision No. 2, effective 1 May, 1920, which awarded increases in existing rates to all classes of railroad employees and subordinate officials, increasing the annual pay-roll of the carriers by approximately \$565,000,000.00;

Decision No. 147, effective 1 July, 1921, which authorized decreases in existing rates of all classes of employees and subordinate officials, effecting an annual saving to the carriers of approximately \$378,000,000.00;

Decisions Nos. 119, 222, 501, 707, 721, 722, 725, 726, 757, 830, and 1,266, effective on various dates, which together constitute a complete revision of the rules and working conditions affecting all classes except employees in the train and engine services;

Decision No. 982, which was the first of a series of decisions involving the rights of the carriers to contract out work and thereby remove certain classes of employees from the jurisdiction of the Board;

Decisions Nos. 1,028, 1,036, and 1,074, effective 1 July, 1922, which authorized decreases in the rates of employees in the shop crafts and in the maintenance of way, clerical, and other departments, reducing the annual wage bill of the carriers by \$135,000,000.00; and

Decision No. 1,267, effective 16 Oct. 1922.

which awarded increases in existing rates of employees in the maintenance of way department, at an annual expense to the carriers of approximately \$23,000,000.00.

The members of the Board in December, 1922, were: Ben W. Hooper (chairman), G. W. W. Hanger (vice chairman), and R. M. Barton, representing the public; Horace Baker, J. H. Elliott, and Samuel Higgins, representing the carriers; and W. L. McMenimen, Albert Phillips, and A. O. Wharton, representing the employees and subordinate officials and the organizations thereof.

L. M. PARKER,
Secretary.

RAILWAYS. In 1922 the railway mileage of the world was 748,005 miles. Of this total, 380,194 miles was in North and South America, 237,888 miles was in Europe, 74,115 miles in Asia, 32,239 miles in Africa, and 23,569 miles in Australia. The railway mileage of the United States is 264,373 miles, or 35 per cent of the world total. At the beginning of 1923 the Bureau of Railway Economics indicated the property valuation of Class 1 carriers in the United States for rate-making as \$19,400,000,000, on which the approved reasonable return would be \$1,116,000,000 net annually. In 1922, this return was not realized. The carriers had to struggle with two strikes of national scope—the coal and shopmen's strikes—which combined to cut their operating profits over a period of months. Nevertheless, the railways of the United States weathered the storm to such an extent that for the year ended 31 Dec. 1922 the operating revenue of the companies, representing 256,235 miles, totaled \$5,658,462,621. After deducting operating expenses, taxes and rent of equipment and facilities, the net income was, \$731,250,138, which is \$418,749,862 short of the 5¼ per cent allowed by the Interstate Commerce Commission under the terms of the Transportation Act of 1920. The financial balance wavered little, with rate reductions amounting to about \$500,000,000 offsetting wage cuts of approximately \$485,000,000 for the year. The former figure represents the saving to the public effected by the July order of the Interstate Commerce Commission cutting \$300,000,000 from the existing structure plus another \$200,000,000 representing voluntary reductions by the individual carriers, while the wage saving comprises the \$134,988,919 reduction by the Labor Board's decision in the case of clerk's, stationary engine workers, signalmen, maintenance of shop and way men, and other cuts over a period of months.

Although railway sentiment leans to the belief that 1922 was constructive, all early hopes of executives that the year would set a record in earnings were lost when coal miners ceased work on 1 April not again to be resumed until 1 September, and when on 1 July the railway shop forces struck for an extended period. The protracted layoff of the coal miners made heavy inroads into the earnings of the systems whose chief source of revenue is derived from the handling of fuel, while practically every carrier was slow in its recovery from the effects of the shopmen's strike.

The total funded debt of the railways of the

United States was \$9,820,277,885, according to the latest compilation of the Bureau of Railway Economics. The entire amount, with the exception of about \$35,000,000, is outstanding in the hands of the public. The total is composed of the following classes of securities: Mortgage bonds, \$7,111,561,947; collateral trust bonds, \$934,489,826; income bonds, \$313,493,681; miscellaneous obligations, \$789,118,004; and equipment trusts, \$662,608,177. The following table shows the results of operation for the calendar years 1922, 1921, and 1920:

CLASS 1.—STEAM ROADS.

	(Millions of dollars)		
	1922	1921	1920
Freight revenue.....	4,007	3,928	4,324
Passenger revenue.....	1,076	1,154	1,287
Railway operating revenues.....	5,617	5,573	6,225
Maintenance expenses.....	1,995	2,021	2,624
Transportation expenses.....	2,175	2,288	2,902
All operating expenses.....	4,456	4,604	5,830
Taxes.....	305	280	281
Net railway operating income *.....	777	616	58
Ratio of operating expenses to operating revenues, per cent....	79.32	82.61	93.65

* Represents the result of deducting from railway operating revenues the following items: Railway operating expenses, railway tax accruals, uncollected railway revenue and net equipment and joint facility rents.

The railways in 1922 carried 340,000,000,000 ton miles of freight and 35,600,000,000 mile-passengers. The following table shows the total revenues and expenses by grand accounts of Class 1 railways of the United States for the years 1921 and 1922 as compiled by the Bureau of Railway Economics:

ACCOUNT	For the 12 months ended December 31st	
	1922	1921
Total operating revenues.....	\$5,617,252,656	\$5,573,153,133
Freight.....	\$4,007,014,655	\$3,927,934,028
Passenger.....	1,076,043,334	1,154,058,118
Mail.....	90,975,536	95,919,962
Express.....	143,332,536	104,674,523
All other.....	299,886,595	290,566,502
Total operating expenses.....	\$4,455,650,216	\$4,603,806,907
Maintenance of way and structures.....	\$735,700,633	\$764,662,651
Maintenance of equipment.....	1,259,664,875	1,256,338,463
Traffic.....	86,694,504	84,406,709
Transportation.....	2,174,932,887	2,288,454,499
General.....	157,908,937	167,995,310

Taxes.....	\$304,885,158	\$279,715,492
Uncollectible.....	1,496,581	1,919,884
Operating income.....	\$855,220,701	\$687,710,850
Equipment rents.....	Dr. \$59,722,604	Dr. \$53,137,317
Joint facility rents.....	Dr. 18,832,137	Dr. 18,627,919
Net railway operating income.....	\$776,665,960	\$615,945,614
Operating ratio, per cent.....	79.22	82.61
Average mileage represented.....	235,233.58	234,969.48

¹ Sleeping and parlor car surcharge in passenger revenue for 1922, \$32,891,124; for 1921, \$32,605,082.

RATE EARNED ON TENTATIVE VALUATION —
TWELVE MONTHS ENDED 31 DEC. 1922.

DISTRICT	Net railway operating income 1922;	Rate earned on tentative valuation (annual basis)	
		1922	1921
Eastern district (including Pocahontas Reg.).....	\$342,749,241	4.01%	3.26%
Southern District (exclud- ing Pocahontas Reg.)....	109,718,764	5.05	2.67
Western District.....	324,197,955	4.03	3.59
United States.....	\$776,665,960	4.14	3.33

NOTE.—“Rate earned on tentative valuation” is computed on the tentative valuation made by the Interstate Commerce Commission in ex parte 74 for rate making purposes in that instance, adjusted by the Bureau of Railway Economics to apply to railways of Class I, and to include the net amount of additions from 1 January 1920. The carriers do not agree to the tentative valuation as representing the true value of railway property devoted to the public service. Such value cannot be determined until the valuation is finally completed in accordance with the Act of Congress. The rate earned on tentative valuation is computed so as to reflect seasonal fluctuations in traffic and earnings.

According to the *Boston News Bureau*, a comparison of the returns of 1922 and 1921 shows that, by sections, the most remarkable recovery was made in the South, in New England and in the Northwest. The Atlantic Coast Line, which was only able to earn \$2.63 a share on the common in 1920 earned around \$15 in 1922; and Louisville and Nashville, unable to cover fixed charges in 1921, earned approximately \$14 a share on its common in 1922. Great Northern's net earnings was \$17,276,598 in 1922, against \$12,766,411 in 1921; while Northern Pacific reported net earnings of \$19,450,514 in 1922 against \$10,843,826 in 1921. A striking recovery of earning power was accomplished by the New England roads. The New Haven earned 78 per cent of its fixed charges in 1922 as against 38 per cent in 1921 and the Boston and Maine, which earned about 32 per cent of its charges in 1921 practically covered them in 1922.

The following is a list, from the *Boston News Bureau*, of the larger systems divided into those earning more and those earning less than so-called “standard return,” that is, the income on which government rental during Federal control was based:

CALENDAR YEAR 1922.

1. Roads Earning More Than Their Standard Return.

	Net railway operating income, 1922	Standard return
Michigan Central.....	18,066,109	\$8,126,349
N. Y. C. & S. L. (including L. E. & W.).....	6,601,148	4,013,511
Pere Marquette.....	6,080,575	3,725,718
Cleveland, Cincinnati, Chicago & St. Louis.....	13,747,229	9,938,597
Elgin, Joliet & Eastern.....	5,152,091	2,672,806
Long Island.....	4,967,454	2,921,321
Chesapeake & Ohio.....	14,410,330	13,630,044

	Net railway operating in- come, 1922	Standard return
Atlantic Coast Line.....	\$14,416,370	\$10,273,543
Central of Georgia.....	4,375,578	3,408,809
Illinois Central (including Yazoo & M. Val.).....	26,752,737	20,172,939
Louisville & Nashville.....	17,637,714	17,296,322
Southern Railway.....	20,472,778	18,653,893
Southern Pacific (P. system in- cluding S. S. lines).....	40,459,532	37,554,097
Union Pacific (not including O. S. L. and O. W. R. R. & N. Co.).....	26,621,319	23,670,741
Miss. K. & T. and (M. K. & T. of T.).....	10,484,558	6,528,202
San Francisco.....	15,490,000	13,897,260

2. Roads Earning Less Than Standard Return.

	Net railway operating in- come, 1922	Standard return
Boston & Maine.....	\$6,475,740	\$9,421,461
New York, New Haven & Hart- ford.....	12,074,160	17,173,367
Delaware & Hudson.....	1,216,669	6,983,661
Delaware, Lackawanna & West- ern.....	6,669,022	16,057,942
Erie (including Chicago & Erie)..<	644,910	13,729,068

	5,558,452	8,054,260
	6,825,884	10,204,619
	8,247,035	13,978,029
	3,629,472	3,723,435

On page 720 are given, from the same source, the gross earnings for the years 1921 and 1922, the total income and fixed charges for 1922, and earnings on common stocks for the years 1921 and 1922 (000 omitted).

Two great systems—the New York Central and the Pennsylvania—are not included in the table because approximate figures on total income and fixed charges were not available, due to these lines having taken over leased lines during 1922. Earnings on the New York Central, however, were expected to approach \$7.50 a share as against \$7.08 a share in 1921. The Pennsylvania paid \$2.70 a share on its common in 1921 but in 1922 it was expected that it would show well above \$3.00 a share.

	Gross		1922		Earnings on common stock	
	1922	1921	Total income	Fixed charges	1922	1921
Atchison.....	\$225,124	\$228,925	\$45,503	\$12,750	\$11 69	\$14 69

¹ Earned on preferred. ² Allowing for only the year's interest on the preferred stock. ³ Includes taxes, rentals, etc. ⁴ Earned on 6 per cent preferred. ⁵ Earned on preferred A.

Capitalization of United States Railways Compared with those of Other Countries.—

In the following table, prepared by the Bureau of Railway Economics, the total railway capital and capital per mile of the railways of the principal countries of the world are shown. These figures are of more than passing interest and refute the frequently propounded thesis of labor unions that American railways are greatly over-capitalized. The table shows that the capitalization per mile of the railways of the United States is lower than that of the more important countries of the world with few exceptions.

COUNTRY	Capital	Capital per mile
America:		
Canada.....	\$2,588,071,016	\$65,714
United States.....	16,993,920,263	68,787
Europe:		
Denmark.....	115,844,757	80,504
France.....	\$3,856,214,779	186,394
Germany.....	9,664,942,000	279,427
Norway.....	110,464,309	54,095
Sweden.....	405,093,253	43,845
Switzerland.....	459,130,072	141,244

¹ Net capitalization.

² State railways.

³ Statistics for the five private companies only; does not include the State and Western railways.

the total amount of the par value of American railway securities, less the par value of those securities still held in the treasuries of the various companies and not issued, and the securities of one road owned by another. In other words it may be defined as the aggregate amount of railway securities outstanding in the hands of the American public.

The valuation of the railroad properties of this country, according to the Interstate Commerce Commission, and arrived at tentatively for ratemaking purposes, was \$18,900,000,000 as of September, 1920, since which date about \$500,000,000 has been added in capital betterments and improvements. This means that the value of the physical properties of the railways of this country used for transportation purposes is according to the Interstate Commerce Commission, approximately \$3,500,000,000 in excess of their net capitalization.

Personnel and Compensation.—According to a report of the Interstate Commerce Commission, 1,804,315 men were employed on Class 1 railways in October 1922, with a total compensation of \$255,514,000. This was the greatest number and compensation since July 1921. The average compensation per employee for October was \$141.51. Agreements concluded between the railways and train crew brotherhoods in the autumn of 1922 continued existing wage scales and working conditions for a year. The carriers abandoned their attempts to include these employees in the second cycle of wage reductions, which, for most other classes, became effective 1 July 1922. Among the reasons for the acquiescence of the carriers in this program is the fact that train crews form a highly specialized labor class in a railway sense and form less than 20 per cent of the number of the personnel and less than 25 per cent of the total payroll. More-

The "net capitalization" of the American railroads, shown as \$16,933,930,263, was defined as

over, train crews are largely on a piece-work basis, being paid for each "run" they make. In the freight service it is possible to make a fairly close adjustment between train mileage and volume of traffic. Other classes of employees cannot be so closely related to variation in service. Following are given the number and compensation of railway employees and grand totals for all employees for three recent annual periods. The figures represent only roughly a year's totals, as they ignore seasonal and other fluctuations from one month to another, but nevertheless represent approximately the relations between classes of employees:

	June, 1922, annual basis		Year 1920		Year 1917

Reports filed with the Senate Interstate Commerce Committee in compliance with its order in the Cummins investigation into revenues and expenses of carriers brought to light the fact that as of 30 June 1921 one railway executive received \$100,000 a year; one \$92,500; eight received \$75,000; and 14 from \$50,000 to \$75,000.

Freight Car Loadings.—Car loadings in 1922 totaled 43,713,519 compared with 39,347,158 cars in 1921 and 45,131,188 in 1920. A new record in cars loaded with all commodities except coal was made in 1922, at an increase of more than 15 per cent over 1921, and nearly 3 per cent over 1920. Notwithstanding the five months' coal strike, coal products in 1922 nearly equaled that of 1921. To 16 Dec. 1922 there were 7,093,638 cars loaded with coal, against 7,734,627 during the corresponding period of 1921, and 9,731,796 during the same period in 1920. The loading of grain and grain products increased approximately 7 per cent over 1921, when such shipments were the heaviest on record. Completed reports for 50 weeks show 2,370,625 cars loaded with grain and grain products. Cars loaded with livestock during 1922 increased approximately 9 per cent over 1921 and 5 per cent over 1920. The roads moved more merchandise and miscellaneous freight, which includes manufactured products than ever before, at an increase of 14 per cent over 1921 and 6 per cent over 1920, when freight traffic was the heaviest in history. Loadings of merchandise and miscellaneous freight to 16 Dec. 1922 totaled 26,252,434 cars. Loading of forest products in 1922 con-

siderably surpassed 1921, but was slightly below 1920. Loading for 50 weeks totaled 2,835,437 cars. This exceeded 1921 loadings by 425,424 cars and was within 152,594 cars of 1920. The loss in freight claims in 1922 was estimated at \$100,000,000 an increase of 200 per cent over the loss in freight claims in the years preceding government control.

Rail Fuel Costs.—The coal strike of 1922 increased the cost of fuel to the carriers. Prior to the time the strike began to affect the roads, the average cost of coal a net ton was steadily decreasing from the 1921 level. In July the roads began to be affected by higher prices and

from then on the cost was above the previous year. The following table shows the comparative cost and amount of coal used by months and for ten months of 1921 and 1922:

	1 Cost of coal per net ton		Net tons of coal consumed	
	1922	1921	1922	1921
January.....	\$3 61	\$4 60	8,106,000	9,247,000
February.....	3 56	4 60	7,830,000	7,644,000
March.....	3 49	4 55	8,503,000	7,711,000

Ten months.....	3 98	4 19	76,036,000	75,873,000

1 Cost figures include freight.

Equipment and Replacement.—During the first nine months of 1922 the railways of the United States purchased 1,672 new locomotives and 112,597 freight cars. In October an average of 60 locomotives and 6,500 freight cars were being ordered weekly.

The table on page 722, based on figures compiled by the *Manufacturers' Record*, gives a comparison of the number of cars and locomotives ordered by the railroads since 1900:

Consolidations.—The Transportation Act of 1920 provided for the voluntary consolidation of the railways into a few systems, in accordance with a plan to be prepared by the Interstate Commerce Commission. A tentative plan calling

for a grouping of the roads of the country into 19 systems was made the basis of hearings in 1922 and early in 1923. These hearings are to guide the Commission in the formulation of the final plan. The law requires that in effecting these consolidations "competition shall be preserved as fully as possible, and wherever practicable the existing routes and channels of trade and commerce shall be maintained."

The several systems are to be so arranged that the cost of transportation as between competitive systems and as related to the respective values of the properties shall be the same, so far as practicable. The aim is that the systems may be able to employ uniform rates in the movement of competitive traffic and, under efficient management, may earn substantially the same rate of return upon their respective property values. In other words, the consolidations are not to be regional or geographical groupings; competition that is sought is to be with respect to service, not rates.

So sweeping a readjustment of railroad relationships as the proposed combinations would entail can be effected only after a considerable period of discussion, and it may be that the carriers themselves will not agree upon the proposed groupings.

The chief consolidation of the year was announced in December. The Van Sweringen Company of Cleveland, Ohio, financiers, held control of the New York, Chicago and Saint Louis, the Chicago and State Line, the Lake Erie and Western, the Fort Wayne, Cincinnati and Louisville, and the Toledo, Saint Louis and Western. On 28 December it was announced in Cleveland that the directors of these roads, referred to as "the Van Sweringen Lines," approved and executed an agreement for the unification of the five roads into a single corporation to be known as "the New York, Chicago and Saint Louis Railroad Company," and directed submission of the agreement and articles of consolidation to the stockholders of the several companies. This consolidation united 1,725 miles in a single system. The Van Sweringen Brothers added the Chesapeake and Ohio Railroad to their holdings in December also through purchase of the controlling interest of H. E. Huntington. This acquisition gives the Van Sweringens control of 4,280 miles of railway, one of the largest

systems of the East, and an outlet to the sea at Fort Monroe, Va., and taps one of the richest coal fields in the East. In England a regrouping and consolidation of several great systems took place. For particulars see subsection on railways in article GREAT BRITAIN. For information on the railways of the principal countries see section on communications in the articles on these countries.

Electrification.—During 1922 active electrification work was more marked in other parts of the world than in the United States. This was due, to a certain extent, to the much higher price of coal and other fuel in these countries than in the United States. The French Government initiated a program of electrification on the main lines of the Paris-Orleans, the Midi and the Paris-Lyon-Mediterranee systems, aggregating 5,200 miles of track to be completed in 20 years. The state-owned lines of Italy are being electrified as rapidly as possible. The most extensive electrification initiated was that of the South African Government Railways totaling 174 miles of route. In the United States the Illinois Central set an engineering commission to plan extensive electrification on that system. It was decided to adopt the 1,500 volt direct current system with overhead trolley. In the city and suburban electric railway field some exceptionally large installations were begun in the United States and in foreign countries. An outstanding activity in this field in the United States was the purchase of light weight safety cars and light weight double truck cars.

Electric Railways.—Statistics based on reports from companies representing one-third of the country's mileage show that despite the growing use of pleasure automobiles and bus competition, more persons rode on electric railways in 1922 than in 1921. The passengers carried exceeded 15,000,000,000. According to a statement, made early in 1923 by C. D. Emmons, President of the American Electric Railway Association, net operating revenues increased 7.4 per cent, although the gross revenue was off 2½ per cent, owing to general fare reductions per passenger from 7.49 cents to 7.33 cents. A decrease of 5.9 per cent in operating expenses served to offset the fare reduction loss. The operating ratio dropped from 75.2 to 72.4 per cent, it was shown, a situation held to indicate the improved condition of the industry and "one of the most favorable signs in its gradual steady recovery."

"Receivership records for the year are encouraging," said Mr. Emmon's statement. Detailed reports from 1 January to 15 Dec. 1922, show that properties with a total mileage of only 517 and total outstanding securities of \$30,986,000 went into receivership, while roads with 458 miles of track and total securities of \$88,729,350 came out.

"Receiverships throughout the industry have decreased gradually since 1919, when the peak was reached with forty-eight companies, embracing total securities of approximately \$535,000,000 going into receiverships.

"Financial conditions with some of the largest companies now in receivership are improving and at least one and possibly more of them may emerge at any time. The general tendency

among regulatory bodies is to keep fares at a level proportionate to increased material and labor costs. The average fare to-day in a group of 275 representative cities is approximately 43 per cent higher than it was at the outbreak of the war, while the average wage increase is 91 per cent, and the average material cost increase is 102 per cent. Inasmuch as labor and material costs constitute about 75 per cent of all operating expenses of electric railways, the proportionate increase in fares over pre-war levels is much lower than is the increase in cost of labor and materials.

"Probably the most important factor in keeping the percentage of increase in the average fare much below the percentage of increase in the cost of wages and materials is that the increase in the average rate of interest has been comparatively slight. Most of the capital invested in companies in years past bore a low rate of interest. The average rate of return to-day upon all the interest-bearing securities in the average electric railway system is very much less than is generally realized. In a great many cases it is less than 5 per cent.

"Fares ranges from 5 to 10 cents in 607 leading cities. The 7 cent fare is operative in the largest single number of cities, 184; the 10 cent fare comes second in 144, and the 6 cent fare third in 102. Other cities of this group are paying: 8 cents, 79; 8 cent fare, 1 cent transfer charge, 26; 5 cents, 20; 5 cents city zone, 5 cents outside, 14; 5 cent fare reduced from higher fare, 13; 6 cent city zone, 7; 5 cent fare, additional charge for transfers, 7; two 5 cent zones, 2; 6 cent zones, 1; 6 cent city zone, 1 cent charge for rides, outside, 1; 6 cent zones, average length two miles, 1.

"Entirely aside from earnings, the local transportation situation is improved in most communities. The bus situation particularly is clarifying. Whereas a year ago bus competition had reached such a point that electric railways in several cities were compelled to suspend operations temporarily, to-day managements, regulatory bodies and the public gradually are co-operating more generally in an effort to find the proper place for the bus.

"At its last convention, the American Electric Railway Association declared that it was the duty of each electric railway company to supply all local transportation in its community and that it should install buses where necessary and be protected from destructive competition by other agencies. Indications point to widespread recognition of the soundness of this policy. Many electric railway companies are adding supplemental bus service and regulatory bodies are restricting bus lines to territory not served by electric railways and classing them as common carriers with the same responsibilities as electric railway lines.

"A dozen cities have relieved their companies of paving charges, and others doubtless will take similar action during the coming year. Recognition of the fact that present paving requirements are largely relics of horse car days when the company horses actually wore out pavement is becoming general."

Railway Motor Cars.—During 1922 many railways initiated the operation of cars propelled by gasoline motors, especially on branch lines

running through sparsely populated sections. Substantial savings in operation have been brought about by the use of these cars and their advocates believe that they will revolutionize the short-haul problem both for passengers and freight. In December a large Eastern builder of such cars reported that 30 railway and other transportation companies were using their cars.

Railway Accidents.—As a result of the educational campaigns launched in recent years by the American Railway Association, the railways made the best record for safety of operation in 1921 and 1922. The statistics of accidents show that the total number of persons of all classes—employees and non-employees—killed on the transportation systems in 1907 was 11,839, the peak year in fatal accidents. The number of fatal accidents has since shown a gradually declining tendency. In 1922 the number of persons killed on the railroads of the United States was 5,776 as compared with 5,587 in 1921. The number injured on the railroads in 1922 was 47,203 compared with 43,324 in 1921. Of those killed in 1922, 2,424 were trespassers while 1,236 were employees. Passengers killed number 193 against 205 in 1921. Passengers injured in 1922 numbered 5,813 against 5,584 in 1921.

A large part of the safety of operation is due to improvement in railroad plant. It has been very much more largely due to the education of employees to the ideas of safety first.

Freight Trains, Cost of Stopping.—According to computations made by operating officials, the cost to a railroad company of stopping an average size freight train is 24 cents if the train is traveling five miles an hour, 69 cents if the speed is 10 miles an hour and \$1.44 if the speed is 15 miles an hour. This analysis appeared in the *Railway and Locomotive Engineering Journal*, and attracted wide attention because of the fact that it represented the first attempt to arrive at a definite conclusion as to this angle of railroading. It was stated that the cost of every movement involved in the stopping of a train had been calculated to the fraction of a cent, and that in order to determine the extra wages paid for the stop those paid the various members of the engine and train crews were taken to be as follows:

Engineers, \$1 an hour; fireman, 77 cents an hour; conductor, 80 cents an hour; and two brakemen at 69 cents an hour.

"If the grade were to be changed to a descending one," says the article in the publication above mentioned, "the distance required to stop would be increased, but the time and distance required to accelerate would be so diminished that the total cost would probably be lessened. On the other hand, if the grade were changed to an ascending one, the time and distance required to accelerate would be so increased as to probably increase the cost. This would also, probably, be increased still more if any curve resistances were introduced into the calculation."

RAILWAY SHOPMEN'S STRIKE. See STRIKES AND LOCKOUTS.

RAMABAI, Pandita, Indian social worker: b. Western Ghats, 1858; d. Khedgoan, April 1922. She was carefully educated by her father,

a man of remarkably advanced views, and gained a thorough knowledge of Sanskrit. Her attainments were so great that in 1877 the pandits of Calcutta conferred on her the title of Pandita (a new distinction), coupled with the name of Saraswati—the Goddess of Wisdom. She lost her husband at an early age, and, moved by the sufferings of child-wives and child-widows, determined to devote her life to their uplift. In 1883, she went to England to seek training for the proper prosecution of her work and while there became a convert to the Christian faith. Thereafter, she traveled in England and in the United States, telling the story of her sister's wrongs, and in the latter country, in 1887, the Ramabai Association was formed, pledged to support for 10 years a school for high-caste Hindu widows. In 1889 she opened a school in Bombay, which was later removed to Poona. During the famine of 1897 she visited the affected districts and rescued 300 high-caste girls from a life of shame. The school and home she opened for them at Khedgoan, some 40 miles from Poona, became known as Mukti (Salvation), while a third school and home is called the Kripa Sadan (Home of Grace). More than 3,000 women, most of them widows (many saved from degradation, and all from hardship incidental to the lot of the Hindu widow), are maintained on a basis of self-help. The Mukti is Socialistic in its operation; its inmates grow their own food, weave their own cloth, manufacture most of the simple articles required, conduct their own education, all under the inspiration hitherto of this woman of genius, this practical mystic, who ranks among the first half-dozen of the daughters of India.

RANDOLPH-MACON COLLEGE, a Methodist educational institution for men, founded February 1832 and located at Ashland, Va. In 1922-23 it had a faculty of 22 members (12 full professors and 10 assistant professors), 200 students, property valued at \$317,029, and an income of \$72,593. Robert E. Blackwell, J.L.D., is president.

RANDOLPH-MACON WOMAN'S COLLEGE, an educational institution, conducted by a board of trustees, under auspices of Methodist-Episcopal Church, South. It was founded in 1893 and located at Lynchburg, Va. In 1922-23 it had a faculty of 50 members, 654 students, property valued at \$1,000,000, and an income, estimated as practically the same as in 1921-22, of \$330,247.93. Dice Robins Anderson, Ph.D., is president.

RAPALLO TREATY. See REPARATIONS.

RATS, Extermination of. See BIOLOGICAL SURVEY, UNITED STATES BUREAU OF.

READING CIRCLE, National. See EDUCATION, UNITED STATES BUREAU OF.

RECLAMATION. The National Reclamation Act was approved 17 June 1902. Under it, and the amendments thereto, receipts from the sales of public lands, with certain small exceptions, and a percentage of the royalties from the production of oil, gas, potassium, etc., are paid into what is known as the Reclamation Fund and used in the survey, construction and operation of reclamation projects in arid and semi-arid States. During the slightly more than 20 years the law

had been in effect up to the end of the fiscal year 1921-22 (30 June), there had been invested in construction projects \$134,826,038.23 of which about \$13,000,000 had been repaid. With this expenditure about 1,675,000 acres, it was stated in the annual report of the Secretary of the Interior, had been furnished with a complete water supply, while, under the provisions of the Warren Act, an additional 1,100,000 acres had been furnished a supplemental supply. On government projects proper the area given comprises 31,462 farms which support upward of 30,000 families. The Service has excavated over 200,000,000 cubic yards of earth and rock of which about 14,000,000 yards were placed in dams. Canals built aggregate over 13,000 miles in length, including 27 miles of tunnels and 135 miles of flumes. Structures of all kinds and sizes number over 110,000. Among the larger works constructed are the Roosevelt Dam in Arizona, 280 feet high; the Arrowrock in Idaho, 349 feet high; the Elephant Butte in New Mexico, 306 feet; the Pathfinder and the Shoshone dams in Wyoming, 218 and 328 feet high, respectively. In 1922 the irrigable area included in the various Reclamation Service projects was 1,700,000 acres; the irrigated area, 1,250,000 acres, and the cropped area, 1,175,000 acres. The estimated value of crops raised on the reclamation projects proper, up to and including 1922, was about \$475,000,000. A census value of livestock upon the projects was \$20,000,000 in 1921. Crops of that year were valued at a total of \$49,620,300, as compared with the peak value of \$88,974,137 in 1919. Reclamation Fund collections in 1922 totaled \$4,294,507.34. The amount of funds available for reclamation work in 1921-22 was \$12,770,736.77; expenditures amounted to \$8,467,852.24. During the year construction, operation and maintenance of irrigation works were continued on 25 projects.

During the year it was announced that the establishment of a 60,000 acre irrigation district, co-operative in character and to cost approximately \$2,200,000, had been virtually accomplished by an organization of land-owners in northern Solano County, California. The Sacramento River was stated to be the source of the water supply. In September it was stated that the directors of an association organized to further what is to be known as the North Divide irrigation project, east of the Black Hills in South Dakota, had decided to petition for water rights which will make possible the irrigation of 35,000 acres of land in Rapid Creek Valley. The project will involve an expenditure of over \$1,000,000. In October an application for the formation of the Kings River Water Storage District in California was filed. The project, it was stated, is a co-operative one involving the expenditure of \$30,000,000 and designed to irrigate 1,000,000 acres and provide hydroelectric power for the use of settlers.

In November the Alberta Irrigation Council of Alberta, Canada, awarded tenders for the construction of the Little Bow irrigation project near Carmanagay. There are about 11,000 acres of land included in this project. In September, English papers announced the awarding of a contract for new irrigation works in the Sudan. The amount involved was approximately £4,000,-

000. The scheme includes the building of a dam across the Blue Nile, nearly two miles in length and the building also of about 650 miles of canals and drainage. In India the irrigation of over 5,000,000 acres is the ambitious project of the Sukkur barrage, or damming of the Indus in the Province of Sind, the most important public work ever contemplated in British India. The cost is estimated at about £18,000,000. Despite financial difficulties, the Mysore government in India, it was announced in December, is determined to complete what is known as the great Krishnaraja-Sagara project by means of which the surplus waters of the Cauvery will be impounded and made available for hydro-electric power and extensive irrigation. The dam, when completed, will store 41,000,000,000 cubic feet of water. During the year extensive irrigation projects were completed in Algeria. Since the conquest of Algeria by the French in 1830, seven important dams have been constructed, the largest of which impounds about 25,000,000 cubic meters of water and irrigates about 90,000 acres of land.

RED CROSS, American National. During the fiscal year ended 30 June 1922, the American National Red Cross practically terminated its foreign operations growing out of the World War, with the exception of the American Junior Red Cross activities, with the fulfillment of obligations and commitments abroad. Following the extensive programs of European relief necessitated by the war and the immediate aftermath, there was carried out a program of child health promotion and disease prevention, which was completed as expeditiously as possible, leaving as a legacy to the Central European nations an education in the care of their own people. All legitimate expectations abroad having been met, the American Red Cross concentrated upon its functions in post-war activities at home, the most important of which are assistance to disabled ex-service men and their dependents, disaster relief, public health nursing, the Junior Red Cross at home and abroad. Care of the disabled men who served in the Army and Navy during the World War is regarded as the primary Red Cross responsibility, calling for patient study of an intricate problem and ready readjustments to situations as they exist or develop. This function does not usurp the government's responsibilities, but supplements official activity through harmonious co-operation with official plans and methods. It seeks out the individual and his particular needs and renders many necessary services, which the government, treating this problem in the mass, cannot provide.

In this work 2,679 Red Cross chapters in all parts of the country were engaged—350 more than were working for ex-service men in the previous year when approximately \$10,000,000 was expended by the national organization and the chapters working together. For the current fiscal year National Headquarters appropriated \$3,030,692.90, an increase of \$365,560.84 over the amount spent for ex-soldier service in the year ended 30 June 1921. Between 1 July 1921, and 30 June 1922, the chapters reported 1,665,079 instances of service to ex-service men and their families at an estimated cost of more than \$5,340,000. Over 1,000 persons, paid and volunteer,

engaged in Red Cross duty in hospitals or district offices of the United States Veterans Bureau, in which an average of 8,000 new cases require definite and particular attention each month. Service claims and information service at Red Cross National Headquarters handled 37,200 compensation and insurance claims, 24,560 allotment and allowance cases, and 9,700 miscellaneous claims. Since February 1919, this service has disposed of 64,174 allotment checks payable to veterans which the postoffice department reported undeliverable.

Seventy-two disasters which drove 145,000 persons from their homes, called for Red Cross emergency relief measures of large proportions and cost \$1,441,486.36 during the fiscal year. The year's disasters included 26 floods, 19 tornadoes, 15 fires, 4 epidemics, 2 theatre collapses, 2 shipwrecks (1 airship), a bridge collapse, mine explosion, railway collision and a drought. In one section alone, the Louisiana-Mississippi border, during the flood emergency the Red Cross fed over 35,000 daily.

The Red Cross, the largest employer of public health nurses in the country, maintained 1,240 nursing services which were active in instructing as many communities in health essentials and disease prevention. During the year 313 new services were established by chapters, and several hundred services so convincingly proved their effectiveness that they were taken over by public authorities. The home visits of these 1,240 nurses aggregated nearly 1,500,000, their visits to schools 140,000, and in six months they inspected 1,250,000 school children. In home hygiene and care of the sick instruction, the Red Cross conducted 3,884 classes, enrolled 2,356 instructors and 93,448 students, and issued 42,656 certificates of proficiency. Its nutrition service embraced 1,199 classes with a total of 27,523 children and 2,589 enrolled dietitians. Seventy-eight food selection classes graduated 733 persons. In general health activities the Red Cross chapters maintained 377 health centers, provided 38,751 health lectures, and conducted more than 10,000 clinics in co-operation with local physicians. The total number of nurses enrolled in the Red Cross nursing service is 38,885, an increase of 1,068 over the fiscal year 1920-21.

More than 325 chapters engaged in life saving or water first aid and the American Red Cross Life Saving Corps set a new high mark in enrollment of qualified life-savers. The influence of "Learn to Swim Week" in many localities is reducing the water fatalities through instruction and the wide dissemination of resuscitation methods demonstrated by Red Cross representatives. Some 275 chapters promoted first aid instruction for employees of industrial and public service organizations, police and fire departments and for adults and children in all walks of life, and the National organization has encouraged where practicable the introduction of first aid instruction in schools, colleges and universities. Borglum bronze medals and certificates are awarded winning teams in first aid demonstration and accident prevention work.

The American Junior Red Cross made two outstanding gains during the year—one in the field of domestic activity in linking up the schools with the junior program, the other a gain

of a dozen countries in Europe pledged to organize juniors on the lines of the American organization. For this accomplishment endorsement was extended by the League of Red Cross Societies for the "creation of an international spirit of human solidarity among young people with a view to preparation of a new civilization of peace." There were 24,528 schools in this country enrolled in the Junior Red Cross, with a total of 4,483,845 pupils wearing the "I Serve" button—the badge of unselfish service earned through personal sacrifice. In international school correspondence 736 classes and schools engaged in exchanging letters with 623 schools in European countries, 90 schools in United States territories, 13 in South Africa and 10 in various other parts of the world. Junior work was financed through the National Children's Fund raised by the Juniors at a cost of \$338,237.40.

The following statement indicates the allocation of Red Cross funds under the main types of Red Cross activity for the current fiscal year as compared with the year ended 30 June 1922:

	Budget 1922-23	Expenditures 1921-22
Assistance to disabled ex-service men and dependents.....	\$3,030,692 90	\$2,665,132 06
Service and assistance to 3,600 Red Cross chapters and their branches.....	1,293,240 80	1,818,450 39
Disaster relief.....	750,000 00	911,222 60
Hospital and other services to regular army and navy.....	306,300 00	369,618 26
Assistance to other organizations co-operating in work related to Red Cross activities.....	200,000 00	163,527 85
Other activities in the United States.....	180,406 99	246,254 76
Medical and hospital supplies for Russia distributed by American Relief Administration.....	1,834,044 83	1,182,185 96
Completion of child health program in Europe.....	641,314 10	1,990,890 02
Completion and liquidation of general relief operations abroad.....	810,718 15	2,124,371 84
Assistance to League of Red Cross Societies.....	200,000 00	350,000 00
Management.....	493,154 70	654,193 95
Total.....	<u>\$9,739,872 47</u>	<u>\$12,475,847 69</u>

Near East Relief Work.—On 13 Sept. 1922, following the burning of Smyrna, \$25,000 was made available for the immediate relief of refugees at that place. On 4 October, Chairman Payne authorized the expenditure of \$75,000 for blankets, clothing and medical supplies in the refugee zone and on 8 October President Harding announced the creation of the Near East Emergency Fund. On 9 October, Chairman Payne cabled the American Committee in Athens authority to expend \$100,000 for emergency supplies, while the Paris representative of the American Red Cross was directed to purchase \$50,000 worth of canned milk and rush the shipment. On 13 October Vice-Chairman Albert Ross Hill, in charge of foreign operations, sailed for Greece to take charge of the American relief work. On 17 October 11,000 overcoats were purchased in England and 2,500 cases of milk were purchased in France to be sent to the relief zone, while the Rochester Chapter of the Red Cross donated \$5,000 worth of shoes

for the refugees. The first shipment of food supplies, costing \$76,000, left New York 24 October. On the same day it was announced that commitments for relief supplies amounted to more than \$750,000. On 30 October medical supplies worth \$18,000 were shipped; on 5 November, 25 carloads of flour were forwarded. On 11 November Vice-Chairman Hill reported about 1,000,000 refugees in Greece and adjacent islands. On 25 November it was announced that disbursements for American Red Cross relief work to that date amounted to \$1,500,000. On 15 December Lieut.-Col. William N. Haskell, Director of the Russian Mission of the American Relief Administration, was made American Red Cross Commissioner to Greece while on the same date it was announced that contributions to the Near East Emergency Fund amounted to \$131,799.89. The principal national officers of the American Red Cross (as of 15 Oct. 1922) are the following: Warren G. Harding, president; William H. Taft, vice-president; Robert W. de Forest, vice-president; John Barton Payne, chairman; James M. Beck, counselor; Eliot Wadsworth, treasurer; Mabel T. Boardman, secretary; John Barton Payne, chairman, Central Committee.

International Red Cross Committee.—The International Red Cross Committee, which has its headquarters at Geneva, Switzerland, was the outcome of the conference of Geneva of 1864. It is composed of nine men of prominence, residents of Geneva. From 1864 until his death in 1910, M. Gustave Moynier was its president. Since then the position has been filled by M. Gustave Ador. The chief object of the International Committee is to present the general interest of the Red Cross in all countries. The duties of the Committee, in detail, are as follows: First, to promote the formation of relief societies in countries where they do not exist; second, the Committee serves as intermediary for the national societies, should they request such intervention; third, the Committee watches over the development of the principles of the Geneva Convention and provides, within the limit of its authority, for the perfecting and carrying out of the terms of the treaty; fourth, the Committee publishes a monthly bulletin; fifth, the Committee forms, in case of war, in localities conveniently selected, an international agency for the exchange of communications between prisoners of war and their families and transmission of assistance to the prisoner. At stated periods there is held an International Red Cross Conference, at which are represented not only the societies, but governments, the Knightly Orders of St. John of Jerusalem and of Malta. These conferences have been held in a number of different capitals, the Department of Foreign Affairs extending the government's invitations, and those to the societies being sent out by the International Committee. Occasionally the holding of the conferences has been interfered with because of a state of war, but the majority of them have taken place at the appointed time. The Joint Council of the International Red Cross Committee and the League of Red Cross Societies was created in 1921 with the object of co-ordinating all voluntary relief work throughout Europe. It is com-

posed of members of the International Red Cross Committee and of the League of Red Cross Societies.

League of Red Cross Societies.—In 1919 on the initiative of the late Henry P. Davison, who was chairman of the War Council of the American Red Cross; the Red Cross Societies of America, France, Great Britain, Italy and Japan founded the League of Red Cross Societies, with the object of applying the spirit and organization of the Red Cross in peace time to the improvement of public health throughout the world. The League maintains a permanent secretariat which, working in close accord with the International Committee, seeks to aid National Red Cross societies through its missions, its publications and its technical services. The League is represented on the Health Section of the League of Nations and co-operates with the *Office International d'Hygiene Publique* in Paris. Its General Council, which meets at least once every two years, is composed of delegates from all national Red Cross Societies, members of the League. The Board of Governors, which meets annually, is composed of representatives of each of the five founder societies, ten nominees of societies designated by the General Council, and the Director-General and Secretary-General of the League.

The League in 1922 moved its headquarters from Geneva to Paris, with offices at 7 rue Quentin-Bauchart. The principal officers are: Director-General, Sir Claude Hill; Secretary-General, Dr. Rene Sand; Treasurer-General, M. Andre Pallain.

DOUGLAS GRIESEMER,

Assistant to the Chairman, American National Red Cross.

REDLANDS, University of, a Baptist co-educational institution, founded in 1909 and located at Redlands, Calif. In 1922-23 it had a faculty of 29 members, 386 students, property valued at \$700,654 and an income of \$177,509. Victor Le Roy Duke, LL.D., is president.

REED COLLEGE, a non-sectarian co-educational institution, founded in 1910 and located at Portland, Ore. In 1922-23 it had a faculty of 30 members, 304 students, property valued at \$2,000,000 and an income of \$177,900. Richard F. Scholz, Ph.D., is president.

REFORMED CHURCHES. For statistics of churches, of which the word "Reformed" forms part of the title, see CHURCHES IN THE UNITED STATES, STATISTICS OF THE.

REGIS COLLEGE, a Roman Catholic educational institution for men, founded in 1888 and located at Denver, Colo. In 1922-23 it had a faculty of 25 members, 270 students and property valued at \$400,000. Income figures not given. Rev. Robert M. Kelley, S.J., is president.

RELIGIOUS MOVEMENTS. Among the Christian churches, the chief event during 1922 was the death of Pope Benedict XV on 22 January. Born at Genoa, in 1854, Giacomo della Chiesa rose to be Archbishop of Bologna and Cardinal, becoming Pontiff in September 1914, as successor to Pius X. Owing to the war, the Vatican was beset with difficulties which may be here briefly summarized. Though situated on Italian soil, it is an international institution. Princes of the church so pro-Ally as Cardinal Bourne of England and Mercier of Belgium there met a thorough German like Cardinal Hartmann of Cologne. In the passion of the moment, the church was accused of favoring the central European belligerents, of bargaining with the Kaiser for a restoration of the Temporal Power, of trying to keep Italy out of the war, and weakening her resolution when she was in it, of discouraging conscription in Quebec and Ireland and of favoring Austria-Hungary against Russia. Amid these cross currents, what Benedict XV really did was to maintain the neutrality of the Vatican. On 12 Dec. 1914, he decreed a truce for Christmas. On 22 Jan. 1915, in an allocution, he declared the church "perfectly impartial" but condemned "every injustice by whatever side it be committed." In view of Bethmann-Hollweg's admission that the invasion of Belgium was illegal, the terms of this allocution were applied by Cardinal Gasparri, Secretary of State, to that case (6 July 1915). It was the Pope's intervention that arrested the deportation of Belgian workmen and facilitated the exchange of prisoners. The Pope refrained, moreover, from condemning the British blockade of Germany.

His efforts for peace were continuous. On 7 Feb. 1915, he ordained a day of prayer. On 28 July 1915, the first anniversary of the outbreak of war, he extended an especial blessing to the belligerent that should first hold out the olive branch. In February 1916, he made a personal appeal for peace to the Emperor of Austria. Two months later, he addressed President Wilson, in somewhat similar terms. On 16 Jan. 1917, he gave full support to President Wilson's Peace Note of the previous 18 December. On 1 Aug. 1917, he issued his own famous peace note, advocating "complete and reciprocal condonation" of damages and war expenses, to be followed by disarmament. Finally, in 1918, the Pope condemned as "a wanton massacre," the sacrifice of life at St. Gervais Church in Paris which had been bombarded by the Seventy Mile Range Gun of the Germans.

With Austria-Hungary shattered, it might be thought that the Roman Catholic Church would emerge the weaker. The reverse is the truth. In August 1914, there were 20 nations in more or less direct diplomatic contact with the Vatican. At the Armistice, there were 31 such nations of which seven maintain Ambassadors accredited to the Holy See and 20 maintain Ministers. England and Holland are included, while Japan, where Catholic missions

are active, has been considering such representation.

In July, 1922, the complete works of Anatole France were placed on the 'Index Expurgatorius' but on the other hand, Rome had gained (August 1922) a distinguished convert in Gilbert K. Chesterton, the English master of paradox, while (June 1922) the two Presbyterian Assemblies of Scotland appointed committees to consider the rapid increase of the Catholic population in that country. This is a local situation which to some extent resembles the pressure of the growing Catholic population of Quebec or Ontario. In Quebec, a great sensation has been caused by the burning of numerous churches, including the cathedral of Notre Dame in the city itself, and the famous Shrine of Saint Anne de Beaufré. There is no evidence of incendiarism, but the epidemic of fires, which did not spare the Laval University, aroused comment.

The immediate problems to be faced by the church have been political and social rather than doctrinal. Hence the significance of the election (6 Feb. 1922) of Achille, Cardinal Ratti, Archbishop of Milan, to be Pope Pius XI. Born at Desio, Italy, in 1857, he had served as Librarian of the Vatican and as Papal Nuncio to Poland after the Armistice. It was only in June 1921 that he received the Cardinal's hat. An Alpine climber, he has been called "the young man's pope."

On Election, his first act was to deliver his blessing, *urbi et orbi*, not within St. Peter's, but from the External balcony, a symbolic indication that the Pontiff was no longer in the former sense to be regarded as "a prisoner." The American Cardinals had not reached Rome in time for the Conclave, but the Pope indicated that on future occasions the other Cardinals must await their attendance. In other ways, he has broken through traditions. He posed (August, 1922) for the movies. To the Knights of Columbus, now active in Italy, he has allotted ground near the Vatican for baseball and (May) witnessed a game. He has praised athletics and aroused curiosity on the question whether he will leave the Vatican, either for processions in Rome or for occasional residence in the villa of Castel Gandolfo. Following the example of Benedict XV, he has insisted on modesty of dress for women, including those who ascend the Holy Staircase on their knees. In December, 1920, Benedict XV denounced the Y. M. C. A., as an organization that "instills indifference and apostasy." But the Church itself has had none the less to face the problem of youth in a new world. In February 1922, the Consistorial Congregation ordered the discontinuance of the National Catholic Welfare Council's work in the United States, which had the support of 87 out of 103 Bishops. In August, this order was reversed on condition that all American Bishops be not required to participate. One difficulty had been the enquiries into industrial disputes and similar matters, furthered by Dr. John A. Ryan of the Catholic University, Washington. Among the Protestant Churches, a somewhat similar situation arose when the Inter-Church World Movement issued a report, severely criticizing the United States Steel Corporation because of the steel strike.

The Pontificate of Benedict XV witnessed a measure of reconciliation between the Vatican and the Italian monarchy. In 1920, an arrangement was made at the instance of King Alphonso of Spain and King Albert of Belgium whereby the heads of foreign and Catholic states could visit the King of Italy without offence to the Church. Cardinals are welcome at the Italian Court and Catholics now vote at the Italian elections. Indeed, they have been organized by Don Luigi Sturzo, an able priest, into the Popular Party, with an advanced Social Programme which includes the right to strike for workmen, universal suffrage for men and women and free education. On his election, Pius XI received the congratulations of the Bonomi Government which, however, fell in consequence—and he admitted Italian officers to his Coronation. The so-called Roman Question—that is, the claim of the Pope to territorial sovereignty—has not been settled but its urgency seems to have been eased. In December 1922, the Pope renewed his formal protest against the decisions of 1870.

As Papal Nuncio in Poland, Cardinal Ratti wielded an influence which extended into Lithuania and Russia. In February, he startled the world and especially France by prayers for the success of the Genoa Conference at which Russia had a seat. The Revolution in Russia has been undoubtedly a severe blow to the Eastern Orthodox Church and there is thus an especial opportunity for an rapprochement between the Greek and Latin churches. Easter, 1923, was, however, observed by "Eastern" Christians with renewed devotion and there were renewed symptoms of Bolshevik persecution.

The Pope has strongly urged that there be international guarantees for the Holy Places in Palestine, thereby voicing his suspicions of Jewish influence, as it might be exercised under the British mandate.

In November 1922, a serious issue arose because of a law approved on referendum in Oregon which in effect places a ban upon all denominational and private schools after 1926. An appeal is being made to the Supreme Court. Negotiations, too, have been proceeding between the Vatican and France, over many matters—the appointment of bishops, religious congregations and so on—which were affected by anti-clerical legislation.

About the statistical volume of organized religion in the United States, certain figures are eloquent. Dr. Walter Laidlaw calculates that between the years 1906 and 1916, the percentage of church members increased from 40.4 to 41.3. In March 1922, Dr. H. K. Carroll stated that in 1921, fifty denominations added 761,727 members to their roll.

In the Protestant Churches, there has been evident an abundance of social service and civic influence. The difficulty which has had to be faced in their case is doctrine. Broadly, there are two parties confronting one another—the Modernists or Liberals and the Fundamentalists who hold to the creeds and include the Premillenarians, that is, believers in the return of Our Lord before the Millenium. Between these combatants, the battleground is the Bible. For the Fundamentalists, W. J. Bryan has attacked

Evolution with a vigor that almost led States like Kentucky to legislate against Darwin. The Modernists, on their side, have been championed by the Rev. Percy Stickney Grant, of the Church of the Ascension, New York, who denied that Jesus had the power of God, and also the Virgin Birth, miracles and the fall of man. The question of trying Dr. Grant for heresy was raised but Bishop Manning has not proceeded to this length. Many Liberal theologians are supporting Dr. Grant on intellectual grounds.

In June, the Northern Baptists held a convention at Indianapolis where an attempt was made by the Fundamentalists to secure a credal test within that body, but this proposal was defeated.

Among the Presbyterians, the fight has raged around the person of Dr. Harry E. Fosdick, a Baptist who preaches from a Presbyterian pulpit in New York. At the instance of the Presbytery in Philadelphia, Dr. Fosdick's opinions were considered by the New York Presbytery but no action was thought necessary.

Other incidents in the struggle were a volume renouncing the Christian faith as held hitherto, from the pen of Dr. Samuel Davis McConnell, once Rector of Holy Trinity Church, Brooklyn, and for 50 years a minister; and a challenging utterance by Bishop William Montgomery Brown, formerly of Arkansas, (October 1921). In December 1922, Dr. Arthur Wakefield Slater, Professor of Biblical Literature was dismissed from William Jewell College, Kansas, because of his advanced views. A case in the other direction was the retirement in 1919 of Bishop F. J. Kinsman who left the Protestant Episcopal Church because of her Modernism.

In England, there is a somewhat similar situation. In 1921, and again in 1922, Modernist Churchmen held conferences which discussed the divinity of Christ and the relation of the Christian to other faiths in terms which no one could pretend were in accordance with the creeds. The trial of Rev. H. D. A. Mayor for heresy did not however succeed. How far matters had drifted may be judged from the fact that the London Missionary Society has had to deal with a hymnbook prepared in India, from which the name of Christ was to be omitted lest it give offence to Moslems and Hindus. We have moreover demands for an abridged Bible or, to quote H. G. Wells, a new Bible altogether.

While the Modernists forswear miracles, Roman Catholics claim that they are still occurring and they give instances. Among Protestants and Jews, there has been, moreover, an amazing interest displayed in all varieties of "faith-healing," whether religious or auto-suggestive, as administered by Dr. Emile Coué. The ministry of the English healer, James Moore Hickson, was endorsed by Bishop Manning.

In many quarters, there is a desire for the reunion of the Churches. The attitude of Pope Benedict XV had been that he could not join any world conference, having this end in view. But in September 1922, the Oecumenical Patriarch of Constantinople, Meletios, wrote on behalf of the Holy Synod, recognizing the validity of Protestant Episcopal orders. Between the

Established Church of England and the Free Churches of that country, deliberations with the object of promoting intercommunion are going forward, and in 1920, Dr. J. H. Jowett, well known in New York, preached in Durham Cathedral. The Inter-Church World Movement with its appeal to the United States for large funds, opened up too many issues to be an aid to reunion. But in preaching the inaugural sermon before the League of Nations, the Archbishop of Canterbury occupied the Chair of John Calvin at Geneva. The curious proposal for a Bahia Temple in Chicago, to include all religions, has not materialized.

For the Salvation Army in the United States, there has arisen something of a crisis owing to the proposed recall (September) of Commander Evangeline Booth, by orders from General Booth in London, and contrary to a strong American sentiment.

At Copenhagen, in August, there was held an important conference, representing the Churches of 25 countries, at which international friendship was promoted.

Perplexing as is this era, never was religion more widely discussed. In New York, huge crowds thronged to see the screen versions of Hall Caine's "Christian" and Winston Churchill's "The Inside of the Cup." In Germany, the Republic allows unwilling members to leave the state church, now de-Kaiserized, and many have done so, but, among the young, there are signs of a returning and more genuine faith. The American Bible Society reports an unprecedented demand for the Scriptures.

PHILIP WHITWELL WILSON.

RENSSELAER POLYTECHNIC INSTITUTE, a non-sectarian educational institution for men, founded in 1824 and located at Troy, N. Y. It is the oldest school of engineering in America and is generally recognized as one of the best. Statistics for 1922-23 show a faculty of 90 members, 1,100 students, property valued at \$5,300,000, and an income totaling \$390,000. Palmer C. Ricketts, E.D., LL.D., is president.

REPARATIONS. With the conclusion of the year, 1922, there arose in Europe a grave crisis. Under the Treaty of Versailles, Germany was made liable for Reparations, both in money and in kind. On 9 Jan. 1923, the Reparations Commission, meeting in Paris, declared Germany had defaulted in respect of certain deliveries of wood and coal. This declaration was made by vote of France, Italy and Belgium who formed a majority on the Commission. Great Britain dissented and Roland W. Boyden, the American observer on the Commission, stated that in the interests of the economic revival of Europe the Treaty should be revised as soon as possible, which view, it was explained, was personal rather than official. On 10 Jan. 1923, France and Belgium marched large forces into the Ruhr valley and occupied Essen, the headquarters of Krupp's Works, and Bochum where Stinnes is supreme. Anticipating this drastic action, the United States Senate, on 6 Jan. 1923, passed a resolution by 57 to 6 asking the President to withdraw the American troops—rather more than 1,000 in number—who still remained at Coblenz on the Rhine, under the

REPARATIONS

command of Maj.-Gen. Henry T. Allen. A few days later, the President complied with this request. Germany, moreover, withdrew her diplomatic representatives from Paris and Brussels. The technical default amounted to only 16½ per cent at most of the deliveries due. But larger issues were involved.

By the terms of the Armistice agreed to on 11 Nov. 1918, it was thus laid down: "Compensation will be made by Germany for all damage done to the civilian population of the Allies, and to their property, by the aggression of Germany by land, by sea, and from the air."

In the subsequent British general election of 1918, David Lloyd George talked about Germany paying "the cost of the war," but in fact, her liability did not include such "an indemnity," being defined strictly as "reparations."

On 28 June 1919, the Treaty of Versailles was signed and by it, these reparations were stated to be in respect of:

Damage to injured civilians, to the victims of German cruelty and their dependents; and to maltreated prisoners of war. Naval and military pensions.

Cost of assisting prisoners of war and their dependents and allowances to dependents of mobilised persons.

Compensation to civilians, subjected to forced labor, and for property seized, injured or destroyed. Return of levies, fines and similar exactions imposed on the civilian population.

Over the inclusion of naval and military pensions in this schedule, there has been much controversy. It was argued that the item was not "a reparation" but "a cost of the war." Lloyd George, however, persuaded both General Smuts and President Wilson that his interpretation was correct and pensions were thus entered on the bill. It is estimated that they represent more than half the total demanded. J. M. Keynes, the economist, put the figure at two-thirds.

What does and what does not constitute "a reparation" are questions which, however, have become entirely subordinate to the further question what, in any event, Germany can be made to pay. In the Franco-German War of 1870, no material damage was inflicted on Germany. The fighting was wholly in France. "Reparation" did not enter the discussion and the "Indemnity" then exacted was 5,000,000,000 francs or \$1,250,000,000. With the addition of \$60,000,000 for interest, this indemnity was paid punctually and completely within four years.

By the Treaty of Versailles, Germany was to make a preliminary payment of 20,000,000,000 gold marks or about \$5,000,000,000, either in gold or other values, by 1 May 1921. On that date, the Allies held that Germany had only paid the equivalent of \$2,000,000,000 and the balance of \$3,000,000,000 was claimed. Germany disputed the amount of the credits allowed her on goods, etc., which she had surrendered and claimed that, on 1 May 1921, she had met in full whatever obligations the Treaty imposed.

This controversy was, however, only a detail compared with the larger question what should be the total sums to be exacted from Germany in years to come. Many conferences were held at Spa, in July 1920; in Paris, on January 1921; in London in March 1921 and

May 1921. The Spa Conference divided reparations among the Allies thus: France, 52 per cent; British Empire, 22 per cent; Italy, 10 per cent; Belgium, 8 per cent; Other Allies, 8 per cent.

Of reparations, the United States thus claimed nothing and was allotted—nothing!

The Paris Conference demanded from Germany (Jan. 1921) a sum of \$56,000,000,000, spread over 42 years, with an addition of 12 per cent levied on her exports. Germany replied with an offer of \$12,500,000,000 which the Allies refused. Duisberg, Ruhrort and Dusseldorf, on the right bank of the Rhine, were occupied; a customs barrier between the occupied areas and the rest of Germany was set up and there were other disciplinary measures, none of which drew money from Germany.

In May 1921, the demand on Germany was reduced to \$33,000,000,000 which sum, under protest, the Germans accepted. The Reparations were to consist of bonds, called A, B and C. The A and B bonds, which may be considered together, amounted respectively to \$3,000,000,000 and \$9,500,000,000. Interest on them was fixed at 5 per cent with 1 per cent for a sinking fund, or 6 per cent in all. The C bonds amounted to \$20,500,000,000 and were only to be issued as Germany proved able to meet the charges on them. Tabulated, the position was thus.

"A" bonds.....	\$3,000,000,000
"B" bonds.....	9,500,000,000
"C" bonds.....	20,500,000,000
	<hr/> \$33,000,000,000 <hr/>

At 6 per cent, the charge on these bonds works out:

"A" bonds.....	\$180,000,000
"B" bonds.....	570,000,000
	<hr/> \$750,000,000 <hr/>
"C" bonds.....	1,230,000,000
	<hr/> \$1,980,000,000 <hr/>

Assuming a complete payment of reparations by Germany, she would thus transmit money or values every year equal to 50 per cent more than the entire indemnity—\$1,250,000,000—paid in four years by France to Germany after the War of 1870. In the opinion of every authoritative expert, this would be an impossible financial operation, nor was it seriously contemplated by the Reparations Commission. In May 1921 the payments receivable from Germany in any given year were fixed thus: (1) \$500,000,000; (2) 26 per cent of the value of her exports, a percentage that amounts at most to \$300,000,000, many estimating the sum at a much smaller figure. At best, then, Germany was not seriously expected to do more than meet the interest and sinking fund on Bonds "A" and "B."

For 1921, she was to pay \$250,000,000 and this she did. A further sum of \$75,000,000, chargeable on exports, was held to be covered by the values of coal, ships, etc., delivered during that year. Up to this date, therefore, that is 31 Dec. 1921, no default was alleged. In fact, the total payments credited to Germany on account of reparations amounted then to

\$1,622,000,000, to which must be added a further sum of \$1,250,000,000, found for armies of occupation, interallied commissions and so on. So expensive were these matters that on 1 April 1922, it was reckoned that no money was yet in sight for meeting the charges on the A, B and C Bonds.

Under the Agreement of May 1921, the payment due during 1922 was to be \$500,000,000, in four instalments, i. e., \$125,000,000 on 15 Jan., 15 April, 15 July and 15 Oct., with the addition of whatever was chargeable on exports.

On 13 January the Reparations Commission extended Germany's time for payment of the first instalment but demanded \$7,500,000 every 10 days, being one-fourth of what was due on exports.

On 28 January Germany requested a moratorium for 1922, with other relief.

On 11 March 1922 the Reparations Commission was confronted by a bill from the United States for \$241,000,000, the cost of the American Army of Occupation on the Rhine. In respect of this item, no payment has been made, but on 22 March Secretary Hughes demanded the priority which, under the Treaty, is stipulated for such claims. On 11 April, Great Britain, France and Belgium, in separate notes, agreed to the parity of treatment on which the United States had insisted.

But, in the meantime, on 11 March 1922, Germany's first 1,000,000,000 marks, \$250,000,000, had been divided thus:

Great Britain	\$125,000,000
France	35,000,000
Italy	7,500,000
Belgium	62,500,000
	<u>\$250,000,000</u>

It appears that these disbursements include refunds on credits allowed to Germany, since the Armistice.

On 22 March, the Reparations Commission again adjusted the payments to be made during 1922. They were to be \$180,000,000 in cash and \$362,500,000 in material or \$542,500,000 in all. This was \$207,500,000 less than the sum of \$750,000,000 which, as we have seen, was required to meet the charges on the A and B Bonds.

The actual payments for 1922 were arranged thus:

Up to 22 March	\$70,500,000
April	4,500,000
Six months at \$12,500,000 a month	75,000,000
Two months at \$15,000,000 a month	30,000,000
	<u>\$180,000,000</u>

These modified terms, granted to Germany on 22 March 1922, were not fulfilled by her. On 31 May, Germany was offered a conditional moratorium for the rest of the year, and on 12 July she asked that the moratorium be fixed for three years. In that month, a payment of \$8,000,000 was demanded of Germany and paid by her, and in August, credit notes were demanded of Germany for Belgium, amounting to \$67,500,000. On 30 September, however, the

total sums credited to Germany on account of Reparations had only increased thus:

On 30 Sept. 1922	\$1,894,500,000
On 1 January 1922	1,621,964,000
	<u>272,536,000</u>

Increase in nine months

Against the total for \$1,894,500,000 paid up to 30 Sept. 1922, there have to be set debits against Germany as follows:

Spa coal advances	\$98,000,000
Allied occupation costs	602,250,000
American troops, cost (estimated)	300,000,000
	<u>\$1,000,250,000</u>

The total net receipts from Germany on the above date were thus only \$894,250,000 gold, this after allowing credit for rolling stock, ships, coal, timber and assets in ceded territories like a part of Schleswig-Holstein.

The arrangements made with Germany during 1922, whether fulfilled by her or not, terminated with that year. On 15 Jan. 1923, the terms of May 1921 were resumed and Germany thus became liable once more for her quarterly instalment of \$500,000,000, that is for \$125,000,000, with whatever sum had accrued as a 26 percentage on her exports. This was the situation which created the crisis in January 1923. An illustration of the futility of the matter was furnished to the British House of Commons in January 1922 when it was stated that Britain had then received from Germany £46,647,615 and had spent on her Army of Occupation £53,000,000.

While the struggle over Reparations was developing, the economy of Europe was profoundly disturbed. The exchanges were completely upset, the German mark, the Russian ruble and the Austrian crown falling to values which became negligible. With the exception of Britain, no country, save some of the smaller neutrals, was attempting to balance its budget and there were vast issues, in one form or another, of paper money. From the United States, Europe had borrowed, with accrued interest, about \$11,000,000,000, to which had to be added about \$4,000,000,000 of commercial credits. The British government alone was willing and able to offer payment. With currency disorganized, with tariffs subdividing the continent into minute industrial areas, with Russia politically segregated and with Germany sullenly resisting financial demands which, in the opinion of all bankers in every nation, had no meaning save as pretexts for possible war, it was hopeless to attempt to float loans for the reconstruction of the Old World. On Britain, dependent as she is on foreign trade and shipping, the paralysis of Europe bore hardly. The number of her unemployed was nearer 2,000,000 than one and is still nearly 1,500,000.

When, therefore, the year 1922 opened, David Lloyd George, as Prime Minister, was engaged with feverish energy on what proved to be his final attempt to reconcile Europe with herself. Personally, M. Briand, the French Prime Minister, was sympathetic, but a powerful section in France, led by M. Poincaré, was profoundly suspicious. On 21 Dec. 1921, Lloyd George and

Briand conferred in London. A week later, there was a meeting in Paris between French and British financiers, led by Louis Loucheur, French Minister of Reconstruction, and Sir Laming Worthington Evans, British Secretary of State for War. At this meeting, it was proposed to found an international corporation to finance the reconstruction of Europe, with a capital of \$100,000,000, to be shared equally by Great Britain, France, Germany and, if she consented, the United States. No such corporation was, in fact, established.

On 6 Jan. 1922, the Allied Supreme Council met at Cannes. The Prime Ministers of Great Britain, France, Italy and Belgium attended, with the Ambassador of Japan at Paris. Ambassador Harvey "observed" for the United States. The Reparations Commission and many officials also attended.

The Council unanimously agreed to call an economic and financial conference of the powers. Germany, Austria, Hungary, Bulgaria and Russia were to be among those invited. Wherever possible, Prime Ministers themselves should attend, so that rapid decisions might be reached. Summarized, the principles to be accepted at the Conference were to be:

(1) Each country has the right to choose for itself its own *régime* of property, its economy and its government. (This meant, of course, that Russian Communism was not challenged, as applied by Russians to themselves.)

(2) Foreigners cannot place capital in a country unless their property be respected and the fruits of their enterprise be assured.

(3) National and municipal debts must be recognised, therefore, and foreign interests indemnified for confiscation of property. There must be legal and juristic punishment and the impartial execution of all commercial and other contracts.

(4) Convenient means of exchange should be made available.

(5) Nations must "abstain from all propaganda which is subversive of the political system established in other countries."

(6) Nations ought to take a common engagement to abstain from all aggression on their neighbors.

On 10 January, the text of an Anglo-French Alliance was provisionally agreed upon. After reference to the two invasions suffered by France within living memory, to the cost of repelling the latest of these invasions, and to the consideration that guarantees for the security of France are indispensable for the restoration of the stability of Europe, the security of Great Britain and the peace of the world, the draft treaty in Article I stated: "In case of direct and unprovoked aggression against the Territory of France by Germany, Great Britain will place herself immediately at the side of France with her naval, military or air forces."

By Articles II and III, Great Britain undertook to resist, with France, any violation by Germany of the military and naval safeguards of the Treaty of Versailles. The alliance was to be renewable for 10 years but was to impose no obligation on the British Dominions (other than Britain) "unless or until approved by the Dominion which is interested."

At this stage of the Cannes Conference,

M. Briand was summoned to Paris where, owing to criticism, he found it necessary to resign office; M. Poincaré, the chief of the critics, became Prime Minister. He held that the British alliance was useless without a Military Convention and the Alliance was thus declined by France.

On 25 Feb. 1922, Lloyd George met Poincaré at Boulogne. The conditions under which, with obvious reluctance, France would send delegates to Genoa to meet the Germans and Russians were laid down — namely, no change in Reparations and the Treaty of Versailles and no repudiation of Russia's debt to France. Moreover — as at the Washington Conference — France objected to any discussion of disarmament — meaning thereby particularly disarmament on land.

On 10 April 1922, the Genoa Conference met. Thirty-three nations were represented, including Ireland, which country was thus for the first time recognized in such diplomacy. The United States authorized Richard Washburn Child, the Ambassador at Rome, to act as unofficial observer. Prime Minister Facta of Italy presided. "There are no longer enemies and friends," said he, in his address of welcome, "there are neither victors nor vanquished." Lloyd George then condemned the "snarling" which still went on in Europe and expressed the hope that as Genoa had helped Europe to discover America, so might Genoa help America to discover Europe.

M. Barthou for France said, "We have come here to act. Europe is strewn with ruins . . . The French delegation will speak no word of hatred. It does not wish anyone humiliated." When, however, Tchitcherin, for Russia, proposed disarmament, Barthou immediately objected.

On 17 April amid complicated and, as they proved, fruitless discussions of finance and commerce, it was suddenly announced that, at Rapallo, Russia and Germany had concluded a Treaty, establishing diplomatic and consular relations and mutually renouncing war claims, the one country against the other. This Treaty was resented, particularly in France, as a breach of faith with the Conference. It was suspected that behind it lay a secret military convention. It is fair to add, however, that the principle of surrendering war claims and cancelling international debts with a view to promoting the trade and prosperity of Europe was one which many statesmen and nearly all bankers wished to see applied, not to Russia and Germany alone but to the whole of Europe. Moreover, on 24 May, Italy also negotiated with Russia a commercial treaty.

The Genoa Conference failed. When asked to recognize her foreign obligations, Russia entered enormous counter-claims in respect of the war itself, and of the campaigns against her waged by Kolchak, Denikin and Wrangel, with the alleged assistance of the Allies. She further contended that after her revolution in the 18th century, France herself had repudiated two-thirds of her debt. On these lines, however dialectically adroit, it was obvious that the discussion was useless. To save the face of the Conference, it was arranged that, in June, the Russian situation should be discussed again by ex-

perts at The Hague, but from these later negotiations, nothing substantial resulted.

The lesson of Genoa was plain. To attempt to reconstruct Europe without limiting armaments, surrendering reparations and writing off international debts which would and could never be paid, was not business. The Soviet delegates doubtless used wild and whirling words, often intended deliberately to provoke "the bourgeoisie" abroad and delight the Bolsheviks at home, but if they had been sweet reason itself, they could not have solved a problem, rendered insoluble by anterior conditions.

In May, the Germans suggested that, if they had a loan, they might be able to meet their obligations under the Treaty of Versailles. The Commission, therefore, invited a committee of international bankers to meet in Paris. The committee included J. Pierpont Morgan, the New York banker. With regard to certain conditions—that she balance her budget by new taxation, recover capital that had been exported and accept Allied supervision of her finances,—Germany was entirely amenable. But it was plain to the Bankers' Committee that no loan of, say, \$1,000,000,000 was possible unless the total fixed for reparations was reduced. The whole of 6-7 June was devoted by the Reparations Commission to a bitter fight in which Sir John Bradbury, for Britain, carried Belgium, Italy, and Roland W. Boyden, the American observer, against France on a resolution that the bankers be permitted to discuss a reduction of reparations and report freely upon it. The bankers, therefore, declared that "the resumption of normal conditions of trade between countries and the stabilization of the exchanges are impossible without the definite settlement of the reparation payments." In conformity with the attitude of his government, M. Sergent, the French banker, refused to sign the report. With France thus dissenting, the idea of granting financial aid to Germany was abandoned and while it was revived in December, when Pierpont Morgan saw President Harding and the German Ambassador at Washington, the same insuperable objection was encountered. France was still unwilling to allow the total of reparations to be discussed.

The bearing of reparations on European finance as a whole is further explained in the section, dealing with European debts.

PHILIP WHITWELL WILSON.

RESEARCH COUNCIL, National. See NATIONAL RESEARCH COUNCIL.

REUNION, or BOURBON, an island possession of France, about 420 miles east of Madagascar. It has an area of 970 square miles and in 1921 had a population of 173,190, including 167,947 Europeans, of whom 167,789 were of French origin, 2,194 British Indians, 1,052 Chinese, 885 Africans, 709 Arabians, and 403 natives of Madagascar. Chief towns are: St. Pierre, 27,895; St. Denis, 21,538; St. Paul, 19,456; St. Louis, 14,803. Chief products are: sugar, rum, coffee, manioc, tapioca, vanilla and spices. Rice and grain are the chief imports. Total value of exports in 1920: 88,980,113 francs; of imports, 53,541,861 francs. There are 80 miles of railway. The yearly budget is

balanced at about 12,000,000 francs. The island is administered by a Governor, assisted by a Privy Council and an elective Council General. In the French Legislature the island is represented by one Senator and two Deputies. The chief port of the island is Pointe-de-Galets, which has rail connection with St. Pierre. There are 16,731 pupils in the primary schools and 327 in the Lycee.

RHODE ISLAND, one of the original 13 States and the smallest in the Union. It is situated in New England and bounded on the north and east by Massachusetts, south by the Atlantic Ocean, and west by Connecticut. Its area is 1,248 square miles, of which only 1,060 square miles is land. In 1920 its population was 604,397. It is 48th in order of size and 38th in order of population. Its population of 566.4 persons to the square mile makes it the most densely populated State of the Union. In 1920 the population included 593,980 whites, 10,036 negroes, and 381 Asiatics and Indians. The same year the foreign-born residents of the State numbered 173,499, of whom 28,887 were French Canadians, 32,241 Italians, 7,525 English Canadians, 5,692 natives of Scotland and 3,126 Germans. The chief cities, with their populations in 1920, are: Providence, the capital, 237,595; Pawtucket, 64,248; Woonsocket, 43,496; Newport, 30,255; West Warwick, 15,461; Central Falls, 24,174; Cranston, 29,407, and East Providence, 21,793. The urban population is 97½ per cent of the total.

Religion.—The principal Christian denominations have an aggregate membership of 344,060, of whom 261,312 are Roman Catholics, 20,176 Episcopalians, 18,771 Baptists, 10,531 Congregationalists, 7,801 Methodists and 2,205 Presbyterians.

Education.—In 1922 the State appropriation for education was \$788,816. In that year there were 2,971 teachers in the public schools of the State and 96,358 pupils. There are 163 high schools with 383 teachers and 9,119 pupils. For higher education there is a State College of Education and Agricultural and Mechanical Arts College. Brown University at Providence is one of the well-known institutions of higher learning in the country.

Finances.—At the beginning of the fiscal year 1922 the balance on hand amounted to \$1,422,911.81. Receipts during the ensuing year was \$7,174,524.67. Disbursements for the same period amounted to \$6,803,367.98, leaving a balance on hand at the beginning of the fiscal year 1922-23 amounting to \$1,794,068.50. For the current fiscal year the estimated receipts amount to \$5,280,203, while authorized expenditures for the same period aggregate \$6,497,709.96. The bonded debt of the State in 1922 amounted to \$11,527,000. The assessed value of real property in 1922 was \$642,139,076; of personal property, \$405,251,141.

Production and Industry.—The census of 1920 reported 4,083 farms with an area of 331,600 acres and a total value of all farm property of \$33,636,766. The chief crops, with their acreage, yield and value, for the year 1922 were: corn, 14,000 acres, 560,000 bushels, \$672,000; oats, 1,000 acres, 31,000 bushels, \$19,-

000; tame hay, 45,000 acres, 54,000 tons, \$1,431,000; potatoes, 3,000 acres, 270,000 bushels, \$243,000; apples, 200,000 bushels; peaches, 28,000 bushels, and pears, 12,000 bushels. On 1 Jan. 1923 there were in the State 6,000 horses, valued at \$798,000; 27,000 milk cows, valued at \$2,268,000; 7,000 other cattle, valued at \$211,000; 3,000 sheep, valued at \$24,000, and 12,000 swine, valued at \$217,000. In 1920 there were 2,466 industrial establishments giving employment to 156,012 persons and paying \$168,509,358 in wages and salaries, using raw materials to the value of \$415,989,203 and turning out products to the value of \$747,323,000. Rhode Island is fifth among the States in the production of cotton textiles, third in woollens and sixth in silks and silk goods, and 15th in hosiery and knit goods. Other important manufactures are rubber and elastic goods, jewelry and electrical supplies. Providence, Woonsocket and Pawtucket are the principal industrial centres. The cotton mills of the State have nearly 3,000,000 spindles. The State also supplies quantities of graphite, building stone and lime.

Communications.—There is a large coastwise and foreign traffic, with Providence as the principal port. There are 214 miles of steam railways in the State and 331 miles of electric railways. There are 365 miles of improved State highways, built at a cost of \$6,872,596.80. Newport is one of the most famous resorts in the East and has been socially prominent for nearly two generations.

Government.—The State executive is a Governor, who is elected for two years and receives a salary of \$8,000. The official name of the State is the State of Rhode Island and Providence Plantations. The legislative power is vested in the General Assembly, composed of a Senate of 39 members and a House of Representatives of 100 members. The State sends two Senators and 3 Representatives to the Federal Congress. It is subdivided into five counties and 39 cities and towns.

Legal Holidays.—1 January; 22 February; Arbor Day (second Friday in May); Memorial Day; 4 July; First Monday in September; 12 October; General Election Day; 11 November (Armistice Day); Thanksgiving Day, and 25 December.

Charities and Corrections.—The principal State institutions with the number of inmates in 1922 were: State Hospital for Mental Diseases, 1402; State Prison and Providence County Jail, prison 360, jail 150, total 510; State Infirmary, 617; State Workhouse and House of Correction, 145; Sockanosset School for Boys, 189; Oaklawn School for Girls, 45; State Home and School, 148, and Exeter School for Feeble Minded, 369.

State Officials.—The State officials for 1922 were: Governor, Emery J. San Souci; Lieutenant-Governor, Harold J. Gross; Secretary of State, J. Fred Parker; Attorney-General, Herbert A. Rice; Auditor, Philip H. Wilbour; Treasurer, Richard W. Jennings; and Commissioner of Education, Walter E. Ranger. The State officials in 1923 are: Governor, William S. Flynn; Lieutenant-Governor, Felix A. Toupin; Secretary of State, J. Fred Parker; Attorney-General, Herbert L. Carpenter; Auditor,

Philip W. Wilbour; Treasurer, Adolphus C. Knowles; and Superintendent of Education, Walter E. Ranger.

Judiciary.—Members of Supreme Court: Chief Justice, William H. Sweetland; Associate Justices, Walter B. Vincent, Charles F. Stearns, Elmer J. Rathbun and John W. Sweeney.

RHODE ISLAND STATE COLLEGE, a co-educational institution, founded in 1892 and located at Kingston, R. I. In 1922-23 it had a faculty of 39 members, 380 students, property valued at \$950,000 and an income of \$350,000. Howard Edwards, LL.D., is president.

RHODES SCHOLARSHIPS, the system of scholarships founded by the will of Cecil John Rhodes, which provided in perpetuity for the support at Oxford University, for a term of three years each, of selected scholars from the British Colonies, the United States and Germany.

Thirty-two Rhodes scholars are appointed from the United States each year. A scholarship is tenable for three years and carries with it a stipend of £350 a year. The selection is made on the three-fold basis of (1) character and personality, (2) scholastic ability, and (3) physical vigor whether shown by participation in outdoor sports or in other ways. The 32 appointments from the United States for 1922 were announced 4 Dec. 1922 by Frank Aydelotte, President of Swarthmore College and American Secretary to the Rhodes Trustees.

With regard to the scholarships for the academic year 1921-22 the following statement was issued by the Rhodes Trust: "During the year 72 Rhodes Scholars took up their scholarships for the first time. The number of scholars actually in residence for either the whole or some part of the academic year 1921-22 was 300, namely, 156 from the British Empire and 144 from the United States of America.

There were also in residence for one or more terms nine ex-scholars. In the course of the year 87 scholars either completed the term of the scholarship or went out of residence without completing it. The academic year 1922-23 starts with 262 Rhodes scholars in residence. In addition, there will be in residence seven ex-scholars.

Sir George Parkin, the first organizing secretary of the Rhodes scholarships, died in London on 25 June, to the deep regret of the trustees and of successive generations of Rhodes scholars. The deaths of the following Rhodes scholars have also been reported during the year: W. I. Perrott, Rondebosch, 1906; McD. K. McLean, Texas, 1910. Mr. Perrott, who was a certified accountant in Cape Town, died in June this year. Mr. McLean, who was a professional medical practitioner, had been fighting tuberculosis for some years. He died in Ashville, North Carolina, in September.

The following academic distinctions at Oxford were gained: F. C. Flint (Oregon, 1919), Chancellor's Prize for an English Essay; J. F. Mills (Jamaica, 1919), Theodore Williams Scholarship in Pathology; J. A. Weir (Saskatchewan, 1914), Scholarship for the Promotion of Legal Studies; H. L. Bröse (South Australia, 1913), Lecturer for the Wykeham

Professor of Physics in Trinity Term; W. M. Jones (New Zealand), Wykeham Professor of Physics; A. O. Ponder (New Zealand, 1917), Lecturer in Chemistry at Balliol College; T. S. Wilder (U. S. A., 1919), Demonstrator for the Professor of Pharmacology in Hilary Term; C. A. W. Manning (Rondebosch, 1914), Senior Hulme Scholarship at Brasenose College; R. P. Hamilton (U. S. A., 1919), Boulter Law Exhibition at Christ Church (halved); T. K. Penniman (Vermont, 1917), Commons' Exhibition in Literae Humaniores at Trinity College; R. M. Carson (Michigan, 1918), President of the Oxford Union Society for the Summer Term.

During the year 91 scholars proceeded to degrees for which they were qualified; and 32 scholars were admitted to read for advanced degrees, as follows: Ph.D., 8; B.Sc., 5; B.Litt., 19. In various branches of athletics 23 scholars represented Oxford against Cambridge. Notice was received during the year of 17 books published by ten Rhodes scholars.

Appointments to the 1924 scholarships will be made during the year 1923, and the scholars then elected will enter into residence in October 1924. The value of the scholarship has been increased for the present by the addition of an annual bonus of £50. Even with this addition, however, the scholarship is not sufficient to cover the expenses of a full year, including vacations, and the holder of a scholarship must be prepared to supplement it by about £50 a year."

RHODESIA, a British South African possession bounded north by the Congo Free State, east by Portuguese territory and the British Central Africa Protectorate, south by Bechuanaland and the Transvaal and west by the Congo State, Portuguese West Africa and Bechuanaland. Its total area is 440,000 square miles and in 1921 the population included 33,621 Europeans, 845,593 natives and 3,247 colored, Asiatics, etc. The Zambesi River divides the region into two parts; Southern and Northern Rhodesia. Southern Rhodesia includes Matabeleland and Mashonaland, has an area of 149,000 square miles and its capital at Salisbury. Northern Rhodesia has an area of 291,000 square miles and is divided in two parts Northeastern and Northwestern Rhodesia, the capital, of the former at Fort Jameson and that of the latter at Lialui. Rhodesia has 2,468 miles of railways. There are separate schools for Europeans and for natives. The European pupils number 5,149 in 77 public, 4 aided and 28 private schools.

The mineral activities of the country are very diversified in character, and the output is steadily increasing in value, the gold industry being by far the most profitable. The grand total value of mineral production up to the end of 1921 was nearly £61,000,000, the most important contributors being the following:

Gold.....	£51,501,615
Chrome iron.....	2,301,521
Asbestos.....	2,187,163
Copper.....	2,094,661
Coal (sales).....	2,094,016

Other minerals produced include diamonds, silver, lead, tin and mica. The average annual

value of the gold output for the last six years is £3,136,045, the figures for 1921 being £3,217,274. Upward of 36,000 natives are now employed in the mines.

The most important exports of the country, other than minerals already referred to, are the products of agricultural and pastoral pursuits, and include maize and maize meal, kaffir corn, tobacco, fruit, slaughtered cattle, hides and skins, etc. The pastoral industries of Rhodesia are very valuable assets, showing considerable expansion in recent years.

The following table shows the total value of the imports and exports of Southern Rhodesia for the last five years:

	Imports	Exports
1917.....	£2,515,243	£4,832,488
1918.....	3,021,579	4,205,438
1919.....	3,254,462	4,473,231
1920.....	5,262,318	5,752,858
1921.....	5,243,123	4,815,155

Imports from and exports to the Union during 1921 were valued at £1,049,859 and £447,725 respectively so that the total volume of trade between Southern Rhodesia and the Union amounted to £1,527,584, about 15.18 per cent of the entire trade of the former.

Until 1922 Rhodesia constituted a British Protectorate under the administration of the British South Africa Company, whose charter dated from 1889. In 1922 the inhabitants were called on to decide by referendum as to the future constitutional status of their country, alternative proposals being a system of responsible government or the entry into the Union of South Africa as the fifth province of that union. Results of the referendum showed a majority of 2,785 in favor of responsible government and against inclusion in the Union of South Africa. Preparations were made at once for the annexation of Rhodesia to the British Dominions by the appointment of a governor and the issuance of letters-patent granting a self-governing constitution.

RICE. The United States in 1922, according to the final report of the Department of Agriculture, produced 41,965,000 bushels of rice, valued, according to the 1 December prices, at \$39,178,000, as compared with 37,612,000 bushels valued at \$35,802,000 produced in 1921, and 52,035,000 bushels, valued at \$62,946,000, produced in 1920. The acreage for the three years was 1,055,000 in 1922, 921,000 in 1921 and 1,335,000 in 1920. Louisiana led in production in 1922 with a total yield of 19,980,000 bushels. Production in bushels in other States was: California, 8,260,000; Arkansas, 7,392,000; Texas, 5,959,000; South Carolina, 208,000; Florida, 75,000; Georgia, 72,000; Mississippi, 19,000.

RICHMOND, University of, a Baptist educational institution, founded in 1832 and located at Richmond, Va. In 1922-23 it had a faculty of 46 members, 816 students with 163 additional in summer school, property valued at \$3,450,000 and an income of \$230,000. Frederick William Boatwright, LL.D., is president.

RICKETS. Medical opinion on this subject has been evolving rapidly. It used to be as-

sumed that the faulty growth of the bones in rickets was the result of lime salts, which is associated with soft-water supplies. This theory was found not to be in accordance with the facts, and it was then supposed that the lack of lime salts and phosphates was due to errors in diet. Careful experiments, however, showed that this theory also was untenable. With the discovery of vitamins or accessory food factors it was recently held that rickets could be classified with scurvy and beri-beri as a deficiency disease due to the absence of the fat soluble vitamin from the diet. Professor Mellanby, in particular, demonstrated that rickets could be produced in growing animals by a diet deficient in this essential element, and that healing took place rapidly when cod liver oil or some other food rich in the vitamin was added to the food.

More recently it has been suggested that the essential factors are not dietetic, but that the production of rickets depends on want of exercise and fresh air. Finally, it has been held by Hess and other workers that the actinic or ultra-violet rays of light control the development of bone, that darkness can determine the production of rickets, and that either sunshine or artificially produced ultra-violet rays can prevent or cure the condition.

In reviewing these various theories before the Diseases of Children section of the British Medical Association Congress Dr. Findlay of the Glasgow Royal Hospital for Sick Children, said that the broad fact remains that rickets in Great Britain and in America is a disease of the poor, although it has been shown by Dr. Hutchinson that in certain parts of India the reverse is the case, since the children of the wealthy, owing to the purdah system, are kept in close, dark dwellings. Dr. Findlay said that in spite of experimental work which appeared to confirm the effects of sunlight, there were difficulties in accepting it as the determining factor. At his hospital better results were obtained by keeping the children in the city and carrying out massage than by sending them to their country branch, where there was undoubtedly a greater abundance of sunlight. The complete absence of rickets in Iceland, where for four months in the year the sun never rises, is also against the theory. The fact, too, that rickets is as prevalent in Vienna as it is in Glasgow, though the former city has double the number of hours of sunshine per annum, led him to the opinion that the absence of sunshine, by producing lethargy, reduced the amount of exercise, and was thus a contributory factor in the causation of the disease.

He concluded that the causation of rickets is associated with confinement, and that whether it was due to want of fresh air, lack of exercise, or the absence of the sun's rays, or because bad hygiene in general favors the development of some virus, it is at present impossible to say. Professor Mellanby, who is universally regarded as the leading British authority on vitamins and dietetics generally, explained that his attitude in this matter had been somewhat misrepresented. He had never written of rickets as a disease uninfluenced by environment. He maintained, however, that

diet was the most important factor, and that environment apart from diet was of secondary importance. Following a somewhat technical explanation of the result of his recent researches on diet, he pointed out that normally the direct action of sunlight was impeded by the effect of clothes and the practice of shading the face of the child, the only exposed part of the skin, from direct sunlight. Even the passage of light through window glass cut off the actinic rays so that the effect of sunlight on a child during its first year must be very small. If it were argued that this was the cause of the prevalence of rickets, how were we to explain the absence of the disease among the Eskimos? His conclusions were as follows:

That when a child is well fed the presence or absence of sunlight makes no difference as far as rickets is concerned.

That in the case of a child fed on a mediocre or borderline diet, exposure of the skin to sunlight will probably prevent rickets; and

That in the case of badly-fed children sunlight will not prevent rickets, but may ameliorate the symptoms to some extent.

Dr. Hutchinson of Glasgow, observed that diet was the only factor the physician could control, and experience showed that by proper regulation of this he could cure the condition. In February announcement was made that cod liver oil is a cure for rickets, the bone disease that has caused deformities of children for ages, according to Dr. E. A. Park and Dr. John Howland of the Johns Hopkins Hospital staff, who have made exhaustive X-ray studies over a long period at the Harriet Lane Home and in the department of pediatrics. Dr. Mary S. Smith made the X-ray records upon which this final and emphatic conclusion has been based.

RIFLE-SHOOTING. The season of 1922 was one of the greatest in the history of this sport from the standpoint of American marksmanship. Not only did the United States teams win the international team and individual championships with the .30-calibre rifle at Milan, Italy, but in the Allied armies' rifle championships at Coblenz the Americans defeated the British, French and Belgians, and, in the international small bore, .22 calibre event, America defeated Great Britain.

The Swiss gave America its toughest opposition in the international matches, the United States shooters winning by 12 points, 5,132 to 5,120. Walter Stokes of Washington, D. C., won the individual championship from Lynhard of Switzerland by two points, 1,067 to 1,065. For 20 years the Swiss dominated the .30 calibre championships until the United States entered in 1920. In 1923 these matches will be shot in this country and tryouts for the American team will be held in no less than a dozen cities.

In the Allied armies' match the British shooters scored 400 points to 510 for America. The others were nowhere. In the small-bore championships the United States won for the sixth time in succession. Rifle shooting has attained great popularity. Even with the restricted number of entries at Camp Perry,

Ohio, where the national matches were held 2-28 Sept. 1922, 800,000 rounds of .30-calibre ammunition were used as well as 96,000 shells.

RIO GRANDE COLLEGE, a Baptist co-educational institution, founded in 1876 and located at Rio Grande, Ohio. It has a faculty of 13 members and in 1921-22 had a student enrollment of 517. The institution's property is valued at \$200,000 and its income is \$25,000. Simeon H. Bing, A.M., is president.

RIPON COLLEGE, a non-sectarian co-educational institution, founded in 1851 and located at Ripon, Wis. In 1922-23 it had a faculty of 29 members, 415 students, property valued at \$481,066.77 and an income of \$197,493.28. Silas Evans, D.D., LL.D., is president.

RIVERS AND HARBORS, Federal Appropriation for the improvement of. Under the War Department Appropriation Act of 30 June 1922, the Congress of the United States appropriated the lump sum of \$42,815,661 for the maintenance and improvement of existing river and harbor works during the fiscal year 1922-23. In addition \$325,000 was appropriated for examinations, surveys and contingencies; \$6,670,000 for Mississippi River flood control; \$400,000 for Sacramento River flood control; \$7,500,000 for Dam No. 2 on the Tennessee River at Muscle Shoals; \$15,000 for the expenses of the California Debris Commission, and \$109,260 for prevention of obstructive and injurious deposits within the harbor and adjacent waters of New York City. Under the law, the Chief of Engineers of the United States Army allots out of the general or lump-sum appropriation the amount to be expended upon each particular improvement. Holding in reserve approximately \$6,000,000 for contingencies, the chief of engineers allotted the 1922-23 appropriation as follows:

ALLOTMENTS FOR RIVERS AND HARBORS UNDER ACT OF 30 JUNE 1922.

Boston Harbor, Mass.	\$40,000
Pollock Rip Shoals, Nantucket Sound, Mass.	115,000
Pawtucket (Seekonk) River, R. I.	90,000
Connecticut River below Hartford, Conn.	45,000
New Haven Harbor, Conn.	21,000
Milford Harbor, Conn.	9,000
Bridgeport Harbor, Conn.	70,000
Port Chester Harbor, N. Y.	30,000
East Chester Creek, N. Y.	18,000
Westchester Creek, N. Y.	12,000
Mattituck Harbor, N. Y.	10,000
New York Harbor: Ambrose, Main Ship, Bay-side, and Gedney Channels, including Anchorage Channel and Craven Shoal, and channel between Staten Island and Hoffman and Swinburne Islands, N. Y.	350,000
Coney Island Channel, N. Y.	5,000
East River, N. Y.	2,000,000
Newtown Creek, N. Y.	80,000
Hudson River Channel, N. Y.	350,000
Rondout Harbor, N. Y.	2,500
Hudson River, N. Y.	380,000
Plattsburg Harbor, N. Y.	1,000
Narrows of Lake Champlain, N. Y. and Vt.	40,000
Woodbridge Creek, N. J.	6,000
Raritan Bay, N. J.	30,000
Raritan River, N. J.	20,000
Shoal Harbor and Compton Creek, N. J.	15,000
Shrewsbury River, N. J.	10,000
Delaware River, between Philadelphia, Pa., and Trenton, N. J.	25,000
Delaware River, Pa., N. J., and Del., Philadelphia, Pa., to the sea.	3,000,000
Delaware River at Camden, N. J.	100,000
Ice Harbor at Marcus Hook, Pa.	1,000
Abasco Inlet, N. J.	50,000
Tuckerton Creek, N. J.	10,000

Wilmington Harbor, Del.	\$125,000
Inland Waterway, from Delaware River to Chesapeake Bay, Del. and Md.	2,500,000
Smyrna River, Del.	53,000
St. Jones River, Del.	30,000
Broadkill River, Del.	15,000
Waterway on the coast of Virginia.	4,000
Cold Spring Inlet, N. J.	50,000
Baltimore Harbor and Channels, Md.	300,000
Potomac River at Washington, D. C.	33,000
Rappahannock River, Va.	21,600
Mattaponi River, Va.	3,350
Pamunkey River, Va.	3,600
Thimble Shoals Channel, Va.	300,000
Appomattox River, Va.	25,000
Pagan River, Va.	25,000
Nansemond River, Va.	20,000
Inland Waterway from Norfolk, Va., to Beaufort Inlet, N. C.	240,000
Norfolk Harbor, Va.	300,000
Scuppernon River, N. C.	15,000
Pamlico and Tar Rivers, N. C.	17,000
Neuse River, N. C.	12,000
Swift Creek, N. C.	800
Contentnea Creek, N. C.	1,600
Trent River, N. C.	2,500
Harbor at Beaufort, N. C.	24,000
Waterway connecting Core Sound and Beaufort Harbor, N. C.	2,500
Inland Waterway, Beaufort to Jacksonville, N. C.	20,000
Cape Fear River at and below Wilmington, N. C.	200,000
Cape Fear River, N. C., above Wilmington.	15,000
Northeast (Cape Fear) River, N. C.	3,000
Black River, N. C.	2,000
Winyah Bay, S. C.	20,000
Santee River and Estherville-Minim Creek, Canal, S. C.	8,000
Waterway from Charleston to Winyah Bay, S. C.	10,000
Savannah Harbor, Ga.	900,000
Savannah River below Augusta, Ga.	10,000
Savannah River at Augusta, Ga.	2,000
Savannah River above Augusta, Ga.	2,000
Waterway between Beaufort, S. C., and St. Johns River, Fla.	55,000
Sapelo Harbor, Ga.	12,000
Darien Harbor, Ga.	8,000
Fancy Bluff Creek, Ga.	1,200
Satilla River, Ga.	2,000
St. Marys River, Ga. and Fla.	12,000
Altamaha River, Ga.	8,000
Oconee River, Ga.	19,000
Ocmulgee River, Ga.	15,000
Brunswick Harbor, Ga.	200,000
Fernandina Harbor, Fla., and Cumberland Sound, Ga. and Fla.	6,000
St. Johns River, Fla., Jacksonville to the Ocean.	450,000
St. Johns River, Fla., Jacksonville to Palatka.	30,000
St. Johns River, Fla., Palatka to Lake Harney.	50,000
Indian River, Fla.	10,000
Miami Harbor (Biscayne Bay), Fla.	40,000
Key West Harbor, Fla.	50,000
Kissimmee River, Fla.	10,000
Caloosahatchee River, Fla.	25,500
Clearwater Harbor and Boca Ceiga Bay, Fla.	14,000
Anclote River, Fla.	5,000
Tampa and Hillsboro Bays, Fla.	250,000
Removing the water hyacinth from navigable waters in the State of Florida.	10,000
Apalachicola Bay, Fla.	15,000
Apalachicola River, Fla., the cut-off, Lee Slough, and lower Chipola River.	5,000
Upper Chipola River, Fla., from Marianna to its mouth.	10,000
Flint River, Ga.	10,000
Chattahoochee River, Ga., and Ala.	122,000
Channel from Apalachicola River to St. Andrews Bay, Fla.	47,000
St. Andrews Bay, Fla.	50,000
Choctawhatchee River, Fla. and Ala.	9,000
Narrows in Santa Rosa Sound, Fla.	7,000
Pensacola Harbor, Fla.	20,000
Alabama River, Ala.	75,000
Mobile Harbor, Ala.	300,000
Black Warrior, Warrior, and Tombigbee Rivers, Ala.	52,000
Tombigbee River from mouth to Demopolis (maintenance of channel).	32,700
Tombigbee River from Demopolis, Ala., to Walkers Bridge, Miss.	2,000
Pascagoula Harbor, Miss.	25,000
Gulfport Harbor and Ship Island Pass, Miss.	100,000
Pascagoula River, Miss.	4,000
Biloxi Harbor, Miss.	10,000

RIVERS AND HARBORS

Channel between Mobile Bay and Mississippi Sound, Ala.	\$20,000	Sturgeon Bay and Lake Michigan Ship Canal, Wis.	\$38,000
Southwest Pass, Mississippi River, La.	2,000,000	Algoma Harbor, Wis.	6,500
South Pass Channel, Mississippi River, La. (maintenance).	600,000	Kewaunee Harbor, Wis.	30,000
Bayou Plaquemine, Grand River and Pigeon Bayous, La.	20,000	Two Rivers Harbor, Wis.	5,500
Bayou Grossetete, La.	5,000	Manitowoc Harbor, Wis.	3,500
Bayou Teche, La.	50,000	Sheboygan Harbor, Wis.	14,000
Bayou Queue de Tortue, La.	20,000	Port Washington Harbor, Wis.	6,000
Calcasieu River and Pass, La.	15,000	Milwaukee Harbor, Wis.	155,500
Removing the water hyacinth, La. (including Mobile District).	30,000	Racine Harbor, Wis.	150,000
Galveston Harbor, Tex.	90,000	Kenosha Harbor, Wis.	37,000
Galveston Channel, Tex.	150,000	Waukegan Harbor, Ill.	123,000
Channel from Galveston Harbor to Texas City, Tex.	100,000	St. Joseph Harbor, Mich.	10,500
Channel to Port Bolivar, Tex.	20,000	South Haven Harbor, Mich.	27,500
Houston Ship Channel, Tex.	750,000	Holland Harbor, Mich.	47,500
Double Bayou, Tex.	7,000	Grand Haven Harbor, Mich.	144,000
Anahuac Channel, Tex.	5,000	Grand River, Mich.	4,500
Mouth of Trinity River, Tex.	1,000	Muskegon Harbor, Mich.	65,000
Turtle Bayou, Tex.	10,000	Manistee Harbor, Mich.	12,000
Clear Creek, Tex.	4,000	Frankfort Harbor, Mich.	24,000
Dickinson Bayou, Tex.	5,000	Charlevoix Harbor, Mich.	1,000
Channel from Aransas Pass to Corpus Christi, Tex.	10,000	Chicago Harbor, Ill.	40,000
Freeport Harbor, Tex.	50,000	Chicago River, Ill.	20,000
Port Aransas, Tex.	200,000	Calumet Harbor, Ill.	100,000
Harbor at Sabine Pass and Port Arthur Canal, Tex.	150,000	Calumet River, Ill. and Ind.	40,000
Sabine-Neches Canal, including Sabine River to Orange and Neches River to Beaumont, Tex.	150,000	Indiana Harbor, Ind.	200,000
Johnsons Bayou, La.	3,000	Michigana City Harbor, Ind.	10,000
Cypress Bayou and waterway between Jefferson, Tex., and Shreveport, La.	61,000	Illinois River, Ill.	140,000
Red River below Fulton, Ark.	15,000	St. Marys River, Mich.	557,000
Ouachita and Black Rivers, Ark. and La.	345,000	St. Clair River, Mich.	80,000
Tensas River and Bayou Macon, La.	5,000	Detroit River, Mich.	1,000,000
Boeuf River, La.	5,000	Alpena Harbor, Mich.	5,000
Bayou Bartholomew, La. and Ark.	2,500	Black River, Mich.	5,000
Saline River, Ark.	2,000	Rouge River, Mich.	103,000
Bayous D'Arbonne and Corney, La.	2,000	Toledo Harbor, Ohio.	50,000
Yazoo River, Miss.	16,000	Port Clinton Harbor, Ohio.	1,000
Tallahatchie and Coldwater Rivers, Miss.	10,000	Sandusky Harbor, Ohio.	60,000
Big Sunflower River, Miss.	12,000	Huron Harbor, Ohio.	18,000
Arkansas River, Ark. and Okla.	28,000	Cleveland Harbor, Ohio.	5,000
White River, Ark.	23,000	Conneaut Harbor, Ohio.	10,000
Black River, Ark. and Mo.	17,000	Erie Harbor, Pa.	42,000
Current River, Ark. and Mo.	8,000	Dunkirk Harbor, N. Y.	50,000
St. Francis and L'Anguille Rivers and Blackfish Bayou, Ark.	5,000	Buffalo Harbor, N. Y.	500,000
White River at Augusta Narrows	14,000	Black Rock Channel and Tonawanda Harbor, N. Y.	40,000
Mississippi River between Ohio and Missouri Rivers	915,000	Charlotte Harbor, N. Y.	15,500
Removing snags and wrecks from the Mississippi below the mouth of the Missouri River, and from the Old and Atchafalaya Rivers.	25,000	Great Sodus Bay Harbor, N. Y.	12,000
Mississippi River between Missouri River and Minneapolis, Minn.	1,000,000	Little Sodus Bay Harbor, N. Y.	12,000
Mississippi and Leech Rivers, Minn.	25,000	Oswego Harbor, N. Y.	23,500
Missouri River, Kansas City to Mouth.	100,000	Cape Vincent Harbor, N. Y.	1,500
Missouri River, Kansas City, Mo., to Sioux City, Iowa.	25,000	Ogdensburg Harbor, N. Y.	4,000
Missouri River, Sioux City, Iowa, to Fort Benton, Mont.	20,000	Los Angeles Harbor, Calif.	500,000
Osage River, Mo.	15,000	Harbor at San Francisco, Calif.	10,000
Gasconade River, Mo.	4,000	Oakland Harbor, Calif.	100,000
Cumberland River, Tenn. and Ky., below Nashville.	425,000	Richmond Harbor, Calif.	100,000
Tennessee River below Riverton, Ala.	160,000	Petaluma Creek, Calif.	50,000
Tennessee River, Chattanooga to Riverton, except Browns Island to Florence.	150,000	Humboldt Harbor and Bay, Calif.	250,000
Tennessee River above Chattanooga.	20,000	San Joaquin River, Calif.	33,000
Construction of Locks and Dams on the Ohio River.	5,000,000	Stockton and Mormon Channels (Diverting Canal), Calif.	10,000
Ohio River (General open-channel work).	435,000	Mokelumne River, Calif.	800
Allegheny River, Pa., open-channel work.	5,000	Sacramento River, Calif.	95,000
Harbor at Grand Marais, Minn.	6,000	Treatment of the Yuba River debris situation — restraining barriers.	30,000
Harbor at Agate Bay, Minn.	3,000	Coos Bay, Oreg.	150,000
Harbor at Duluth, Minn., and Superior, Wis.	68,500	Coos River, Oreg.	3,000
Port Wing Harbor, Wis.	2,500	Yaquina Bay and Harbor, Oreg.	300,000
Harbor at Ashland, Wis.	12,000	Columbia River and tributaries above Celilo Falls to the mouth of Snake River, Oreg. and Wash.	12,500
Harbor at Ontonagon, Mich.	14,000	Snake River, Oreg., Wash. and Idaho.	10,000
Keweenaw Waterway, Mich.	125,500	Clatskanie River, Oreg.	6,200
Harbor of Refuge, Marquette Bay, Mich.	2,400	Willamette River above Portland, and Yamhill River, Oreg.	27,300
Harbor at Marquette, Mich.	90,000	Lewis River, Wash.	17,700
Harbor of Refuge at Grand Marais, Mich.	20,000	Cowlitz River, Wash.	11,000
Warroad Harbor and Warroad River, Minn.	20,600	Skamokawa Creek, Wash.	2,000
Zippel Bay, Lake of the Woods, Minn.	1,000	Grays River, Wash.	2,000
Baudette Harbor and River, Minn.	1,500	Columbia and Lower Willamette Rivers, below Vancouver, Wash., and Portland, Oreg.	850,000
Manistique Harbor, Mich.	5,000	Willapa River and Harbor, Wash.	265,000
Menominee Harbor and River, Mich. and Wis.	42,000	Grays Harbor and bar entrance, Wash.	36,000
Green Bay Harbor, Wis.	91,000	Puget Sound and its tributary waters, Wash.	30,000
Fox River, Wis.	100,000	Waterway connecting Port Townsend Bay and Oak Bay, Wash.	10,000
		Port Gamble Harbor, Wash.	500
		Lake Washington Ship Canal, Wash.	40,000
		Swinomish Slough, Wash.	5,000
		Bellingham Harbor, Wash.	4,000
		San Juan Harbor, P. R.	200,000
			\$35,604,250
		Subsequent Allotments:	
		Nome Harbor, Alaska.	4,000
		St. Jones River, Del.	14,000

The Rivers and Harbors appropriation for 1923-24 totalled \$56,589,000.

ROADS, PUBLIC, United States Bureau of. The Bureau of Public Roads is in the Department of Agriculture. Its most important work is the administration of the Federal aid road work and the construction of roads in the national forests. Its other activities include research in all phases of the design and construction of roads and economic investigations to determine their value and the service they render to the community. Its agricultural engineering branch conducts investigations and disseminates information with regard to the utilization of water for irrigation, the drainage of farm lands, the use of mechanical power on the farm, the water supply and sewerage of farm homes, the design and arrangement of farm buildings and their heating, lighting and ventilation, and other matters connected with agriculture which involve the employment of engineering knowledge.

The Bureau was created in 1893 under the name of the Office of Road Inquiry. Its first activities, which with some enlargement were its only functions until 1916, involved the investigation of the best methods of road design and construction and the dissemination of the results of its investigations by means of published reports and demonstrations in the form of object-lesson roads constructed for local

communities under the supervision of its engineers.

The passage of the Federal-Aid Road Act on 11 July 1916 added to its duties the supervision of Federal-aid road construction and the national forest road work and since that date its major activities have been administrative rather than educational, though the investigational and research work in connection with road-building materials, road design, administration and economics have been continued on an enlarged scale with important results.

The original Federal-aid road legislation provided an appropriation of \$75,000,000. Of this appropriation \$5,000,000, was made available for the fiscal year 1917, \$10,000,000 for the fiscal year 1918, and sums increasing by \$5,000,000 annually for the succeeding fiscal years up to 1921. In 1919 a second appropriation provided \$200,000,000 additional, \$50,000,000 of which was made available for the fiscal year 1919, and \$75,000,000 for each of the fiscal years 1920 and 1921.

The Federal Highway Act, approved 9 Nov. 1921 appropriated \$75,000,000 for the fiscal year 1922; and the Postoffice Appropriation Act for the fiscal year 1923 authorized the appropriation of \$50,000,000 for that year, and \$65,000,000 and \$75,000,000 respectively for the fiscal years 1924 and 1925. Of these amounts authorized only \$25,000,000 has been appropriated for the fiscal year 1923 and the agricultural appropriation

APPROPRIATIONS FOR FEDERAL-AID ROAD CONSTRUCTION.

FISCAL YEAR	By act of 11 July, 1916	By act of 28 Feb. 1919	By act of 9 Nov. 1921	By post office appropriation act for fiscal year 1923	Total
1917.....	\$5,000,000				\$5,000,000
1918.....	10,000,000				10,000,000
1919.....	15,000,000	\$50,000,000			65,000,000
1920.....	20,000,000	75,000,000			95,000,000
1921.....	25,000,000	75,000,000			100,000,000
1922.....			\$75,000,000		75,000,000
1923.....				\$50,000,000	50,000,000
1924.....				\$65,000,000	65,000,000
1925.....				\$75,000,000	75,000,000
1926.....					
Total.....	\$75,000,000	\$200,000,000	\$75,000,000	\$190,000,000	\$540,000,000

¹ \$50,000,000 authorized; \$25,000,000 since appropriated.

² \$65,000,000 authorized; \$29,300,000 since appropriated.

³ Authorized only; none yet appropriated.

APPROPRIATIONS FOR NATIONAL FOREST ROAD CONSTRUCTION.

FISCAL YEAR	By act of 11 July, 1916	By act of 28 Feb. 1919	By act of 9 Nov. 1921	By post office appropriation act for fiscal year 1923	Total
1917.....	\$1,000,000				\$1,000,000
1918.....	1,000,000				1,000,000
1919.....	1,000,000	\$3,000,000			4,000,000
1920.....	1,000,000	3,000,000			4,000,000
1921.....	1,000,000	3,000,000			4,000,000
1922.....	1,000,000		\$5,000,000		6,000,000
1923.....	1,000,000		10,000,000		11,000,000
1924.....	1,000,000			\$6,500,000	7,500,000
1925.....	1,000,000			\$6,500,000	7,500,000
1926.....	1,000,000				1,000,000
Total.....	\$10,000,000	\$9,000,000	\$15,000,000	\$13,000,000	\$47,000,000

¹ \$6,500,000 authorized; \$3,000,000 since appropriated.

² \$6,500,000 authorized; none yet appropriated.

bill, in the 67th Congress carried \$29,300,000 for 1924. None of the \$75,000,000 authorized for the fiscal year 1925 has yet been appropriated. In respect to these authorized amounts, however, though they have not yet been appropriated in full, the United States recognizes a contractual obligation in the whole amount and there is no doubt that the money will be appropriated as needed.

The funds appropriated for each year are apportioned among the States in proportion to their area, population and mileage of rural post roads and star routes, each factor having a weight of one-third.

The various acts referred to also made appropriations for the construction of roads in the national forests and the amounts for each fiscal year appropriated for this purpose and for Federal-aid road construction are shown in the preceding table.

Federal-Aid Road Construction.—The Federal-aid roads are built under the immediate supervision of the 48 State highway departments subject to the approval of the Bureau of Public Roads which acts for the Secretary of Agriculture. The procedure established by the original Federal-Aid Road Act remains unchanged in many respects though some important changes have been introduced by subsequent legislation, especially by the Federal Highway Act of 1921.

The most important change brought about by the Federal Highway Act was the provision for the selection of a connected system of roads upon which all future Federal funds will be expended. The selection of that system, known as the Federal-Aid Highway System is now nearing completion. It will consist of not more than 7 per cent of the total mileage of roads existing in the United States at the time of the passage of the act and will include more than 180,000 miles of the most important roads in the United States. Not more than three-sevenths of the system will be primary roads of interstate importance, the remainder being secondary or inter-county roads.

The selection of the system has been made in the first instance by the State highway departments, and the function of the Bureau is to see that the roads thus selected make the proper connections at State lines so that the system will be continuous for the United States as a whole as well as within each State. Until the various State systems are finally approved the construction of roads is being continued but only such roads as will form part of the system finally selected without reasonable doubt are being approved by the Bureau.

Projects for the improvement of particular parts of the system with Federal aid are initiated by the State highway departments. As the first step the State department submits to the Bureau a formal request for assistance, known as a project statement. This statement describes briefly the particular road to be improved in its relation to other roads, gives approximate information as to the present and probable future traffic and describes, in general terms, the character of improvement contemplated, giving a preliminary estimate of the cost.

The project statement is forwarded to the district engineer in charge of that one of the

12 districts, into which the entire country is divided, who is in charge of the work in the State, and by him is transmitted with his recommendation for approval or disapproval to Washington. The Bureau, guided by the opinion of the district engineer, makes its recommendation to the Secretary of Agriculture, and if he approves the project the State is so notified and it then prepares to submit detailed plans, specifications and estimates for the work. These, when ready, are transmitted to the district engineer and, if he approves them, the State can immediately advertise and let the contract for the work.

Modifications of the plans may be required after they have been forwarded to the Bureau, but it is not necessary to delay the preliminary construction operations after the approval of the district engineer has been secured. When the detailed plans have been approved by the Bureau the Secretary of Agriculture enters into a formal agreement with the State highway department by which the government undertakes to pay to the State on satisfactory completion of the work a specific amount of Federal money which in most States may not exceed 50 per cent of the cost of the work. In the States, 5 per cent or more of whose area is unappropriated public land under the jurisdiction of the United States, the participation of the government in the payment for individual construction projects may be greater than 50 per cent by one-half the percentage of such land in the State.

On roads built with the funds appropriated for the fiscal year 1923 the maximum Federal payment that may be made is \$16,250 per mile exclusive of payments made for bridges more than 20 feet in span. To roads constructed with funds appropriated for the fiscal year 1924 and subsequent appropriations the limit of allotment will be reduced to \$15,000 a mile. This limit was at first \$10,000. The act of 28 Feb. 1919 made it \$20,000 and the reductions for 1923 and subsequent years were made by the Postoffice Appropriation Act for the fiscal year 1923.

The only requirement affecting the character of the roads built is that they shall be substantial and suitable for the traffic they will be called upon to carry. The Bureau has approved all types of construction, after assuring itself, in each case, that the type proposed was adequate to meet the traffic requirements.

Frequent inspections of the construction work are made by engineers of the Bureau and Federal payments are made only for work which meets with the Bureau's approval. After completion the Bureau's engineers make periodic inspections to make sure that the roads are being maintained by the State as required by law.

In case the condition of a completed road is found at any time to be unsatisfactory the Bureau notifies the State highway department that the road is in need of repair. If within 90 days the State has not repaired the road the Bureau is required by law to repair it with its own forces or by contract under its direct supervision, charging the cost of such work to any balance of Federal money apportioned to the State. The Secretary of Agriculture, moreover, will withhold all further payments of aid to the State until the amount paid for the repair is refunded to the government, and when such refund is

made it is returned to the general fund and reapportioned among all the States, so that the offending State loses all but its pro-rata part. It has not yet been necessary for the Bureau to repair any road in accordance with this provision of law.

Up to the end of the calendar year 1922, 18,913 miles of Federal-Aid road had been completed. Federal payments to these roads, the total cost of which was \$328,358,884 amounted to \$139,227,438. At the end of the year there were 19,187 miles additional still under construction and estimated as 70 per cent complete. The estimated total cost of these roads was \$336,181,265 and the total allotment of Federal money for them was \$149,663,763. More than 11,400 miles of the completed roads were brought to completion during 1922.

Distribution of Surplus War Material.

In addition to the monetary Federal aid it is also a function of the Bureau to distribute aid for road construction in the form of surplus war materials of various kinds suitable for the purpose. Lists of materials declared surplus by the War Department are received from the War Department and copies are forwarded to the State highway departments so that they can requisition what they need. From the replies received from the State highway departments the final distribution is made. No material is sent to any State except upon request and so far as possible it is the endeavor of the Bureau to supply the wants of the States but its ability to do so is limited to a certain extent by the provision of law which requires that the distribution be made upon a value basis in accordance with the same factors which are employed in apportioning the monetary Federal aid.

By 1 July 1922 surplus war materials valued at over \$139,000,000 had been distributed to the States. Most important among the articles distributed were motor vehicles. Approximately 30,000 motor vehicles including motor trucks and automobiles had been distributed up to the above date, and, in addition, the list of articles distributed included a wide range of mechanical equipment, tractors, wagons, explosives, large quantities of steel, wire, spare parts for automobiles, pipe and other materials.

National Forest Road Construction.—The work of the Bureau on national forest roads does not consist of examining and supervising the engineering work of others but involves the performance of the highway engineering work itself. All roads in the national forests are classified as forest highways or forest development roads. The former include all roads which are necessary sections or extensions of the Federal-Aid System or which are of primary importance to counties or communities. The forest development roads include those primarily for the protection, administration and utilization of the forests. The roads are also classified as major roads, including all forest highways except those which do not require the services of a highway engineer or which cost less than \$2,000 per mile and all forest development roads which cost more than \$5,000 per mile; and minor roads comprising all other forest roads. Improvement of the minor roads is in the hands of the Forest Service, another bureau of the De-

partment of Agriculture. Most of the work on major projects is performed by the Bureau of Public Roads either with or without the co-operation of others.

In the selection of forest highways the Bureau co-operates with the Forest Service and the State highway departments in a manner prescribed by regulations issued by the Secretary of Agriculture. The construction work on all major projects is directly under the Bureau, but no work is considered complete until it has been approved by the State highway department, and as to certain matters by the Forest Service. Most of the forest road work is in the Western States and much of the detail of administration is handled by a deputy chief engineer and staff with headquarters at San Francisco. Up to the end of the calendar year 1922, 1,487 miles of forest roads had been completed at a cost of \$13,181,786; and on 31 December, 675 miles additional were under construction.

Highway Research Activities.—The highway research activities have been developed along two principal lines, the physical and the economic. The physical researches include investigations to determine the effect of the abrasive and impact forces of traffic on various types of road surface, the design of surfaces to withstand such forces, the study of the characteristics of subgrade soils and the effect of moisture on their bearing power, the strength and wearing qualities of various highway materials, studies of bridge stresses and bridge design and numerous other less important physical phases of the road construction problem. Physical investigations are conducted on a large scale at the experimental farm of the Department of Agriculture at Arlington, Va., and experiments are also conducted in co-operation with universities, State highway departments and other agencies.

The economic researches include the study of the laws of traffic distribution, the best methods of administering and financing road construction and the benefits resulting in the form of reduced operating costs of vehicles and increased production and land value as a result of the improvement of the roads.

Agricultural Engineering Activities.—The investigational and extension work in agricultural engineering includes a wide variety of work described by the following headings: (a) Methods of utilizing water for irrigation; (b) Pumping for irrigation; (c) Irrigation appliances and equipment; (d) The flow of water in ditches and pipes of various materials; (e) The measurement of water for irrigation; (f) Customs, laws and regulations relating to irrigation; (g) The drainage of irrigated lands; (h) The construction, operation and maintenance of land drainage improvements; (i) The drainage of various soils; (j) The organization, financing and regulation of drainage districts; (k) Gully-ing and erosion and their prevention; (l) The drainage of tidal marshes and swamp lands; (m) Farm domestic water supply and sewage disposal; (n) The utilization of mechanical farm equipment; (o) The construction and arrangement of farm buildings; (p) The lighting, heating and ventilation of farm homes and structures.

THOMAS H. MACDONALD.

Chief, Bureau of Public Roads.

ROANOKE COLLEGE, a Lutheran educational institution for men, founded in 1853 and located at Salem, Va. In 1922-23 it had a faculty of 22 members, 200 students, property valued at \$700,000 and an income of \$70,000. Charles J. Smith, D.D., is president.

ROBINSON, John Edward, American Methodist Episcopal bishop: b. County Galway, Ireland, 12 Feb. 1849; d. Bangalore, India, 16 Feb. 1922. He came to the United States in 1865; studied at Drew Theological Seminary in 1873, and was ordained to the Methodist Episcopal ministry in 1874. Shortly thereafter he went to India and Burmah as a missionary, serving in the Secunderabad Circuit, 1875-76; Richmondtown, Bangalore, 1877-79; Rangoon, Burmah, 1880-84. He was presiding elder of the Burmah district, 1885-86; Bombay district, 1887-96; Asansole district, 1896-1900; Calcutta district, 1900-04. In May 1904 he was elected missionary bishop of Southern Asia. He edited the *Burmah Evangelist*, 1884-87; the *Indian Witness*, 1896-1904. He was a member of the General Conferences of 1888, 1892 and 1904. He wrote 'Rise and Progress of Methodism' (1889); 'Apostolic Succession' (1890); 'Brief History of Methodism' (translated into various Indian languages, 1915). He retired in 1920. Albion College conferred the degree of D.D. upon him.

ROCHESTER, University of, a non-sectarian co-educational institution founded in 1850 and located at Rochester, N. Y. In 1922-23 it had a faculty of 69 members, an enrollment of 707 students in the extension division, 753 in the College of Arts and Science, about 200 in the Eastman School of Music, and about 1,200 in the preparatory and special departments. The institution's property was valued at \$16,226,427.14 and its income for 1921-22 was as follows: College of Arts and Science, \$376,000; Eastman School of Music, \$270,000; School of Medicine and Dentistry, \$550,000; total income, \$1,196,000. Rush Rhees, D.D., LL.D., is president.

ROCKEFELLER FOUNDATION. An institution chartered by the State of New York in 1913, "to promote the well-being of mankind throughout the world." It devotes its resources almost entirely to public health and medical education. Its principal funds on 1 Jan. 1923 amounted to \$174,000,000. Both the income and principal are available for appropriation. The annual income is approximately \$8,700,000. The Foundation's activities are carried on chiefly through three departmental agencies of its own creation—the International Health Board, the China Medical Board, and the Division of Medical Education.

One of the earliest activities of the International Health Board was work for the relief and control of hookworm disease, initiated in the Southern States in 1910, by the Rockefeller Sanitary Commission, taken over by the Board in 1915, and gradually extended to foreign countries. In 1922 hookworm work was conducted in co-operation with 11 Southern States and 22 foreign governments. Resurveys in 65 counties in the Southern States show a reduc-

tion in the rate of infection in school children from 54.8 per cent when control work began, to 28.7 per cent at the present time. In many communities the rate of infection has been reduced more than 90 per cent.

The yellow fever work of the year centered in Mexico, where the Board co-operated with the government in applying control measures which had proved effective in earlier campaigns in Ecuador, Peru and several Central American countries. Larvicidal fish are relied upon principally to prevent the breeding of yellow fever mosquitoes. Continued use of the recently developed vaccine and serum indicates their efficiency when used under proper conditions.

Demonstrations in malaria control carried on in 38 towns in nine States proved to these communities that malaria can be practically eliminated at a moderate cost. Larva-consuming fish, oiling and drainage are the principal means employed to prevent mosquito breeding. Experimental field studies in the efficiency of other methods of control were continued in the United States. In Nicaragua, Porto Rico, Brazil, the Philippine Islands, and Palestine field studies were conducted in the problem of malaria control as affected by tropical and other conditions.

Largely as a result of the hookworm campaigns in the Southern States, full-time health service for small towns and rural communities has been developing rapidly with the county as the unit. Over 200 counties, chiefly in the South, now employ full-time health officers. During 1922 the International Health Board co-operated in the establishment or operation of 140 county health units in 19 States.

The International Health Board entered into a co-operative arrangement with the health section of the League of Nations whereby it will provide a sum not to exceed \$32,840 a year for a period of five years to maintain an international epidemiological intelligence service. It will also provide a sum not to exceed \$60,080 a year for three years to put into effect a scheme for the international exchange of health personnel under the auspices of the League. Other public health activities of the Board include: financial co-operation in a demonstration of rural health administration in the province of New Brunswick, Canada; temporary financial aid, with advice and counsel, in establishing a public health laboratory service in several American States and Central American countries and a department of health in Czechoslovakia; the lending of experts as consultants to aid in reorganizing the public health system of the Philippine Islands, to establish an industrial hygiene system for Australia, to develop a public health nursing service in Brazil, and to organize a sanitary engineering division in a state health department.

Continuing its program of aid in the training of public health personnel, the International Health Board in 1922 agreed to give \$2,000,000 toward the building and equipment of a school of hygiene in London and \$212,000 for the building of an institute of hygiene in Warsaw. Full responsibility for financing the Johns Hopkins School of Hygiene and Public Health, which since its organization in 1918 had been supported by annual appropriations from the Foundation.

was transferred to the university authorities with a gift of \$6,000,000 for buildings and endowment. Payments were continued on the pledge of \$1,660,000 to Harvard University for its school of public health. Contributions were also made to the support of institutes of public health in São Paulo, Brazil, and in Prague, Czechoslovakia.

For the promotion of medical education the Foundation gave \$300,000 to the University of Hongkong for the endowment of chairs of medicine and surgery; appropriated \$500,000 toward its pledge of \$3,500,000 for the rebuilding and reorganization of the medical school and hospital of the Free University of Brussels; continued its payments on the contribution of about \$5,000,000 for buildings and equipment of University College Hospital and Medical School, London; paid sums due on its pledges to the medical schools of five Canadian universities and to the Pasteur Institute in Paris; provided the services of an associate dean for the medical school of the University of the Philippines; and of a pathologist for the Medical School of São Paulo, Brazil; and sent an American pathologist to give a course of lectures at Salvador University. A study of medical schools and the needs of medical science in Europe was carried on by the Division of Medical Education. Scientific equipment for English and American medical journals and books were furnished to 312 libraries in 82 European institutions which had been virtually out of research in English-speaking countries by the war or by the subsequent fall in the rate of exchange.

The program of the Rockefeller Foundation in the development of western medicine in China is handled through the China Medical Board, whose main contribution has been in the establishment and maintenance of the Peking Union Medical College. The 14 college and hospital buildings, together with residences for the faculty, dormitories, power house, gas plant, service buildings, etc., were sufficiently complete in 1921 for occupancy, and 1922 saw the end of the construction program. There are now 61 members of the medical faculty, 29 house officers, 19 members of the premedical faculty, and 34 nurses (including instructors in the Nurses Training School). During the year increased attention was paid to premedical education and an adviser in this field was appointed. Other activities of the year included: appropriations for the science work of three institutions — Peking University (mission), \$105,000, Nankai College (Chinese), Tientsin, \$95,150, Southeastern University (Chinese), Nanking, \$95,150; grants totaling \$188,452.50 to 10 hospitals for maintenance, buildings and equipment, based largely on their usefulness as means of continuing the professional growth of young doctors; appointment of 11 eminent American and European scientists as visiting professors at Peking Union Medical College or other schools; numerous fellowships for Chinese and missionaries at Peking Union Medical College and a few abroad; and aid to agencies in China aiming to promote general and medical education and improve hospital administration. Pending possible changes in several medical schools no new appropriations were made for medical education

except a small maintenance grant to Shantung Christian University.

Fellowships for which funds were provided directly or indirectly by the Foundation were held in 1922 by 226 individuals from 23 countries. The fellowships granted through the International Health Board, the China Medical Board, the Division of Medical Education and the National Research Council provide for both men and women an opportunity for study in the United States and other countries to fit them for leadership and technical efficiency in preventive medicine and medical education. The dean and six influential members of the faculty of the University of Strasbourg, Alsace, visited the United States, Canada, and England as guests of the Division of Medical Education to study organization and methods in medical education. A leading health authority in France also came to the United States as the guest of the International Health Board.

The Foundation has its headquarters at 61 Broadway, New York City. Its officers and members are: Officers — George E. Vincent, president; John D. Rockefeller, Jr., chairman of the board of trustees; Edwin R. Embree, secretary; L. G. Myers, treasurer; Robert H. Kirk, comptroller. Members — John G. Agar, Wallace Buttrick, John W. Davis, Simon Flexner, Raymond B. Fosdick, Frederick T. Gates, Harry Pratt Judson, Vernon Kellogg, John D. Rockefeller, John D. Rockefeller, Jr., Wickliffe Rose, Julius Rosenwald, Martin A. Ryerson, Frederick Strauss, George E. Vincent, William Allen White, Ray Lyman Wilbur.

E. R. EMBREE,
Secretary.

ROCKEFELLER, William, American capitalist: b. Richford, Tioga County, N. Y., 31 May 1841; d. at his country estate, Rockwood Hall, North Tarrytown, N. Y., 24 June 1922. He was a brother of John D. Rockefeller, the Standard Oil magnate. He attended the Academy at Owego, N. Y., and later the public schools of Cleveland, Ohio, to which city his parents moved in 1853. When 17 years of age he went to work in a Cleveland office at a very low salary. Two years later he entered the employ of a produce commission firm as a bookkeeper, and in 1862 became a partner in the concern. In 1865 he joined his brother John D. Rockefeller in the oil business. The latter had then been engaged in the oil industry about three years, with Samuel Andrews and M. B. Clark as his partners. The firm name was Andrews, Clark and Company, and already it was rated as wealthy. After William Rockefeller entered the business two new firms were organized — William A. Rockefeller and Company in Cleveland and Rockefeller and Company in New York. Five years later, in 1870, the Standard Oil Company, with a capitalization of \$1,000,000, was formed by combining the various plants which were engaged in the refining and sale of oil. The partners in this enterprise were John D. Rockefeller, William Rockefeller, Henry M. Flagler, Samuel Andrews and Stephen V. Harkness. In 1874 the Standard Oil Company acquired control of several important refineries in Pittsburgh, Philadelphia and New York, including the great plant of Charles Pratt and Com-

pany located in the last mentioned city. Thereafter one company after another was brought under the control of the Standard with the result that by 1879 it enjoyed almost a monopoly in oil transportation facilities, including pipe lines, while the Standard "alliance" produced approximately 95 per cent of the refined oil supply of the country. The Standard Oil Trust, afterward dissolved, was organized in 1882, some 50 men holding control of various companies in different States turning over their holdings to nine trustees, including William Rockefeller, who was elected vice-president and a director and also president of the Standard Oil Company of New York, organized at that time. Thereafter he became identified with numerous financial corporations of the first magnitude, including railroads, banks and manufactories. He was vice-president and a director of the Standard Oil Company of New Jersey, and a director of the Hanover National Bank, the National City Bank and the United States Trust Company. He retired from the presidency of the Standard Oil Company of New York in 1911 and, during the same year, resigned as director and vice-president of the Standard Oil Company of New Jersey. Other companies with which Mr. Rockefeller was connected as a director or trustee include the Anaconda Copper Mining Company; Consolidated Gas Company; Union Pacific Railroad Company; Delaware, Lackawanna and Western Railroad Company; Michigan Central Railroad Company; Cleveland, Cincinnati, Chicago and Saint Louis Railway Company; Pittsburgh and Lake Erie Railroad Company; Lake Erie and Western Railroad Company; Brooklyn Union Gas Company; New York Edison Company; Chicago, Milwaukee and Saint Paul Railway Company; West Shore Railroad; New York State Realty and Terminal Company; New York Central Railroad Company, and Amalgamated Copper Company. Mr. Rockefeller was married in 1864 at Fairfield, Conn., to Almira Geraldine Goodsell, who died in 1920. They had four children — Emma, who married Dr. D. Hunter McAlpin; William G., Percy Avery and Ethel Geraldine, who married Marcellus H. Dodge. Mr. Rockefeller, prior to his death, had been a resident of New York City for more than 40 years.

ROCKFORD COLLEGE, a non-sectarian educational institution for women, founded in 1847 and located at Rockford, Ill. In 1922-23 it had a faculty of 43 members, 500 students, property and invested funds totaling \$1,250,000 and an income from all sources of \$225,000. William A. Maddox, Ph.D., is president.

ROCK HILL COLLEGE, a Roman Catholic educational institution for men, founded in 1858 and located at Ellicott City, Md. In 1922-23 it had a faculty of 10 members, 120 students, property valued at \$100,000 and an income of \$50,000. Brother Felician is president.

ROCKY MOUNTAIN SPOTTED FEVER. See PUBLIC HEALTH SERVICE, UNITED STATES.

RODENTS, Extermination of. See AGRICULTURE, UNITED STATES DEPARTMENT OF.

ROENTGEN, Wilhelm Konrad von, German scientist: b. Lennep, Ruhr District, 27

March 1845; d. Munich, 10 Feb. 1923. As the discoverer of the X-ray, the fame of Doctor Roentgen has spread to every civilized corner of the earth. He was 50 years old when, in 1895, he made the great discovery which has gone far toward revolutionizing the science of medicine and surgery. He received his rudimentary education in Holland and then studied at Zurich where he took his doctor's degree in 1869. He first went to Würzburg as assistant to Kundt; then to Strassburg as extraordinary professor, becoming *privat-docent* there in 1874. In 1875 he was made professor of mathematics and physics at the Agricultural Academy of Hohenheim and in 1876 he returned to Strassburg. In 1879 he became professor of physics and director of the Physical Institute at Giesesen and in 1885 he returned to Würzburg. He was director of the Physical Institute of Würzburg University when he discovered the Roentgen or X-ray. The following year (1896) he was awarded the Rumford Medal of the Royal Society in London jointly with Philip Lenard who had conducted researches in the same line. At the time Doctor Roentgen discovered the X-ray which, penetrating matter, makes it possible to see through solids, he was studying the conduction of electricity through gases and had placed a vacuum tube he was using in a black cardboard box which completely cut off the ordinary light. Noticing that, without any apparent cause, a paper screen covered with barium platimocyanide, which was lying nearby began to glow, as if covered with phosphorus, Doctor Roentgen traced the glow to rays from the vacuum tube, the cardboard having failed to stop them. Further experiments showed that these rays made it possible to see coins in a purse, a nail driven into wood, spectacles in a leather case and the bones in the human hand. Inasmuch as the behavior of the light was curious especially in regard to reflection and refraction, doubt arose in Doctor Roentgen's mind as to whether it was a light or not, and he therefore named it X-rays. When he announced his discovery the X-rays were looked upon as some new manifestation of energy. It has since been demonstrated that X-rays differ from ordinary light only in the wave length. From the day of Doctor Roentgen's discovery the value of the X-ray has constantly increased and to-day it is recognized as one of the most valuable therapeutic agents known. Likewise its value as a diagnostic agency is incalculable. All over the world are specialists who devote their entire time to X-ray work. Dentists use it in determining the hidden condition of teeth. It will disclose various internal disorders, such as misplaced or abnormal organs like the stomach and intestines and the presence of hidden malignant growths. Through its use foreign bodies in the human system often can be easily located and their removal made comparatively simple. Bone fractures are easily located by it. Its use in the treatment of disease is being rapidly extended. At least some forms of cancer seems to yield to it, while experts claim that certain eczematous conditions can be cleared up by X-ray treatment in a very brief period. X-ray machines of powerful capacity are now being

used. The rays are among the most useful tools of the chemists and physicists in investigating properties of matter. The first Roentgen Ray Congress was held at Paris in 1900 at which time Doctor Roentgen was awarded the Nobel prize in physics. In addition to the discovery of the X-ray, Doctor Roentgen made many other valuable contributions to the science of physics.

ROLLINS COLLEGE, a co-educational inter-denominational institution, endorsed by Congregational and Presbyterian Churches, founded in 1885 and located at Winter Park, Fla. In 1922-23 it had a faculty of 32 members, 350 students, property valued at \$500,000 and an income of \$129,000. Robert J. Sprague, Ph.D., was acting president, 18 Jan. 1923.

ROOSEVELT MEMORIAL ASSOCIATION. The objects of this Association which was founded and incorporated immediately after Colonel Roosevelt's death, are as follows: To erect a monumental memorial to Theodore Roosevelt in Washington; to establish a memorial park in Oyster Bay; to perpetuate Roosevelt's ideals by spreading the knowledge of his character and career.

The work of the Association thus far has centered mainly in the third aim. A Bureau of Roosevelt Research and Information has been established which is making extensive collections of books, pamphlets, magazine articles, manuscripts, photographs, cartoons, clippings and other material relating to Roosevelt. An exhibition of a part of this material was held at the New York Public Library during the first three months of 1922 and was visited by 100,000 persons. Arrangements have been made with the Woman's Roosevelt Memorial Association, which is building Roosevelt House on the site of Roosevelt's birthplace at 28 East 20th Street, New York City to place the Association's collections there for permanent exhibition. The Association has published the following volumes dealing with Theodore Roosevelt: I, 'Roosevelt in the Bad Lands,' by Hermann Hagedorn dealing with Mr. Roosevelt's life as a ranchman in the valley of the Little Missouri in western Dakota; II, 'Roosevelt in the Kansas City Star,' edited by Ralph E. Stout, containing Mr. Roosevelt's war-time editorials; and III, 'The Americanism of Theodore Roosevelt,' sections from his writings and addresses, compiled by Hermann Hagedorn and edited for school use by Dr. John A. Lester. Other volumes, including an authorized collected edition of Mr. Roosevelt's books, are in course of preparation. A service is to be established to provide schools, churches and clubs at a nominal rental with lantern-slides, moving pictures, books and pictorial exhibits dealing with Mr. Roosevelt's life. A stretch of 13 acres has been purchased at Oyster Bay for the memorial park. Negotiations for the purchase of a further 22 acres are under way. William

Boyce Thompson is president of the Association. Hermann Hagedorn is executive director. The total sum collected by the Association to 1 Nov. 1922, with accrued interest, was \$1,987,352.06. Disbursements since 1 Feb. 1920, have been \$113,610.35. The national headquarters of the Association are at 1 Madison Avenue, New York City.

ROSARY COLLEGE, a Catholic educational institution for women, located at River Forest, Ill. It was incorporated October 1918 and opened in October 1922. Statistics for the year 1922-23 show a faculty of 30 members, 160 students, and property valued at approximately \$1,000,000. Income figures were not available 15 Jan. 1923. The college is under the supervision of the Dominican Sisters.

ROSEN, BARON Roman Romanovitch, Russian diplomat: b. 1849; d. New York, 31 Dec. 1921. His Swedish ancestors settled in Lithuania after the wars of Gustavus Adolphus and acquired wealth and distinction. He was educated at the University of Dorpat and the Imperial Academy of Law at Petrograd. His diplomatic career began at the Russian Legation at Tokio as vice-consul and later secretary. He came to the United States as consul-general from Russia to San Francisco. In 1886-89 he was chargé d'affaires at Washington when there was no Russian Ambassador. He then served as Minister to Mexico, Serbia, Bavaria, Greece and Japan, and in 1905 became Ambassador from Russia to the United States, succeeding Count Cassini. He was one of the Russian plenipotentiaries to the Peace Conference at Portsmouth. He was a man of culture and social tact and spoke a number of languages. During the Bolshevik rule his entire estate was lost and after escaping to New York in the face of dangers and hardships, he wrote for magazines. He published 'Forty Years of a Diplomat's Life' (1921). His death was caused by an automobile accident.

ROSE POLYTECHNIC INSTITUTE, a non-sectarian educational institution for men, founded 10 Sept. 1874, and located at Terre Haute, Ind. It is purely an engineering college. Statistics for 1922-23 show a faculty of 22 members and 255 students. The value of the property and its income were not given. Philip B. Woodworth, Sc.D., is president.

ROTARY CLUB. A business and professional men's organization which came into being in Chicago, Ill., on 23 Feb. 1905, with a group of four men—one a coal dealer, one a mining operator, one a merchant tailor, and the fourth an attorney. At the initial meeting the plan of drawing membership from men of different business or professional callings was adopted. "Rotary" was chosen as the name of the new club because the members met in "rotation" at their places of business. It adopted as its motto, "Service above self—He profits most, who serves best." In 1910—by which time 16 clubs had been formed,—the first convention was held in Chicago, and the "National Association" was formed. Two years later, in order to include clubs in Canada and London, England, the national organization was changed to an International organization. Since 1912 the growth of

the club has been very great. At the beginning of 1923 it had a membership of about 83,500 in 1,280 clubs located in the United States, Canada, Newfoundland, Great Britain, Ireland, Cuba, South America, Panama, China, India, Norway, Australia, New Zealand, Hawaii, the Philippine Island and Japan. This growth is remarkable in view of the fact that the organization has never at any time employed any paid organizers and exercises extreme care in surveying cities and towns applying for membership, to make sure that such communities are ready for a Rotary Club and are of sufficient size from which to secure a membership of representative men and still have the membership restricted to one man from each business or profession. The fact that no charter has ever been surrendered or withdrawn during the 18 years of the club's existence shows the care with which such surveys have been made.

Under the plan of organization a new club must start with not less than 15, nor more than 25 members; and, during the first year of its existence, cannot grow faster than at the rate of three members each month. Each club is a complete unit in itself, and is supposed to make itself a part of the community in which it is established, and to adapt itself to the peculiar problems of that community. A model constitution, which all new clubs are required to adopt was provided a few years ago, but many of the older clubs have their own basic laws. An international board, with headquarters in Chicago, meets every 60 days, and keeps itself informed of the desires and wishes of the clubs; but there is no administration unit between the clubs and headquarters, each club being entirely independent of every other club.

The Rotary Clubs are grouped in what are called districts, of which there were 39 in the world, 1 Jan. 1923. Each district has a governor, elected by the annual convention, from nominations made by the clubs of the district. This governor is an international officer, and the accredited representative of the International Board to the clubs. The governor requires a monthly report from each club, and in turn makes a monthly report to the International Board. None of the International officers, save the secretary general and his assistants, are paid—all are volunteer workers.

The International Board consists of a president, three vice-presidents, a board of directors composed of the foregoing officers and five others, a secretary and a treasurer. No president of the International Rotary can succeed himself.

There is also a Rotary International Association for Great Britain and Ireland, whose officers consist of a president, two vice-presidents and one immediate past-president, a treasurer and a secretary. Its headquarters are in London.

Rotary membership on 1 July 1922 was distributed as follows: 75,749 in the United States and Canada; 6,086 in the British Isles; 1,265 in all other countries.

Each Rotary Club has a board of directors that is its governing body. Annual conventions have been held as follows: Chicago, 1910; Portland, 1911; Duluth, 1912; Buffalo, 1913; Houston, 1914; San Francisco, 1915; Cincinnati, 1916; Atlanta, 1917; Kansas City, 1918; Salt Lake

City, 1919; Atlantic City, 1920; Edinburgh, 1921 and Los Angeles, 1922. The 1923 convention will be held in Saint Louis.

It has been truthfully said that no satisfactory definition of Rotary has yet been framed. This is probably due to the fact that Rotary is the outpouring of a spiritual movement, functioning through Rotary, to focus for action the desires, active or latent, in every one to help his fellow-man. It is also due in part to its vigorous youth and to its constantly finding new methods of expression.

As outlined by its platform, its business and purposes are succinctly: First, To promote recognition of the worthiness of all legitimate occupations and to dignify each member's occupation as affording him opportunity to serve society; Second, To increase the efficiency of each member as a citizen and a business man by the exchange of ideas and business methods; Third, To encourage high ethical standards in every business and profession and in service to the community of each business and profession; Fourth, To promote acquaintance and fellowship among men of various business and professional activities as an opportunity and an aid to service; Fifth, To quicken the interest of every member in public welfare and to co-operate with all other civic organizations in community development.

One of the activities to which each club is requested to devote a large part of its attention is the work among boys. The restoration to health of crippled children has also enlisted a great deal of its attention.

The Rotarian, a monthly magazine, issued at Chicago, is the official publication of the Rotary International. *The Rotary Wheel*, a monthly publication issued at London, is the official publication of the Rotary International Association of Great Britain and Ireland.

JOSEPH T. McALLISTER,

ROTHROCK, Joseph Trimble, American botanist: b. McVeytown, Pa., 9 April 1839; d. West Chester, Pa., 2 June 1922. He was graduated from Harvard in 1864 and in medicine from the University of Pennsylvania in 1867. He served in the Civil War and was wounded at Fredericksburg. From 1877-93 he was professor of botany at the University of Pennsylvania, and from 1893 to 1905 commissioner of forestry for Pennsylvania. In 1903 he founded South Mountain Camp Sanatorium for consumptives of which he was superintendent until 1908. He was a member of Pennsylvania Commandery, Military Order, Loyal Legion. Doctor Rothrock was one of the editors of *Forest Leaves* and author of 'Botany of the Wheeler Expedition' (1878); 'Flora of Alaska' (1867); 'Vacation Cruisings' (1884); and the 'Pennsylvania Forestry Reports' (1895, 1896 and 1897).

ROWING. See SPORTS.

RUBBER. The rubber trade of the whole world was in a bad condition in 1921, but improved much in the latter half of 1922, and is again on the way to prosperity in 1923. The saving factor is, of course, rubber tires, which steadily increase in use as all the world runs on wheels. Brazil, formerly the chief source of the raw rubber, furnished more than half the world's supply up to 1910, when what is known as plan-

10

tation rubber became an important factor, surpassing Brazil rubber in 1913, and going ahead in leaps and bounds, until in 1922 the plantation product was 25 times as great as the Brazilian. This plantation rubber is cultivated mainly by British companies in the East, and shipped mostly from Singapore, but also largely from Colombo, Belwan-Deli and Penang. Rubber growing was tremendously prosperous from the beginning of the Great War up to 1919, and was so developed that over-production became apparent, and has been a very trying factor for the past few years. In 1922 a British estimate of the stocks of raw or crude rubber on hand was the equivalent of a whole year's consumption of all the nations of the globe. Rubber kept coming along in increasing quantities, and the worldwide depression in industry reduced the demand, especially at the close of 1920 and all of 1921. Brazil lost her rubber trade through adhering to primitive methods of production, and at the same time mistakenly taxing the export. Other localities lost trade in much the same way, and to-day 95 per cent of the rubber comes from the plantations. Attempts are being made by American capital to plant and grow in Sumatra and in the Philippines, where the climate is suitable, in the hope of not being wholly dependent on the British rubber from the plantations.

To check the falling prices of crude rubber, the leading companies in the plantations got together and entered into an understanding to curtail production 25 per cent. This was only a partial remedy, reducing plantation production from its peak of 304,816 long tons in 1920 to 273,000 tons in 1921. Stocks on hand continued enormous, and buyers dictated the market. During the first eight months of 1922 plantation rubber was quoted on the London market at from six and one-half to nine pence, the price nine pence being the equivalent of about 18 cents American. That the producing companies deserved this slump is evidenced by observing their profits during the fat years of the war and after. The 10 leading British companies averaged about 125 per cent in dividends for nearly 10 years, and one declared a stock dividend of 375 per cent. None of the 10 made a dividend of less than 25 per cent in the decade. When it became apparent that the good time was disappearing, a strong effort was made to have the government tax the exportation of rubber progressively and to meet the situation, the British Government put into effect in November 1922 what is known as the Stevenson plan, limiting, by means of a sliding scale of export taxes, the production of rubber in countries under the British flag to 60 per cent of the 1920 crop (335,000 tons), until the price passes one shilling and three pence or approximately 30 cents a pound. After that, according to the *Literary Digest*, the plan provides for a series of adjustments which will permit 100 per cent production only when the price reaches three shillings per pound. As a result of this restrictive measure, coupled with heavy buying, the price of crude rubber advanced in American markets from 13 cents in the early part of 1922 to 37 cents on 23 Jan. 1923. Exportation from British possessions up to 60 per cent of the 1920 production bears a nominal duty of one and one-eighth of a cent gold per pound. Under the Stevenson plan, if exports exceed 60

per cent of the 1920 production, each pound exported is subject to a sliding scale of duties ranging from 7.94 cents to 23.85 cents. As a result of this measure, the Department of Commerce estimates that tires and other rubber articles will cost the American consumer from \$300,000,000 to \$600,000,000 more annually.

In as much as the United States consumes nearly three-fourths of the world's rubber supply, the imposition of the tax on plantation rubber resulted in an appropriation by the 67th Congress of \$500,000 to be used in ascertaining the possibilities of cultivating rubber in the United States possessions, especially in the Philippines and in other countries from which concessions might be obtained.

On 23 April 1923, C. B. Seger, chairman of the directors of the United States Rubber Company, announced three new processes of rubber manufacture, the exclusive property of his company. One involved a new method of making and vulcanizing cord tires; another marking a revolutionary step in rubber manufacture, was called by Mr. Seger sprayed rubber. Of this product he said:

"Sprayed rubber, the result of a new method of producing crude rubber from the original latex, insures for the first time since rubber was discovered, a pure and absolutely uniform product.

"Heretofore all rubber produced and sold on the market has been coagulated out of the rubber latex, by means either of smoke or chemicals. Rubber produced by the old primitive native methods of heat and astringent smoke over a slow fire is contaminated with smoke and other combustion products. Nor can there be any assurance of uniform quality. When rubber is produced by treating latex with acetic acid, the rubber contains acid residues. Furthermore, the acid tends to destroy some of the valuable natural properties of the latex. The new spraying process takes the latex, sprays it into a snow white mist and brings this snow white mist into contact, with pure superheated air, driving out the water of the latex, and nothing else.

"Sprayed rubber is 100 per cent pure solids from the virgin latex. No acid, no smoke. It is dry and pure and remains so. It has greater strength because it contains all the natural strength of the rubber of the original latex unimpaired by chemicals or the destructive effect of machine working. It is uniform in quality—something never before obtained."

The condition of the crude rubber industry can be best understood by studying the following table:

WORLD'S PRODUCTION OF CRUDE RUBBER.
(In Long Tons.)

YEAR	Plantations	Brazil	Other	Total
1910.....	8,200	40,400	21,500	70,500
1911.....	14,419	37,730	23,000	75,149
1912.....	28,518	42,410	28,000	98,828
1913.....	47,618	39,370	21,452	108,440
1914.....	71,380	37,000	12,000	120,380
1915.....	107,867	37,220	13,615	158,702
1916.....	152,650	36,500	12,448	201,598
1917.....	213,070	39,380	13,258	265,698
1918.....	255,950	30,700	9,929	296,579
1919.....	285,225	34,385	7,350	326,860
1920.....	304,816	30,790	8,125	343,731
1921.....	271,233	19,837	2,890	293,960
1922 (estimated)...	360,000	15,000	3,500	378,500

The importations of crude rubber into the United States are entered mostly at the port of New York, though Baltimore, Boston, Seattle, San Francisco and Los Angeles occasionally receive cargoes. The stock comes in very regularly, though December generally sees the largest arrivals. Plantation rubber now constitutes 95 per cent of the shipments. The importations in long tons for the last two years follow:

GRADES	1921	1922
Plantations.....	173,975	276,649
Paras.....	10,915	11,092
Africans.....	2,329	2,691
Guayule.....	58	281
Other.....	86	257
TOTAL IMPORTATIONS.....	187,363	290,970

The imports of crude rubber quoted above do not include all the rubber used in manufacture in the United States, because there is a considerable trade in reclaimed rubber, made from scrap rubber. The questionnaire of the Rubber Association of America, representing reports of 85 per cent of the trade, reports that in the fiscal year ending 30 June 1922, there were over 48,000 tons of reclaimed rubber produced. The stock of crude rubber on hand in the United States at the same date was reported as 82,110 tons and stocks afloat for United States ports 33,266 tons, these being about the normal stocks. The true total of stock is believed to be about 5 per cent greater, however, due to some concerns not reporting.

More than three-fourths of the rubber consumed in the United States goes into rubber tires, and the proportions of its use are well shown in the following table, compiled by the Rubber Association of America for the first six months of 1922. It represents 85 per cent of the country's total, as 15 per cent of the industry failed to report.

The following table shows the number of pounds of crude rubber consumed in the manufacture of rubber products and total sales value

the Rubber Association their inventory, production and shipments. The reports for November 1922, quoted below, are believed to represent fully 85 per cent of the country's production and stocks.

Number manu- facturers reporting	PNEUMATIC CASINGS		
	Inventory	Production	Shipments
62	4,964,976	2,733,134	2,379,708
INNER TUBES			
61	6,210,053	3,850,908	3,075,023
SOLID TIRES			
11	234,684	85,775	61,466

The total value of rubber products exported from the United States in 1922, was \$33,450,832, a gain of \$3,242,877 over 1921. Tire exports, valued at \$20,393,034 in 1922, as against \$16,313,414 in 1921, are responsible for the increase. Rubber belting, hose, and packing exports decreased from \$4,106,937 in 1921 to \$3,154,594 in 1922; while exports of rubber footwear and soles and heels increased from \$3,909,261 to \$4,439,633. Exports of druggists' rubber sundries remained practically even at \$871,465.

Automobile casings were exported at the rate of 110,000 monthly, while inner tube shipments averaged only 78,000 monthly during 1922. The largest markets for casings were: England, 334,043; Argentina, 94,685; Cuba, 94,390; Mexico, 79,747; Canada, 59,884; British South Africa, 50,406; Brazil, 48,033; New Zealand, 47,846; Sweden, 46,862; Australia, 41,384; Philippine Islands, 40,543; Denmark, 32,986; France, 24,373; Spain, 23,058; Uruguay, 22,893; and Norway, 21,353. Only 54,931 casings other than automobile were exported during the year. Solid tires for automobiles numbered 55,665, valued at \$1,518,932.

The 1919 census reported 119,448 wage earners employed in the rubber industry. The estimate in January 1923, was 150,000 employees. A number of rubber manufacturers failed in

of shipments of manufactured rubber products in the United States during first half of 1922.

To preserve normal stocks of tires, the majority of the manufacturers report monthly to

1921 and some few early in 1922; but it is believed that liquidation is ended. Tire production has grown from 26,000,000 to 32,000,000 comparing 1920 with 1922, and 1923 starts off

with predictions of 45,000,000. The United States Rubber Company, one of the largest concerns, reported sales in 1922 of \$167,000,000, and profits of \$7,000,000 earned after all deductions. The Firestone Tire and Rubber Company, with sales of \$64,500,000 for its fiscal year ending 31 Oct. 1922 (an increase of 23 per cent), showed earnings of \$7,348,000, after making all deductions.

The rubber manufacturers of America have been working together for two years or more on standardization of product, and the English manufacturers are working on the same lines. There has also been recognized the necessity for the industry on both sides of the Atlantic, to work more in harmony, and in February 1923, a committee of representative men in the British rubber trade visited the United States by invitation, in the endeavor to secure a better understanding. It is expected that more positive standards of grades of quality in tires, tubes, cloth, etc., will result, and become generally recognized. And it may well be that more stable prices of crude rubber will be developed, as a result of the demand of American manufacturers on the plantations producers. See also AUTOMOBILES.

CHARLES H. COCHRANE.

RUHR VALLEY, the valley of the Ruhr River in western Germany and one of the most important industrial and mining districts in Europe. The Ruhr River is an inconspicuous stream, hardly more than 100 miles long, with little volume of water, and navigable even with the aid of its 11 locks for a distance of only 43 miles, says the 'National Geographic Society News Bulletin.' But its valley and the rolling country to the north for a few miles, to which it has given its name, is a region of concentrated industrialism. There, in a district roughly 40 by 10 miles, has been developed the greatest coal production in Europe. And with iron ore available from the nearby former "German Lorraine" and Luxemburg, there came up the industry of fabricating iron and steel which went far toward building up the mighty German Empire of 1913.

The solar plexus of the Ruhr district is Essen, known the world over as the home of the great Krupp works. The town was founded in the 9th century, but as late as 1854 it had but 10,500 inhabitants. Before the World War it had grown to a city of 300,000 and of these nearly 50,000 were employed in the Krupp works. With the development of Essen as a steel and iron centre hundreds of other establishments joined the Krupps until the environs of the city are now a forest of chimneys. But while Essen is the centre of the Ruhr it by no means monopolizes its business. Great cities are thick in this area. Entering the region at Duisburg, its gate-city, with 230,000 inhabitants, by a journey of less than five miles one reaches Oberhausen with a population of 90,000. Three miles farther is Mulheim with 112,000, five miles away Essen with 300,000, and four miles farther Gelsenkirchen with 170,000. By an advance of another four miles into the Ruhr one reaches Bochum with a population of 137,000, while barely ten miles farther to the east and still short of the eastern limits of the region lies Dortmund with 214,000 inhabitants. It is as

though St. Paul, Minn., Flint, Mich., Albany and Rochester, N. Y., Richmond, Va., Grand Rapids, Mich., and Oakland, Calif., were grouped closely over an area slightly longer and somewhat narrower than Rhode Island, while among them were scattered a dozen or more communities ranging in size from Bismarck, N. Dak., and Aberdeen, Wash., to Austin, Texas, and Chattanooga, Tenn.

"In and around practically all of the towns of the Ruhr except those at its gateway are to be found the works of coal mines, while in all are iron and steel plants and numerous other manufacturing establishments. In the cities at the gateway to the Ruhr are centered the banking and transportation facilities for handling the tremendous output of this home of Germany's Tubal-Cains." (Bull. 405-N. S., Nat. Geog. Soc., Washington, D. C.)

"Ruhrort, the part of Duisburg situated where the Ruhr river meets the Rhine, far from being an unimportant town, takes at least one world honor. It is the most extensive river port in the world. When the quays of the older part of Duisburg and those of the little town of Homberg across the Rhine are added, the wharfage facilities of the Duisburg district are fairly staggering in extent. They stretch for more than five miles along the Rhine; and many branched basins have been constructed leading from that river and the Ruhr as though giant hands had been pressed into the earth again and again, leaving a channel for each finger.

"A constant stream of tugs, barges and larger vessels moves in and out of the channels under normal conditions, and the craft of Ruhrort are to be found in all parts of the Rhine. Down the Ruhr valley come coal and some iron, though the larger part of the iron needed in this great industrial region was shipped in before the war from German Lorraine, French Lorraine, Luxemburg, Sweden and Spain. A considerable part of this was brought in on the Rhine. Other raw materials and food products were imported, adding to the commerce, and coal and manufactured products were shipped out in great quantities.

"Near the water front in the Duisburg district are situated innumerable factories and industrial establishments—collieries, steel and iron plants, rolling mills, blast furnaces, foundries, machine shops, chemical works, saw mills, ship yards, and various other enterprises. Because of its importance as an industrial center and river port, the Duisburg region can be looked upon as a Pittsburgh and a New Orleans rolled into one." (Bull. 379—N. S., Nat. Geog. Soc., Washington, D. C.)

Early in 1921, the Entente Allies occupied Dusseldorf, Duisburg and Ruhrort on account of difficulties in securing reparations from Germany. During 1922 France made repeated threats to occupy the region and on 10 Jan. 1923, after the Reparations Commission, at Paris, had declared Germany in default in respect of the deliveries of wood and coal, French and Belgian troops advanced in force into the Ruhr Valley and occupied Essen and Bochum. Week by week in the early part of 1923 the advance continued and city after city was occu-

pied. A policy of obstruction was adopted by the German local authorities. Strikes of coal miners were general and considerable friction developed between the occupying forces and the German civil population. Sabotage marked the railmen's strike and drastic measures were taken by the French command to insure the maintenance of order. See also REPARATIONS.

RUMANIA, a kingdom of Europe on the shores of the Black Sea, bounded by Russia, Hungary and Bulgaria. Capital, Bucharest.

Area and Population.—Rumanian territory was greatly increased as a result of the treaties following the World War. In the following table are given the areas and population of both the Old Kingdom and the territorial acquisitions following the war.

DIVISIONS	Area, square miles	Population
Old Rumania.....	53,489	7,904,104
Bessarabia.....	17,146	2,344,800
Bukovina.....	4,030	800,098
Transylvania.....	22,312	2,678,367
Crisana.....	8,038	1,316,981
Maramuresh.....	6,258	766,666
Benat.....	11,009	1,582,133
Total.....	122,282	17,393,149

Old Rumania is made up of Moldavia (area, 14,710 square miles; pop. 2,145,464); Wallachia (area, 29,810 square miles; pop. 3,298,394); The Dobrudja (area 8,969 square miles; pop. 381,306), and Oltenia (pop. 1,413,897). The second Balkan War added 2,969 square miles with 273,090 population, mostly Turks, at the expense of Bulgaria. The population even in the old territories is by no means homogeneous; Magyars, Saxons, Swabians, Ruthenians, Germans, Bulgars, Russians, Turks and Tatars being well represented. The chief cities are: Bucharest, the capital, 345,628; Chisinau, 114,110; Cernauti, 87,128; Ismail, 85,600; Jassy, 76,120; Galatz, 73,512; Braila, 65,911; Oradea Mare, 64,169; Arad, 63,166; Cluj, 60,808; Ploesti, 57,376; Craiova, 51,877; Constantza, 27,662; and Focsani, 25,287.

Religion.—The national church is the Rumanian Orthodox, the clergy of which are paid by the State. Subventions are granted to the clergy of other denominations. The National Orthodox Church has 9,695,715 communicants. There are 1,483,929 Roman Catholics; 1,456,147 Greek Catholics; 1,344,970 Protestants; 834,344 Jews; 44,087 Mohammedans, and 17,596 Armenians.

Education.—Primary education is free and compulsory in all localities where there are schools. There are 5,764 primary schools with 11,088 teachers and 692,896 pupils. For secondary education there are 76 schools for boys with 1,287 teachers and 44,983 students, and 66 schools for girls with 1,051 teachers and 9,584 students. Thirty-eight of the former and 12 of the latter are state institutions. There are 12 normal schools for men with 181 teachers and 2,425 students; four normal schools for women with 93 teachers and 1,435 students.

There are 129 professional schools (54 for girls) with 869 teachers and about 8,000 students. There are 25 commercial schools with 5,000 students and 25 agricultural schools with 669 students. There are several other special schools. For higher education there are four universities—Bucharest, Jassy, Cluj and Cernauti—with a total of 7,876 students.

Production and Industry.—Rumania is an agricultural country, about 80 per cent of the people being engaged in that industry. The principal grain crop yields for the years 1921 and 1922 are given below:

CROP	1921, tons	1922, tons
Wheat.....	2,138,148	2,600,000
Rye.....	230,674	265,000
Barley.....	985,292	1,955,000
Oats.....	963,168	1,430,000
Indian corn.....	2,772,897	2,360,000

About 12,000 acres are planted under tobacco, the annual yield being about 6,000 tons. The wealth created from forest products is considerable, there being about 18,750,000 acres under forest. The last live stock census showed 4,771,812 head of cattle; 6,159,982 sheep; and 2,444,791 swine and 1,444,232 horses. Salt, lignite, iron and copper ores and petroleum are the chief minerals. Oil production in 1921 was 1,160,885 metric tons. In the autumn the United States Department of Commerce reported that the production of oil in Rumania during September was about 4,000 tons daily. The production for August 1922 was 112,000 tons, as against 115,000 tons for July. For the first eight months of 1922 oil exports were 246,780 tons. The improvement in oil transportation was continued throughout 1922. The oil output for September 1922 was 110,000 tons. Exports of gasoline and refined oil had ceased temporarily in November 1922 by government order. Salt is one of Rumania's chief mineral resources. There was overproduction in the fall of 1922 and the surplus at the mines piled up because of the lack of transportation and many miners were thrown out of work. The salt mines are a state monopoly.

Among the important manufacturing industries are brewing, flour milling and distilling. There are 2,747 establishments of factory grade, capitalized at 2,837,296,627 lei and employing 157,423 operatives (lei equals one franc).

Finance.—Government receipts and expenditures for the fiscal year ended 31 March 1922 had not been published 31 Dec. 1922. The Rumanian Minister of Finance, however, had the following figures compiled, but they apparently do not include certain extraordinary expenditures. Revenues: Old Rumania and Bessarabia, 4,407,540,195 lei; Bucovina and Transylvania, 1,762,242,943 lei; total, 6,169,783,138 lei. Expenditures: Old Rumania and Bessarabia, 4,645,860,219 lei; Transylvania and Bucovina, 1,521,246,704 lei; total, 6,167,106,923 lei. These figures make up the ordinary receipts and expenditures and show a small surplus of 2,000,000 lei. However, no mention is made of the extra credit of 50,000,000 lei for carrying out the provisions of the agrarian reform law in Transylvania, the extraordinary expenditures for the Ministry of War, and various other extra

credits. The foreign debt of Rumania is 30,-250,000,000 lei, of which 10,000,000,000 lei is the proportion of the debts of Austria and Hungary and Russia assumed by Rumania after the World War.

Commerce.—Official figures furnished by the Ministries of Finance, Industry, and Commerce show the exports of Rumania, by quantities, for 1922, in comparison with those for the year 1921, as follows:

COMMODITIES	1921	1922
Cereals:		
Wheat, metric tons.....	75,691	28,110
Wheat flour, metric tons.....	19,423	23,231
Rye, metric tons.....	55,864	26,786
Barley, metric tons.....	387,168	581,986
Oats, metric tons.....	165,466	228,673
Corn, metric tons.....	769,149	291,649
Millet, metric tons.....	33,565	5,909
Bran, metric tons.....	3,957	3,955
Beans, metric tons.....	68,960	76,902
Petroleum and by-products:		
Gasoline, metric tons.....	145,115	131,584
Refined oil, metric tons.....	172,971	272,316
Gas and fuel oils, metric tons.....	15,210	14,877
Lubricating oil, metric tons.....	13,533	16,857
Paraffin wax, metric tons.....		10
Crude oil, metric tons.....	15,511	2
Wood, lumber, etc.:		
Props and laths, metric tons.....	28	354
Boards, of fir, metric tons.....	121,673	622,122
Other resinous wood, metric tons.....	17,119	49,305
Oak lumber, metric tons.....	5	338
Other miscellaneous lumber, metric tons.....	746	6,685
Fir logs, cubic meters.....	20,029	86,559
Animals:		
Bulls, heads.....	131	400
Cows, heads.....	8,687	19,341
Oxen, heads.....	61,634	125,366
Pigs, heads.....	61,351	174,207
Animal products:		
Lard, metric tons.....	786	273
Pork fat, metric tons.....	158	63
Wine, liters.....	397	5,522
Salt.....	7,396	33,999

The United States Department of Commerce reported at the close of 1922 that the business stagnation grew worse in Rumania during the coronation festivities in October. Exchange continued to fluctuate and the cost of living rose gradually. Exportation was of greater volume than was expected in view of the general situation. Contributing factors in the business depression were the short corn crop and the political disturbances in the Near East.

Communications.—The Rumanian merchant marine consists of 158 vessels of 71,158 tons, of which 17 are steam vessels of 29,441 tons. Rumania has 7,240 miles of railways with several new lines under construction. These include the Csermo-Salonta line, 37 kilometers; the Zorleni-Basarabasca line, 180 kilometers; the Bucharest-Opantelimo line, 7 kilometers, and the Braila-Roman line, 17 kilometers. Three other lines aggregating 184 kilometers are projected. Rumania has 27,635 miles of metalled roads. There are 4,700 post offices, 8,612 miles of telegraph lines and seven urban telephone systems with 1,004 miles of lines, and 7,966 interurban systems with 24,168 miles of lines.

Banking, Etc.—Banknote circulation in the middle of October 1922 was 15,370,000,000 lei, an increase of 510,000,000 lei in one month. Exchange stood at \$0.006384 on 10 November. The government at the same time made successful efforts for the consolidation of the foreign floating debt.

Government.—The executive power is vested in the sovereign, who exercises it through a responsible ministry. The legislative power is in the hands of a bicameral chamber—Senate and Chamber of Deputies. The former has 170 members and the latter 347 members. The reigning Sovereign in 1922 was Ferdinand I, born 24 Aug. 1865, the nephew of the late King Carol, whom he succeeded 11 Oct. 1914.

History.—Early in the year the Jonesco Cabinet was succeeded by a Liberal Ministry under the leadership of Jan Bratiano. The new ministry attacked energetically the problems of economic reconstruction and made a survey of the nation's resources. It was pointed out that while Rumania's war debt did not exceed 3,000,000,000 lei, loans to the extent of 11,-000,000,000 lei had been contracted following the Armistice, of which 6,000,000,000 lei went to the redemption of foreign currencies in the territories acquired as the result of the war. In Transylvania several Hungarians were imprisoned charged with conspiracy against the safety of the state. The attitude of the Russian Delegation at the Genoa Conference with regard to Bessarabia caused anxiety to the Rumanian Government. It was felt that the Soviets might undertake a hunger offensive against Rumania. The Premier went to Paris, where he had important negotiations with the French government and military authorities, with the object of an understanding with France as to a common plan of action in case Rumania was invaded by the Russians. After a long interview with Marshal Foch on 24 May it was understood that France would supply arms and munitions and loan staff officers to help direct operations. Agrarian reform was initiated in the acquired territories by transferring lands to the peasants on a system of forced rents pending a more permanent settlement. The great social event of the year was the wedding of the Princess Marie to King Alexander of Serbia in Belgrade on 8 June. During the year it was manifest that the country was fast recovering from the chaos of the war. In 1920 flour had to be imported from Australia and from the United States, and other foodstuffs from France, Canada and Spain. In 1922 there was a surplus of cereals for export. The Constitution is to be redrafted in order to co-ordinate the four legal codes in use in the country as a result of the acquisition of territory from Russia, Austria and Hungary. King Ferdinand and Queen Marie were crowned with elaborate ceremonies at Alba Julia on 15 October. On 10 November Eftimie Antonescu arrived in the United States to confer with American officials relative to the repayment of Rumania's debt to the United States. The final arrangement consisted of a refunding plan with its adoption contingent upon the approval of the interested Allied powers. Rumania is contemplating the acquisition of subsoil rights similar to those of Mexico in order to keep her oil fields from the grasp of foreign capitalists. In October Rumania sent a note to the Russian government relative to the dispute about Bessarabia, and emphasizing the fact that Russia had seized Bessarabia by force in 1812. Rumania offered to open negotiations if Russia accepts the Dniester River as

the Russo-Rumanian frontier. On 10 November the Soviet Foreign Minister, Tchitcherin, replied to the Rumanian note, stating that Russia regards the Pruth as the frontier and requires Rumania to evacuate Bessarabia, as Russia will never agree to the annexation of that province by Rumania.

RURAL CREDITS. A system of credits provided for in the Agricultural Credits Act, passed by the 67th Congress on 3 March 1923 and designed to enable the farmer to secure the sort of credit he needs to produce efficiently and market in an orderly way the products of the farm. The act represents an effort by Congress to meet a need which has been felt for at least 50 years. It furnishes the basis for a system of intermediate credit adapted to farm conditions and farm needs and is expected to bring about a reduction in the interest farmers pay for money borrowed.

The act is divided into two parts. One part provides government agencies for handling agricultural loans. The other part authorizes the organization of private agencies under government supervision for making loans on live-stock security and on farm commodities on the way to market.

The government loan activities will be carried on in connection with the Federal land banks. At present the country is divided into 12 districts, and in each of these districts there is a Federal land bank which makes land mortgage loans, these 12 banks being directed by a central Federal Farm Loan Bureau in Washington. In connection with each of these land banks there is to be established an intermediate credit bank, located in the same city with the land bank and under the supervision of the officers and directors of the land bank. The Federal government supplies each of these intermediate credit banks with a capital not exceeding \$5,000,000. These intermediate credit banks are authorized to discount farmers' notes which have been taken by banks and other financial institutions, and to carry such notes for a term of from six months to three years. The banks may also loan direct to farmers' co-operative associations under conditions set forth in the act.

These intermediate credit banks may issue debentures having back of them the farmers' notes taken by the banks. These debentures, it is believed, can be sold to people wishing a safe investment. They are exempt from taxation, just as the bonds issued by the Federal land banks are exempt. The interest charged by the intermediate credit banks may not exceed by more than 1 per cent the interest paid on the debentures issued, and the farmer who borrows must not be charged an interest rate of more than 1½ per cent above the interest charged by the intermediate credit bank.

It is the contention of the advocates of the law that the farmer will find he can borrow needed capital for a period up to three years without having to pay an unduly high interest rate, without having to renew his notes every 90 days or six months, and without being in danger of having to sacrifice his crops or live stock because of a sudden financial flurry.

The second division of the act authorizes the organization, under a Federal charter, of

national agricultural credit corporations, these to be organized by private capital. They will be under the supervision of the Comptroller of the Currency, just as are other national banking institutions. Each must have a capital stock of at least \$250,000. Such corporations may issue collateral trust debentures up to 10 times their capital and surplus. It is expected that corporations of this character will be organized in the Western States where the live-stock industry is important and where now cattle loan companies are in operation.

In addition to the provisions of the act designed to furnish the farmer intermediate credit, certain changes were made in the law under which the Federal land banks operate and in the Federal Reserve Act. Provision for the establishment of the co-called permanent organization of the 12 Federal land banks is made by providing that three out of the seven directors for each bank are to be elected by the borrowers from the bank and three are to be appointed by the Federal Farm Loan Bureau. The seventh director, who will be the president of the board, will be chosen from three persons who have received the highest nomination vote for this position by the borrowers or stockholders of the bank.

Heretofore the maximum amount which might be loaned to any individual by a Federal land bank was \$10,000. This has been increased to \$25,000. Also the purpose for which mortgage loans may be made has been broadened to include the repayment of any existing indebtedness.

The Federal Reserve Act was amended by broadening the definition of what is called agricultural paper, making it include the grading and processing of agricultural products by co-operative marketing associations. Heretofore the Federal Reserve Banks have not been permitted to discount agricultural paper for a longer period than six months. This period has been increased to nine months.

A large number of State banks are not now members of the Federal Reserve System, some of them because their capital is not large enough to meet the requirements of the law. An amendment to the Federal Reserve Act, designed to encourage small banks to join the system, was incorporated in the Agricultural Credits Act. A bank which has capital equal only to 60 per cent of the capital required of national banks may now be admitted, if within a reasonable time assurance is given that the capital will be increased to correspond with the capital required of national banks.

The life of the War Finance Corporation was extended up to 29 Feb. 1924, the expectation being that by that date the new credit facilities provided for under the Agricultural Credits Act will be sufficient to meet the needs. See also **FARM LOAN SYSTEM, FEDERAL.**

RUSH-BAGOT AGREEMENT. See **PEACE AND ARBITRATION, INTERNATIONAL.**

RUSSELL, Lillian (Mrs. Alexander P. Moore), American light opera singer and famous stage beauty: b. Clinton, Iowa, 4 Dec. 1861; d. Pittsburgh, Pa., 6 June 1922. She was the daughter of Charles E. and Cynthia H. Leonard, and was christened Helen Louise, though her

family and intimate friends called her "Nellie." When she was four years old her parents moved to Chicago where her father engaged in the printing business and published the works of Robert G. Ingersoll, and where her mother, an ardent equal suffragist and an intimate friend of the late Mrs. Susan B. Anthony, developed into a well-known lecturer and public speaker. Nellie Leonard attended the Convent of the Sacred Heart in Chicago and made her stage debut when 10 years old in a play which constituted a part of the commencement exercises of the convent. She next attended Park Institute, a West Side Chicago finishing school, and at the age of 14 sang at a students' concert given at Kimball Music Hall. In Chicago she studied both vocal and violin music and for a time sang in a church choir. In 1879 her mother took her to New York to study for the opera under Leopold Damrosch. Her first professional appearance upon the stage was made during the same year as a member of the chorus in Edward E. Rice's production of 'H. M. S. Pinafore.' Later she sang at Tony Pastor's Theatre in 14th Street, where she was billed as an English ballad singer and for a time sang ballads exclusively. It was at the beginning of this engagement that she adopted the name of 'Lillian Russell' by which she was known professionally throughout the remainder of her career. Pastor later gave her a part in a condensed version of 'Olivette' and thereafter she appeared in a burlesque of the 'Pirates of Penzance' entitled 'The Pie Rats of Penn Yann.' She next joined a company which made a short trip to California, playing 'Fun in a Photograph Gallery' and 'Babes in the Wood,' and upon her return to New York she was engaged to sing D'Jemma in 'The Snake Charmer.' She next appeared as the Princess in 'Olivette,' then in 'Patience' and thereafter in 'The Sorcerer.' Joining the New York Casino cast she sang in the 'Princess of Trebizonde.' In 1884 she went to London where she sang at the Gaiety Theatre in 'Virginia' and also appeared in 'Polly,' at the Novelty Theatre. Other productions in which she appeared include: 'Pocahontas'; 'The Girl with the Glass Eyes'; 'The Maid and the Moonshiner'; 'Dorothy'; 'The Queen's Mate'; 'Nadgy'; 'The Brigands'; 'The Grand Duchess'; 'Poor Jonathan'; 'Apollo'; 'La Cigale'; 'The Mountebanks'; 'Girofle-Girofla'; 'The Princess Nicotine'; 'The Queen of Brilliants'; 'La Perichole'; 'La Tzigane'; 'The Goddess of Truth'; 'The Little Duke'; 'The American Beauty'; 'The Wedding Day'; 'La Belle Helene'; 'Erminie'; 'Fiddle-dee-dee'; 'The Big Little Princess'; 'Barbara's Millions'; 'The Butterfly'; 'Wild-fire'; 'The Widow's Might'; 'The First Night'; 'In Search of a Summer,' and 'Hokey Pokey.' She also appeared frequently in vaudeville. For a number of years prior to her death she wrote "beauty" articles for newspapers which were widely syndicated. She published 'How to Live a Hundred Years,' (1913) and her personal reminiscences which were appearing serially in the *Cosmopolitan* magazine at the time of her death. In the winter of 1922 she spent several months in Europe on a special mission for the United States Department of Labor. Her death was attributed to an accident she

suffered on shipboard as she was returning to the United States. Miss Russell was thrice married before she married Alexander P. Moore, of Pittsburgh, Pa., now Ambassador to Spain, on 11 June 1912. Her first husband was Harry Braham, conductor of Edward E. Rice's 'Pinafore' company. She next married Edward Solomon, conductor of the Casino Orchestra, 10 May 1884. Her third husband was Signor Perugini, in private life John Chatterton, an operatic tenor, whom she married 22 Jan. 1894.

RUSSELL SAGE COLLEGE, a non-sectarian institution for women founded in 1916 and located at Troy, N. Y. In 1922-23 it had a faculty of 32 members, and a student enrollment of 307. Value of the institution's property and its income not disclosed. Eliza Kellas, Ph.D., is president.

RUSSELL SAGE FOUNDATION, an institution established by Mrs. Russell Sage in memory of her husband. The endowment was \$10,000,000, to which \$5,000,000 was added by will. It was incorporated by an act of the legislature of New York in April, 1907, for "the improvement of social and living conditions in the United States of America." The Foundation does not relieve individual need or duplicate the work of existing agencies. It studies and interprets facts with regard to social conditions and methods of social work, makes the information available by publications, conference, and other means of public education, and seeks in various other ways to stimulate action for social betterment. The Trustees of the Foundation are: Robert W. deForest, President; Mrs. William B. Rice, Vice-President; Charles D. Norton, Treasurer; John M. Glenn, Secretary and General Director; Frederic A. Delano, John H. Finley, Dwight W. Morrow, Louisa Lee Schuyler, and Mrs. Finley J. Shepard. The direct activities of the Foundation are carried on by eight departments. They are, with their directors, Charity Organization, Mary E. Richmond; Child-Helping, Hastings H. Hart; Industrial Studies, Mary Van Kleeck; Publication and Library, Frederick W. Jenkins; Recreation, Lee F. Hanmer; Remedial Loans; Statistics, Ralph G. Hurlin; Surveys and Exhibits, Shelby M. Harrison.

The Charity Organization Department teaches and publishes in the field of charity organization. Its studies have so far been confined to social case work, to the co-operation of social agencies and to their administrative details. 'Social Diagnosis,' by Mary E. Richmond, entered its seventh printing, in 1922, and, although written primarily for social workers, has made a wide appeal to others. A digest, 'American Marriage Laws,' by Fred S. Hall, Associate Director of the Department, and Elizabeth W. Brooke, was followed by a study of the administration of marriage laws in 83 cities, which has continued through the last three years. Recently, the Department began investigating the burden of unemployment in 15 American cities. 'What Is Social Case Work?' one of the latest publications, contains an analysis and interpretation of social work by the director.

The Child-Helping Department has begun an intensive study of the organization and administration of 100 institutions for delinquent chil-

dren. The field work in the study of schools and reformatories for boys is being done by William H. Slingerland, and for girls, by Margaret Reeves. No comprehensive study of this kind has previously been made. The Department conducted its usual service of advice and information with reference to the improved care of dependent, delinquent, neglected, and defective children, and has furnished assistance to those who were founding or reorganizing child-caring agencies. Advice has been given with reference to proposed cottage institutions for Catholic children at Cleveland, Toronto and St. Cloud, Minnesota. The Department has issued many publications on child welfare; juvenile delinquency and problems of institutional care, also other pamphlets concerning probation, methods of dealing with girls and women awaiting court action, practical prison problems, self-government in a county prison farm, a survey of Florida jails and a model plan for jails. A recent book edited by Dr. Hart, 'Plans and Illustrations of Prisons and Reformatories,' contains descriptions and illustrations of several of the best designed reformatories for minors, and proposed plans for prisons and jails, including a new plan by Dr. Hart for a metropolitan jail.

Since the World War, the Department of Industrial Studies has been engaged in a series of investigations on the participation of workers in determining policies and practices that directly affect their welfare in industry. These include an employees' representation plan in the bituminous coal mines and steel works in the West, a works' council in a Federal government plant, and a plan of employees' representation in the textile industry. A study is also being made of a well-established and apparently successful scheme for co-operative relations between management and employees in a large department store. 'The Coal Miners' Insecurity,' a pamphlet containing an analysis of the fundamental economic facts which make for unrest and inefficiency in the bituminous coal industry, was published two weeks after the beginning of the nation-wide strike in April, 1922. Facts presented led to the conclusion that unless the industry is reorganized, so as to stabilize production and make employment regular, the waste and bitterness of strikes will be unavoidable.

The Department of Recreation has considered such subjects as recreation legislation, athletics and games for school children, community use of school plants, holiday celebrations, municipal administration of recreation facilities and rural recreation. Recently the Department made experiments and demonstrations in the use of physical recreation and of music in hospitals for mental diseases and in correctional institutions. The results achieved indicate far-reaching possibilities in the use of games, drills and athletic activities as well as of music for both recreative and therapeutic purposes. Clarence A. Perry, Associate Director of the Department, has been conducting a study of the little theatre movement and is preparing a booklet on community dramatics. During 1922 the national athletic badge test standards for boys and girls were revised and extended on the basis of nation-wide experience in their use and recent progress in physical training methods. A study of recreation legislation in the United States, including

Federal and State laws and city ordinances, will aid the staff in supplying information on this subject and in providing material for a publication.

The Department of Remedial Loans makes known the evils of the small loan business; urges the passage and enforcement of adequate small loan laws; encourages the organization of remedial loan societies in co-operation with the National Federation of Remedial Loan Associations, and fosters the formation of credit unions.

During 1922, there was a continuation in various States of the effort to secure the enactment of a Small Loan Law, prepared some years ago by Arthur H. Ham, formerly director of the Department. This law requires that individuals and associations making loans of \$300 or less be licensed and supervised by State banking departments; limits interest charges to a maximum rate of 3½ per cent a month, to be computed only on unpaid balances; and forbids fees. The Department has organized and given considerable time to establishing a central organization of credit unions in New York City, has completed a study of savings and loan plans among employees, and also study of credit union developments in Massachusetts. During the year, a pamphlet was issued on 'The Progress and Improvement of Small Loan Legislation.'

The Department of Statistics assists the other departments in conducting researches and insures the accuracy of statistical material published by the Foundation. Its recent independent researches include a study of wages and changes in the cost and standards of living in the United States from 1800 to the present time.

The Department of Surveys and Exhibits has continued its study and development of methods of gathering facts concerning social conditions, of working out plans for improvement on the basis of the facts, and of presenting the findings to the public. One of the chief developments in the field of social publicity has been in securing its recognition as an important branch of social work. Progress has been made in this direction through the planning by Evart G. Routzahn and Mary Swain Routzahn of a course of study for the New York School of Social Work, the publication of a 'Reading List on Publicity Methods' and the organization of a number of conferences in connection with annual meetings of social workers and of public health workers.

Recently the field work of a comprehensive study on national, State and local public employment offices was completed. The Department participated in an exhibition and festival called "America's Making" in New York City, which celebrated immigrant contributions to the life of America. ¶

The Foundation maintains a free public library containing more than 21,000 books and 61,000 pamphlets on social problems. Recent bibliographical bulletins issued by the Library are: 'Psychological Tests in Industry'; 'Unemployment'; 'Seasonal Industries'; 'Books of 1921'; 'Social Settlements'; 'Motion Pictures'; and 'American Foundations.' The Library also has published the 'Social Workers' Guide,' listing reports of approximately 4,000 institutions, Federal, State, and municipal. The Foundation also issued in 1922 'The Settlement Horizon,' a comprehensive study of the settlement move-

ment, past and present, by Robert A. Woods and Albert J. Kennedy.

The Foundation has from time to time invested funds in social enterprises, such as the Chattel Loan Society of New York City and the National Employment Exchange, in order to start them on a sound basis and make demonstrations that would encourage similar ventures elsewhere. Some years ago, a large sum was invested in the development of Forest Hills Gardens, in Queens Borough, New York City, for the purpose of establishing a suburb that would be planned and built up in a scientific, substantial and attractive way. Purchasers of lots and houses were allowed to pay about half the value of their holdings in monthly instalments covering a period of ten years. Having accomplished its purpose, the Foundation has recently sold to a number of residents of the Gardens the stock of the Sage Foundation Homes Company, which was created to manage and develop the property.

The Foundation in 1922 appointed a committee to prepare a plan for the future development of the City of New York and the territory adjacent to it. The members are, Charles D. Norton, Chairman; Robert W. deForest, Fred-eric A. Delano, John M. Glenn, Dwight W. Morrow and Frank L. Polk. Frederick P. Keppel is secretary and Flavel Shurtleff, assistant secretary. The Foundation has made a liberal appropriation for the work and is furnishing offices in the Foundation building. But it is not expected that a project of such magnitude can be sustained by the Foundation alone.

RUSSIA, officially Allied Soviet Republics, a Federal state of eastern Europe and northern Asia, formerly an Empire. The Empire covered one-seventh of the surface of the earth, having an area exclusive of internal waters, of 8,417,118 square miles. The population was estimated at 182,182,600 in 1915. After the fall of the Empire considerable territory was ceded to the border new states together with their populations. The Soviet census of 1920 gives the total area of the Soviet Federation, together with the Far Eastern Republic (joined to the Soviet in 1922) as 8,166,130 square miles with a population of 131,546,045. For the areas, populations, production, industries, etc., of the new states once part of Russia, see articles on ESTHONIA, FINLAND, LATVIA, LITHUANIA, POLAND, etc.

The chief divisions of the Soviet Republics are:

European Russia:	Area	Population
Great Russia	1,290,440	65,751,898
Ukraine (nine provinces)	174,510	26,001,802
White Russia	23,290	1,634,223
Minor areas (Europe)	1,739,760	21,404,745
Siberia	4,210,420	9,257,825
Far East Republic	652,740	1,811,725
Associated Republics:		
Azerbaijan	33,970	2,096,973
Armenia	15,240	1,214,391
Georgia	25,760	2,372,403
Asiatic connections:		
Bokhara	79,440	3,000,000
Khiva	24,310	519,438
Mongolia	5,556,000	645,000

The chief cities of Russia are Petrograd (Pop. 1915; 2,318,645, probably less by 1,000,000

in 1922); Moscow, the capital of the Soviets, 1,050,011; Odessa, 631,040; Kharkov, 258,360; and Kazan, 195,300.

Religion.—Under the old regime the Russian Orthodox Church was the state church. This church was disestablished by the Soviet Government and certain categories of its property were confiscated. After the Revolution of 1917 it was stated that all religions might be freely professed in Russia. It soon developed that religious forms were distasteful to the governing authorities and persecution of the old hierarchy ensued. At the same time evidences were not wanting to show that the Soviet Government was attempting to set up a State Church, by combining the principles of Christianity and those of Karl Marx. This about face on the part of the authorities was due to a realization on the part of the government of the hold that the old church and the old forms of the faith had on the great masses of the people and also to the fact that the church was the most powerful obstacle in the way of the socialization of Russia. Outside the Orthodox faith it is estimated that there are 12,000,000 of other faiths, with the Roman Catholic and the Lutherans prevailing.

Education.—All education is in charge of the Commissariat of Education, whose scope is much wider than that of the Former Minister of Education. It has taken over the state theatres, the Academy of Arts, the Imperial Musical Society and other musical schools and institutions. The budget of the Department for the first nine months of 1922 was fixed at 123,000,000 gold roubles. The chief reform in the ordinary schools has been the institution of the Labor Schools. Attendance is compulsory and there are two grades in the Labor School, one for children of from 8 to 12 years and one for children of from 13 to 16 years. Lunches and all necessary equipment, books included, are provided and co-education is the rule. In the first grade the children are taught to make the school self-supporting and technical work begins in the second grade as part of the general industrial system. In 1922, it was reported that Russia had 91,500 schools with 7,200,000 children in attendance. There are 23 universities and in addition institutes of various descriptions for the special sciences. There are 57 higher pedagogical institutions with 10,305 students; 154 three-year pedagogical courses with 18,000 students; and 90 one-year pedagogical courses with 5,400 students. The campaign against illiteracy, launched in 1920, has resulted in the teaching to read and write of about 5,000,000 out of the 30,000,000 illiterate total. It is stated that only 15 per cent of the Soviet army are illiterate, as compared with 85 per cent in the Czarist armies of pre-war days.

Production.—The Soviet economic system is based on the theory of state ownership and control of the principal means of production, distribution and exchange. In October 1922 the official report of the General Council of Russian Trades Unions at their Fifth Congress in Moscow stated that the average wages of the Russian factory workers amounted to \$4 per month at that time. As the report pointed out this was a great improvement from the wage

of \$1.66 per month in March 1922. The question arose: How did the workers manage to live on a wage so low. The answer was that the difference was made up by pilfering and speculation.

It was calculated that from these two sources the workers managed to increase their ordinary earnings by an average of six shillings a month. And yet the workers, compared with pre-war conditions, received only half of the subsistence minimum.

The symptoms of a speedy recovery of Russian agriculture, while the disintegration of Russian industries was still going on, was causing great anxiety in Soviet quarters in the closing months of 1922. It is considered that if the present disintegration of the towns is not arrested the existing predominance of the proletariat in the State will have to give place to that of the peasants. Rykov, Lenin's deputy, in his address to the Trades Unions Congress, said: "The harvest of this year, which yielded between 60 and 70 per cent of the normal agricultural production of Russia, has already manifested the danger that lies in the whole system of our economy, the danger which above all threatens the working class. The danger is that agriculture is able to recover much more speedily than our industries. One year of good harvest tends to turn the general situation in our Republic in favor of the peasants as against the workers. Two or three consecutive years of good harvests will result in the economic position of the peasants out-running by far that of the working class." The measures Rykov recommended were: To increase taxation, to squeeze all other expenditure save that for big industry and transport and by all means to increase the output of the mines, to improve transport, and to revive big industries.

The final figures of the 1922 harvest in Russia, according to the Central Department of Statistics of the Soviet Government, show the yield of the principal bread crops, including oats and barley, to be 2,380,000,000 poods. (The corresponding pre-war figure is 4,000,000,000 to 4,500,000,000 poods.) The grain production of Soviet Russia comes to 1,650,000,000, and of the Soviet Ukraine to 730,000,000 poods. Calculated per head of the population, the yield in Soviet Russia is far below that of the Ukraine. In the former it comes to 21.7 poods per head, in the latter 34.5 poods. The average per head of the whole of Russia is 24.4 poods.

On the face of official figures, the average yield per head of 24.4 poods should leave a certain surplus margin above the consumption of Russia; but it should be remembered that the 2,380,000,000 poods include also the principal fodder stuffs. Therefore the average per head quoted above should be respectively diminished, as the figure 24.4 includes also the fodder stuffs, as for instance, oats and barley, etc., used for the feeding of cattle.

Industrial Production.—The following data are reproduced directly from tables published in the Moscow *Izvestiya* of 7 Nov. 1922. They show the trend of production in the principal industries in Soviet Russia, in comparison with pre-war output. It will be noted that in

several instances the figures for 1922 are incomplete.

PRODUCTION OF INDUSTRIES IN SOVIET RUSSIA DURING THE FISCAL YEARS ENDED SEPTEMBER 30, 1913 AND 1922.

COMMODITIES PRODUCED	1913	1922
Coal, poods ¹	1,738,000,000	591,270,000
Petroleum, poods.....	564,000,000	274,265,000
Ore mining (iron and manganese), poods.....	638,400,000	13,478,000
Salt, poods.....	121,800,000	43,951,000
Pig iron, poods.....	257,400,000	10,184,636
Open-hearth ingots, poods.....	259,300,000	19,314,560
Rolling-mill products, poods.....	214,200,000	15,248,660
Locomotives, new, number.....	609	102
Railroad cars, new, number.....	20,492	842
Plows and harvesters, number.....	778,000	47,032
Electrical machinery and supplies, gold rubles.....	42,211,000	11,109,800
Cotton yarn, poods.....	16,000,000	2,712,000
Woolen yarn, poods.....	2,400,000	654,300
Flax yarn, poods.....	2,093,000	962,846
Silk fabrics, arshins ²	60,000,000	2,469,000
Tanning, hides.....	16,500,000	6,300,000
Boots and shoes, pairs.....	54,880,000	3,001,000
Rubber materials, gold rubles.....	78,000,000	28,103,000
Rubber shoes, pairs.....	20,000,000	4,041,000
Paper, poods.....	9,100,000	1,622,000
Matches, cases.....	3,803,000	701,266
Basic chemicals:		
Acids, poods.....	15,571,000	2,916,710
Alkalies, poods.....	12,014,000	2,532,800
Drugs, kilos.....	5,000,000	959,475
Sugar, poods.....	82,806,000	10,000,000
Tobacco, funts ³	23,790,000	16,015,000
Glass, poods.....	11,200,000	919,717
Alcohol, vedros ⁴	200,874,000	4,872,500

¹ 1 pood = 36.1 pounds; or, approximately, 62 poods = 1 long ton.

² 1 arshin = 28 inches.

³ 1 funt = 0.9 pound.

⁴ 1 vedro = 2.7 imperial gallons, or 3.25 United States gallons.

⁵ For eleven months.

⁶ For nine months.

⁷ For the crop year; estimated on the strength of refineries' reports as published up to 31 December.

Soviet Land Policy.—The land policy of the Soviet Government since the Revolution is a story of perpetual attempts to bring about some harmony between the divergent interests and inclinations of the industrial and agricultural classes.

In the years following the land-socialization policy, there was a marked decrease in the area under cultivation. Whatever the causes of this decline, the prevailing opinion, even among Bolsheviks, seems clearly to have been that something was radically wrong with the Government policy, and the Government has been forced by circumstances to take two highly important steps in the reversal of that policy.

The first step, in the spring of 1921, was a virtual abandonment of the principle that the entire product of the farms belonged to the State. All peasants who paid promptly and fully a fixed tax-in-kind were given the right to dispose of any surplus in any manner they chose. This was followed by a series of measures cutting down the number of commodities subject to tax in kind from 13 to 4—cereals, hay, meat and butter—reducing somewhat the total quantity to be taken, and more clearly defining the method of assessment and collection. The second step, taken in the spring of 1922, was a complete revision of the fundamental law of land possession. While it re-

iterates the basic principle that the land belongs to the State and repeats the prohibition against the purchase, sale, and mortgage of land, it completely abandons the idea that "all forms of individual use of the land should be regarded as merely temporary and doomed to disappearance." The peasants are given not the technical ownership but the actual possession of the land. The old village communities are allowed to continue their practice of permanent group possession with repartition from time to time to their members for actual use. At the same time the individual peasant family may break away from these communities and acquire direct possession, perpetual and hereditary.

In short, the law is a distinct recognition of the individualistic tendencies of the mass of the peasants, coupled with a continued attempt to guard against any return to economic inequality in land possession. The new system of land taxation, which is markedly graduated in character, helps toward the same end of maintaining a social equilibrium.

Commerce.—During the first three quarters of 1922¹ the import trade of Soviet Russia, exclusive of contributed relief supplies, was valued (on the basis of 1913 price averages for the respective commodities) at 223,773,000 pre-war rubles; this compares with imports for the corresponding period of 1921, valued at 187,500,000 pre-war rubles. The exports for the first nine months of 1922 covered goods to the value of 53,700,000 pre-war rubles, in comparison with values for the 1921 period approximating 10,000,000 pre-war rubles.

The distribution of this foreign trade over the various months and quarters is shown in the following table:

MONTH, 1922	Quantities, long tons	Values, in gold rubles ²
IMPORTS		
January.....	63,400	11,034,000
February.....	67,700	11,954,000
March.....	158,700	16,462,000
April.....	249,800	38,410,000
May.....	293,900	40,596,000
June.....	239,400	34,445,000
July.....	200,000	24,351,000
August.....	236,900	22,439,000
September.....	168,500	24,082,000
Total.....	1,678,300	223,773,000
EXPORTS		
January.....	16,700	4,447,000
February.....	3,300	1,675,000
March.....	7,400	2,708,000
April.....	24,700	4,506,000
May.....	118,300	7,363,000
June.....	67,600	4,105,000
July.....	77,900	7,992,000
August.....	147,600	13,653,000
September.....	133,100	7,273,000
Total.....	596,600	53,722,000

¹ The Soviet Russian fiscal year ends 30 September. For analysis of the trade covering January-June, 1922, see "Commerce Reports," November 27, 1922, p. 561.

² Value of gold ruble = \$0.515.

According to *Economic Life* of 3 January, the value of imports for October was 24,652,000 gold rubles; of exports, 12,107,000 gold rubles.

The following comparison for two of Russia's principal purchasing markets shows the change in the character of commodities imported in 1912 and 1922, respectively:

COUNTRY OF ORIGIN	Millions of pre-war rubles, 1912	Millions of pre-war rubles, Jan.-Sept., 1922
Germany:		
Foodstuffs.....	39.8	6.8
Raw materials and semimanufactures.....	212.3	4.7
Manufactures.....	235.4	37.8
Total.....	487.5	49.3
Great Britain:		
Foodstuffs.....	14.0	5.6
Raw materials and semimanufactures.....	98.4	3.7
Manufactures.....	42.5	17.4
Total.....	154.9	26.7

In the House of Commons, on 27 Nov. 1922 the president of the Board of Trade gave out the following statement, showing the values of trade between the United Kingdom and Russia in the year 1921 and in the nine months ended 30 Sept. 1922:

ITEMS	Year 1921	January-September, 1922
Imports into the United Kingdom from Russia.....	£2,694,674	£3,189,898
Exports of produce and manufactures of the United Kingdom to Russia.....	2,181,007	2,756,022
Re-exports of foreign and colonial merchandise to Russia.....	1,210,283	622,894

Finance.—According to a report submitted by the Soviet delegation at The Hague the Government expenditures in 1921 totaled 16,700,000,000,000 rubles, and 16,375,000,000,000 of new currency were issued; thus 98 per cent of the budget was met by printing money. Revenue and expenditure of the Soviet Government in Russia, as stated in Soviet paper rubles, show, on the basis of official Russian reports, the following monthly changes during 1922 up to 1 Dec. 1922. The enormous increase in both revenue and expenditure is attributable to the exceedingly rapid depreciation of the paper ruble.

The monthly figures are as follows: each is in terms of millions of rubles—that is to say, the six last ciphers of each sum are omitted:

(000,000 omitted)			
	Revenue	Expenditure	Deficit
January....	1,166,000	13,771,000	12,005,000
February....	2,882,000	21,101,000	18,219,000
March.....	6,763,000	39,622,000	32,859,000
April.....	13,431,000	60,065,000	46,634,000
May.....	25,177,000	110,969,000	85,792,000
June.....	60,580,000	167,428,000	106,848,000
July.....	92,943,000	247,239,000	154,296,000
August.....	122,614,000	343,962,000	221,348,000
September...	195,411,000	412,977,000	217,566,000
October.....	205,949,000	510,074,000	304,123,000
November...	320,361,000	686,759,000	366,398,000
Total..	1,047,277,000	2,613,967,000	1,566,690,000

Railways.—The total rail mileage is placed at 34,000, much of it in bad condition and with defective rolling stock. The percentage of unsound locomotives had mounted at the end of May 1922 to 66 per cent (12,607 out of a total of 19,093), instead of the 16 to 18 per cent average of pre-war days and the 57 per cent of May, 1921. Matters were even worse with

freight cars; at the end of May, although 192,000 were counted under "operating stock" out of a total number of 392,000, there were so few cars left on the tracks fit for transporting any valuable cargo that, notwithstanding the closing of the seed and potato shipments, there was still a shortage of sound cars for moving freight from the ports.

Foreign Investments in Russia.—On the basis of statements by the Soviet Government, the *Economiste Européen* of Paris publishes the following calculation of capital invested in Russian industry by foreign countries prior to the war. The first column gives the amount actually invested, classified by countries from which the capital was sent. The second column gives the Soviet statement as to the portion of such investments which had been "nationalized" by the Soviet itself. The sums are in gold rubles, at the rate of 51 cents per ruble:

	Invested	Nationalized
France.....	731,746,600	648,089,700
England.....	507,479,800	500,563,500
Germany.....	441,593,200	317,475,500
Belgium.....	321,602,500	311,812,500
United States.....	117,750,000	117,750,000
Holland.....	35,486,700	30,456,700
Switzerland.....	33,479,100	31,606,700
Sweden.....	23,779,300	16,647,700
Denmark.....	14,737,700	14,537,700
Austria.....	7,550,000	5,900,000
Norway.....	2,300,000	2,300,000
Finland.....	2,000,000	2,000,000
Italy.....	2,106,200	2,106,200

Classified by industries in which such investments of capital had been made, the same statement shows that out of a total foreign industrial investment of 2,242,974,100,000 Soviet rubles, 834,320,100,000 was placed in the mining and metallurgical industry, 392,709,600,000 in metal-working establishments, 259,430,900,000 in city property and structures, 237,200,000,000 in banking establishments, 192,494,000,000 in the textile industry, and the rest, in smaller amounts, chiefly in chemical industry and general manufactures.

Defense.—On 12 Oct. 1922 at Moscow, War Minister Trotsky stated that the Red Army was then 800,000 strong. Two days later the Associated Press reported from the same city that Russia had 1,600,000 men under arms, mainly concentrated along the western frontier from the Baltic to the Black Sea. These figures, it was stated, were brought out in connection with the conference then being held by the Baltic states at Reval, in preparation for taking part in the Moscow disarmament congress proposed by the Russian Foreign Minister. The Soviet Army has about 10 squadrons of 15 battle planes each. The air service is reported as efficient as that of any other army. During the summer of 1922 the Government reorganized and rehabilitated the Black Sea fleet and also that in the Baltic. There are four battleships of the Dreadnought class, three older battleships, four battle cruisers, five armored cruisers, eight light cruisers, 80 destroyers, and 19 submarines. Several light cruisers are reported building in the Black Sea.

Government.—The Russian state is a free Socialist community of all the labor classes of

the country. To protect the conquests of the recent Revolution military service is universal. The highest authority in Russia is the all-Russian Congress of Soviets, made up of representatives of the town Soviets and of Provincial Congresses of Soviets. The Congress elects the Central Executive Committee of 300 members, in whose hands lie the supreme legislative, administrative, and controlling body of the State. This Central Committee forms a Council of People's Commissaries for the general administration. At a meeting of the newly-elected All-Russian Executive Committee, held in the Kremlin, Friday, 29 Dec. 1922 the following members of the Council of the People's Commissars were unanimously elected: President of the Council of Commissars, Nikolai Lenin; first vice-president, M. Rykov; second vice-president, M. Tsurupoff; third vice-president, Leo Kamenef; commissar for education, M. Lunacharsky; foreign trade, Leonid Krassin; finance, M. Sokolnikoff; nationalities, M. Stalin; labor, M. Schmidt; food, M. Brukhanoff; war and navy, Leon Trotzky; communications and interior, M. Djerjinsky; posts and telegraphs, M. Dvornalevsky; health, Dr. Semashko; foreign affairs, George Tchitcherin; justice, M. Kursky; Agriculture, M. Yakovenko; inspection of workers and peasants, M. Tsurupa; president of the Supreme Economic Council, M. Bogdanoff.

History.—The famine continued to occupy the front rank of national problems at the beginning of the year. Saratov was the worst famine district and here the American Relief Administration (q.v.) by January had organized so that it could at least save the children of this region. The situation became so serious that on 9 February the Soviet Government resolved to empower the Minister of Justice to seize the wealth of all religious bodies and sects for famine relief. This was the first attempt at the expropriation of the Church by the Soviets. Reports of terrible conditions in the Volga region continued to reach western Europe and America. The total number of famine-stricken was estimated at between 12,000,000 and 15,000,000. Typhus was decreasing and in many places had not been as bad as in 1919. Cholera had appeared in Kiev, Ekaterinoslav and Voronezh, and a new cholera epidemic was feared in the Spring. On 17 March a grant of £1,100,000 was made by the British Parliament for additional food relief to the Russian famine areas. Violence was threatened in many places to the Soviet collectors of church treasure and rioting occurred in Kasan and Shuja.

Politically the outstanding event of the year was the participation of the Soviet Government in the Genoa Conference. The delegation, headed by the Foreign Minister, George Tchitcherin, reached Riga on 29 March on the way to Genoa. There they discussed matters of common interest with delegates from the border states gathered for the Baltic Conference. The details of the Genoa Conference are dealt with in a separate article (q.v.). Perhaps the greatest result of the conference was the conclusion of the Russo-German Treaty of Rapallo, as a result of which the conference was almost broken up. This agreement was the first step toward a close

union between Russia and Germany, and diplomatic relations between these countries were resumed late in April. On 1 May a great review of the Red Army took place in Moscow under the walls of the Kremlin. Fully 100,000 troops marched in review before the Minister of War, followed by hundreds of thousands of workers of both sexes. The Minister of War, Trotsky, in his address, commented on the developments of the Genoa Conference. He declared the Allied nations insisted on conditions to which Russia would never yield. "We offered to disarm," he said "but the Allies did not want that. We offered to bargain, we offered to pay pre-war debts, but they declared that they would recognize us only if we abolished Soviet Russia and restored capitalism. We answered 'No' and will always answer 'No'!" The resistance of the Church to the requisition of church treasure continued throughout the spring and early summer. Several clergymen and laymen were tried and sentenced to death or to terms of imprisonment for opposition to the requisitioning. A formal order for the trial of the Russian Patriarch, Archbishop Tikhon, was issued on 6 May on the charge of opposing the requisitioning of church treasure for famine relief. A revolt in Georgia progressed through March and April to the point where it necessitated a strong offensive to suppress it. The Georgians sent a special mission to Genoa to voice their grievances and their position was stated to one of the commissions. When the Genoa Conference came to an end, M. Tchitcherin remained together with M. Rakowski to bring about the negotiations for a trade treaty with Italy. This was successfully accomplished. The other Russian delegates departed for Berlin there to complete arrangements under the Rapallo Treaty for German aid in the economic reconstruction of Russia. Several plans to operate through syndicates were announced in May. One result of the Genoa Conference was the withdrawal by the Soviet Government of its troop concentration on the frontiers of Bessarabia, caused by the request of Rumania at the conference and especially by the guarantee of France to Rumania of her possession of Bessarabia. The struggle with the Church went on with the greatest bitterness. Early in May 12 priests were condemned to death for opposing the requisitions of treasure. Tikhon, the Patriarch, was forced to resign by a committee of clergy headed by Bishop Antonin, who were in league with the authorities. Tikhon announced his resignation on 17 May and at once returned to private life. Pope Pius XI protested on 26 May to the Moscow Government against the prosecution of the Patriarch, and a protest was also sent by some members of the Church of England. The reply of Lenin on 7 June affirmed the purpose of the government to prosecute Tikhon and other ecclesiastics for their resistance to measures aimed to save the lives of millions, and declared that Tikhon and his followers had always worked with Tsardom and the nobility. About this time reports reached the outside world of the rifling of the tombs of Russia's ancient rulers. Scores of protests were made against this desecration of the tombs of the Tsars but without avail. On 8 June the Social Revolutionary trial got under way in Moscow. Several men had been accused

of conspiracy to murder the more prominent Soviet leaders. The great international Socialist leaders were engaged as counsel for the accused. The first session was very stormy. New property rights within certain limits were recognized by a decree early in June and marked a partial return to the capitalist system. Lenin was stricken with apoplexy and for many days his condition was serious. He retired to the country to recuperate. On 4 June a chapter of Russian history was closed in the United States when Boris Bakhmetieff, Kerenski's ambassador to the United States, submitted his resignation to Secretary of State Hughes. The trial of the Social Revolutionaries came to an end on 7 August with the condemnation to death of a main group charged with counter-revolution and long terms of imprisonment for the others. On the following day the death sentences were suspended on condition that all anti-Bolshevik activity should cease. The determination of the Government to stamp out all opposition at home was evidenced by the wholesale arrests of intellectuals which were taking place in all parts of Russia during the summer months. Many well-known university professors, persons suspected of Monarchist tendencies, or anti-Soviet in their political views, the lawyers who defended the Social Revolutionaries at their trial, were included. In all about 2,000 intellectuals were to be exiled. On 1 September official figures showed that Soviet Russia, operating through the dreaded Cheka (Secret Police) had caused more people to be killed than all Russia lost during the World War. According to the figures published the Cheka executed 1,766,118 persons, including 6,775 professors, 8,800 physicians, 355,250 other intellectuals, 1,243 priests, 54,650 officers, 200,000 soldiers, 50,000 policemen, 12,950 workmen and 815,100 peasants. Both in Germany and in Russia there was great disappointment of hopes reposed in the famed Rapallo Treaty. The Commission of Commerce and Marine of the American Bankers' Association issued a pamphlet on 21 August marshaling exhaustive evidence to show that conditions in Russia were at that time wholly unfavorable for the resumption of commercial relations. In view to such resumption the Washington administration authorized Ambassador Houghton at Berlin to inquire of Krassin and Tchitcherin there whether the Soviet Government would sanction the admission of an American Technical Commission to study the present economic condition of Russia. Krassin's answer was in the affirmative on condition that Russia be allowed to send a similar commission to the United States. This reply was unsatisfactory to Washington.

Early in October Lenin returned to active participation in the affairs of the Soviet Government. Three problems faced him: how to encourage foreign investments, how to improve the economic situation, and how to protect Russian interests in the Near East. One of his first official acts was to impose his veto against the ratification of the Urquhart Agreement—the agreement negotiated by Leonid Krassin with the Russo-Asiatic Consolidated, Limited, controlled by the Urquhart interests—for the return of their mining properties in Siberia. Lenin vetoed this agreement on the ground that the economic advantage to Russia was debatable

and politically it was futile because of the attitude of Great Britain in the Near East. The agreement, signed 10 September, provided for the complete restitution of the English corporation's properties with compensation for confiscations made by the Soviets, the total claims aggregating \$280,000,000. The land to be returned covered 2,500,000 acres and a new 99-year lease was to be granted by the central Soviet Government. M. Litvinov stated the veto of the Urquhart agreement was caused by the pronounced hostility of Great Britain in the Near East question. Russia was very anxious to be admitted to the Near East Conference. On 15 September the Moscow Government sent a strong note to the British High Commissioner at Constantinople protesting at the Allied control of the Turkish capital, and, more especially, of the Straits, "irrespective of and to the injury of the rights of Turkey, Russia, the Ukraine and Georgia, which are vitally interested in free communication between the Black Sea and the Mediterranean." Further, the note demanded the return of Constantinople to the Turks, "whose victorious struggle for freedom Russia warmly salutes and supports." From this note it was evident that the Russian government voiced the traditional policy of old Russia for an outlet to the sea. They further emphasized the rights given them under the treaty concluded with Turkey in 1921 and openly proclaimed their sympathy with the Turkish cause as opposed to British policy in the Near East. On 26 September Moscow sent another note, addressed to England, France, Greece, Italy, Rumania, Yugoslavia, Egypt and Bulgaria, proposing a general conference to settle the Near East situation, especially the disposition of the Straits, and declaring that Russia would refuse to recognize any decision in which the Russians were not allowed a voice, and denouncing Great Britain's "usurpation" of the Straits. Another note was sent to Great Britain, Italy and France on 1 October protesting against the Allied blockade of the Black Sea, and asserting the right of Russia to representation at the Mudania Conference. Mustapha Kemal, the Turkish Nationalist leader, in his reply to the Allied representatives on 5 October, supported the Russian contentions. In a letter to the Congress of Trade Unions on 19 September Lenin stated that the refusal of the capitalistic states to give Russia credit was hampering the restoration of industry, but that the insistence of the foreign powers on the restoration of private ownership in Russia would prove futile. The expectation of a large grain surplus from the harvest did not materialize, and at the approach of winter there was much cause for disquiet. In the autumn the deportation of the intellectuals was carried out ruthlessly, while trials and executions for counter-revolutionary activity were occurring at various places. The expropriation of the Church treasures gave rise to a schism. The new church group headed by Antonin termed their church "The Resurrection Church" and looked on the old church as "The Dead Church." The latter, however, was by no means dead, and still retained its old place in the hearts of the common people. The Resurrection Church was itself split by schism, when a new organization, headed by M. Novakoff, was

formed on 11 October. This cult sought a reversion to the practices of the early Christians.

The fifth anniversary of the Bolshevik revolution of 7 Nov. 1917 was celebrated with great éclat in Petrograd on 5 November and in Moscow on 8 November. The Moscow celebration was in the nature of a welcome to the delegates of the Congress of the Third International. The whole city was ablaze with crimson flags. Trotsky, the War Minister, addressed the crowds, declaring that Russia had a big army and a good army, but that she was ready to disarm if other nations disarmed. A review of 20,000 men then took place with the Communist youths, sailors and cadets in the procession. Foreign observers were impressed with this striking evidence of Russia's strength and vital spirit after five years of Soviet rule.

There was but slight change in the political situation during the autumn. Russia continued to insist on admission to the Lausanne Conference on equal terms with the Allied nations and Turkey, and late in October sent a note to the British Government complaining of the failure of the latter to reply to several notes upon this subject of such vital importance to Russia. There was a curious rapprochement between Russia and France, the first indication of which was an arrangement concluded in October for the admission of a Russian Red Cross mission to France to supervise the repatriation from France of former Russian soldiers. The second was the sending of a French economic mission to Moscow headed by Eduard Herriot, Mayor of Lyons and leader of the Radical Socialist Party. The mission returned to Paris on 16 October and was enthusiastically received by officials and by the press of the capital. M. Herriot declared the moment was favorable for a resumption of relations with Russia. He said that Russia's claims regarding the Turkish Straits must be considered and Russia must be helped in reconstruction and given an opportunity to pay her debt.

The Congress of the Third International met in Moscow early in November and opened with the pageant and review incident to the fifth anniversary celebration of the Bolshevik regime. On 13 November Premier Lenin addressed the delegates from the dais in the great throne-room of the Kremlin, explaining why Russia had abandoned its revolutionary system, had rejected Communist principles and reverted to state capitalism. He said that the government had started transformation too fast, without the backing of sufficient force, and had become like an army that had gotten too far in advance of its base. In order to retain power the Communist majority had to satisfy the peasants and the small bourgeoisie that comprise the vast numerical majority of the country, and who were protesting against the system imposed by the Communists. Therefore, small industry and commerce were permitted to be created privately, though great industry was still backward. For this latter money was needed, at least 100,000,000 gold roubles, and but 20,000,000 gold roubles were available. To maintain the success of the Red revolution, he said that the proletariat class must retain power by remaining masters of the capitalism that is given admission. The land of

Russia still belongs to the state and the basic industries are in the hands of the state. Where mixed companies are formed, "half state and half foreign or native capitalists, the state retains control of them and after using them to acquire commercial knowledge, can dissolve them at will. Thus there is no danger in close association with the capitalist enemy." In the meantime, the Premier advocated the most rigid economy even in such branches as education, which the state was most anxious to develop—from political understanding down to the simple knowledge of how to read and write. Through education Soviet theories are to be extended and expansion forced so that capitalist countries and their peoples may know what a proletarian revolution really means.

Early in November the change in the national title from "Russian Socialist Federated Republic" to the "Allied Soviet Republics" took place, when the All-Russian Soviet Executive adopted a resolution, introduced by the Ukrainian Soviet Government, providing for a "centralized organization of the Allied Soviet Republic," doing away with the illusion of independence and autonomy, with which the various federated republics had been labeled. The change necessitated new supplementary treaties between Soviet Russia, Soviet Ukraine, Soviet White Russia, the Transcaucasian Republic, and the late Far East Republic. The last named state decided to abolish itself on 17 November and join the Moscow Soviet, and selected 15 delegates to the all-Russian Red Congress. As a consequence, the diplomatic negotiations pending between China and Japan had to be resumed with the central government at Moscow. Under the new system the Moscow Government alone deals with all matters relating to foreign affairs, the army, navy, economic life and finances of all units that had comprised the old Federation. The Central Executive Committee, to which a number of representatives of the former "independent" states are admitted, acts as the "Supreme Government Executive Organ." The former "independent" federated republics are permitted independent administration merely of their "national cultural needs"—education and social welfare.

On 2 December the Disarmament Conference between Russia and the Border States was opened in Moscow. Maxim Litvinov, chairman of the Russian delegation, surprised the assembly by his proposal (1) to reduce the Russian army to 200,000 men in the next 18 months, provided the border states agreed to proportionate reductions; (2) to limit strictly military budgets to a certain sum per soldier; (3) to establish a zone of neutralization on the frontiers between Russia and her neighbors in order to prevent the recurrence of frontier clashes which in the past have constituted a grave menace to peace. He added that Russia regretted being unable to make proposals for naval limitations, but that the Russian fleet was already reduced to one-quarter of its 1917 strength. Latvia and Lithuania agreed in principle to the proposal, as did Finland. The delegates from the last named pointed out that the inequality of Russia and her neighbors in size rendered the scheme for the reduction of armies extremely difficult. They advised therefore the establishing of a joint arbitra-

tion board to settle all disputes. By 8 December the conference had settled practically all the clauses of the proposed treaty. Territorial questions were expressly excluded at the instance of the Polish delegation. It was also admitted by Moscow that Poland because of the difficulty of her position between Germany and Russia could not readily accept the full disarmament program.

At the end of the year plans for a new trade ministry were under way. The Russian banks also were extending their operations abroad through European and Russian banking houses. On 22 November, at Paris, the "Supreme Council of Russian Monarchists" completed a five-day session in the course of which Grand Duke Nicholas was elected successor to the late Tsar, Nicholas II. On 12 March 1923 it was officially announced at Moscow that Lenin had suffered another stroke. It was evident that his condition was regarded as critical.

Several clergymen of the Roman Catholic Church, including Archbishop Zepliak and his Vicar-General Mgr. Butchkawiez, were placed on trial at Moscow during Holy Week, were found guilty of teaching and preaching in defiance of the Soviet law, and the archbishop and vicar-general were sentenced to death. Strong representations were made by churches, governments and societies against the carrying out of the sentences, with the result that the sentence of Archbishop Zepliak was commuted to imprisonment, but Vicar-General Butchkawiez was executed 31 March. The execution caused a revulsion of feeling throughout the world against the Soviet system. The protestations alarmed the Soviet leaders, who began to think that they had overreached themselves. On 1 May 1923 it was reported that the panicky actions of the Bolshevik leaders were due to the death of Lenin. It was said that his death was being kept secret lest an uprising occur among the populace.

RUSSO-GERMAN TREATY. See PEACE AND ARBITRATION, INTERNATIONAL; REPARATIONS.

RUST COLLEGE, a Methodist Episcopal co-educational institution for colored students, founded in 1866 and located at Holly Springs, Miss. In 1922-23 it had a faculty of 27 members, 476 students, property valued at \$225,000, and an income of \$50,000. M. S. Davage, is president.

RUTGERS COLLEGE, and the State University of New Jersey, an educational institution, founded in 1766 and located at New Brunswick, N. J. The college is for men but as part of the university there is the New Jersey College for Women, with different grounds and buildings. In 1922-23 it had a faculty of 98 members, a student enrollment of 800 in college, and 2,700 in the university. The institution's property was valued at \$2,000,000, and its income amounted to approximately \$600,000. W. H. S. Demarest, D.D., LL.D., is president.

RYE. The rye crop of the United States in 1922 was estimated by the Department of Agriculture at 95,497,000 bushels valued at \$66,085,000, as compared with the 1921 crop of 61,675,000 bushels valued at \$43,014,000 and the 1920 crop of 60,490,000 bushels valued at \$76,693,000.

The acreage for the three years was as follows: 1922, 6,210,000; 1921, 4,528,000; 1920, 4,409,000. The average yield per acre during the three years mentioned was 15.4 bushels in 1922, 13.6 bushels in 1921 and 13.7 bushels in 1920. The average price on 1 December was 69.2 cents per bushel in 1922, 69.7 cents per bushel in 1921 and \$1.45 per bushel in 1920. Production in bushels in the leading rye-growing States in 1922 was as follows: North Dakota, 24,506,000; Minnesota, 21,926,000; Michigan, 8,294,000; South Dakota, 7,902,000; Wisconsin, 7,139,000; Illinois, 4,096,000; Indiana, 3,816,000; Pennsylvania, 3,740,000.

The world rye crop in 1922 was estimated by the United States Department of Agriculture as 770,152,000 bushels produced in 18 countries, figures for which were available. The same countries in 1921 produced 770,603,000 bushels. No statistics, it was stated, were available for Russia, Austria, Denmark, Greece, Norway and most of the countries of the southern hemisphere. The German rye crop of 1922 was estimated by the International Institute of Agriculture at Rome at approximately 210,580,000 bushels or 57,070,000 bushels less than the 1921 crop. France's rye crop was placed at 37,600,000 bushels, compared with 44,392,000 bushels in 1921. An unofficial estimate placed the rye crop of Yugoslavia at 7,090,000 bushels, an increase over the 1921 crop of 5,770,000 bushels.

RYERSON, Edwin Warner, American surgeon: b. New York, N. Y., 14 March 1872. In 1897 he was graduated with the degree of M.D. at Harvard University and in 1897-98 was house surgeon at the Boston Children's Hospital. Thereafter he made postgraduate studies in Berlin and Vienna. Dr. Ryerson has been in practice in Chicago since 1899. He is orthopedic surgeon of the Presbyterian and Children's Memorial hospitals and of the Home for Destitute Crippled Children. He is also associate professor of surgery at Rush Medical College. In February 1911, Dr. Ryerson was appointed first lieutenant in the Medical Reserve Corps and was advanced to the rank of captain in July 1917. From 27 Aug. 1917 to 7 Aug. 1919 he was major in the Medical Corps of the United States Army. Dr. Ryerson is member of the American Medical Association, of the American Orthopedic Asso-

ciation, of the Chicago Medical Society, the Chicago Orthopedic Society and fellow of the American College of Surgeons.

RYLAND, Robert Knight, American artist: b. Grenada, Miss., 10 Feb. 1873. In 1892 he was graduated at Bethel College, Kentucky, with the degree of A.B. From 1894-1900 he studied at the National Academy of Design and at the Art Students' League, New York. He was awarded the Lazarus scholarship for mural painting, spending the years 1903-05 in Rome. From 1908 to 1919 he was instructor in drawing at Cooper Union, New York City. Mr. Ryland is member of the Architectural League of New York and of the American Society of Mural Painters.

RYNEARSON, Edward, American educator: b. near Farmland, Ind., 23 June 1867. He was educated at Ohio Wesleyan University from which he was graduated with the degree of A.B. in 1893, receiving the degree A.M. therefrom three years later and the degree D.Ped. in 1919. In 1895-96 he studied biology at the University of Chicago. Dr. Ryneerson spent seven summers at the Marine Biological Laboratory at Woods Hole, Mass., and one summer at the Columbia University. In 1893-95, Dr. Ryneerson was teacher of biology at Steele High School, Dayton, Ohio; from 1896-98 professor of biology at Central High School, Pittsburgh; head of academic department of Pittsburgh High School from 1898-1902 and director of the high schools of Pittsburgh from 1902-12. Since 1912 he has been principal of the Fifth Avenue High School of Pittsburgh and since 1917 has been director of vocational guidance. In 1908 he was sent by the Board of Education of Pittsburgh to visit the schools of Great Britain and the Continent. Dr. Ryneerson is member of the National Society for the Study of Education, of the National Education Association, of the Pennsylvania State Teachers Association, of the Pittsburgh Academy of Science and Art and of the National Association for Vocational Guidance, serving as president of the last-named in 1922. He has published: 'Wild Animals Pittsburghers Should Know' (1901); and collaborated in 'Elementary Lessons' and 'Laboratory Manual' in science.

S

SACRED HEART, College and Academy of the, a Catholic educational institution for women, founded in 1869 and located at Cincinnati, Ohio. In 1922-23 it had a faculty of 15 members, 132 students, and property valued at \$500,000. Rev. Mother Mary Nolan, A. M., is president.

SACRED HEART, College of the, a Roman Catholic educational institution for women, located in Manhattanville, New York City. It was incorporated as an academy in 1847, and as a college in 1917. In 1922-23 the faculty numbered 17 and the student body 124. No statistics regarding the property value and income were available. Madam Ruth Burnett is president.

SAILPLANE. See AERONAUTICS.

SAINT ANSELM'S COLLEGE, a Catholic educational institution for men, founded in 1889 and located at Manchester, N. H. In 1922-23 it had a faculty of 14 members, and an enrollment of 100 students. Information not available as to the value of institution's property or its income. Rt. Rev. Abbott Ernest, D.D., O.S.B., is president.

SAINT BENEDICT'S COLLEGE, a Catholic educational institution for men, founded in 1858 and located at Atchison, Kan. In 1922-23 it had a faculty of 31 members, 370 students, and property valued at \$630,000. Income figures not given. Rt. Rev. Martin Veth, O.S.B., S.T.L., LL.D., is president.

SAINT BERNARD COLLEGE, a Roman Catholic educational institution for men, founded in 1892 and located at Saint Bernard, Ala. In 1922-23 it had a faculty of 26 members, and a student enrollment of 160. Value of the institution's property and its income not given. Rt. Rev. Bernard Menges, O.S.B., is president.

SAINT BONAVENTURE'S COLLEGE AND SEMINARY, a Roman Catholic educational institution for men, founded in 1856 and located at Saint Bonaventure, N. Y. In 1922-23 it had a faculty of 35 members, 570 students, and property valued at \$1,500,000. Income figures not given. Very Rev. Thomas Plassmann, O.T.M., is president.

SAINT CATHERINE, College of, a Roman Catholic educational institution for women, founded as a senior college in 1911 and located at Saint Paul, Minn. In 1922-23 it had a faculty of 35 members, 318 students, property valued at \$735,000 and an income of \$139,000. Sister Antonia, A.M., is president.

SAINT ELIZABETH, College of, a Catholic educational institution for women located at Convent Station, N. J. It was founded 29 May 1900. Statistics for the scholastic year 1922-23 show a faculty of 36 members with a student enrollment of 215, and property valued at \$828,780. Income figures for the year are not available; the income during

1921-22 was \$114,107.75. Sister Marie José Byrne is dean.

SAINT GREGORY'S COLLEGE, formerly the Catholic University of Oklahoma, an educational institution for young men and boys, founded in 1915 and located at Shawnee, Okla. In 1922-23 it had a faculty of 12 members, 125 students, property valued at \$400,000 and an income approximately \$30,000. Rev. D. Blaise, O.S.B., is president.

SAINT HELENA, a volcanic island of the South Atlantic, 1,200 miles from the west coast of Africa. Its area is 47 square miles and in 1921 it had a population of 3,747. The island belongs to Great Britain and is famous as the place of exile of Napoleon Bonaparte. The capital is Jamestown. In 1920 the island revenue was £13,126 and the expenditure £12,175. Exports the same year were valued at £41,857 and imports at £67,441. The Governor in 1922 was Col. R. F. Peel.

SAINT IGNATIUS COLLEGE, a Catholic educational institution for men, founded in 1855 and located at San Francisco, Calif. In 1922-23 it had a faculty of 24 members, and 230 students. Information regarding valuation of property and income not given. Rev. Pius L. Moore, S.J., is president.

SAINT JOHN'S COLLEGE, a non-sectarian educational institution for men, founded in 1696 and located at Annapolis, Md. In 1922-23 it had a faculty of 17 members, 202 students, property valued at \$700,000 and an income of \$90,000. Thomas Fell, Ph.D., LL.D., L.H.D., D.C.T., is president.

SAINT JOHN'S UNIVERSITY, a Catholic educational institution for men, founded in 1857 and located at Collegeville, Minn. In 1922-23 it had a faculty of 38 members, 462 students, property valued at \$1,125,000 and an income of \$225,000. Rt. Rev. Alcuin Deutsch, is president.

SAINT JOHN'S UNIVERSITY, a Catholic educational institution for men, founded in 1898 and located at Toledo, Ohio. In 1922-23 it had a faculty of 34 members, 313 students, and property valued at \$499,000. Income figures not given. Rev. Francis X. Busch, S.J., is president.

SAINT JOSEPH'S COLLEGE, a Roman Catholic educational institution for men, founded 1851; chartered 1852, and located at Philadelphia, Pa. In 1922-23 it had a faculty of 18 members and a student enrollment of 116 in college, and 602 in high school. Value of institution's property and its income not given. Rev. Albert G. Brown, S.J., is president.

SAINT KITTS, NEVIS AND SAINT CHRISTOPHER. See LEEWARD ISLANDS.

SAINT LAWRENCE CANAL. See PEACE AND ARBITRATION, INTERNATIONAL; CANALS.

SAINT LAWRENCE UNIVERSITY, a non-sectarian, co-educational institution, founded in 1856 and located at Canton, N. Y. In 1922-23 it had a faculty of 69 members (including the Brooklyn Law School), and a student enrollment of 1,656. Valuation of the institution's property and its income for 1922-23 were not available, but in 1922 its property was valued at \$513,506 and its income was \$60,561. Richard Eddy Sykes, D.D., is president.

SAINT LOUIS UNIVERSITY, an educational institution founded in 1818 and located in Saint Louis, Mo. It is non-sectarian but under Catholic management. The law, and commerce and finance courses are open to women, the other courses are for men only. Statistics for 1922-23 show a faculty of 245 members, 3,264 students, property valued at \$3,000,000 and an income of \$450,000. Very Rev. William F. Robison, S.J., is president.

SAINT MARY-OF-THE-WOODS COLLEGE, a Roman Catholic educational institution for women, founded as an Academy 1846, and as a College in 1909, and located at Saint Mary-of-the-Woods, Ind. In 1922-23 it had a faculty of 35 members; 170 students. No figures are given as to its property valuation or its income. Mother M. Cleophas is president.

SAINT MARY'S COLLEGE, a Roman Catholic educational institution for men, founded in 1863 and located at Oakland, Calif. In 1922-23 it had a faculty of 28 members, 489 students, and property valued at \$750,000. Income figures not given. Brother Vantasian is president.

SAINT MARY'S COLLEGE, a Roman Catholic educational institution for men, founded in 1848 and located at Saint Mary's Kan. In 1922-23 the faculty numbered 36 and the student body 490. The value of the institution's property and its income for the year were not available. Rev. B. J. Rodman, S.J., is president.

SAINT MARY'S COLLEGE, a Roman Catholic educational institution for men, located at Saint Mary, Ky. It was founded in 1821. Statistics for 1922-23 show a faculty of 10 members, a student enrollment of 125, property valued at \$200,000 and an income totaling \$57,000. Rev. Michael Jaglowicz, C.R., is president.

SAINT MARY'S COLLEGE AND ACADEMY, a Catholic educational institution for women, founded 10 Nov. 1845 and located at Monroe, Mich. In 1922-23 it had a faculty of 30 members, 350 students, and property valued at \$500,000. Income not given. Mother M. Domitilla is president.

SAINT MARY'S COLLEGE AND ACADEMY, a Catholic educational institution for women, founded in 1855 and located at Notre Dame, Ind. In 1922-23 it had a faculty of 53 members, 345 students, property valued at \$1,077,580 and an income of \$208,221.85. Mother M. Pauline is president.

SAINT MARY'S COLLEGE AND ACADEMY, a Roman Catholic educational institution for women, founded in 1872 and located at Prairie du Chien, Wis. In 1922-23 it had a faculty of 16 members and a student enrollment of 109. Value of institution's property

and its income not given. Mother M. Angela is president.

SAINT MICHAEL'S COLLEGE, a Catholic educational institution for men, founded in 1905 and located at Winooski Park, Vt. In 1922-23 it had a faculty of 15 members, and 175 students. Information regarding valuation of property and income not given. Very Rev. William Jeanmarie, S.S.E., is president.

SAINT OLAF COLLEGE, a Lutheran co-educational institution, founded in 1874 and located at Northfield, Minn. In 1922-23 it had a faculty of 60 members, 928 students in collegiate grade, property valued at \$963,008.24 as of 30 April 1922, and a net income of \$186,068.46 for the eight months ending 30 Dec. 1922. L. W. Boe, D.D., is president.

SAINT PETER'S COLLEGE, a Roman Catholic educational institution for men, chartered in 1872 and opened in 1878. It is located at Jersey City, N. J. In 1922-23 it had a faculty of 25 members and 715 students. Information was not available regarding the value of the institution's property or its income. Rev. T. F. Graham, S.J., is president.

SAINT PIERRE AND MIQUELON, the largest islands of two small groups off the south coast of Newfoundland and belonging to France. The Saint Pierre group has an area of 10 square miles and a population of 3,419; the Miquelon group has an area of 83 square miles and a population of 499. Cod-fishing is an important industry. In 1922, the islands acquired some unenviable notoriety — from its being then a supply station for smugglers of liquors, who purchased their liquors there and thereafter brought them to the United States. The New York *Herald* exposed the operations of the rum runners and their aides. Imports, other than liquors, are textiles, salt, food stuffs and meat. The local budget in 1921 was balanced at 1,818,383 francs. The expenditure of France the same year was 280,607 francs. Saint Pierre is the chief town.

SAINT STEPHEN'S COLLEGE, an Episcopal educational institution for men, founded in 1860 and located at Annandale-on-Hudson, N. Y. In 1922-23 it had a faculty of 15 members, 103 students, property valued at \$875,000 and an income of \$92,000. Bernard Iddings Bell, D.D., is president.

SAINT TERESA, College of, a Roman Catholic educational institution for women, founded in 1911 and located at Winona, Minn. In 1922-23 it had a faculty of 36 members, 511 students, and property valued at \$2,000,000. No income figures given. President, Mother M. Leo Tracy.

SAINT VIATOR COLLEGE, a Roman Catholic educational institution for men, founded in 1868 and located at Bourbonnais, Ill. In 1922-23 it had a faculty of 30 members, 372 students enrolled up to January, property valued at \$354,984.84 and an income of \$168,057.58. Rev. Terence J. Rice, C.S.V., is president.

SAINT VINCENT COLLEGE AND ECCLESIASTICAL SEMINARY, a Catholic educational institution for men, founded in

1846 and located at Beatty P. O., Latrobe Station, Pa. In 1922-23 it had a faculty of 47 members, 575 students and property valued at \$1,000,000. Income figures not given. Rt. Rev. Aurelius Stehle, O.S.B., D.D., is president.

SAINT XAVIER COLLEGE, a Catholic co-educational institution, founded in 1831 and located at Evanston Station, Cincinnati, Ohio. In 1922-23 it had a faculty of 118 members, 1,526 students, property valued at \$1,250,000, and an income of \$75,000. James McCabe, S.J., is president.

SAINT XAVIER COLLEGE FOR WOMEN, a Roman Catholic educational institution the academic department of which was founded in 1847, and the college in 1912. It is located at Chicago, Ill., and in 1922-23 had a faculty of 15 members, 120 students, property valued at \$957,000 and an income of \$125,000. Reversed Mother M. Sophia is president.

SAKHALIN, an island off the east coast of Siberia, of which the part north of the 50th parallel belongs to Russia and the southern part to Japan. The area of the island is 27,816 square miles and it is about equally divided by the 50th parallel. The population numbers 138,000, of whom 105,765 are in Karafuto, the Japanese section. During the post-war period the occupation of the Russian part of the island by the Japanese was the cause of much recrimination. The Far East Republic requested the withdrawal of the Japanese several times during 1921 and at the Washington Disarmament Conference the question was discussed. Japan in 1922 decided to withdraw her troops and after the absorption of the Chita government by the All Russian Soviet of Moscow late in the year this withdrawal was accomplished peacefully.

SALE, George Samuel, British university professor: b. Rugby, England, 1831; d. London, 25 Dec. 1922. He was educated at Rugby School, where his father was a master under Arnold. In 1850 he entered Trinity College, Cambridge, with a Rugby exhibition. He took his B.A. degree in 1854 (M.A., 1857), and, having attained a Fellowship, was, in 1858, appointed a classical lecturer. In 1860, his health having broken down, he, on the advice of the late Sir Henry Holland, settled in New Zealand, and took up sheep-farming in Canterbury. Later he became editor of *The Press*, now perhaps the leading journal in New Zealand. After nine months as editor he took up gold mining. In 1869 when Westland became a separate province, he returned to England and entered at Lincoln's Inn with the intention of being called to the Bar. But his destinies were bound up with those of the young colony. In 1870 the University of Otago was founded, chiefly through the enterprise of the Presbyterian community, and Sale was appointed to the combined Chairs of Classics and English literature, which he held until 1908. During his long tenure of his position Sale was undoubtedly the most potent influence in the academic life of New Zealand. Over generations of students he exercised a powerful influence. In 1874 he took a leading part in the negotiations which led to the reconstruction of the university system of New Zealand.

SALEM ACADEMY AND COLLEGE, an educational institution for women, founded in 1772 and located at Winston-Salem, N. C. Though founded by the Moravians it is self owned and inter-denominational. In 1922-23 it had a faculty of 64 members, 409 students (249 in the college and 160 in the academy), property valued at \$535,000, and a gross income of \$188,000. Howard E. Rondthaler, Ph.D., D.D., is president.

SALEM COLLEGE, a co-educational institution under the auspices of the Seventh Day Baptists, founded in 1888 and located at Salem, W. Va. In 1922-23 it had a faculty of 24 members and in January 1923 it had a student enrollment of 457 which included about 130 in extension classes. Its property is valued at \$270,000, and its income is approximately \$45,000. S. Orestes Bond, A.M., is president.

SALVADOR, a republic of Central America on the Pacific Coast, having an area of 34,155 square kilometers, or 13,183 square miles, and a population of 1,501,000 on 1 Jan. 1922. The capital is San Salvador, which has 80,756 inhabitants. The capital and surrounding districts suffer much from earthquakes; those of 1917 and 1919 nearly destroyed the capital and also Nejapa, Quetzaltepeque, and Armenia.

Religion, Education, etc.—Roman Catholicism is the prevailing religion but all denominations are in full enjoyment of religious liberty. Primary education is free and compulsory. There are in the Republic 805 primary elementary schools with 1,613 teachers and 49,406 pupils. Secondary schools number 27 with 2,345 pupils. There is a national university at the capital with the usual faculties. Judges of all courts of second and third instance are elected by the National Assembly for a term of two years and judges of first instance are selected by the supreme court for two years.

Finance.—Revenue for the fiscal year 1921-22 amounted to \$8,965,000 and expenditures were slightly less than this amount. The outstanding debt of the Republic amounts to 29,232,313 colonies, about equally divided between internal and external debts.

Production and Industry.—Agriculture and mining contribute most largely to the wealth of the Republic; there are many native industries including the weaving of cotton textiles. Silk is also made and woven. Saddles, shoes and other leather goods are made and tobacco and cigars are manufactured from native tobacco. The great products of the country are coffee, which leads in the amount and value among national exports, gold, silver, indigo, sugar, rubber, and hides and balsam are among the staple products of the Republic. There are about 100,000,000 coffee trees on 183,332 acres. Live stock is raised. The forests include such woods as cedar, mahogany and walnut.

Commerce.—In 1920 the foreign commerce of Salvador was valued at \$30,000,000 but the following year a decline set in which continued also in 1922 although to a less extent. The trade of the Republic is largely with the United States, the United Kingdom and France. Coffee exports total about 65,000,000 pounds. The vessels entered at the ports of the Republic in 1920 numbered 520 with a total tonnage of 657,396.

There are 213 miles of railway all of narrow gauge. Good roads are numerous, the total mileage of improved roads being 1,476 miles. There are 162 post-offices, 22 telegraph offices and 220 telephone offices. There are three wireless stations.

Government.—The executive is a president elected for four years. The legislative power is vested in a single chamber of 42 deputies, three from each department of the Republic. Deputies are elected by universal suffrage for terms of one year. The President in 1922 was Senor Don Jorge Melendez. He is assisted by a cabinet of four ministers.

History.—On 17 March 1922 there was opened to traffic the railway between Cojutepaque and San Salvador, this being a new link in the International Railway of Central America, which in turn forms part of the Pan American Railway. On 23 March Salvador declared a period of mourning, and gave the military funeral rites of a general to the late Baltazar Estupinian, Minister of Government, Promotion and Agriculture. On 26 April the President signed a legislative decree ratifying the Pan American postal conventions which originated in the Congress of Buenos Aires in 1921. On 24 May the National Assembly ratified the Hague International Opium Convention and final protocol, and on 29 May the President signed the decree. In June hundreds of persons were drowned in river floods, the severity of which was greatest about the 11th and 12th, and then, contrasting with the storms, there was prolonged drought, injuring or destroying the crops. On 30 June Royal Spanish decorations, conferred by King Alfonso upon President Meléndez, the vice-president and others prominent in the government, were presented in the National Palace by Viscount de Pegullal, envoy of Spain, in recognition of Ibero-American activities and understanding. About the same time the Post-office Department announced resumption of the postal money order service between Salvador and Germany, which had been discontinued during the war. And again, about the same time, a central flood-relief committee was appointed by the President to handle the funds contributed by the government, by the American Red Cross, by individuals, and the governments of several of the Central American states, for the relief of suffering occasioned by the San Salvador flood above mentioned. The Salvadorean Red Cross aided in supplying food and providing shelter. Finally, the record of the year includes the important work (under the Rockefeller Foundation) of Dr. Robert Archibald Lambert, who gave a course of lectures in pathology at the San Salvador Medical School. Doctor Lambert, who was at that time assistant professor of pathology and bacteriology in the School of Medicine at Yale, made a survey of the medical schools of Salvador, Guatemala, and Nicaragua, to obtain accurate knowledge of the present standards of medical education in Central America. See also CENTRAL AMERICAN CONFERENCE.

SALVATION ARMY, The, a religious and charitable corporation, its parent charter in America having been taken out under the laws of the State of New York. Its origin took place in the East end of London, England, in the year

1865, where its founder, the Rev. William Booth, carried forward an evangelistic campaign with the avowed purpose of reaching the unchurched masses. The effort proved to be very successful and resulted in a permanent organization which rapidly developed a military form of government, but it was not until late in the seventies that the name was changed from The Christian Mission to The Salvation Army.

Though the growth of the movement until then had been exceptional, it now became phenomenal and it rapidly spread into many of the countries of the world. The United States of America was "invaded" in the year 1879 and to-day the Army has representation in no less than 76 different countries and colonies. Its officers, or those wholly engaged in its work, number over 25,000 of which 3,940 are in the United States. Its corps and outposts throughout the world reach the total of 12,211, 10 per cent of this number being in the United States.

In addition to these corps or stations there are a great many social institutions and agencies consisting of shelters and food depots for men and for women, hotels for working men and for working women; industrial homes, workshops, and wood yards; labor bureaus, maternity homes, children's homes, and hospitals. Among its numerous social activities a great prison work is carried on. Its Missing Friends Bureau is world wide in scope and has been instrumental in the restoration of many lost ones.

Of 1,300 social institutions scattered about the world, 216 are in the United States and consist of the following: Working men's hotels, 73; naval and military hotels, 7; women's hotels, 2; young women's boarding homes, 10; industrial homes, 95; children's homes, 3; maternity hospitals and rescue homes, 13; slum posts and nurseries, 13.

The Army also maintains many emergency homes and much dispensary work is done in connection with what is known as "corps work." Supplementary to all this some 750 day schools are operated by the Army in different parts of the world, notably in Newfoundland, India and such countries. In the United States of America the Salvation Army is under the direction of Commander Evangeline Booth who is a daughter of the founder, William Booth, and a sister of the present general, Bramwell Booth, whose headquarters is in London. The International Headquarters in London is recognized all over the world as being custodian of those things fundamental to the life of the Army but each territory is under the leadership of a commissioner who directs all activities in the particular field to which he is appointed. The vastness of the Army's congregations throughout the world can be gauged by the fact that upwards of 45 millions of people attended its meetings in the United States of America in 1922. All Army authorities unite in saying that the movement found its inception in a great love for souls and that its usefulness can only be maintained as it continues to realize that originating spirit. Its multifarious social welfare enterprises are but one form of expressing that love. Fundamentally the Army is religious.

COL. W. F. JENKINS,

National Secretary.

SAMOA, an island group in the Pacific Ocean about 14° S. latitude and 133 miles north of Tonga. East of 171° of longitude all the group belong to the United States; all to the west of this line formerly belonged to Germany but since the war are administered by New Zealand. Tutuila, the largest island, lies in the American sphere. It is 70 miles from Apia and has an area of 77 square miles and a population of 6,185. American Samoa has 8,324 inhabitants. The soil is very fertile. Oranges, limes, grapes, and citron are among the fruits grown. Besides copra, the only article of export, there are produced taro, breadfruit, coconuts, yams, bananas, and pineapples. Imports to American Samoa amounted to \$235,293 in 1920 and exports to \$98,213. There is a powerful wireless station at Tutuila. The commandant of American Samoa is also governor by commission from the President of the United States. He appoints officers and frames ordinances, but native customs are not changed without the consent of the people. See also SAMOA, WESTERN, TERRITORY OF.

SAMOA, WESTERN, Territory of, formerly German Samoa, includes Savaii and Upolu, Apolima and Manono. These islands were occupied by British forces in 1914 and under the Treaty of Versailles these were assigned under a mandate from the League of Nations to the King of England in right of his Dominion of New Zealand and are now governed by the latter. Savaii has an area of 660 square miles and Upolu an area of about 600 square miles. Apia, on Upolu, is the chief port. In 1921 the population of Western Samoa was 37,051, of whom 2,026 were whites and 32,953 native Samoans. Of the whites, 1,035 were British, 292 Americans, 49 Swedes, and 402 Germans. There are 2 government schools with 784 pupils and about 8,000 pupils in the several missionary schools. The chief products of the territory are copra, cocoa, sugar, rubber and cardamoms. Revenues in 1921 amounted to £149,027 while expenditures were £300 in excess of this sum. Imports in 1920 were valued at £561,193 and exports at £386,587. The administrator in 1922 was Col. R. W. Tate, who acts under the New Zealand Minister for External Affairs.

SAMOS, an island in the Aegean Sea, off the coast of Anatolia, famous in early Grecian history. Its area is 181 square miles and its population is 65,576. Vathy is the capital. Greece was in occupation of the island in 1922.

SANFORD, Edward Terry, American jurist: b. Knoxville, Tenn., 23 July 1865. He was graduated from the University of Tennessee, in 1883, with the degrees of A.B. and Ph.B. In 1885 he received the degree of A.B. from Harvard University, and in 1889 the degrees of A.M. and LL.B. from the same institution. He had been admitted to the bar in 1888, a year before obtaining his law degree, and had begun practice in Tennessee, his home State and the scene of his long legal career. Throughout he took a keen and practical interest in education and public affairs. From 1898-1907 he was a lecturer in the law department of the University of Tennessee. In January 1907, he was appointed Assistant Attorney-General of the United States and filled that office until June 1908, when he

resigned to become United States District Judge for the Eastern and Middle districts of Tennessee. In this latter capacity he served until February 1923 when he became Associate Judge of the United States Supreme Court. To this office he had been nominated by President Harding, 24 Jan. 1923, to fill the vacancy created by Justice Pitney's retirement effective 1 Jan. 1923 on account of illness. Among the positions (executive and honorary) that Justice Sanford has occupied are the following: charter member and president board of trustees, George Peabody College for Teachers (1909); delegate to Universal Congress of Lawyers and Jurists, Saint Louis, 1904; member, American Bar Association (formerly a vice-president and member of general council); honorary member, Tennessee Bar Association (president 1904-05); vice-president, Tennessee Historical Society; honorary member, Harvard Chapter Phi Beta Kappa; Alabama State Bar Association; associate member, Vanderbilt Chapter Phi Beta Kappa.

SANITARY BUREAU, International. See PEACE AND ARBITRATION, INTERNATIONAL.

SAN JOSÉ SCALE. See ENTOMOLOGY, UNITED STATES BUREAU OF.

SANTLEY, Sir Charles, English singer: b. Liverpool, 28 Feb. 1834; d. London, 22 Sept. 1922. He studied under Gaetano Nava in Milan and made his operatic début at Pavia in 1857, as the Doctor in Verdi's 'Traviata.' Thereafter he sang Germont in this opera and the baritone rôle in 'Ernani.' In 1857 he returned to England and sang in 'The Creation.' His first appearance as a solo singer in England took place in 1857; and in March 1858 he sang the title-rôle in 'Elijah' at Exeter Hall, a part with which he was identified for many years. In 1859 he made his first appearance in England in opera at Covent Garden, as Hoel in 'Dinorah.' During the following three years various parts in new operas fell to him including Danny Mann in Benedict's 'Lily of Killarney' in 1862. In that year he was engaged for Her Majesty's Theatre, with Tietjens and other great artists, and he remained with this company for several seasons. For some time he sang on alternate nights, in Italian, at Her Majesty's Theatre; and, in English, at Covent Garden. One of his greatest successes was 'Don Giovanni.' His regular connection with the opera ended in 1870 when he sang Vanderdecken in 'The Flying Dutchman' with Ilma di Murska. He ended his operatic career in 1876, with the Carl Rosa Company at the Lyceum Theatre. It might be said that with the close of his operatic life his real career began. From this time onward he was a constant figure on the London concert stage and he took part in almost every festival of importance until his retirement. His first appearance at an English festival was at Birmingham in 1861, when he sang 'Elijah'; and this established him forever as the chief of English baritone singers. In 1907 Santley celebrated the 'jubilee' of his first appearance, with a concert at Albert Hall. He was knighted the same year. After this his public appearances were rather rare. Sir Charles was created a Commander of the Papal Order of Saint Gregory by Pope Leo XIII in 1887. He composed several orchestral works, a mass and other church music, and wrote

'Student and Singer' (1892); 'The Art of Singing' (1908), and a book of kindly reminiscences (1909). His first wife, Miss Gertrude Kemble, was the granddaughter of Charles Kemble, the actor and their daughter, Edith, made a great reputation as a concert singer during her short career which ended with her marriage to the Hon. R. H. Lyttelton. Sir Charles possessed wide culture, force of character and much humor.

SANTO DOMINGO, one of the Antilles and politically constituting the territories of the republic of Haiti and the Dominican Republic (q.v.).

SAO THOME AND PRINCIPE, two islands belonging to Portugal and lying about 125 miles off the coast of Africa, in the Gulf of Guinea. The population numbers 65,845, including 1,570 whites. The islands are volcanic in character and are covered by a rich vegetation. Cacao, coffee, rubber, and cinchona are the chief commercial products of the islands. The revenue in 1921 was 1,718,895 escudos and the expenditures exceeded this amount by about 10,000 escudos. Exports were valued at 17,490,648 escudos and imports at 12,398,237 escudos.

SARAWAK, a British Protectorate consisting of the northwestern part of the island of Borneo. Area, 42,000 square miles with 400 miles of coast line. The population is estimated at 600,000 and includes Dyaks, Malays, Kayans, Kenyahs, and Muruts with some Chinese. Kuching is the capital, located 23 miles inland on the Sarawak River. There are several Christian missions in the Protectorate. Coal exists in large quantities and oil has been discovered at Miri. The chief exports are gold, plantation rubber, cutch, benzine, gutta percha, fish, damar and tallow nuts. The bulk of the trade is with Singapore. There are four wireless stations. There is a large and flourishing trade which is handicapped by large import and export duties. The budget balances annually at about \$1,500,000. Foreign trade amounts to about \$19,000,000. The British agent in 1922 was Sir L. N. Guillemard.

SASKATCHEWAN, a Prairie Province of the Dominion of Canada, west of Manitoba and east of Alberta and extending from the United States border northwards to the Northwest Territories. It has an area of 251,700 square miles and in 1921 had a population of 757,510. Regina, the capital, has a population of 34,432. Other cities are: Saskatoon, 25,739; Moosejaw, 19,285; Prince Albert, 7,558; and North Battleford, 4,108. The province is administered by a lieutenant-governor and a legislative assembly of 63 members, elected for five years. Lieutenant-Governor in 1922, H. W. Newlands; Premier, W. M. Martin. For Education, Production, Industry, etc., see CANADA.

SAVINGS BANKS. According to the report of the Comptroller of the Currency to the Fourth Session of the 67th Congress, 4 Dec. 1922, savings deposits in the United States on 30 June 1922 aggregated \$13,381,661,000. Of this amount, \$3,046,647,000 was deposited in national banks, \$2,649,660,000 in State (commercial) banks, \$439,016,000 in stock savings banks, \$5,686,603,000 in mutual savings banks, \$1,382,748,-

000 in loan and trust companies, \$32,733,000 in private banks, \$137,736,000 in the Postal Savings System, and \$6,518,000 in school savings banks. In mutual and stock savings banks in the United States there were 12,538,997 depositors and 420,242 in the Postal System, while 1,295,607 children were depositors in the school savings banks. It is estimated that there are 16,982,842 individual depositors of savings in national, State, and private banks and in loan and trust companies. There are, moreover, about 3,000,000 owners of time certificates of deposit which are widely used in place of savings accounts in rural sections. Duplicating this number of savers but to some extent additional are the 5,809,888 members of building and loan associations and other millions who invest the proceeds of their thrift in life insurance, government bonds, real estate securities, industrial savings institutions, and corporate securities. In the savings banks of countries other than the United States there are 132,944,566 depositors credited with \$6,717,257,335 or an average deposit account of \$50.53. The average deposit in the mutual and stock savings banks of the United States was \$572.71 on 30 June 1922 and \$327.76 in the United States Postal Savings System. See BANKING.

SAXONY, (a) the province of Saxony in Prussia. Area, 9,756 square miles; population, 3,129,193; (b), the former Grand Duchy of Saxony, proclaimed a republic in 1918 and incorporated in the new state or federation of Thuringia; (c), the third largest state of the German Empire, formerly a Kingdom, with an area of 5,787 square miles and a population of 4,670,311. The chief cities are Leipzig, 604,397; Dresden, 587,758; Chemnitz, 304,961; Plauen, 104,926; and Zwickau, 70,509. There are 4,354,200 Lutherans, 213,615 Roman Catholics, 36,000 other Christians and 17,000 Jews. There are 2,233 common schools with 857,610 pupils and a number of private and secondary schools. There are 124 establishments of higher learning exclusive of the University of Leipzig, which is one of the greatest in Germany. Agriculture is well developed but the state is mostly industrial and is second only to Prussia. Textiles form the chief branch of her industries but mining and metal working are also of importance. Coal production averages about 4,000,000 tons yearly. Lignite is mined to the extent of 6,000,000 tons yearly. The Diet is vested with legislative functions. Executive functions are exercised by the Diet through a responsible ministry. The Premier in 1922 was Herr Johann Wilhelm Buck. See GERMANY.

SCHOOL OFFICERS, State. The following list of the chief school officials in the various States of the United States was compiled by the United States Bureau of Education and published in *School Life*, one of the publications of the Bureau. Those marked with an asterisk (*) were recently chosen.

CHIEF STATE SCHOOL OFFICIALS

State.	Name.	Title.	City.
Alabama.	John W. Abercrombie	State superintendent of education	Montgomery.
Alaska.	Lester D. Henderson	Commissioner of education	Juneau.
Arizona.	*C. O. Case	State superintendent of public instruction	Phoenix.
Arkansas.	*A. B. Hill	State superintendent of public instruction	Little Rock.
California.	Will C. Wood	State superintendent of public instruction	Sacramento.
Canal Zone.	W. W. Andrew	Superintendent of schools	Balboa Heights.
Colorado.	*Mrs. Mary C. C. Bradford	State superintendent of public instruction	Denver.
Connecticut.	A. B. Meredith	Commissioner of education	Hartford.
Delaware.	H. V. Holloway	State superintendent of public instruction	Dover.
District of Columbia.	F. W. Ballou	Superintendent of schools	Washington.
Florida.	W. S. Cawthon	State superintendent of public instruction	Tallahassee.
Georgia.	*N. M. Ballard	State superintendent of schools	Atlanta.
Hawaii.	Vaughan McCaughey	Superintendent of public instruction	Honolulu.
Idaho.	*Miss Elizabeth Russum	State superintendent of public instruction	Boise.
Illinois.	Francis G. Blair	State superintendent of public instruction	Springfield.
Indiana.	Benjamin J. Burris	State superintendent of public instruction	Indianapolis.
Iowa.	*Miss May E. Francis	Superintendent of public instruction	Des Moines.
Kansas.	*J. W. Miley	State superintendent of public instruction	Topeka.
Kentucky.	George W. Colvin	State superintendent of public instruction	Frankfort.
Louisiana.	T. H. Harris	State superintendent of education	Baton Rouge.
Maine.	Augustus O. Thomas	State superintendent of public schools	Augusta.
Maryland.	Albert S. Cook	State superintendent of schools	Baltimore.

Wisconsin.	John C. Callahan	State superintendent of public schools	Madison.
Wyoming.	Mrs. Katherine A. Morton	State superintendent of public instruction	Cheyenne.

SCHROEDER, Seaton, American naval officer: b. Washington, D. C., 17 Aug. 1849; d. there, 19 Oct. 1922. He was graduated from the United States Naval Academy in 1868 and passed through all the grades reaching commander in 1899; captain in 1903 and rear-admiral in 1908. He served on many important expeditions. In 1871 he was a member of Commodore Roger's expedition against the Korean forts and in 1879-80 was associated with H. H. Goringe in removing the obelisk from Egypt to New York. In 1886-88 he served in the Bureau of Navigation, Navy Department; in 1888-90 special duty with building dynamite cruiser *Vesuvius*, which he commanded in 1890-93. During the war with Spain he was executive officer of the *Massachusetts*, and was advanced three numbers in rank for eminent and conspicuous conduct. In 1900-03 he was naval governor of the island of Guam and commander of the *Yosemite*; in 1908-09 he commanded a division of the Atlantic fleet; and in 1909-11 was commander-in-chief of the Atlantic fleet. After his

retirement in 1911 he served three years in the Hydrographic Office in Washington and was recalled to active duty during the World War. Admiral Schroeder contributed to magazines; was prize essayist, United States Naval Institute in 1894; and wrote a book entitled 'Fall of Maximilian's Empire' (1887).

SCIENCE, American Association for the Advancement of. An organization founded in September 1848 which "aims to advance science in the New World in every feasible way." The majority of its members are of the United States and Canada, but its field is not limited to these two countries and it has members in all parts of the world. Its organization presents two aspects. In addition to individual members, numbering 10,566 in good standing on 30 Sept. 1922, it is also a "great general organization of 83 wholly autonomous and independent associated societies and 13 local academies of science and learning." Forty-three of the larger associated societies and all of the associated academies are officially

affiliated with the Association. The Association has 16 sections, representing the main current subdivisions of science, each designated by a letter. The following is a list of the sections with the names of the chairman and secretary of each for the calendar year 1923. The chairmen of the sections are also vice-presidents of the Association. In the list the first name in each case is that of the chairman and the second that of the secretary: A (Mathematics)—Harris Hancock, University of Cincinnati, Cincinnati, Ohio; William H. Roever, Washington University, Saint Louis, Mo.; B (Physics)—W. F. G. Swann, University of Chicago, Chicago, Ill.; S. R. Williams, Pasadena, Calif.; C (Chemistry)—E. W. Washburn, University of Illinois, Urbana, Ill.; W. D. Harkins, University of Chicago; D (Astronomy)—Vacant (1 May 1923); F. R. Moulton, University of Chicago; E (Geology and Geography)—N. M. Fenneman, University of Cincinnati; Elwood S. Moore, University of Toronto, Toronto, Canada; F. (Zoological Sciences)—E. L. Rice, Ohio Wesleyan University, Delaware, Ohio; H. W. Rand, Harvard University, Cambridge, Mass.; G (Botanical Sciences)—C. J. Chamberlain, University of Chicago; Robert B. Wylie, State University of Iowa, Iowa City, Iowa; H (Anthropology)—E. A. Hooton, Peabody Museum, Cambridge, Mass.; R. J. Terry, Washington University Medical School, Saint Louis, Mo.; I (Psychology)—Raymond Dodge, Wesleyan University, Middletown, Conn.; Frank H. Freeman, University of Chicago; K (Social and Economic Sciences)—J. F. Crowell, 30 Church Street, New York City; Frederick L. Hoffman, Babson Institute, Wellesley, Mass.; L (Historical and Philological Sciences)—Florian Cajori, University of California, Berkeley, Calif.; Frederick E. Brasch, 6963 Morton Place, Chicago, Ill.; M (Engineering)—Vacant (1 May 1923); L. W. Wallace, 26 Jackson Place, Washington, D. C.; N (Medical Sciences)—Richard P. Strong, Harvard University Medical School, Boston, Mass.; A. J. Goldfarb, College of the City of New York; O (Agriculture)—R. A. Pearson, Iowa State College, Ames, Iowa; P. E. Brown, Iowa State College, Ames, Iowa; P (Manufactures and Commerce)—Not organized (1 May 1923); Q (Education)—Henry W. Holmes, Harvard University; A. S. Barr, 1925 Hazelwood Avenue, Detroit, Mich. The last annual meeting of the Association was held at Cambridge, Mass., 26-30 December 1922 and was attended by 2,339 members. A special summer meeting, with the Pacific and Southwestern divisions, will be held at Los Angeles, Calif., 17-19 Sept. 1923. The next regular meeting will be held at Cincinnati, Ohio, beginning 27 Dec. 1923. The officers of the Association for the calendar year 1923 are: President, Charles D. Walcott, Smithsonian Institution, Washington, D. C.; permanent secretary, Burton E. Livingston, Johns Hopkins University, Baltimore, Md.; general secretary, D. T. MacDougal, Carnegie Institution of Washington, Department of Botanical Research, Tucson, Ariz.; assistant secretary, Sam F. Trelease, Johns Hopkins University, Baltimore, Md.; treasurer, R. S. Woodward, Carnegie Institution of Washington, Washington, D. C. The Association's mail address is

Smithsonian Institution Building, Washington, D. C.

SCIENCES, National Academy of. See ACADEMY OF SCIENCES, NATIONAL.

SCOTLAND. The northern part of the island of Great Britain and an administrative subdivision of the United Kingdom. It has an area of 29,797 square miles and in 1921 had a population of 4,882,288, or 164 inhabitants to the square mile. The chief cities, with their populations, are: Glasgow, 1,034,069; Edinburgh, the capital, 420,281; Dundee, 168,217; Aberdeen, 158,869; Paisley, 84,837; and Greenock, 81,120. The total number of births in 1921 was 123,196; of deaths, 66,211; of marriages, 39,268. The Church of Scotland is Presbyterian in form. It has 1,457 parishes and an aggregate endowment from all sources of £400,000, and 739,000 communicants. Ministers number 1,800 with 105 lay missionaries and 193,000 Sunday scholars. The United Free Church of Scotland has 1,484 congregations, 530,000 adherents and 198,000 Sunday scholars. The Episcopal Church of Scotland has 56,000 adherents and the Roman Catholic 546,000 members. Education is compulsory to the age of 15 years. There are 3,123 schools in receipt of government grants with accommodation for 963,000 pupils and an average attendance of 675,000. There were 24,604 certificated teachers. For industries, communications, etc., see GREAT BRITAIN.

SCULPTURE. See PAINTING AND SCULPTURE.

SEAMAN, Mrs. Elizabeth Cochrane (NELLIE BLY), American journalist: b. Cochrane's Mills, Pa., 1866; d. New York, 27 Jan. 1922. She was a daughter of Judge Cochrane, founder of the town in which she was born, and began her journalistic career while still in her teens, writing for a Pittsburgh paper at \$5 a week. Eventually she developed into one of the most widely known and highest salaried newspaper women in the country, having earned, it is said, as much as \$25,000 in a single year with her pen. She was a pioneer among women writers in the field of sensationalism. She went down into the sea in a diving bell, ascended into the air in a balloon and, upon one occasion, lived for a time as an inmate of an insane asylum, all for the purpose of acquiring material for sensational newspaper articles. However, the feat that made her famous was her trip around the world in 1889. She was sent out by the New York *World* to beat the record of Phileas Fogg, the hero of the novel, 'Around the World in Eighty Days' by Jules Verne, and succeeded, making the tour in 72 days 6 hours and 11 minutes. Her progress was followed by all readers of newspapers and by the time she landed back in New York she was a national character. A Pittsburgh editor gave her the name Nellie Bly and she used it throughout the remainder of her career. In 1895 she married Robert L. Seaman, a wealthy manufacturer, 40 years her senior. When he died in 1910 she took charge of his estate, but a series of forgeries by her employees, disputes of various sorts, bankruptcy proceedings and a mass of vexatious and costly litigation swallowed up her fortune. She returned to journalism and at the time of her death

was a member of the staff of the New York *Evening Journal*.

SEBREE, Uriel, American naval officer: b. Fayette, Mo., 20 Feb. 1848; d. Coronado, Cal., 6 Aug. 1922. From the schools of Fayette he went to the United States Naval Academy, where he was graduated in 1867. He served in various parts of the world and was promoted captain in 1901 and rear-admiral in 1907. He retired in February 1910, having had many important commands. In 1873 he was a member of the Arctic relief expedition on the steamship *Tigress* under Greeley; also a member of the Greeley relief expedition under Commander Schley in 1884. In 1889-92 he was on the *U. S. S. Baltimore* under command of Captain Schley. From 1903 to 1904 he commanded the battleship *Wisconsin*. Next he served as naval secretary of the Lighthouse Board, which he gave up to become commander-in-chief of the Pacific fleet; and he took the armored cruiser squadron around Cape Horn in 1907, in advance of the battleship fleet which circled the globe. On his arrival Admiral Sebree took command of the Pacific squadron and in 1910 led his cruisers to the Asiatic station.

SELANGOR. See FEDERATED MALAY STATES.

SELDEN, George Baldwin, American inventor: b. 1845; d. Rochester, N. Y., 17 Jan. 1922. He was the inventor of the first gasoline-propelled vehicle and was a pioneer in the automotive industry. For years he was president of the Selden Motor Company, of Rochester. Mr. Selden was graduated from Yale University in 1869 and thereafter studied law under his father. He began his inventive career by experimenting with engines for light vehicles driven by steam, ammonia gas, bisulphite of carbon and other liquids. He then turned his attention to petroleum as a fuel. In 1875 he built an engine that was driven by a mixture of laughing gas and kerosene, but it proved to be a failure. By the following year he had reached the conclusion that the internal combustion engine of the compression type, using liquid fuel, was the solution of his problem. Despite the gibes of others he persevered. In 1879 he filed the first patent for a gasoline motor-propelled vehicle only to reap a rich harvest of long-drawn-out litigation which is said to have cost him nearly all of the money his invention brought him in. A patent was issued to him in 1896. In the meantime, other gasoline-propelled vehicles had been built in the United States and in Germany. Setting up a claim to the basic patent, Selden, in 1900, brought suits against Ford and Winton. The lower courts decided in his favor, but the decision was reversed by the Appellate Court, which, though it upheld the Selden patent, ruled that Ford and Winton were making a motor of another type. Later the litigation commenced by Selden was renewed by the Electric Vehicle Company of New Jersey, to whom the inventor sold the manufacturing rights. With the exception of Ford, the manufacturers against whom suit had been brought surrendered and formed the Association of Licensed Automobile Manufacturers, agreeing to pay a royalty equal to 1¼ per cent of the price of their cars. Later the royalty was reduced to four-fifths of one per cent. Ford continued the fight alone. In 1911

Judge Noyes handed down an opinion in which he affirmed Selden's patent but held that the Ford engine was of the Otto type. As the other manufacturers were using the same type of engine that Ford was using the association they had formed was disbanded and the royalties that were being paid on the Selden patent ceased.

SELENIUM. See CHEMICAL MANUFACTURING.

SEMBAT, Marcel Etienne, French politician: b. Bonnières, Seine et Oise, 19 Oct. 1862; d. Chamonix, 5 Sept. 1922. He was educated at the College Stanislas, and became one of the most prominent leaders of the Moderate Socialist party in the French Chamber. His career belongs rather to the pre-war period, when, under the leadership of Jean Jaures, the United Socialist Party in the Chamber formed a solid phalanx of opposition to all but the most pronouncedly radical governments. Jaures, nicknamed "the Thunderer," was the unquestioned orator, but Marcel Sembat's caustic wit and the remarkable faculty he had of using the weak point of an argument, made him the valuable debater. The tragic end of Jaures and the outbreak of the World War forced the eclipse of the United Socialist Party. While France was fighting the enemy, all patriotic Frenchmen, whether Socialists or not, joined the "Union Sacrée"; and Marcel Sembat was one of those who took office, first without portfolio and then as Minister of Public Works, by the side of the men they had formerly opposed so bitterly in the Chamber. When the struggle took place at Tours over the question of adherence to the Third International and the Communist leaders, Cachin and Frossard won the day, Marcel Sembat, realizing that the last hour of the United Socialist Party had come, delivered his last great speech. In this he declared that he and his friends would have to sever their connection with their Communist colleagues. Although Sembat remained Deputy for the Department of the Seine (Paris), which he had held since 1893, he took little or no part in politics thereafter. Sembat was a very wealthy man and head of a large coal-distributing business; but neither his wealth, nor his position as a big employer of labor, prevented him from giving whole-hearted support to the Socialist movement. He was often reproached for being a "millionaire Socialist" but he won respect for the sincerity of his opinions and the honest work he did for the improvement of conditions among the workers of France. He was a man of culture, wrote on French art and followed the work of English scholars with special interest. Sembat was editor of *La Lanterne* and *l'Humanité*. The sudden death of M. Sembat was a terrible grief to his devoted wife, who on the day following his death shot herself beside his body. Death was instantaneous. Mme. Sembat was a painter and exhibited a canvas at the Salon of 1920. The couple had been married 30 years and were childless. M. Sembat's fortune, between 4,000,000 and 5,000,000 francs, by a strange irony of fate, reverts in its entirety to the bourgeois government, which the Socialist leader, Marcel Sembat, had fought throughout his entire political life.

SHACKLETON, SIR ERNEST (Henry), British explorer: b. Kilkee, Ireland, 15 Feb. 1874; d. on board the *Quest* off South Georgia Island in the South Atlantic Ocean, 5 Jan. 1922. He was educated at Dulwich College, entered the British mercantile marine when 16 years of age, served 11 years and was commissioned a lieutenant in the Royal Naval Reserve. In 1901 he was chosen third lieutenant of the National British Antarctic Expedition, commanded by Captain (then Lieutenant) R. F. Scott, which made the voyage in the *Discovery* and which reached south latitude 82° 17', approximately 500 miles from the South Pole and the farthest point south reached up to that time. Shackleton's work as a member of this expedition resulted in his being selected by Captain Scott to make the final dash over the great ice barrier. Owing to ill health, Shackleton was forced to return to England in the relief ship before the expedition completed its work. The long voyage home completely restored his health. In 1904 he was chosen secretary of the Scottish Geographical Society. In 1907 he again started south as the head of the British Antarctic Expedition, organized by himself, making the voyage in the *Nimrod*. On 9 Jan. 1909 he reached South Latitude 88° 23', but 113 miles from the South Pole. There he was forced to turn back. Having himself broken all records in South Polar research, his own record was broken in slightly less than three years when, on 16 Dec. 1911, Amundsen reached the Pole. On this expedition Shackleton ascended Mount Erebus, 13,120 feet high, and located the south magnetic pole, determining its position as latitude 72° 25' S.; longitude 154° E. He also ascertained that a great chain of mountains extends from the eighty-second parallel, south of McMurdo Sound, to the eighty-sixth parallel. On his return to England, Shackleton learned of the expeditions of Amundsen and Scott and expressed the opinion that one or the other would reach the Pole by following either his own or a parallel route. Following receipt of the news that Amundsen had reached the Pole and that Scott, after accomplishing the same feat on 18 Jan. 1912, had died in the Antarctic of hunger and exposure 29 March following, Shackleton set out on an even more daring project—that of crossing the Antarctic continent from one end to the other. He left London 1 Aug. 1914. Three days later the war with Germany started. Shackleton immediately, with the consent of his comrades, offered his ships, stores and his own and their services to his country, but, at the express wish of the King and the Government, the voyage was continued. Misfortune after misfortune was encountered by the expedition. One of its vessels, the *Aurora*, drifted for 10 months in the ice; another, the *Endurance*, was caught in an ice

pack and so badly damaged that it had to be abandoned, the crew taking refuge on Elephant Island. Shackleton and two members of his party made their way to South Georgia and thence went to Falkland Islands for assistance. He fitted out a ship and started back to rescue his companions, but, owing to terrific gales, it was not until he had made his fourth attempt at rescue that the marooned men on Elephant Island were reached and brought away, 30 Aug. 1916. The leader of the marooned party was Frank Wild, who again accompanied Shackleton on his last Antarctic trip and succeeded to the command of the *Quest* when Shackleton died. Returning to England after this third trip to the Antarctic, Shackleton, during the North Russian Winter Campaign of 1918-1919, served as Director of Equipment and Transport of the British Mobile Forces. Then again came the call of the Antarctic, too persistent to be ignored. In September 1921 he set sail in the *Quest*, a tiny vessel registering only about 200 tons. The voyage, during certain portions, is said to have been the most tempestuous of any he had ever made. He was taken ill about the time his vessel left Rio de Janeiro, and died on the day after it reached South Georgia Island of *angina pectoris*. News of his death did not reach the outer world until after the lapse of nearly one month. His body was first taken to Montevideo, Uruguay, to be shipped to England, but, in accordance with the wishes of his widow, Lady Shackleton, it was sent back to South Georgia Island and buried in the graveyard of the English Church at Gryvicken, so that the region which had so fascinated him might be his last resting place. His purpose in making this last expedition was to investigate the underwater connection between South Africa and South America, and to determine the extent and ramifications of the great submarine ridge which rears itself up for thousands of miles from the floor of the middle Atlantic. Among the awards made to him were the special gold medal of the Royal Geographical Society, the King's Polar Medal with two bars and gold medals from the Royal Scottish Geographical Society, and the geographical societies of Denmark, Belgium, France, Antwerp, Italy, America, Paris and Russia. He was an officer of the Legion of Honor (France) and was knighted in 1909. He published 'The Heart of the Antarctic' (1909), and 'The Diary of a Troopship.'

SHAFROTH, John Franklin, American public official, b. Fayette, Mo., 9 June 1854; d. Denver, Col., 20 Feb. 1922. He was graduated from the University of Michigan in 1875 and was given LL.D., from this college, in 1909. In 1876 he was admitted to the bar and practiced at Fayette, Mo., until 1879, when he removed to Denver. From 1887-91 he was city attorney of Denver. In 1895 he was elected to Congress as a Republican, but in 1896 aligned himself with the Free Silverites, who three times re-elected him to Congress. He refused to retain his seat in the 58th Congress (15 Feb. 1904), on the ground that the general election at which he was a candidate had been tainted by fraud. He was governor of Colorado in 1909-11 and 1911-13, and in 1913 was elected to the United States Senate, as a Democrat.

SHANTUNG SETTLEMENT. See WASHINGTON CONFERENCE.

SHARP, William Graves, American diplomat: b. Mount Gilead, Ohio, 14 March 1859; d. Elyria, Ohio, 17 Nov. 1922. He received the degree of LL.B. from the University of Michigan in 1881, and the degree of LL.D. from the University of Michigan, Allegheny College, and Oberlin College in 1919. At Elyria, Ohio, he practiced law for a while, and for many years he was interested in the manufacture of iron and chemicals. He was Prosecuting Attorney for Lorain County, Ohio (1885-88); Democratic Presidential Elector (1892); Democratic nominee for Congress (1900); and delegate to the Democratic National Convention, St. Louis (1904). From 1909-15 he was a member, from the 14th Ohio District, of the 61st, 62nd, and 63rd Congresses, but resigned 23 July 1914. He served from 2 Dec. 1914-14 April 1919 as Ambassador Extraordinary and Plenipotentiary to France, in which capacity he was the first American to become Dean of the diplomatic corps at Paris. He was a life-long student of astronomy, and attained the distinction of being elected a foundation member of the Société Astronomique de France, by which nation he was awarded the Grand Cross of the Legion of Honor.

SHAW UNIVERSITY, a Baptist co-educational institution, founded in 1865 and located at Raleigh, N. C. In 1922-23 it had a faculty of 30 members, 406 students, property valued at \$500,000 and an income of \$115,875.97. Joseph L. Peacock, D.D., is president.

SHEALY, Terence J., Jesuit missionary and lecturer: b. Cork, Ireland in 1862; d. New York, 5 Sept. 1922. Educated at Mungret College, Ireland, on his arrival in this country he entered the Novitiate of the Society of Jesus at Frederick, Mo., and was ordained by the late Cardinal Gibbons in 1898. He was founder and head of the Fordham Law School, where for many years he was professor of jurisprudence. For the last 13 years he had conducted layman's retreats. The first retreat under his direction was at Keyser Island, South Norwalk, Conn. In 1911 a retreat was established at Mount Manresa, Fort Wadsworth, Staten Island, where Roman Catholic men spend the week end for religious instruction. In connection with the Laymen's League, Father Shealy established extension work in Philadelphia, Albany, Washington, and other large cities in the East.

SHEARER, John Sanford, American physicist: b. New York, 20 Oct. 1865; d. Ithaca, N. Y., 18 May 1922. He was graduated from Cornell University in 1893 and received the degree of Ph.D., from the same institution in 1900. He became an instructor in physics in Cornell, assistant professor in 1902 and full professor in 1909. For one year he taught physics in Columbia University and then returned to his alma mater, where he remained the rest of his life. Doctor Shearer was the author of 'Notes and Questions on Physics' (1900); and 'Lecture Outlines and Notes' (1906). He was a major in the Sanitary Corps, National Army, in 1917; lieutenant-colonel, 1918; and consultant in roentgenology, American Expeditionary Forces, France.

SHEEP. See AGRICULTURE IN THE UNITED STATES.

SHELTON, Albert Le Roy, American missionary: b. Indianapolis, Ind., 9 June 1875; d. 17 Feb. 1922. His parents moved to Kansas when he was five years old and he was sent to local schools. He began to teach when he was 17. During the war with Spain he enlisted in the 22nd Kansas regiment, but did not see service. He obtained a scholarship in the Medical Department of the University of Kentucky and completed a four-years' course there. Soon after his graduation the United Christian Missionary Society appointed him medical missionary to China. In 1903 he went to the Far East, first stationed at Tachienlu; but in 1908 he was transferred to Batang, near Tibet. He was a member of the Disciples of Christ. In 1920 he was kidnapped and held by Chinese brigands for 60 days. He related this experience in October 1920 when attending a church convention in Saint Louis. While in New York in the autumn of 1921 he collaborated with Dr. Cory in writing a book called 'Pioneering in Tibet,' dealing with missionary work in the Far East. Dr. Shelton left Vancouver 1 Aug. 1921, to open a hospital at Lhasa, having received permission to do so from the Dalai Lama, the supreme power there. He was captured by Chinese brigands, who carried him into the mountains. The missionaries refused to sanction efforts to ransom him saying that "ransom would lead to the kidnapping of all missionaries." Chinese troops finally routed the brigands and the fleeing kidnappers abandoned Dr. Shelton because he had become ill. He was found by a rescue party, which included Fred A. Smith, a Chicago newspaper man. His wife did not accompany the missionary to Batang, having gone to Calcutta to obtain translations of the Scriptures in the Tibetan language.

SHEPPARD-TOWNER ACT. See MATERNITY AND INFANCY ACT.

SHIPBUILDING. According to *Lloyd's Register of Shipping*, the total output of the shipyards of the world in 1922 amounted to 852 vessels of 2,467,084 gross tons, as compared with 4,341,679 tons in 1921, a decrease of 1,874,595 tons. This sharp decline, it was stated, brought the production for 1922 almost 900,000 tons below the figure for the last pre-war year, 1913. Construction in the United States aggregated 59 vessels of 119,138 tons; in Great Britain and Ireland, 235 vessels of 1,031,081 tons; in France, 62 vessels of 184,509 tons; in Germany, including Danzig, 195 vessels of 575,264 tons; in Japan, 49 vessels of 83,419 tons; in the Netherlands, 60 vessels of 163,132 tons. The 1922 decrease was sharpest in American yards in comparison with the total for the preceding year, the decline being 887,000 gross tons, against 507,000 tons for Great Britain and Ireland and 480,000 tons for all other countries. *Lloyd's Register* gives the following table showing the comparison between the two years, the figures representing gross tons:

	1922	1921
United States.....	119,138	1,006,413
Great Britain and Ireland.....	1,031,081	1,538,052
Other countries.....	1,316,865	1,797,214
World total.....	2,467,084	4,341,679

The progressive decline of American shipbuilding is illustrated by the fact that while American yards launched 532,000 tons less than the British yards in 1921, the margin was widened to 911,000 tons last year. In 1921 the shipyards of this country launched 790,000 tons less than other countries excluding Britain; but last year the gap was increased to nearly 1,200,000 tons.

The volume of world shipbuilding as a whole last year was only about a third of the record year, 1919, since which time there has been a steady decrease. The world total for the last pre-war year and the four post-war years has been as follows in gross tons:

1913.....	3,332,000
1919.....	7,144,000
1920.....	5,861,000
1921.....	4,341,000
1922.....	2,467,000

While practically every maritime country in the world showed a decrease in shipbuilding during the past year as compared with the previous one, Germany about held her own, her production being second only to that of British yards. Launchings in Germany during 1922 were 525,829 gross tons, as against 509,064 tons in 1921. The output for both years is above the pre-war figure of 465,000 tons, and represents a total of more than a million tons of new German vessels. Nearly 25 per cent of last year's total production is represented by the German output alone. And, in addition, the shipyards of Danzig during the year launched 49,435 tons. In 1913 the German output was only about 15 per cent of the total for the world.

In 1913 American shipyards produced only 8 per cent of the world total; but in 1919 57 per cent of the aggregate output was produced in this country, or more than Great Britain and all other nations combined. In 1920, American yards' work represented 40 per cent of the total; but in 1921 there was a drop to 23 per cent, and last year's production was less than 5 per cent of the whole. The gross tons of output for these years, compared with the British production as follows, *Lloyd's Register* states:

	United States	Great Britain and Ireland
1913.....	276,000	1,232,000
1919.....	4,075,000	1,620,000
1920.....	2,476,000	2,055,000
1921.....	1,006,000	1,538,000
1922.....	119,000	1,031,000

British yards, it will be noticed, last year produced about 900,000 tons less than in the year before the war, and their share of the world's output is still below the pre-war figure, although a gain was shown last year over the previous year in this respect. In 1913 the British production was 58 per cent of the world total. In 1919 it was only 22 per cent, but in 1920 it rose to 35 per cent. It remained at the latter figure in 1921, but last year it increased to 42 per cent. The output of other than British or American yards represents a much greater percentage of the whole now than it did before the war. In 1913 the proportion of the total output produced by the smaller maritime nations was 83 per cent.

In 1919 it was only 20 per cent, but in 1920 it rose to 22.7 per cent, in 1921 to 41.4 per cent and last year to 53.4 per cent. This gain was almost entirely due to the activities of the German shipyards. And while Germany in 1913 launched nearly 1,500,000 tons less than Great Britain did, last year she was within 500,000 tons of the British total, and her output was much greater than that of any other maritime nation and nearly five times the American total.

World construction of tankers showed a sharp decline last year, launchings of this class of vessels aggregating nearly 700,000 tons less than for the previous year. The British total showed a slight gain, but the American production was greatly reduced. The following table prepared by *Lloyd's Register* shows in gross tons the comparison for the two years:

	1922	1921
United States.....	14,440	690,000
Great Britain and Ireland.....	262,826	251,000
Other countries.....	78,588	109,000
World total.....	355,854	1,050,000

More than 70 per cent of the world's tanker construction last year, therefore, was in British yards, as compared with less than 5 per cent in the United States.

Decreases were also shown last year in the number of large vessels under construction, those of 10,000 gross tons and upward totaling only 27 as against 47 in 1921. The largest ship launched was the *Columbus* of 35,000 tons, built by Germany.

Motorship construction showed a decline last year, the launching of vessels to be fitted with internal combustion engines representing 209,557 gross tons, as against 306,000 tons in 1921. There was a greater decline, however, in the construction of ships to be fitted with turbines, these aggregating 776,000 tons, compared with 1,185,000 tons the previous year.

Exclusive of Britain and Germany, the greatest volume of launchings last year was in France, followed by Holland, the United States, Italy, Japan and the British Dominions, in the order named. The output of these countries last year compared with 1921 was as follows, in gross tons, *Lloyd's Register* states:

	1922	1921
France.....	184,509	210,663
Holland.....	163,132	232,402
United States.....	119,138	1,006,341
Italy.....	101,177	164,748
Japan.....	83,419	227,425
British Dominions.....	62,765	129,675

It will be noted that there were a number of changes in the ranking of the various shipbuilding countries during the past year. Great Britain still leads, but the United States has dropped from second place to fifth. Germany has advanced from third to second, and France from sixth to third. Holland still holds fourth place, Japan has dropped from fifth to seventh, and Italy has advanced from seventh to sixth.

On 1 Jan. 1923, American shipyards were building or under contract to build for private shipowners 218 steel vessels of 251,858 gross tons, compared with 216 steel vessels of 257,328

gross tons on 1 Dec. 1922. These figures do not include Government ships or ships building or contracted for by the United States Shipping Board. See also MERCHANT MARINE OF THE UNITED STATES.

SHIPPING. World Tonnage.—A summary of the 1922-23 edition of *Lloyd's Register of Shipping*, reprinted in *Commerce Reports*, published by the United States Department of Commerce, lists a grand total of 33,935 merchant vessels of over 100 gross tons, with an aggregate gross tonnage of 64,370,786. This represents an increase of 729 ships and 2,396,133 gross tons over the world's merchant fleet on the corresponding date (30 June) of the preceding year and an increase of 3,099 ships and 15,281,234 gross tons over the 1914 figures. The steel steam and motor tonnage amounted to 56,802,000 gross tons on 30 June 1922, as compared with 54,158,000 on 30 June 1921, and 42,514,000 on 30 June 1914. The following table shows the merchant fleet of steam and motor ships of the principal maritime nations:

TONNAGE OF STEEL, STEAM AND MOTOR VESSELS OF OVER 100 GROSS TONS.			
COUNTRIES	1914	1921	1922
United Kingdom ..	18,877,000	19,288,000	19,053,000
British Dominions ..	1,407,000	1,950,000	2,201,000
United States	1,837,000	12,314,000	12,506,000
Austria-Hungary ..	1,052,000
Denmark	768,000	866,000	944,000
France	1,918,000	3,046,000	3,303,000
Germany	5,098,000	654,000	1,783,000
Greece	820,000	576,000	653,000
Holland	1,471,000	2,207,000	2,613,000
Italy	1,428,000	2,378,000	2,600,000
Japan	1,642,000	3,063,000	3,325,000
Norway	1,923,000	2,285,000	2,237,000
Spain	883,000	1,094,000	1,187,000
Sweden	992,000	1,037,000	996,000
Other countries	2,398,000	3,400,000	3,301,000
Total	42,514,000	54,158,000	56,802,000

Germany's merchant fleet declined from more than 5,000,000 gross tons before the war to just over 600,000 in 1921, and increased to 1,783,000 gross tons during the year ended 30 June 1922. A part of the German gain is undoubtedly reflected in the decline of British tonnage during the same period, due to the resale to German buyers of large numbers of former German ships ceded to Great Britain as a part of the reparations program. During the year, which ended 30 June 1922, German interests repurchased 130 vessels aggregating 491,567 gross tons.

In fact, the tonnage of British steel steam and motor vessels was but slightly larger in 1922 than in 1914, while the world's merchant tonnage of this class increased 34 per cent, thereby reducing the relative importance of the British seagoing fleet.

American steel steam and motor tonnage registered a small increase in 1922, as did that of the other countries listed, with the exception of the United Kingdom, Norway, and Sweden. Next to Germany, the greatest gain in 1922 was made by Holland, with an increase of more than 400,000 gross tons.

Idle Tonnage.—In a review published in *Commerce Reports* (12 Feb. 1923) the United States Department of Commerce stated that the employment of the world's merchant marine was

greater in 1922 than in 1921, owing largely to the increased over-seas movement of goods, but that operation was on the basis of low and declining charter rates. During the last six months of 1922, according to the review, the idle steam tonnage of the world declined approximately three-quarters of a million gross tons and 1 Jan. 1923 stood at around 9,000,000 tons. During the whole of 1922 idle tonnage declined nearly 20,000,000 tons.

Idle tonnage in British ports, which was 1,961,000 gross tons on 1 Jan. 1922, and 1,667,000 tons on 1 July 1922, dropped to 1,010,000 tons on 1 Jan. 1923. The tied-up tonnage in French ports, which increased from 1,085,000 tons to 1,200,000 tons during the first half of the year, declined to 730,000 tons at the end of 1922. Italian and Norwegian idle tonnage also declined. On the other hand, the idle fleet of the United States Shipping Board increased over 400,000 tons, and the privately owned American vessels out of employment on 1 Jan. were nearly 200,000 tons above the amount on 1 July. Japanese and Greek tonnage also had less employment at the end of the year than on 1 July.

The following table shows the idle tonnage in the principal maritime countries of the world. The Department of Commerce stated that the figures in each case are not absolutely accurate and some interpolations had to be made, but as a whole it gives a fair picture:

GROSS TONNAGE IDLE IN THE PRINCIPAL MARITIME COUNTRIES OF THE WORLD.			
COUNTRY	1 Jan. 1922	1 July, 1922	1 Jan. 1923
United States:			
Shipping Board ..	4,314,000	3,978,000	4,411,000
Shipping Board tankers	124,000	124,000	214,000
Privately owned ..	781,000	523,000	703,000
United Kingdom ..	1,961,000	1,667,000	1,010,000
France	1,085,000	1,200,000	730,000
Italy	1,585,000	585,000	472,000
Holland	327,000	330,000	330,000
Norway	207,000	112,000	53,000
Sweden	204,000	114,000	22,400
Greece	170,000	100,000	116,000
Japan	120,000	79,000	99,000
Belgium	1275,000	1275,000	275,000
Denmark	161,000	33,000
Spain	1,530,000	530,000	520,000
Total	10,934,000	9,740,000	8,955,400

¹ Interpolated from best available data.

The amount of German tonnage out of employment on 1 January was reported to be negligible. Continuing its review of the shipping situation, the Department of Commerce said: "According to the specially constructed index number of trip charter rates (described in *Commerce Reports*, August 28, 1922, p. 615), which stood at 121 per cent of 1911-1913 on July 30, 1922, the level of ocean rates had dropped to 111 per cent by September 30 and to 109 by December 31, 1922. When it is considered that the index numbers of wholesale prices in this and other countries are above 150 per cent of pre-war, it can be seen how much ocean rates are out of line. The lowness of rates, however, is understandable on referring to the enormous fleet of idle vessels. No conspicuous or prolonged rise in rates is likely to occur with this cloud over the market.

"It is difficult to understand why idle ton-

nage declined during the year in the face of dropping rates, unless consideration is given to the volume of ocean-borne trade. While figures for all countries are not available, there are sufficient data to indicate that the volume of international trade increased during 1922.

"British coal and coke exports, which made up nearly one-third of the total volume of overseas shipments of the world in 1913, increased from 24,660,000 tons in 1921 to 64,198,000 tons for 1922, a total not far from the record of 76,687,000 tons for 1913. This increase of 40,000,000 tons in ocean shipments of coal during 1922 undoubtedly was the big factor in causing more tonnage to be put into service. The total inborne and outborne ocean-carried trade of France, which amounted to 42,219,000 tons in 1913 and to only 27,211,000 tons in 1921, will be approximately 40,000,000 tons in 1922, based on returns for the first nine months of the year.

"Our own ocean-borne trade declined approximately 13,000,000 tons in the fiscal year 1922. Of this decline, over half was represented by coal. These instances indicate clearly that the total movement of goods overseas in 1922 gained considerably over 1921 and provided work for additional ships, though at starvation rates.

"**Sales Prices of Ships.**—While idle tonnage was declining and rates dropping, the sales price of ships was maintained at slightly above \$30 a dead-weight ton. The average price of 12 cargo ships of 5,000 to 10,000 dead-weight tons, not over 5 years old, sold during the last half of 1921 was \$31 (£6 18s. 5d.) per dead-weight ton, as compared with \$33 (£7 19s.) for 12 similar ships sold during the first half of 1922 and with \$31 for 32 similar ships sold during the last half of 1922. The price of vessels stiffened early in 1922, slumped in the summer and early fall, and rose again slightly toward the end of the year. Ship prices are below pre-war values; in 1913 a good cargo vessel could be ordered for around \$35. Current prices are also below reproduction costs; the most recent contracts placed in British yards have been around \$40 to \$45 a ton."

According to the *Journal of Commerce* (New York), investments in new shipping ventures in the United States during 1922 totaled \$67,225,000 as compared with \$60,190,000 in 1921, and \$585,448,000 in 1920. On 12 Sept. 1922 the Government's fleet of 226 war-built wooden ships was sold by the Emergency Fleet Corporation at a private competitive sale for \$750,000 for the entire fleet. These vessels cost, it is said, approximately \$700,000 each to build. The terms of the sale provided that the ships would be promptly dismantled. Three times previously the Government had attempted to sell the wooden fleet, but only one prior bid had been received for it. It was costing the Government \$50,000 a month to take care of the ships. Very soon after the sale of the ships it was announced that the scrapping of them had begun. On 15 March 1923 following the failure of Congress to pass the Ship Subsidy Bill (q.v.), it was announced that the Shipping Board contemplated the sale of some of the vessels under its care to foreign buyers.

Ships Lost in 1922.—According to the annual report of the Liverpool Underwriters Association, 216 vessels, aggregating 407,750 gross tons,

were lost during 1922. Of this number 60, including 37 sailing vessels and 23 steamships of a total of 91,000 tons, were under the American flag. British losses totaled 45 ships aggregating 112,000 tons. The Japanese lost 30 steamships of a total tonnage of 42,027 tons and the rest of the world lost 14 sailing vessels of 21,759 tons and 67 steamships of a total of 140,263 tons. These vessels were all above 500 tons gross.

The losses in 1922 included two from weather damage, 65 foundering and abandonments, 86 strandings, 18 collisions, 26 from fires and explosions and 19 missing. In the same period the partial losses included 492 vessels from weather damage, 1,425 by strandings, 1,818 by collisions, 500 by fires and explosions, 1,041 received a damage to machinery, shafts and propellers and 1,184 from other causes—a total of 6,469 compared with 5,208 in 1921.

In 1921 the number of American sailing vessels lost was 37 with a tonnage of 44,761 and 19 steamships with a total tonnage of 53,734. In the same year the British loss was 12 sailing vessels of 13,174 and 36 steamships of a total of 88,064. This is a total loss for 1921 of 479,119 tons, a decrease in the past year of 71,363 tons. A total of 232 ships were lost in 1921.

Largest Steamships and Steamship Companies.—According to *Lloyd's Register* the largest steamships afloat are the following: *Maesttic*, length overall 956 feet, breadth 100 feet, gross tonnage 56,000; *Leviathan*, length 920 feet, breadth 100 feet, gross tonnage 54,282 (the United States Shipping Board announced in April 1923 that after reconditioning the *Leviathan* had a gross tonnage of 59,956.65, making it the largest ship afloat). *Berengaria*, length 898 feet, breadth 97 feet, gross tonnage 52,022; *Olympic*, length 890 feet, breadth 92 feet, gross tonnage 46,439; *Aquitania*, length 901 feet, breadth 92 feet, gross tonnage 45,647; *Homeric*, length 775 feet, breadth 76 feet, gross tonnage 35,000. According to the same authority the largest steamship companies in the world are: British India Steam Navigation Company, 907,357 gross tons; Furness Lines, 765,027 gross tons; A. Holt and Company, 590,937 gross tons; Ellerman Lines, Ltd., 568,623 gross tons; Nippon Yusen Kaisha, 567,025 gross tons; Compagnie Generale Transatlantique, 527,599 gross tons; Peninsular and Oriental Company, 518,124 gross tons; White Star Line, 458,521 gross tons; Standard Oil Company of New Jersey, 455,367 gross tons; Osaka Shosen Kaisha, 427,475 gross tons; Cunard Steamship Company, 423,511 gross tons. For a history of United States shipping and detailed figures in regard thereto see MERCHANT MARINE, UNITED STATES.

SHIPPING BOARD, United States. See MERCHANT MARINE OF THE UNITED STATES.

SHIP SUBSIDY. Discovering shortly after his inauguration that the great merchant fleet which had been built up by the United States after its entrance into the World War had developed into a "white elephant" on the government's hands, President Harding, on 28 Feb. 1922, appeared before the Congress and urged the enactment, as an amendment to the Merchant Marine Act of 1920, of a measure which came to be known as the Ship Subsidy Bill. This bill authorized the United States Shipping Board

to sell Government owned ships to citizens at public or private sale upon such terms and subject to such conditions as the Board might prescribe, but directed that the payment of the purchase price and interest should not be deferred more than 15 years after the making of the contract of sale and that the interest rate should not be less than 2 per cent per annum. It further provided for the creation of the United States Shipping Board Construction Loan Fund not to exceed \$125,000,000 out of which loans could be made to aid persons, citizens of the United States, in the construction of vessels of the best and most efficient type and in equipping vessels already built with the most modern and efficient machinery and commercial appliances. The bill also provided for a reduction of income taxes on shipping corporations equal to 5 per cent of the goods shipped under the American flag; directed that 50 per cent of all immigrants coming to the United States should be transported in vessels documented under the laws of the United States; established the Merchant Marine Naval Reserve; double tonnage duties and taxes except for sailing vessels of less than 1,000 gross tons and other vessels of less than 1,500 gross tons; and provided for the discontinuance of the army and navy transport service and the diversion of this privilege to private lines under 10 year contracts negotiated by the Secretaries of the Army and Navy. The bill also established the Merchant Marine Fund into which, it was stated, should be paid all tonnage duties and taxes, 10 per cent of the amount of all customs duties and all excess earnings paid by the owner of any vessel. Out of this fund it was provided the Board should pay subsidies on 10 year contracts based on gross tonnage of vessels, nautical miles sailed and speed. These subsidies were to range from one-half to 1 per cent gross ton per 100 nautical miles to two and one-tenth cents. It was estimated that the President's program would cost approximately \$15,000,000 the first year and might eventually cost as much as \$30,000,000 a year. The bill was favorably reported by the House Committee but no further action was taken upon it at that session. In a further effort to secure passage of the measure, President Harding called Congress into extraordinary session on 20 November and on the following day delivered his second message on the subject, which in part was as follows: "The war construction and the later completion of war contracts, where completion was believed to be the greater economy to the public treasury, left us approximately 13,200,000 gross tonnage in ships. The figures are nearer 12,500,000 tons now, owing to the scrapping of the wooden fleet. More than half this tonnage is Government owned, and approximately 2,250,000 tons are under Government operation in one form or another. The net loss to the United States Treasury—sums actually taken therefrom in this Government operation—averaged approximately \$16,000,000 per month during the year prior to the assumption of responsibility by the present administration. A constant warfare on this loss of public funds, and the draft to service of capable business management and experienced operating directors, have resulted in applied efficiency and enforced economies. It is very gratifying to report the diminution of the losses to

\$4,000,000 per month, or a total of \$50,000,000 a year; but it is intolerable that the Government should continue a policy from which so enormous a Treasury loss is the inevitable outcome. This loss, moreover, attends operation of less than a third of the Government owned fleet. It is not, therefore, a question of adding new Treasury burdens to maintain our shipping; we are paying these burdens now. It is not a question of contracting an outlay to support our merchant shipping, because we are paying already. I am not asking your authorization of a new and added draft on the public Treasury; I am appealing for a programme to diminish the burden we are already bearing . . . I am, first of all, appealing to save the Treasury. Perhaps the unlimited bestowal of Government aid might justify the apprehension of special favoring, but the pending bill, the first ever proposed which carries such a provision automatically guards against enrichment or perpetuated bestowal. It provides that shipping lines receiving Government aid must have their actual investment and their operating expenses audited by the Government that Government aid will only be paid until the shipping enterprise earns 10 per cent on actual capital employed, and immediately that when more than 10 per cent earning is reached half of the excess earnings must be applied to the repayment of the Government aid which has been previously advanced. Thus the possible earnings are limited to a very reasonable amount if capital is to be risked and management is to be attracted. If success attends, as we hope it will, the Government outlay is returned, the inspiration of opportunity to earn remains, after transportation by sea is established."

The bill after being amended, passed the House on 29 November by a vote of 208 (204 Republicans; 4 Democrats) to 184 (114 Democrats; 69 Republicans; 1 Socialist) but filibustering tactics prevented it from coming to a vote in the Senate either in the special session or in the regular session which followed and which closed 3 March 1923, when the 67th Congress passed out of existence.

SHOES. See BOOT AND SHOE INDUSTRY.

SHOOTING. See RIFLE-SHOOTING.

SHORTER COLLEGE, a Baptist educational institution for women, founded in 1873 and located at Rome, Ga. In 1922-23 it had a faculty of 25 members, 246 students, property valued at approximately \$500,000 and an income of \$136,000. Daniel James Blocker, M.A., D.D., is president.

SHRADY, Henry Merwin, American sculptor: b. New York, 24 Oct. 1871; d. there, 12 April 1922. He was a son of Dr. George Frederick Shradly, who attended General Grant in his last illness. One of his ancestors was a founder of King's College, now Columbia University. He received his education at Columbia from which he was graduated in 1894. At that time he had no thought of an artistic career. He studied for the bar, but never practised and was engaged in business from 1895 to 1900. During a convalescence from typhoid fever, he took up painting merely as an amusement. His wife, who was Harriet E. Moore, saw the merit in his work and without his knowledge sent several of his paintings to the exhibition of the National

Academy of Design, where they met with high favor and promptly found purchasers. He next tried his skill at sculpture and modeled some small animal figures that met an even more cordial reception than did his pictures. So many orders came that he felt obliged to adopt sculpture as a profession. His successes were the more remarkable in that he had never taken a lesson in drawing or modeling.

In 1901, Mr. Shrady won the competition for an equestrian statue of George Washington to be placed at the Brooklyn end of the Williamsburg Bridge. He also executed equestrian statues of General Williams for Detroit; of General Lee at Charlottesville, Va.; and a statue of Jay Cooke at Duluth. In 1913 the Holland Society awarded him the commission for a statue of William the Silent for Riverside Drive, New York City.

His greatest work, however, is the colossal monument to General Grant, which was unveiled at Washington, D. C., on 27 April 1922, the centenary of the birth of General Grant. He was awarded this commission in 1902. It has been called the most ambitious piece of architectural sculpture ever attempted in America.

SHURTLEFF COLLEGE, a Baptist co-educational institution, founded in 1827 and located at Alton, Ill. In 1922-23 it had a faculty of 18 members, 186 students, property valued at \$650,000 and an income of \$51,755. George M. Potter, A.M., is president.

SIAM, (Sayam, or Muang-Thai), a kingdom of southeastern Asia, bounded on the north by Burma and Tongking, south by the Gulf of Siam and Cambodia, east by Annam and west by Burma. Its area is about 198,900 square miles of which about 45,000 are in the Malay Peninsula. The population is 8,266,408, of whom fully 7,000,000 are Siamese. Bangkok, the chief city, has a population of 931,171 and includes about 200,000 Chinese.

Religion.—The prevailing religion is Buddhism, of which there are 13,616 temples and 87,538 priests.

Education.—The Government primary schools number 402, with 1,026 teachers and 35,045 pupils. Non-Government primary schools number 2,416 with 2,819 teachers and 113,793 pupils. The Government maintains 135 secondary schools with 506 teachers and 10,913 pupils. In addition there are seven non-Government secondary schools with 78 pupils. There are 26 special Government schools with 569 pupils. The Temple schools are very numerous and there are also schools attached to the various Christian missions. The Chulalongkorn University was founded in 1917 at Bangkok with faculties of medicine, literature, political science, engineering and natural science.

Finance.—For the fiscal year 1921-22 the revenue of the kingdom amounted to £6,483,333 and the expenditure to £6,836,048. Extraordinary expenditure against capital account for the same period amounted to £1,429,011. Revenues are derived from the opium trade, land taxes, capitation tax, excise, railways, mines and forests and customs dues. The national debt amounts to £6,633,960, made up of various loans most of which have been expended on works of public utility.

Production and Industry.—Rice is the chief agricultural product and forms a staple export.

It forms also the principal diet of the people. About 6,151,200 acres are planted to rice in normal years. The average annual export of rice is 1,070,000 tons but this was decreased to 277,410 tons in 1921 due to a partial failure of the crop. In the neighborhood of the capital there are 80 rice mills. Irrigation projects are being pushed both by the Government and by private enterprise in the region north of the capital where there are large tracts considered as waste lands until of recent years. The last census of livestock showed 6,294 elephants, 132,675 horses and ponies, 2,620,682 bullocks and 2,508,164 buffaloes. There are extensive forests in Upper Siam and the cutting of teak is an important industry. It is largely in British hands. The dry logs are floated down stream during the rainy season. The exports of teak in 1921 amounted to 71,617 tons valued at \$5,788,768 approximately. Siam was formerly a large exporter of rubber but the output has declined in recent years. However, in the Malay region the planting of rubber trees bids fair to revive the country's position as an exporter of rubber.

The mineral resources of the Kingdom are extensive, including tin, coal, iron, tungsten, wolfram, zinc, manganese and antimony. The mining of tin is well developed on the Island of Puket and at Renong on the mainland. The output of tin averages 8,850 tons yearly.

Commerce.—The bulk of the trade of the Kingdom passes through the capital, Bangkok. In 1921 the failure of the rice crop was reflected in an adverse trade balance. In normal years the trade balance is favorable. Imports in 1921 were valued at \$76,895,530 and exports at \$34,518,800. The chief exports were rice and teak wood; the chief imports: cotton goods, foodstuffs, metal goods and machinery, and tobacco and cigarettes. Most of the exports go to the British Malay States, Hong Kong, and the United Kingdom. These countries and Burma and India also furnish the bulk of the imports.

Shipping and Communications.—In 1921, 571 vessels of 492,812 tons entered the port of Bangkok. There is regular steamer communication between the latter port and the ports of Southern China, with Singapore and the ports of the Malay Peninsula. British, Japanese, French, Norwegian and other vessels make frequent calls. Siam has 1,376 miles of state railways open to traffic. Of this, 591 miles are of standard gauge and 785 miles of metre gauge. Bangkok is connected by rail with the Federated Malay States lines by a line down the Peninsula to Padang Besar. There are a few private lines. Siam has 379 post offices, 89 telegraph offices, two telephone exchanges with 1,228 instruments. There are two wireless stations, one at Bangkok and another at Senggora. Both are under the control of the naval authorities.

Defense.—There is compulsory military service; every able-bodied citizen being liable to two years service with the colors. The army is divided into three army corps. The naval forces include a light cruiser, a few gunboats, three dispatch vessels and one destroyer. There are 5,000 men available for service afloat and a reserve of 20,000. About \$6,500,000 is spent on defense yearly.

Government.—The executive power is exercised by the King, who is advised by a cabinet

consisting of the heads of the Government departments. There is a Legislative Council of 40 members, consisting of the ministers of state and appointees of the Crown. The Council has power to revise, amend, and complete the legislation of the Kingdom. The Kingdom is divided into 18 Monthon or provinces, of which 17 are presided over by a Lord-Lieutenant under whom are several subordinate Governors. These exercise full administrative control over their respective districts. The Bangkok district is under the Minister of Local Government. There are many subdivisions. The reigning King is Chao Fa Maha Vajiravudh, b. 1 Jan. 1881; succeeded to the throne on the death of his father, 23 Oct. 1910. He is styled King Rama VI, being the sixth sovereign of the present dynasty. Each sovereign has the privilege of designating his successor. Of late years Western civilization has made great strides in the Kingdom. There are several foreign advisers and administrators, American, British, French, etc.

SIBERIA, the northern part of Asiatic Russia, comprising nine provinces with a territory of 4,210,420 square miles and a population of 9,257,825. See **RUSSIA**.

SIERRA LEONE, a British Colony and Protectorate lying on the west coast on Africa between Liberia and French Guinea. The area of the colony is 4,000 square miles with a population of 75,572, including 702 whites. The capital is Freetown, with 34,090 inhabitants. There are 170 primary and secondary schools with an average attendance of 6,432. The chief imports of the colony are coal, cotton textiles, tobacco, oil and spirits. The chief exports are ginger, palm kernels, kola nuts, palm oil. Imports in 1920 were valued at £3,548,478 and exports at £2,949,380. Revenue the same year amounted to £999,382 and expenditures to £843,403. The net public debt of the colony is £1,729,848. The Protectorate has an area of 27,000 square miles with a population of 1,327,560. The Governor in 1922 was R. J. Wilkinson and the Colonial Secretary J. C. Maxwell.

SILESIA, the name of a former division of Austria-Hungary, now included in Czechoslovakia, and also of a province of Prussia. Former Austrian Silesia has an area of 1,988 square miles and a population of 763,579. Prussian Silesia (part now of Poland) has an area of 15,573 square miles and a population of 5,225,962 in 1910. After the World War Upper Silesia was the subject of a plebiscite and in 1921 the plebiscite was held. After considerable strife between the German and Polish populations, the boundary was determined by a commission from the League of Nations. Of Upper Silesia Poland received about 2,488 square miles with a population of 1,125,537. The remainder was allotted to Prussia. See **GERMANY**; **POLAND**.

SILK INDUSTRY. For 4,000 years China led the world in silk. In recent years Japan outstripped her in silk-growing, and now America is taking first place in silk manufacture, displacing France. The Chinese production is estimated to have a value of about \$140,000,000 a year, and Japan's nearly double that figure. The United States imports all her raw silk, mainly from Japan. The production is estimated by

seasons, from 30 June to 30 June. In 1921-22 the world's production was 59,437,000 pounds, of which Asia exported 48,740,000, almost all to the United States. The 1922-23 crop is estimated as 63,660,000 pounds. Figured in bales of 132 pounds each, the 1922-23 estimated crop will be divided as follows:

	Bales
Italy.....	52,000
France.....	3,300
Spain.....	1,000
Levant.....	8,300
Japan.....	300,000
Shanghai.....	*68,000
Canton.....	*46,000
India.....	1,470
WORLD PRODUCTION.....	480,070

* These are export figures only. China is estimated to produce nearly as much more for home use

The United States consumption of raw silk for the last three years is in bales: 1920, 232,530; 1921, 341,919; 1922, 366,578. Measured in dollars, the imports of raw silk into the United States during 1922 totaled a fraction over \$300,000,000. These figures indicate a large expansion in the silk manufacturing industry of the country, since the census of 1919, when the raw silk consumed was under 60 per cent of last year's total. Nevertheless, manufacturers and retailers agree that 1921 was a very hard year, though admitting 1922, especially the latter half, was moderately prosperous. The two striking features of the year's business were the unstable condition in prices of raw silk, setting in about April, and the enormous importations from Japan in the first half of the year, exceeding the total importation of 1921. At the close of 1922 the stocks reported at Yokohama were 42,000 bales, and about 25,000 bales in New York, the total visible supply being 178,000 bales, less than the normal.

There are in round numbers 1,000 silk manufacturers in the United States, and 400 establishments doing silk throwing and winding. Their estimated capitalization is \$400,000,000, and they paid out about \$135,000,000 in wages in 1922. In the census year their production was valued at \$688,000,000, in 1921 \$583,268,000, and in 1922 \$700,000,000. About 100,000 broad silk looms are active, and 12,000 ribbon looms, while the producing spindles number about 3,000,000. The broad silk export of 1922 was 3,033,000 yards, valued at \$3,870,000, a slight increase in value and decrease in quantity, as compared with 1921. Over 70 per cent of the exportation was to Canada; Argentina and Mexico being also buyers. The Mexican demand fell off 60 per cent as compared with 1921. The total exports of all kinds of manufactured silk from the United States was nearly \$12,000,000 in 1922. The bulk of the industry is in Pennsylvania, followed by New Jersey, New York, Connecticut and Rhode Island. The prices for raw Japan silks in 1922 ranged from \$7.75 to \$8.25, nearly \$2 better than in 1921, but far below the 1920 figures. The best China raw silks brought \$8.80 as a top figure in 1922, and Italian \$8.50.

The silk trade of America is well organized, there being the Silk Association of America, which has celebrated its 51st birthday; the Broad

Silk Manufacturers of the United States, Ribbon Manufacturers of the United States, Silk Throwsters of the United States, and Silk Travelers' Association. The silk styles of the present year, 1923, are brilliantly colored and figured, there being a great profusion of printed designs. A portion of these are mixed with cotton, and there is a moderate production of artificial silk. During the past year the Federal Trade Commission took strong action against jobbers using the word "Mills" as a part of their corporate name, to give the public the impression they were dealing with first hands.

Artificial silk manufactured in the United States in 1922 totaled 24,406,000 pounds; almost double the amount manufactured in 1921. Imports of artificial silk to 30 Nov. 1922 amounted to 1,857,917 pounds.

SILLIMAN COLLEGE, a Presbyterian educational institution for women, founded in 1852 and located in Clinton, La. In 1922-23 it had a faculty of 10 members, 85 students, property valued at \$75,000, and an income of \$16,673.29. Rev. U. B. Currie, D.D., is president.

SILVER. The Bureau of the Mint, with the co-operation of the Geological Survey, estimated the 1922 production of silver in the United States at 55,510,859 ounces, valued at \$1 per ounce, as provided by the Pittman Act of 23 April 1919, for domestic product. Compared with 1921, this estimate indicates an increase of 2,458,418 ounces. The country's record production of silver occurred in 1915, the figures for that year being 74,961,075 ounces. The production in ounces in 1922 by States and Territories was as follows: Alaska, 652,251; Arizona, 4,198,695; California, 3,119,002; Colorado, 5,951,593; Georgia, 2,933; Idaho, 5,965,098; Illinois, 3,915; Michigan, 361,912; Missouri, 68,351; Montana, 9,601,048; Nevada, 108,027; New Mexico, 657,231; North Carolina, 8; Oregon, 193,121; Pennsylvania, 2,215; South Dakota, 121,757; Tennessee, 75,138; Texas, 601,765; Utah, 15,588,734; Virginia, 6; Washington, 210,885; Philippines, 27,174; total, 55,510,859 ounces. Mexico produced about 65,000,000 ounces and Canada 17,000,000 ounces in 1922.

From 1492, the year of the Discovery of America, to the end of 1920, the world production of silver amounted to 12,573,706,282 ounces fine, having a coinage value of \$16,256,913,158. World consumption in 1922, as well as production, was the largest in many years, due to heavy demands from the Far East, which took about 218,000,000 ounces. World consumption for 1922 is estimated at 307,000,000 ounces, while production is estimated at 207,000,000 ounces. In 1922 many nations seemed still disposed to substitute nickel, aluminum, and base metal alloys for silver in coinage. In Great Britain and Holland the subsidiary coinage was debased and silver coins disappeared in Germany. Nevertheless, it was estimated that a total of about 200,000,000 ounces of silver was held in the reserves of the chief European countries.

The average price of silver in the open market in 1922 was 68 cents, United States gold currency, per fine ounce, as compared with 63.07 cents in 1921. The pre-war average was 55½ cents for the five-year period, 1909-13. American mines received \$1.00 per ounce, the fixed

price under the Pittman Act. The world output for the first three months of 1923 was approximately 56,000,000 ounces, or, at this rate, about 225,000,000 ounces for the year. About 70 per cent of silver comes as a by-product of copper, lead and zinc mines and not from silver mines proper. Depression in the lead, copper and zinc mining industries is at once reflected in the silver output. In March 1923 it was estimated that the world would need about 55,000,000 ounces more of silver than the mines of the world would produce, and the extra silver would have to come from coin meltings, especially in Europe.

Imports of silver to the United States for the year ended 31 Dec. 1922 were \$70,806,653, as compared with \$63,242,671 in 1921 and \$88,060,041 in 1920. Exports amounted to \$62,807,286 in 1922, as compared with \$51,575,399 in 1921 and \$113,616,224 in 1920.

SIMMONS COLLEGE, a Baptist co-educational institution, founded in 1891 and located at Abilene, Texas. In 1922-23 it had a faculty of 35 members, 800 students enrolled up to January 1923, property valued at \$750,000 and an income of \$100,000. Jefferson D. Sandefer, LL.D., president.

SIMMONS COLLEGE, a non-sectarian educational institution for women located at Boston, Mass. It was founded in 1899. Statistics for 1922-23 show a faculty of 121 members, a student enrollment of 1,228, and a property valuation of \$1,535,202.57. The college's income for the year ending 30 June 1922, was \$342,127.73. Henry Lefavour, Ph.D., LL.D., is president.

SIMPSON COLLEGE, a co-educational institution, connected with the Methodist Episcopal Church, founded in 1867 and located at Indianola, Iowa. In 1922-23 it had a faculty of 38 members, 750 students, property valued at \$540,000, an endowment of \$500,000 and an income of \$105,000. John L. Hillman, D.D., is president.

SIMS, George Robert, English journalist, author and playwright: b. London, 2 Sept. 1847; d. there, 5 Sept. 1922. He was author, or part author, of 30 plays, a number of novels, poems, sketches and essays. He was educated at Eastbourne, Hanwell Military College and Bonn. His first attempt at literature was jingling rhymes, 'The Lunatic Laureate' contributed to *Fun*. Next he joined the staff of the *Weekly Dispatch* and five years later became editor of *One and All*. He was one of the founders of *The Referee* and under the name of "Dagonet" contributed a column to this paper every week under the title of "Mustard and Cress." His first acted play was 'Crutch and Toothpick,' an adaptation from Labiche. This was followed by 'The Lights o' London' (1881), his most famous play, and 'The Roman Rye' (1882). 'In the Ranks' (1883) and 'Harbour Lights' (1885) were written with Harry Pettitt. He and Arthur Shirley adapted 'Two Little Vagabonds' from the French (1896). His other plays include 'The Silver Falls' (1888); 'The English Rose' (1890); 'The Trumpet Call' (1891); 'The White Rose'; 'The Lights of Home'; 'The Star of

India'; 'Master and Men'; 'The Gypsy Girl,' and the pantomimes 'Puss in Boots' and 'Puss in New Boots.' Among the farces and comedies under his name are: 'Mother-in-law' (1881); 'The Member for Slocum' (1881); 'Flats' for Charles Wyndham (1881); 'The Gay City' (1881); and 'The Half-Way House.' He also wrote a number of extravaganzas, burlesques and comic operas. One of his best known poems was 'Osler Joe.' His books include: 'Dorcas Dene, Detective' (1897); 'Once upon a Christmas Time' (1898); 'In London's Heart'; 'A Blind Marriage'; 'Living London'; 'Among My Autographs'; 'The Life We Live'; 'How the Poor Live'; 'The Dagonet Ballads,' etc. 'My Life' (1917.) The King of Norway gave him the order of Knight of the Royal Norwegian Order of St. Olaf in 1905.

SINGAPORE. See STRAITS SETTLEMENTS.

SINGH, Sir Partab, Regent of Jodhpur, India: b. 21 Oct. 1845; d. Simla, British India, 4 Sept. 1922. He was the second son of Maharajah Takht Singh of Jodhpur, head of the great Rathor clan of Rajputs. From early years he was distinguished for his horsemanship and manly sports of every kind, accomplishments that were of great value to him when he became Dewan in 1878 to his elder brother, the late Maharajah Sir Jeswant Singh. When his nephew, Sir Sardar Singh, succeeded to the title as a minor, he became Regent. In 1902 the Paramount Power selected him as a collateral relative to succeed the Maharajah of Idar, Bombay Presidency, who had died in infancy. Both he and his consort, the benevolent and sympathetic Mahranees Bhadyanyi, who died in 1907, became greatly beloved. Upon the death of his nephew, Sir Sardar Singh, in 1911, Sir Partab was once again called to be Regent of Jodhpur, this time for his grand-nephew, Maharajah Sumer Singh, then 13 years of age. Sir Partab introduced far-reaching reforms in every department of the State of Jodhpur, suppressed crime and in every way possible worked for the benefit of the people. Through the construction of large irrigation works under his administration the country was relieved from famine to which it had been chronologically subject. Internal communications were also developed. His career as a soldier equaled his record as a statesman. He first saw actual service in 1877, when he was attached to the Kabul Mission, headed by the late Sir Neville Chamberlain and he was made Companion of the Order of the Star of India, the first of many honors given him by Queen Victoria, King Edward and King George. When the Northwest frontier was in revolt in 1897-98, he served on the staff in both the Mohmand and Tirah campaigns; and during the latter concealed the fact that he had been wounded until it was discovered by accident. The famous "Sirdar Rissala," or "Jodhpur Lancers," formed and trained by himself, did excellent service under his command in the operations of 1900-01 against the Chinese Boxers. Sir Partab was in charge of the Imperial Service section of the representative body of Indian troops that went to England for King Edward's Coronation. When the World War broke out Sir Partab

"would not be denied his right to serve the King-Emperor in spite of his 70 years"; and he arrived in France accompanied by the youngest of India's princely fighters, his grand-nephew and ward, the Maharajah of Jodhpur, then 16. Subsequently his adopted son and successor at Idar also served at the front. He endured trench warfare but did not like it and frequently said his "great ambition was to die on the battlefield, fighting for the King-Emperor." Of his prowess on the chase and in the saddle many stories are preserved, particularly in the autobiography of Lord Roberts. Even in his advanced years he was cool on a tiger hunt and could play polo with all the dash, courage and staying-power of the youngest. This veteran warrior-statesman so strikingly exemplified the noble ideals of Rajput chivalry, valor and fidelity that for three generations he occupied a unique place in the affections of the British Empire. King George wrote a tribute on learning of his death, in which he added this personal note: "His attendance upon me as *aide-de-camp* during my two visits to India, gave me special opportunities of realizing his noble character and genial companionship."

SIOUX FALLS UNIVERSITY, a Baptist co-educational institution, founded in 1883 and located at Sioux Falls, S. D. In 1922-23 it had a faculty of 15 members, 200 students, property valued at \$138,000 and endowment of \$218,000, and an income of \$61,000. Fred G. Boughton is president.

SKIDMORE COLLEGE, a non-sectarian educational institution for women, founded in 1911 and located at Saratoga Springs, N. Y. In 1922-23 it had a faculty of 45 members, 390 students, and property valued at \$1,325,000. Income figures not given. Charles H. Keyes, Ph.D., is president.

SLAVONIA. See CROATIA AND SLAVONIA.

SLEEPING-SICKNESS (*encephalitis lethargica*). This disease, according to the United States Public Health Service, is slow in developing and long in duration. The period of convalescence is variable; in some cases recovery is completed within two weeks after the subsidence of the acute symptoms; but in others it is prolonged and leaves its record on the mind, on certain muscles and on the nerves of the cranium. The mental troubles, however, usually pass off eventually. In a bulletin relating to the subject, which was issued in March 1923, Surgeon-General H. S. Cumming of the United States Public Health Service said: "The appearance of encephalitis in epidemic form has, except for one epidemic reported from Austria, always been preceded by an epidemic of influenza. Forty-six per cent of the cases studied by Dr. Smith had had influenza and 54 per cent had not. The influenza-attack rate has been ascribed to the lowering of the vitality of the patients by the influenza; but has also been explained as being really due to another attack of influenza which has invaded the central nervous system of the body. Whether or no there is any connection between the two diseases has not yet been established.

"The United States Public Health Service has no statistics in regard to the prevalence of *encephalitis lethargica*, popularly known as sleeping sickness, that are sufficiently reliable and complete to warrant a statement as to the extent of the disease throughout the United States. The disease is 'reportable' by physicians in comparatively few States; and in the larger part of the country the only data available are based on newspaper reports. Moreover the disease is rather easy to confuse with some other diseases; and its prevalence is therefore likely to be unduly magnified. Thus, in an investigation made by Dr. H. F. Smith, of the Public Health Service, of the 1918-19 epidemic, 22 per cent of the supposed cases had to be excluded as being really cerebro-spinal meningitis, cerebral syphilis, brain abscess, tuberculous meningitis, epilepsy, poliomyelitis, hysteria, or acute alcoholism.

"The disease appears to be only difficultly communicable. Not a single secondary case is known to have occurred in the immediate families of the patients reported in 1918-19, although some 900 persons were exposed.

"The fatality is rather high. Of the 159 cases studied by Smith, death resulted in 46, or 29 per cent.

"It is interesting, though perhaps not significant, that the peak of the outbreak of 1918-19 was reached in New York City in January; in Virginia in February, and in Louisiana, Texas, and Illinois in March. In California the largest number of cases reported in any one month was in April. Whether this progress was related to the season of the year or was merely a result of the spread of the disease is not known. Comparison with the present spread may throw some light on the subject." See also MEDICINE AND SURGERY, ADVANCEMENT OF.

SMALLPOX. See PUBLIC HEALTH SERVICE, UNITED STATES.

SMITH, Alexander, Scottish chemist: b. Edinburgh, 11 Sept. 1865; d. Edinburgh, 9 Sept. 1922. He was graduated from the University of Edinburgh in 1886 and from the University of Munich with the degree of Ph.D. in 1889. He was assistant in chemistry at the University of Edinburgh in 1889-90, and professor of chemistry and mineralogy at Wabash College in 1890-94. He then taught chemistry in the University of Chicago and became director of general and physical chemistry there, and from 1911-21 was head of the department of chemistry at Columbia University, New York. He was a member of the National Academy of Sciences and honorary member, Spanish Society of Physics and Chemistry (Madrid). His 'Laboratory Outline of General Chemistry' and 'Introduction to General Inorganic Chemistry' have been translated into German, Russian, Italian and Portuguese. He also published 'General Chemistry for Colleges' (1898) and 'Text-book of Elementary Chemistry' (1914). The University of Edinburgh gave him the degree of LL.D. in 1919.

SMITH, Delavan, American newspaper publisher: b. Cincinnati, Ohio, 28 Dec. 1861; d. Lake Forest, Ill., 25 Aug. 1922. He was educated at Lake Forest Academy, Lake Forest

College and the Massachusetts Institute of Technology. Mr. Smith became connected with the Indianapolis *News* in 1892, when his father, William Henry Smith, acquired an interest in it, became one of the principal owners of the paper when the elder Smith died in 1896, and for a number of years before his own death was its publisher. Associated with him for several years in the ownership of the paper were his brother-in-law, Charles R. Williams, editor-in-chief from 1892 to 1911, and his cousin, the late Charles Warren Fairbanks, Vice-President of the United States, 1905-09. In May 1909, Mr. Smith and Mr. Williams were indicted on a charge of criminal libel alleged to have been committed in connection with criticisms of the Panama Canal purchase. They successfully resisted an effort to take them to Washington for trial and the case was dropped. Mr. Smith was a member of the American Historical Association, the Chicago Historical Society, and various clubs. He was also vice-president of the Oliver Typewriter Company.

SMITH, Stephen, American physician: b. Skaneateles, Onondaga Co., N. Y., 19 Feb. 1823; d. Montour Falls, near Elmira, N. Y., 26 Aug. 1922. He received an academic education and was graduated in medicine at the College of Physicians and Surgeons, Columbia University, in 1850. Brown University gave him the degree of A.M. in 1876 and the University of Rochester, LL.D. in 1891. He was attending surgeon at Bellevue Hospital, New York, in 1854; professor of surgery, 1861-65 at Bellevue Hospital Medical College; professor of surgery, New York University, 1874; editor of the *New York Journal of Medicine*, 1857-60; editor, *New York Medical Times*, 1860-64; investigated sanitary condition of New York in 1865; United States Commissioner to Ninth International Sanitary Convention, Paris, 1894; and was founder and first president of the American Public Health Association. He served on many boards of health, was commissioner in lunacy and a commissioner of the New York State Board of Charities. His publications include: 'Handbook of Surgical Operations'; 'Principles of Operative Surgery'; 'Doctor in Medicine'; 'The City that Was,' describing conditions in New York before his sanitary reforms; and 'Who is Insane'? He was six months short of being 100 years old. His recipe for longevity was: "Work and keep out of the easy chair; don't eat too much meat; drink lots of milk and get plenty of sleep."

SMITH COLLEGE, a non-sectarian educational institution for women, founded in 1871 and located at Northampton, Mass. In 1922-23 it had a faculty of 227 (including office and library staff), 2,038 students, property valued at \$509,073.49 and an income of \$1,269,020.26. William Allan Neilson, Ph.D., LL.D., is president.

SMITHSONIAN INSTITUTION. The institution was created by act of Congress in 1846, according to the terms of the will of James Smithson, of England, who in 1826 bequeathed his property to the United States of America "to found at Washington, under the name of the Smithsonian Institution, an estab-

lishment for the increase and diffusion of knowledge among men."

These purposes the institution carries out by means of research and exploration and by its various series of publications which are distributed throughout the world. During the fiscal year 1922 the institution conducted or co-operated in a number of researches and explorations, among which may be mentioned Secretary Walcott's geological researches in the Canadian Rocky Mountains and Assistant Secretary Abbot's work on the solar constant of radiation. Other lines of work included paleontological researches in various parts of the United States; a botanical reconnaissance of southeastern Asia for the special purpose of collecting the bamboos, many of which are of economic interest; a biological collecting expedition to Australia, which is of special value because the remarkable fauna of that continent is rapidly being exterminated through various causes; two botanical expeditions to Central America; and a number of other explorations.

The institution and its branches published during the year a total of 164 volumes and pamphlets, of which there were distributed 165,196 copies.

The library of the institution received during the year 15,796 additions. This brings the total number of volumes, pamphlets, etc. in the library to 1,079,400.

BRANCHES OF THE INSTITUTION.

National Museum.—Undoubtedly the most important event of the year for the National Museum was the receipt and installation of the Herbert Ward collection of African ethnologica and sculptures. This collection, one of the most important ethnological units in the world, was brought together by Herbert Ward, an Englishman, who was with Stanley on his famous exploring expedition through Africa. It consists of 2,700 ethnological specimens and 19 superb sculptures in bronze of African natives by Mr. Ward.

An actual beginning was made during the year toward establishing the Loeb collection of chemical types, a permanent reference or study collection of new substances and original material resulting from chemical research, funds for the maintenance of which were bequeathed by Prof. Morris Loeb, the eminent chemist, who died in 1912. Two specially constructed cabinets were received from the Chemists' Club of New York and a portion of each of seven new chemical compounds discovered in the United States Department of Agriculture were deposited in the collection. It is planned to solicit all available new chemical material, with the view of eventually making of the Loeb collection a complete series for the use of investigators in chemistry.

The Museum acquired during the year a total of 359,677 specimens. In the department of biology the outstanding feature of the year's accessions is the collection of about 100,000 insects collected by Dr. William Mann in South America, especially eastern Bolivia. Another important collection of insects was that made by Dr. J. M. Aldrich in Alaska, which numbered around 10,000 specimens. A considerable con-

signment of biological material, mostly vertebrates, was received from Mr. Charles M. Hoy, who has been working in Australia under the auspices of Dr. W. L. Abbott. In geology a number of valuable additions were made to the collections, among them specimens of Bolivian tin and tungsten ores from Mr. F. L. Hess; rich examples of carnotite and hewittite presented by the Standard Chemical Co., Naturita, Colo.; and eight gold nuggets donated by Mr. Frank Springer.

The number of visitors to the Natural History Building during the year was 441,604; to the Arts and Industries Building, 262,151; and to the Aircraft Building, 46,380.

National Gallery of Art.—Among the accessions received by The National Gallery during the year was a portrait of President Grant, presented by Mrs. U. S. Grant, jr.; an oil painting entitled "The Signing of the Treaty of Ghent," by Sir A. Forestier, presented to the Smithsonian Institution by the Sulgrave Institution; a painting entitled "Tohickon," by Daniel Garber, provided through the Henry Ward Ranger bequest; and a portrait of Edwin H. Harriman, an artist's proof etching, one of 21 from the copper.

Preliminary steps had been taken at the end of the year toward the acceptance of a rich collection of British masterpieces brought together by the late John H. McFadden, of Philadelphia. The collection comprises 44 notable examples of the work of 19 British artists, and the acceptance of this valuable loan is regarded with much favor.

The first annual meeting of the National Gallery of Art Commission was held on 6 Dec. 1921. Reports of the committees were presented and many important matters relating to the gallery were discussed, among them the urgent need of a National Gallery Building and the problem of the acceptance of proffered works of art while the gallery has for exhibition purposes only the large central hall of the Natural History Building of the National Museum.

Freer Gallery of Art.—The Freer Gallery of Art, an independent unit of the National Gallery of Art, continued work on the collections preparatory to the opening of the gallery to the public in the spring of 1923. This building and the superb collection of Oriental and American art which it was built to house, are both the gift of the late Charles Lang Freer, of Detroit, to the nation, through the Smithsonian Institution. Work during the year included chiefly the classification and cataloguing of Chinese, Japanese, and Tibetan paintings, Chinese tapestries, and Chinese and Japanese pottery; the preliminary classification of Korean pottery and Chinese and Japanese stone sculptures and jades; and the cataloguing of American paintings, drawings, and prints.

Bureau of American Ethnology.—The material culture and ceremonials of the American Indian are being modified so rapidly through contact with the white race that it is imperative for the Bureau to make every effort to record all possible data bearing on the aboriginal Indian culture. The desirability of preserving this material so that accurate knowledge of this interesting and vanishing race may be available for future generations is evident.

Dr. J. Walter Fewkes, chief of the Bureau, continued his successful archeological field-work on the Mesa Verde National Park, Colo., bringing to light a most interesting and instructive ruin which he has named "Pipe Shrine House" on account of the numerous tobacco pipes found on a shrine in the kiva of this ruin. He also excavated and repaired Far View Tower, a round structure 10 feet high, which was probably used for observations of the position of the sun on the horizon at sunrise and sunset, in order to determine the time for planting and other dates important for an agricultural people.

Dr. John R. Swanton continued work on his dictionaries of the Hitchiti and Alabama languages. Mr. J. N. B. Hewitt devoted his time to a number of Chippewa and Ottawa texts, and in continuing the preparation of the second part of his work on Iroquoian Cosmology, the first part of which has already been published by the Bureau. Mr. Francis La Flesche completed and turned in during the year the manuscript of the second volume of his publication on the Osage tribe. Dr. Truman Michelson carried on field-work among the Fox Indians of Iowa, paying special attention to the linguistic relations of this and neighboring tribes. Mr. J. P. Harrington completed his bulletin on the Kiowa language and conducted field-work among the Indians of the Chumashan area of California, laying special emphasis on the place names, material culture, and language.

International Exchanges.—During the year 1922 the packages of scientific and governmental publications sent abroad by the International Exchange Service and received by it from foreign countries totaled 592,600 pounds. Exchange relations were reopened with Rumania and Jugoslavia during the year. Relations were established also with the newly formed governments of Esthonia, Latvia, Lithuania, and Ukrainia. Conditions in Russia and Turkey are not yet sufficiently settled to warrant the exchange of publications previously carried on between the United States and these countries.

The regular schedule of shipments to foreign countries was resumed during the year. To Great Britain and Germany, shipments are made weekly; to France and Italy, semimonthly; and to other countries, monthly.

National Zoological Park.—The year 1922 was one of the most successful since the establishment of the National Zoological Park. The number of visitors exceeded 2,000,000; the collection of animals was larger and more important than ever before; a number of minor improvements were completed and progress made on certain larger projects; and the reservation itself was maintained in excellent condition. The total number of animals on exhibition at the close of the year was 1,681, representing 482 species of mammals, birds, and reptiles. This is not only a larger number of individuals than ever shown before, but also a larger number of different species. One hundred and fifty mammals, birds, and reptiles were born in the park during the year.

Astrophysical Observatory.—In addition to the main observatory, which occupies a number of frame structures within an inclosure of about 16,000 square feet south of the Smithsonian ad-

ministration building at Washington, the Astrophysical Observatory maintains observing stations in three of the most cloudless regions of the earth, Mount Wilson, Calif.; Mount Harqua Hala, Arizona; and Montezuma, Chile.

The outstanding feature of the year's work was the publication of volume IV of the 'Annals of the Astrophysical Observatory,' a quarto volume of 390 pages, which covers in detail the work of the years 1912 to 1920. New instruments and methods of observing are described, and a mass of solar observations is presented and discussed. Many kinds of evidence are given to show solar variability, and reference is made to applications of the results which have been made by several meteorologists.

The observing station erected on Mount Harqua Hala, Arizona, through the generosity of Mr. John A. Roebling, has been much improved owing to the zeal of Mr. A. F. Moore, in charge of the station. Solar constant observations were made on upward of 70 per cent of the days of the year. Comparisons made during and after a visit by the director, Dr. C. G. Abbot, Assistant Secretary of the Smithsonian Institution, show no change in the scale of pyrheliometry, so that the results from this station are comparable with those at Montezuma, Chile. Earlier in the year Dr. Abbot visited the station at Montezuma, where he revised all the adjustments of apparatus and some of the methods employed there.

International Catalogue of Scientific Literature.—The United States Regional Bureau of the International Catalogue of Scientific Literature continued during the year to collect, classify, and index the data relating to American scientific literature, pending resumption of publication, interrupted by the World War. That a method will be found of financing this valuable international enterprise is the confident expectation of the many regional bureaus engaged in the preparation of this index of the world's scientific literature.

C. G. ABBOT,

Assistant Secretary, Smithsonian Institution.

SMYRNA, Capture and Burning of. See NEAR EAST.

SMYTHE, William Ellsworth, American publicist and author: b. Worcester, Mass., 24 Dec. 1861; d. New York, 27 Oct. 1922. He was educated at Worcester. In 1888-90 he was editor of the Kearney (Neb.) *Enterprise* and in 1890-91 of the *Omaha Bee*. In 1891 he founded the National Irrigation Congress of which he was secretary and later chairman. In 1895 he established the New Plymouth Colony, Idaho, and having devoted himself almost exclusively to the question of irrigation lectured extensively on this subject in Western institutions and conducted a popular campaign in California in behalf of radical reform of water laws and the adoption of the Australian system of land settlement. In 1909 he established "Little Landers" of San Diego; in 1913 the "Little Landers" of Los Angeles; and in 1916 (with Charles Weeks) Runnymede, Cal., and also in that year founded "Little Lands in America." From February 1919, he had been interested in reconstruction program to extend the reclamation movement to the entire United States. He contributed to

magazines on his specialty and was the author of 'The Conquest of Arid America' (1900); 'Constructive Democracy' (1905); and 'History of San Diego' (1907).

SOCIALISM. Important victories at the polls for the Labor parties in England and Australia and the fusion of the Social Democrats and Independent Socialists in Germany were the most notable events affecting the status of the Socialist movement of the world in 1922. In Germany delegates from both Socialist groups met at Nuremberg in September and recreated the labor bloc, with 178 members in the Reichstag, representing 11,000,000 Socialist electors. While there prevails a monarchist tendency in Germany, the trade union organizations remain intact and an agreement has been set up between the Socialist trade unions and the Christian organizations of workers. The labor victory in England was clear-cut, 142 Laborites being sent to Commons, forming His Majesty's Opposition for the first time in the history of the country. The essential part of Labor's program, however, consists less of the realization of an immediate Socialist plan than of securing recognition of the rights of labor. In both England and Australia, the lower houses of the Parliaments are composed of three non-Labor groups and a Labor Party. In both the consequent dissipation of non-labor strength has resulted in considerable accretion of strength of labor. In Australia the Labor Party never made the mistake of carrying its internal quarrels to the polls, so it went forward united. Only the Australian system of preferential voting saved the non-labor forces from a debacle. By that system the three non-Labor parties had an advantage. If Labor adheres to its traditional policy of combining with no other party, it cannot form a government in the new House. It will have not more than 30 members in a House of 75.

In the field of international Socialism, of important significance was the meeting at The Hague in December of the executive committees of the Second International, Moderates, and the Vienna Working Union of Socialist Parties, Centrists, at which Arthur Henderson, English labor leader, presided. An outgrowth of the conference was the call for a unity gathering at Hamburg for 21 May. Should the Hamburg conference prove productive of results, it will mean that all Socialist groups outside the Communist or Third International will be united under the same banner for the first time since the Armistice. For the first time in nine years the Hungarian Socialist Party emerged from underground in 1922: it had been subjected to persecution on both hands, by the Communists and the Horthy conservatives, but now makes its official appearance in Budapest. Socialists appear to be gaining slowly in France, where the party had suffered considerably as a result of the Communist split. The moderate Socialists kept the old machinery of the party and the majority of the Parliamentary group, while the Communists retained contact with the masses. However, the old party seems to be gaining new strength. The Radical Socialists, who are its neighbors, have very substantial forces in the provinces.

In the United States, the Socialists devoted

themselves assiduously to the formation of an American Labor Party, built along the lines of the British Labor Party, in which various factions of the labor movement retain their autonomy but combine for the same candidates at the polls. In New York, the Socialist and Farmer-Labor Parties sent out a call for unity and succeeded in enrolling 50 trade-unions under their political banner. At the elections in New York, however, the combined parties received a considerable set-back, which is ascribed in part to the liberal platform of the Democratic Party. Charles P. Steinmetz, Socialist and Farmer-Labor candidate for State Engineer and Surveyor, however, received a remarkable personal vote, polling 291,736 votes, the biggest total ever gathered by a Socialist in that State.

At the Cleveland Conference for Progressive Political Action held in December and attended by delegates representing some of the largest labor unions in the country, the Socialists found themselves considerably outnumbered by those forces opposing an independent political party of labor. They succeeded, however, in bringing up the issue of a united labor candidate for President in the next national elections.

Meyer London, the lone Socialist in the 67th Congress, was defeated but the numerical strength of the Socialist delegation was maintained when Victor Berger, of Wisconsin, won back his seat by more than 3,000 majority. In Wisconsin, the Socialists elected 11 assemblymen and three State senators, giving the party second place in the lower house, with a strong radical LaFollette support in the Senate. In New York, though no Socialists were returned to the State legislature, in 10 assembly districts they established themselves as the second party or forced a Republican-Democratic coalition.

A Socialist gain was made in Vermont where a candidate won a seat in the lower house of the legislature running independently without the support of a Socialist organization. In Minnesota a Socialist gain was reported. Here the Farmer-Labor Party, with a strong admixture of Socialists, controls the State legislature. The gross total of the Socialist Congressional vote for 1922 failed to equal the 1920 presidential vote of 919,799. See also FARMER-LABOR PARTY.

SOCIAL WORK, Family, American Association for Organizing. The American Association for Organizing Family Social Work promotes the organization and development of family social work societies (Associated Charities) throughout the United States and Canada. It offers assistance, through its field secretaries, in the work of organizing and reorganizing societies as well as in the maintenance of programs of work. Its officers are: Mrs. John M. Glenn, chairman; Karl De Schweinitz, vice-chairman; Stockton Raymond, treasurer; Francis H. McLean, field director and David H. Holbrook, executive director. It has its headquarters at 130 East 22d street, New York City.

SOLVAY, Ernest, Belgian inventor: b. 1839; d. Brussels, 26 May 1922. He was the son of a salt refiner of modest means; but, through his invention of the Solvay process for the manufacture of soda, acquired so large a fortune that he was reputed to be Belgium's richest man. He was frequently called "the Carnegie of Belgium." His invention was threatened at the outset by failure; owing to the persistence of the inventor it was made a success. The first patents were taken out in 1861. Soda in 1863 was costing \$55 a ton. Due to the Solvay process in 1913 soda was reduced to \$20 a ton. During the World War, Mr. Solvay took a prominent part in Belgium relief work and so embittered the Germans that he was sentenced to three months' imprisonment for insulting a German officer. On his 76th birthday King Albert made him a Grand Officer of the Order of Leopold and he also received the Lavoisier Medal of the Institute of France and the Grand Medal of the University of Paris. In his turn he presented \$100,000 each to the Universities of Paris and Nancy and divided \$1,000,000 among Belgian educational and charitable institutions and the employees of his firm, the Solvay Society of Brussels. He was a member of the Belgian Senate; president of the Bureau of International Institute of Bibliography, Brussels; honorary member, Royal Institute of Great Britain, and founder of several international institutes of chemistry and sociology.

SOMALILAND. For the Somaliland Protectorate see article under this head. For the French and Italian possessions in Somaliland, see respectively FRENCH SOMALILAND; ITALIAN SOMALILAND.

SOMALILAND PROTECTORATE, a territory of about 68,000 square miles administered by the British Colonial Office and situated on the Gulf of Aden between Lahadu and Bandar Ziyada. The population numbers about 300,000 Mohammedans. The inhabitants on the coast region are settled but those in the hinterland are nomads. The chief towns are Berbera (30,000); Zevla (7,000); and Bulhar (7,000). Rice, textiles, dates and sugar are the chief imports while hides and skins, gums and resins, cattle and sheep are the chief exports. Transport is by camels. There are four wireless stations. The rupee is the basis of currency and has the same value as in India. The local peace forces comprise a camel corps of 400 and 500 police. The Governor and Commander-in-Chief in 1922 was Sir G. F. Archer.

SONNINO, BARON Sidney Constantino, Italian statesman: b. Pisa, Italy, 11 March 1847; d. Rome, 24 Nov. 1922. His father was Baron Isaac Saul Sonnino, an Italian Jew from Leghorn, and his mother Menhennit Dudley Georgina Sofia Armand Terry, an Englishwoman whom Baron Isaac met in Alexandria, Egypt. By special ordinance of the Department of Justice, Sidney Sonnino's birth, attested by two witnesses, was recorded 17 years thereafter on 13 May 1864 in the official records of the City of Pisa by his father. The elder

Sonnino was accustomed to spend half of the year in Italy and the other half in Egypt. When an epidemic scourged Egypt, Baron Isaac, instead of fleeing the country, remained at his post and soon took charge of the most important institutions in the city, such as the Custom House, banks, and other public services, gaining the confidence of the Egyptian Napoleon, Mohammed-Ali. At the death of Mohammed, and his son, Ibrahim Pasha, Abbas Pasha, who succeeded them, sent home all the Europeans who occupied public offices, and so Baron Sonnino settled in Leghorn.

Sidney was graduated from "Liceo" in 1862, at the age of 15, and soon enrolled as a law student at the University of Pisa, where he finished the four-year courses in three years, thus becoming a doctor of jurisprudence, with full honors, at the age of 18 (July 1865). However, the practice of law was distasteful to him and he soon gave it up. He then decided to enter the diplomatic service. He was sent to Madrid, 5 June 1867, to Vienna, 26 June 1868, to Berlin, 13 Dec. 1868, to Paris, November 1870, and then again to Madrid. Ordered to Petrograd, he refused to go and went home. On 26 April 1873, he resigned, as he did not think himself fit for diplomatic work. In 1876, he started with his friend, Leopoldo Franchetti, an investigation of economic conditions in Sicily, the result of which they published in 1877 in two volumes. Their work was like a thunderbolt to the politicians, who began to fear and admire the two young men. The public press in Italy at that time was in a deplorable condition, and Sonnino decided to start a new publication, patterned after the English *Saturday Review* or *Nation*. On 6 June 1878, the first copy of *Rivista Settimanale* came out, but as there was another magazine of the same name in the field, the title soon was changed to *Rassegna Settimanale*.

Rassegna was an entirely independent weekly; serious and authoritative. Among the first contributors were Carducci, Stecchetti, Panzacchi, Martini, Villari, Fucina, Bartoli, Luzzatti and many other well-known writers and future statesmen. The magazine, however, was too learned for the public in general and therefore was changed in 1882 to a daily, edited by Michele Torraca, under the name of *La Rassegna*. Later Sonnino founded the *Giornale d'Italia*.

On 26 May 1880, Sidney Sonnino entered Parliament, not to go out until 1919. He represented San Casciano in Val di Pesa. His first speech dealt with emigration, and woman and child labor. In 1881 he first advocated universal suffrage. His profound knowledge of finance soon made him a critic of the policy of the then existing cabinet. From 15 Dec. 1893 to 12 June 1894, Sonnino was Minister of Finance and Treasury, and from 14 June 1894 to 5 March 1896, Minister for the Treasury only. Challenging unpopularity and the fierce opposition of his adversaries, he cut deep into the financial sores of the country and succeeded in eliminating the deficit. From 8 February to 27 May 1906 and from 11 Dec. 1909 to 31 March 1910, he was Prime Minister. From October 1914 until 1919 he was Minister for Foreign

Affairs. In September 1919 he retired from public life.

Sonnino was a very silent man. Even when strolling around Pisa with his intimate friend di Jiny, he exchanged but few words. He was more of an English type of statesman than an Italian demagogue. He never went after power by compromising with his principles. He had the courage of the patient, and the patience of the leader waiting for the fatal hour. He was a conservative reformist, and as such was hated by both the extreme Right and the extreme Left. But he did not care. He kept on his own road, always aiming at his final goal, paying no attention to what others would say. All of his political and parliamentary life was a complete devotion to his principles. He did not want to become a party leader, and did not care if his own group had many members or a few. He preferred to remain alone, but never deserted his flag. He was a very learned man. A well-known Dantist, a lover of art, a scholar in economic and financial subjects, he used to spend a good part of his day in his private library in a lonely research for truth and in ideal conversation with the spirits of the great. He never was a politician. He always despised their methods. On 10 March 1883, he criticised Italy's alliance with Austria and Germany, asserting: "Such a policy of alliance is a gratuitous alienation of our liberty; not only it does not benefit our interests, but it places us, hand-and-feet-bound to *designs which are not revealed to us* and to which we are strangers. As there is neither concert nor co-operation, there is not, neither can there be, effective participation in advantages. There is no equality if one is not aware of what the other knows, if one is ready while the other is not. There is neither profit nor dignity in such a situation." He opposed the Triple Alliance throughout.

In the fall of 1914, in order to avoid war, he tried to induce Austria to cede to Italy at least a part of Italia Irredenta, but as Austria did not accede to his proposals, he entered the famous Treaty of London with the Allies. This "Pact" was attacked by President Wilson at Paris, but Sonnino stood by it, stating over and over again Italy's inalienable rights to what is by nature Italian through and through. Sonnino was often misunderstood all over the world, especially in the United States where many persons regarded him as a conservative reactionary diplomat of the old school. Nothing was further from the truth. Sonnino's mind was always open to liberal thoughts.

GIOVANNI SCHIAVO.

SOPHIE NEWCOMB MEMORIAL COLLEGE FOR WOMEN, a non-sectarian educational institution established in 1886 in accordance with donations made by Mrs. Josephine Louise Newcomb, as a part of Tulane University at New Orleans, La. In 1922-23 it had a faculty of 60 members, 628 students, property, including campus, buildings and non-productive assets, valued at approximately \$1,650,000, a productive endowment of \$2,225,000 and an estimated income of \$214,082. Pierce Butler, Ph.D., is dean.

SORGHUM MIDGE. See ENTOMOLOGY, UNITED STATES BUREAU OF.

SORGHUM SYRUP. According to the Department of Agriculture there were 36,532,000 gallons of sorghum syrup produced in the United States during 1922, compared with 45,566,000 gallons produced in 1921 and 49,505,000 gallons produced in 1920. The 1922 crop was valued at \$25,946,000, the 1921 crop at \$28,681,000 and the 1920 crop at \$52,943,000. The acreage for the three years was: 1922, 448,000; 1921, 518,000; 1920, 536,000. The average yield per acre in 1922 was 81.5 gallons and the average price per gallon on 1 December was 71 cents. Alabama led in production with a total yield of 5,994,000 gallons. Kentucky was second with 3,984,000 gallons; Mississippi third with 3,696,000 gallons. North Carolina produced 2,940,000 gallons in 1922; Georgia, 2,490,000; Texas, 2,415,000; Arkansas, 1,792,000; Tennessee, 2,940,000; South Carolina, 1,743,000; Missouri, 1,920,000; Virginia, 1,222,000; Oklahoma, 1,122,000 and West Virginia, 840,000.

SORGHUMS, Grain. According to the Department of Agriculture the production of grain sorghums in the United States in 1922 totaled 90,381,000 bushels, valued at \$79,389,000. These figures compared with a production of 113,990,000 bushels, valued at \$44,575,000 in 1921, and a production of 137,408,000 bushels, valued at \$127,629,000 in 1920. The acreage for the three years was 5,051,000 in 1922; 4,635,000 in 1921, and 5,120,000 in 1920. The average price per bushel of the crop was 87.8 cents in 1922, 39.1 cents in 1921 and 92.9 cents in 1920. Texas led in production with a total yield of 39,400,000 bushels. Kansas was second with 20,260,000 bushels, and Oklahoma was third with 19,575,000 bushels. Production in other States was as follows: Iowa, 144,000 bushels; Missouri, 300,000 bushels; Nebraska, 342,000 bushels; Colorado, 3,705,000 bushels; New Mexico, 1,595,000 bushels; Arizona, 900,000 bushels, and California 4,160,000 bushels.

SOUTH, University of the, a Protestant-Episcopal educational institution for men (co-educational during the summer term) founded in 1857 and located at Sewanee, Tenn. In 1922-23 it had a faculty of 26 members, 263 students, property valued at \$2,000,000 and an estimated income of \$267,129. Benjamin F. Finney, is president and vice-chancellor.

SOUTH AFRICA, Union of, a self-governing British dominion constituted by the Union of South Africa Act of 1909 by which the self-governing colonies of the Cape of Good Hope, Natal, the Transvaal and the Orange River Colony were united in a legislative union, these colonies becoming original provinces of the Union under the names of Cape of Good Hope, Natal, the Transvaal and the Orange Free State.

Population and Area.—The total area of the Union is 473,089 square miles, of which the Cape of Good Hope has 276,966; Natal, 35,284; Transvaal, 110,450; and the Orange Free State, 50,389. The population in 1921 was 6,026,992, of whom 1,522,442 were white and 5,404,550 were colored. The chief colored element is the Bantu, about four-fifths of the colored group.

The seat of the Union Legislature is at Cape Town. The chief cities are: Johannesburg (pop. 149,678 whites; 134,513 colored); Cape Town (112,548 whites; 94,010 colored); Durban (54,230 whites; 86,094 colored); Pretoria (45,163 whites; 28,607 colored); Port Elizabeth (25,940 whites; 19,987 colored), and East London (20,340 whites; 14,251 colored).

Religion.—The latest census statistics give the following adherents of the several denominations among those of European descent: Dutch Churches, 800,178; Anglicans, 265,149; Presbyterians, 60,471; Roman Catholics, 55,552; Wesleyans, 91,199; Lutherans, 20,320; Baptists, 15,507; Congregationalists, 13,176; Jews, 58,741. Of the non-European population the religious affiliations are: Dutch Churches, 204,702; Anglicans, 276,849; Presbyterians, 72,114; Wesleyans, 456,017; Lutherans, 195,308; Hindus, 115,701; Roman Catholics, 37,242; Mohammedans, 45,842.

Education.—There are four universities—the University of Cape Town (806 students); the University of Stellenbosch (584 students); the University of South Africa (composed of five constituent colleges, 730 students) and the Witwatersrand University of Johannesburg (309 students; 1,400 in evening classes). For other than higher education there are in the Union 4,752 schools for whites attended by 292,628 white pupils, and 3,046 schools for colored pupils attended by 221,783 pupils. The total number of teachers is 18,689 and the annual expenditure on these schools averages, £23,000,000.

Finance.—Until 1914 the expenditures of the four Provinces were defrayed entirely by grants from the Union Government. In the year named the Financial Relations Act came into operation and under it certain revenues were assigned to the Provinces and the central grants limited to 50 per cent of the recurrent expenditure of the Provinces. The ordinary revenues of the Union for the year 1922 totaled \$145,750,000, while the ordinary expenditure amounted to \$124,502,690. To this disbursement account must be added \$58,659,000 expenses on the loan account and \$23,216,455 for Provincial administration. The gross public debt of the Union amounted on 31 March 1923 to £191,784,936.

Production.—Wheat growing is on the increase and the corn crop is now one of vast proportions. The yields in the last three years have been lessened by extensive droughts. The wheat crop in 1922 amounted to 438,374,000 pounds and the Indian corn crop to 1,687,867,000 pounds. Other crops of importance are barley, oats, kaffir corn, potatoes and tobacco. The tobacco crop averages about 11,000,000 pounds yearly. Butter and cheese-making are on the increase, great progress having been made since the outbreak of the World War. There are in the Union 5,974,802 cattle, 690,124 horses, 283,980 ostriches, 35,091,980 sheep, 8,960,954 goats and 560,155 swine. The 1922 wool clip amounted to 550,000 bales and the mohair stock to 80,000 bales. Cotton growing is now favored as a drought resisting crop. The yearly crop is now about 2,500,000 pounds of seed cotton. Tea is grown on about 4,000 acres.

Manufactures.—According to figures issued

by the Director of the Census of the Union of South Africa, industrial establishments during the six-year period, 1915–16 to 1920–21, increased from 3,998 to 7,006; the total number of persons employed from 101,178 (39,524 white and 61,654 colored) to 179,838 (62,966 white and 116,872 colored); salaries and wages from £8,913,000 to £21,906,000; and gross value of output from £40,435,000 to £98,302,000.

Of the 7,006 industrial establishments at the close of June, 1921, 1,879 were food and drink establishments, 897 metals and engineering, 888 vehicles, 674 building and contracting, and 668 clothing and textiles. The metals and engineering trades had 18,931 white and 20,066 colored employees; the building and contracting trades, 8,122 white and 23,675 colored; and the food and drink industries, 7,958 white and 26,025 colored. Metals and engineering paid £7,030,000 in salaries and wages; building and contracting, £3,310,000; and food and drink, £2,768,000. The gross value of food and drink output was £36,066,000; metals and engineering, £20,011,000; and building and contracting, £9,122,000. The value of raw materials used by food and drink establishments was £36,066,000; and building and contracting, £9,122,000.

Mining.—Gold, diamonds and coal form the basis of the mineral wealth of the Union. Gold production in 1922 amounted to 7,760,047 fine ounces. There are about 175,000 persons employed in the gold mining industry. Diamond mining showed increased activity during 1922 owing to the demand from America, India, and the East. Several mines that had been closed were reopened and at the close of the year it was anticipated that the large mines would resume operations on a small scale early in 1923. There are about 55,000 persons engaged in the diamond industry. The coal resources of the Union are estimated at 56,200,000,000 tons.

Commerce.—The Union trade returns for the calendar year 1922 showed an excess of exports. The total value of imports during 1922, including imports for government use and imports of specie, were valued at £51,557,371, as compared with £58,201,337 in 1921. General increases over the previous year were recorded during 1922 in the imports of cotton, leather, silk goods, haberdashery, and motor cars. Machinery, implements and hardware indicate a very marked increase.

The value of South African exports in 1922 was £57,025,785, as compared with £57,960,154 in 1921. While these totals show but a slight variation, marked increases and decreases were recorded in many items. Diamonds, Angora hair, hides and skins, whale oil, and wattle bark show appreciable increases, both in volume and value, while the value of wool exported increased by £2,500,000 the volume decreased by 20,000,000 pounds. Raw gold exports decreased by £5,000,000 as did those of corn and coal by £900,000 each.

Communications.—The state railways of the several colonies were operated by the latter prior to the Union. In 1910 these lines were merged into one system, the South African Railways under the control of the central government. There are 9,571 miles open to traffic, of which 4,266 are in the Cape Province, 1,342

in the Orange Free State, 2,644 in the Transvaal, and 1,319 in Natal. There are in addition 507 miles of privately owned railways.

Defense.—All citizens are liable to military service under the Defense Act but in practice only a proportion of the younger men are enrolled yearly. In 1921 the last of the Imperial forces were withdrawn, the Union becoming thereafter responsible for the military administration of its territories.

Constitution and Government.—Legislative power is vested in a Parliament composed of the King, Senate, and House of Assembly. The Governor-General is appointed by the King and with an Executive Council, the members of which are chosen by him, administers the executive affairs of the Union. The Senate has 40 members. Each Senator must be a British subject of European descent, 30 years of age, and resident for five years within the Union and the owner of property of the value of £500. In 1922 the political complexion of the Senate was: 17 South African Party; 13 Nationalists and 2 Labor members. The lower house has 134 members chosen in electoral divisions—51 from the Cape Province; 17 from Natal; 49 from the Transvaal; and 17 from the Orange Free State. The personal qualifications are the same as for members of the Senate, save for the property qualification. Money bills must originate in the lower house. The complexion of the lower house in 1922 was: 74 South African Party; 47 Nationalists; 12 Laborites and one Independent. Pretoria is the seat of government of the Union and Cape Town the seat of the Legislature.

The Governor-General in 1922 was Prince Arthur of Connaught (salary \$50,000 per annum). The Prime Minister and Minister of Native Affairs was the Rt. Hon. Jan C. Smuts (\$17,500). In each Province there is an Administrator appointed by the Governor-General and a Provincial Council elected for three years. These councils deal with local affairs in the Provinces, elementary education, charities, roads and highways, fish and game conservation, etc. The English and Dutch languages are both official.

History.—Early in February a tense situation developed in the Rand mining district due to the strike of gold miners. The strike almost became a revolution in favor of a republic and reached its climax on 11 March 1922. On that day strikers were in control of most of the suburbs of Johannesburg and had been reinforced by mounted commandos of Boer farmers. The fighting lasted four days and there were many casualties on both sides. By 13 March the Government troops were closing in on Johannesburg from all sides and the situation was soon in hand. On 18 March the strike was called off, it had lasted 67 days and had seriously interfered with the output of the precious metals. The Premier in reviewing the outbreak before the Assembly said that the aim of the rioters at Johannesburg was the setting up of a Soviet Republic in South Africa. The government forces lost 50 killed and 237 wounded while the rebels lost 133 killed and 287 wounded. The cost to the Union was placed at \$25,000,000. The Washington treaties were

ratified on 19 July by the South African Assembly. Discovery of a new gold belt in the Transvaal was reported 3 August and a rush of miners followed. A bill granting the vote to women was defeated in the Assembly. The Union's management of the mandate over the former German colony of Southwest Africa was criticised in the Assembly of the League of Nations on 8 September by Delegate Bellegarde of Haiti. It was stated that about 100 of the inhabitants were massacred by bombs dropped from aeroplanes because they refused to pay an excessive dog tax. The reason given was that the natives would hunt and not work. The tax complained of was subsequently reduced. On 27 October Rhodesia voted to remain outside the Union of South Africa. Little inducement had been made to her by the Union and little interest was manifested by the general public. A working agreement was announced as having been concluded on 2 November between the Nationalists and the Labor Party on the basis of both dropping some of their tenets. The coalition of these parties aroused the opposition of Premier Smuts. Toward the close of the year it was said that numbers of American negro emissaries were traversing the former German colonies, and also the French and English colonies everywhere preaching to the negroes that Africa belonged of right to the black races and that it comported not with human dignity to permit oneself to be ruled by a race of another color.

SOUTH AMERICA. See articles on the several independent republics of that continent; also articles on British, Dutch and French Guiana.

SOUTH AUSTRALIA. See AUSTRALIA.

SOUTH CAROLINA, a south Atlantic State, one of the 13 original States, bounded on the north by North Carolina, on the southeast by the Atlantic Ocean and southwest by Georgia. Its area is 30,989 square miles and in 1920 it had a population of 1,683,724. The State is 39th in order of size and 26th in order of population. In 1920 whites numbered 818,538; negroes 864,719, Indians 304 and Asiatics 163. In the same year the foreign-born residents of the State numbered 6,401, and included 1,187 Russians, 1,079 Germans, 491 English and 442 Irish. The chief cities, with their population in 1920 are: Charleston, 67,957; Columbia, the capital, 37,524; Spartanburg, 22,638, and Greenville, 23,127.

Religion.—The principal Christian denominations have an aggregate membership of 794,126. Of this number, 413,630 are Baptists, 278,854 Methodists, 38,361 Presbyterians, 11,000 Episcopalians, 14,788 Lutherans, 9,514 Roman Catholics and 46 members of the Reformed Church.

Education.—Primary education is free, but not compulsory. Certain restrictions are imposed on the employment of illiterate children in factories or mines. There are separate schools maintained for white and colored children. There are 14,824 elementary schools in the State with 9,699 teachers and 478,045 pupils, and 13 high schools with 427 teachers and 12,555 pupils. For purposes of higher education there are the State University at Columbia,

Clemson Agricultural College, Charleston City College, Allen University for Colored Students, Erskine College, Wofford College and several smaller denominational colleges.

Finances.—At the beginning of the fiscal year 1922 the balance on hand in the State Treasury amounted to \$771,753.85. Receipts during the year amounted to \$9,246,434.51. Disbursements during the year amounted to \$8,369,733.60. The bonded debt of the State in 1922 was \$5,382,308.35; the floating debt, \$3,250,000, making a total indebtedness of \$8,632,308.35. The assessed value of real property in 1922 was \$217,972,840; of railroads, \$49,740,781, and of personal property, \$168,286,218.

Agriculture.—The State is agricultural. In 1920 there were 192,693 farms, more than half of which were operated by negroes. The total area under farms was 12,461,945 acres and included 6,206,644 acres of improved land. The value of all farm property in 1920 was \$953,064,742. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 2,062,000 acres, 29,899,000 bushels, \$26,012,000; winter wheat, 165,000 acres, 1,320,000 bushels, \$2,072,000; oats, 406,000 acres, 9,744,000 bushels, \$7,405,000; rye, 6,000 acres, 60,000 bushels, \$108,000; tame hay, 455,000 acres, 455,000 tons, \$7,962,000; sorghum sirup, 21,000 acres, 1,743,000 gallons, \$1,063,000; rice, 8,000 acres, 208,000 bushels, \$239,000; potatoes, 33,000 acres, 2,508,000 bushels, \$3,210,000; sweet potatoes, 104,000 acres, 9,568,000 bushels, \$6,793,000; cotton, 2,058,000 acres, 530,000 bales, \$64,395,000; tobacco, 90,000 acres, 57,600,000 pounds, \$13,248,000; peanuts, 36,000 acres, 27,360,000 pounds, \$1,368,000; apples, 383,000 bushels; peaches, 845,000 bushels, and pears, 104,000 bushels. Livestock raising is on the increase. On 1 Jan. 1923 there were in the State 70,000 horses, valued at \$6,440,000; 209,000 mules, valued at \$25,916,000; 228,000 milk cows, valued at \$7,980,000; 189,000 other cattle, valued at \$2,362,000; 23,000 sheep, valued at \$97,000, and 947,000 swine, valued at \$10,417,000.

Other Products.—About half the area of the State is forested with yellow pine and considerable hardwoods. The cut, however, is diminishing rapidly. The fisheries of the State include oysters, whiting, shad and sea bass. The minerals worked are phosphate rock, clays, granite, gold, silver, manganese, iron ore and lime. In cotton manufactures the State is second only to Massachusetts. There are nearly 5,000,000 spindles in operation in the State. About \$250,000,000 is invested in industry. In addition to cotton, the chief industries are flour and grist milling, tobacco factories and turpentine and rosin factories.

Communications.—The State has 3,804 miles of steam railways and 147 miles of electric railways. The coast is indented with several harbors, of which the most important is that of Charleston.

Government.—The executive is a Governor, elected for two years, who receives a salary of \$3,000. The General Assembly is composed of a Senate of 44 members, elected for four years and a House of Representatives of 124 members, elected for two years. Qualified electors are all citizens of the United States, who have paid their poll tax and are registered. For registra-

tion one must be able to read and write English and to have paid the taxes payable in the previous year on property in the State assessed at \$300 or over.

Officials.—The Governor in 1922 was the Hon. Robert A. Cooper, who was succeeded in January 1923 by the Hon. Thos. G. McLeod, whose term expires 16 Jan. 1925. Other State officials are: Lieutenant-Governor, E. B. Jackson; Secretary of State, W. Banks Dove; Attorney-General, Samuel M. Wolfe; Comptroller, Walter E. Duncan; Treasurer, S. T. Carter, and Superintendent of Education, J. H. Hope.

Judiciary.—Members of supreme court: Eugene B. Gary, Chief Justice; T. B. Fraser, R. C. Watts, T. P. Cothran and J. H. Marion, Associate Justices.

SOUTH CAROLINA, Presbyterian College of. See PRESBYTERIAN COLLEGE OF SOUTH CAROLINA.

SOUTH CAROLINA, University of, a State co-educational institution, founded in 1801 and located at Columbia, S. C. In 1922-23 it had a faculty of 41 members, 692 students, property valued at \$1,787,654, and an income of \$212,989.69. William D. Melton, LL.D., is president.

SOUTH DAKOTA, a west north-central State, bounded north by North Dakota, east by Minnesota and Iowa, south by Nebraska and west by Wyoming and Montana. Its area is 77,615 square miles and in 1920 it had a population of 636,547. South Dakota is 14th in order of size and 37th in order of population among its sister States. In 1920 the population included 619,147 whites, 16,384 Indians, 832 negroes and 184 Asiatics. The foreign-born residents the same year numbered 182,391, and included 15,674 Germans, 16,813 Norwegians, 11,193 Russians, 2,943 English, 1,954 Irish and 1,151 Austrians. The rural population the same year was 84 per cent of the total. The chief cities of the State, with their populations in 1920, are: Sioux Falls, 25,002; Watertown, 9,400; Mitchell, 8,478; Aberdeen, 14,537; Huron, 8,302; Lead, 5,013; Rapid City, 5,777 and Yankton, 5,024.

Religion.—The principal Christian denominations have an aggregate membership of 199,017, of whom 72,113 are Roman Catholics, 46,947 Lutherans, 21,429 Methodists, 9,855 Presbyterians, and 8,852 Baptists.

Education.—Primary and secondary education are free for all children from the age of six to 21 years and from the age of eight to 16 attendance at a public day school is compulsory for all who are not otherwise taught. There are in the State 4,749 elementary schools and 193,311 children of school age. The average attendance is 121.638. There are 421 secondary schools with 1,018 teachers and 12,694 pupils. For higher education there are four normal schools and a School of Mines, an Agricultural College and a State University. Denominational colleges within the State are Huron College, Dakota Wesleyan University, Yankton College and three Indian schools. On 1 July 1921 the permanent school fund invested totaled \$14,227,659.44, while deferred payments on school lands sold amounted to \$13,553,134.78. The total expenditure for public schools in 1921 was \$11,766,530.85. The average salary of male teachers in

that year was \$1,021.43; of female teachers, \$870. The per capita cost of education per total population was \$18.48. The per capita cost per pupil was \$80.16.

Finances.—At the beginning of the fiscal year 1922 the balance on hand was \$6,598,586.60. Receipts during the year amounted to \$20,903,208.12. Disbursements during the same period amounted to \$20,796,613.62, leaving a balance on hand at the beginning of the fiscal year 1923 amounting to \$6,705,181.10. The State has no floating debt, but the following State bonds are outstanding: soldiers' bonus bonds, \$6,000,000; highway bonds, \$6,000,000; total, \$12,000,000. In addition to the above, the State has guaranteed the payment of \$41,500,000 of rural credit bonds and \$500,000 of soldier land settlement bonds, also \$270,000 of bonds for a State cement plant. All of these three enterprises are presumed to be self-supporting. The consideration of South Dakota finances must take into account the State's system of rural credits, through which the State loans money to farmers upon first mortgages at cost. Up to 1 July 1922 the Rural Credit Board of South Dakota had made 9,575 loans, aggregating \$37,901,150, and secured by mortgages on 2,468,300 acres, or an average loan of \$15.35 per acre.

Production and Industry.—The census of 1920 reported 74,655 farms with a total acreage of 34,533,775 and including 19,051,922 acres of improved land. The total value of all farm property the same year was \$2,824,413,768. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 3,861,000 acres, 110,038,000 bushels, \$55,019,000; spring wheat, 2,893,000 acres, 38,188,000 bushels, \$35,133,000; winter wheat, 96,000 acres, 1,824,000 bushels, \$1,678,000; barley, 952,000 acres, 21,896,000 bushels, \$9,196,000; oats, 2,400,000 acres, 74,400,000 bushels, \$23,808,000; buckwheat, 12,000 acres, 96,000 bushels, \$67,000; rye, 439,000 acres, 7,902,000 bushels, \$4,583,000; tame hay, 1,000,000 acres, 1,750,000 tons, \$13,125,000; potatoes, 110,000 acres, 8,580,000 bushels, \$3,775,000, and apples, 263,000 bushels. In recent years dairy and creamery produce, eggs and poultry have assumed large proportions. On 1 Jan. 1923 there were in the State 760,000 horses, valued at \$39,520,000; 14,000 mules, valued at \$952,000; 450,000 milk cows, valued at \$22,950,000; 1,521,000 other cattle, valued at \$44,717,000; 703,000 sheep, valued at \$5,413,000, and 2,283,000 swine, valued at \$30,820,000. The wool clip of 1920 amounted to 4,804,000 pounds. The mineral products of the State include gold, silver, lead, copper, clays and building stones of various kinds. Most of the mineral wealth of the State is in the Black Hills region. In the northwestern part of the State there are considerable coal fields. South Dakota had in 1922 an output of \$6,636,000 in gold and 120,200 ounces of silver, compared with \$6,605,167 in gold and 112,464 ounces of silver in 1921. The Homestake mine paid a dividend of 25 cents a share monthly for the first ten months and increased it to 50 cents a share in November, making a total for the 12 months of \$879,060. The chief manufacturing industries of South Dakota are those connected with agriculture, such as the making of butter, cheese and flour and grist milling. The

value of all manufactures in 1920 was placed at \$62,420,000.

Communications.—The State has 4,276 miles of steam railways and 26 miles of electric railways, 4,205 miles of telegraph lines and 14,586 miles of telephone lines. There are 978 miles of improved State and Federal highways and 1,134 miles of County and State highways, constructed at a total cost of \$8,228,119.09.

Legal Holidays.—1 January; 12 February; 22 February; Memorial Day; 4 July; First Monday in September; 11 November (Armistice Day); 25 December, and every day on which an election or primary election is held throughout the State, and every day appointed by the President of the United States or by the Governor of the State for a public fast, thanksgiving or holiday.

Recent Legislation.—In the matter of recent legislation South Dakota has undertaken several ventures in what some choose to call State Socialism, which, to date, are being prosecuted with success. The chief of these is the rural credit system, the statistics of which are given above under finances; second, the guarantee of bank deposits; third, State insurance of crops against hail; fourth, State coal mining; fifth, \$2,000,000 in State bonds have been authorized for the establishment of a State plant for the manufacture of Portland cement to be used chiefly by the State Highway Commission; sixth, in November 1922 an act was referred to the electors providing for a State hydro-electric plant and the guarantee of its bonds to the extent of one per cent of the assessed valuation.

Charities and Corrections.—The chief State institutions, their locations and the number of inmates in 1922 were: Hospital for Insane, Yankton, 1,125; Home for Feeble-Minded, Redfield, 382; School for Deaf, Sioux Falls, 74; School for Blind, Gary, 36; Tuberculosis Sanitarium, Custer, 220; Penitentiary, Sioux Falls, 191, and Training School (Reform), Plankinton.

Government.—The executive is a Governor, elected for two years, who receives a salary of \$3,000. The legislative power is vested in a Senate and House of Representatives, with special reservations to the electorate; thus, five per cent or more of the electors may propose measures to the legislature or may demand a referendum on laws passed by the legislature before such laws take effect, except emergency measures. The Senate consists of not less than 25 and not more than 45 members, and the House of not less than 75 nor more than 135. The legislature meets biennially on the first Tuesday after the first Monday of January in odd years.

Officials.—Governor, W. H. McMaster; Lieutenant-Governor, Carl Gunderson; Secretary of State, C. A. Burkhardt; Attorney-General, Byron S. Payne; Auditor, Jay Reeves; Treasurer, W. S. O'Brien, and Superintendent of Education, Fred Shaw.

Judiciary.—Members of the Supreme Court: John Howard Gates, Ellison G. Smith, Samuel C. Polley, Frank Anderson and Carl G. Sherwood.

SOUTH DAKOTA STATE COLLEGE OF AGRICULTURE AND MECHANICAL ARTS, a co-educational institution founded in 1883 and located at Brookings, S. D. In 1922—

23 it had a faculty of 102 members, 1,600 students, property valued at \$1,097,380 and an income of \$954,553.16. President, Willis E. Johnson, LL.D.

SOUTH DAKOTA STATE SCHOOL OF MINES, a State institution attended chiefly by men, but to which women are admitted. It was founded in 1885 and is located at Rapid City, S. Dak. In 1922-23 it had a faculty of 17 members, 201 students, property valued at \$400,000 and an income of \$100,000. Cleophas C. O'Hara, Ph.D., LL.D., is president.

SOUTH DAKOTA, University of, a State co-educational institution, founded in 1882 and located at Vermillion, S. Dak. In 1922 it had a faculty of 70 members, 1,239 students (enrollment not figured by school years), property valued at \$870,000 plus 86,000 acres of land with minimum sale value of \$10 per acre, and an income of \$319,500. Robert Lincoln Slagle, Ph.D., LL.D., is president.

SOUTHERN CALIFORNIA, University of, a co-educational institution founded in 1879 and located at Los Angeles, Calif. Although non-sectarian, local control of the university is vested in a board of trustees elected by the Southern California Conference of the Methodist Episcopal Church. In 1922-23 it had a faculty, including special lecturers, assistants and fellows, of 408 members and a total of 6,200 students. Its total assets (book value) amount to \$2,695,064.95. Its income for 1922-23 was estimated at \$1,014,628.90. Rufus Bernhard von KleinSmid, A.M., Sc.D., J.D., D.M.C.P., is president.

SOUTHERN COLLEGE, a Methodist co-educational institution, founded in 1907 and located at Lakeland, Fla. In 1922-23 it had a faculty of 23 members, 200 students, property valued at \$577,626.04 and an income of \$80,000. R. H. Alderman, A.B., is president.

SOUTHERN METHODIST UNIVERSITY, a co-educational institution under the auspices of the Methodist Episcopal Church, South, founded in 1915 and located at Dallas, Texas. In 1922-23 it had a faculty of 101 members, 1,985 students, property valued at \$2,000,000 and an income of \$400,000. James Kilgore was acting president in January 1923.

SOUTHWEST AFRICA, formerly German Southwest Africa, now a Protectorate administered by the Union of South Africa under mandate. It is bounded north by Portuguese West Africa, south by the Cape Province, East by Bechuanaland and west by the Atlantic Ocean. The total area is about 322,400 square miles with a native population of 218,000 and 19,237 Europeans, of whom about 7,000 are Germans. The chief native races are the Ovambos, Herreros, Bergdarmas and Hottentots. The Herreros are excellent stockmen. Stockraising is the chief occupation. There are about 400,000 head of cattle and about 2,300,000 sheep and goats. Since the British occupation 30 schools have been established and are now attended by 1,250 pupils. Revenues in 1922 amount to £891,000 and expenditures to £1,286,529. The staple mining industry is diamonds. These are found along the coast. The stones are small but of great purity.

Copper, gold and silver, vanadium, marble and tin are worked also. Agriculture is being fostered by the Government by means of irrigation. The chief port is at Walvis Bay, where harbor works are being constructed. Windhoek is the capital. It is connected with Cape Town by railway, the journey taking 72 hours. The total railway mileage is 967 of 3½-foot gauge and 98 miles of 2-foot gauge. Construction on the line from the capital to Gobabis, 132 miles, was proceeding in 1922. In addition there are 98 miles of private railway line. The Protectorate is administered from Windhoek. There are 17 districts controlled by magistrates. The chief of the administration is the Governor-General of the Union of South Africa, who delegates his powers to an Administrator, in whom is vested the legislative as well as the executive authority. He is assisted by an Advisory Council of six members. The Administrator in 1922 was Gijbert Reitz Hofmeyr.

SOUTHWESTERN COLLEGE, a Methodist-Episcopal co-educational institution, founded in 1885 and located at Winfield, Kan. In 1922-23 it had a faculty of 42 members, 910 students, property valued at \$1,000,000 and an income of \$140,000. Albert E. Kirk, D.D., is president.

SOUTHWESTERN PRESBYTERIAN UNIVERSITY, a Southern Presbyterian educational institution for men, founded in 1875 and located at Clarksville, Tenn. In 1922-23 it had a faculty of 13 members, 151 students, property valued at \$300,750 and an income of \$62,786.87. Charles E. Diehl, D.D., is president.

SOUTHWESTERN UNIVERSITY, a Southern Methodist co-educational institution, founded in 1873 and located at Georgetown, Tex. In 1922-23 it had a faculty of 32 members, 727 students, property valued at \$1,035,930.94 and an income of \$92,808. Paul Whitfield Horn, LL.D., is president.

SPAIN, a constitutional monarchy of south-eastern Europe, occupying the greater part of the Iberian Peninsula, the remainder being the territory of Portugal. The kingdom has an area of 190,050 square miles, exclusive of the Balearic and Canary Islands and the Spanish possessions in Africa, which bring the total area to 194,783 square miles. Spain has a population of 20,783,844 according to the latest estimates. The kingdom is divided into 49 provinces. The population is homogeneous, except for about 400,000 Basques in the north, some 50,000 gypsies and a few thousand Jews. The chief cities of Spain are: Madrid, the capital, 608,793; Barcelona, 582,240; Valencia, 236,447; Seville, 150,631; Malaga, 136,365; Murcia, 123,936; Zaragoza, 117,742; Cartagena, 102,542; Bilbao, 98,904; Granada, 77,477; Valladolid, 69,799; Lorca, 70,807; Palma, 67,544; and Cadiz, 63,101. In 1920 there was an increase in emigration, 147,918 leaving Spain in that year mostly for South America.

Religion.—The Roman Catholic is the national church of Spain and practically the entire population are adherents of that faith, the exceptions being about 7,000 Protestants, 4,000 Jews, and Freethinkers-Rationalists. The national church has nine archbishops and 47 bishops. The State expends about 47,000,000 pesetas yearly for the maintenance of the clergy and the buildings

of the church. There is full liberty of worship for all religious denominations.

Education.—Primary education is compulsory. There are 11 education districts with the universities as centres. There are 26,108 public schools and 5,669 private schools with 2,604,308 pupils. There are 58 institutions for secondary education with 51,815 students. For higher education there are 11 universities—Barcelona, Granada, Madrid, Murcia, Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid and Zaragoza. There are 24,501 students in these universities. In addition there are several special schools.

Production.—Agriculture is the chief occupation of the people, about 25 per cent of all those engaged in gainful occupations being occupied with cultivation of the soil. The land is greatly subdivided, there being a very great number of small proprietors. The yield for 1922 of wheat was less than that of 1921 by 500,000 tons. The 1922 barley crop was 300,000 tons less than the 1921 crop. The almond yield for 1922 amounted to 2,500,000 kilos; the raisin crop to 14,000,000 kilos and the grape crop to 1,200,000 kilos, exclusive of wine grapes. Spain has 3,300,000 acres under vines, the yield from which is about 9,000,000,000 pounds of grapes which yield about 700,000,000 gallons of wine yearly. The olive is cultivated in all sections of Spain, except in the Cantabrica region. Andalusia is the centre of the industry. During the World War and in the years following the foreign demand for Spanish olive oil was unprecedented and severe export restrictions were imposed by the Government in order to conserve the supply for this universally used article of diet in Spain. The olive oil production averages 300,000 tons yearly. The production of olives averages 1,500,000 tons yearly. The orange, fig, apple, and banana are the principal fruit crops of Spain, followed in importance by prickly pears and peaches. The value of the orange crop of Spain is over four times that of any other fruit crop, exceeding in value \$10,000,000 yearly. Bananas are raised solely in the Canary Islands, where, according to the latest available statistics, there are 1,803,750 banana trees occupying about 4,500 acres. Eastern Andalusia leads in the production of prickly pears and the Levant provinces hold first place for peach production. Fruit crops of secondary importance are lemons, plums, pears, cherries and pomegranates, each of which amounts approximately to \$500,000 yearly. The almond is by far the heaviest nut crop in Spain, averaging about \$9,000,000, and is followed by chestnuts and filberts, which are produced to an average value each year of about \$3,000,000 and \$2,000,000 respectively. The crop of English walnuts, which has a value of about one-third that of filberts, is produced chiefly in the north and northeastern sections of the country, although English walnuts are grown to some extent in every province except the Balearic and Canary Islands. Peanuts are an unimportant crop in Spain, there being planted but 19,687 acres in 1920. One of the main agricultural pursuits of Spain is the raising of sugar beets. The output of the refineries averages 60,000,000 kilos yearly. Cane sugar is produced on a far lesser scale than beet sugar. There are 24 cane sugar refineries in

the country, nearly all in the provinces of Malaga and Granada. The output of the cane refineries averages 6,000,000 kilos yearly. Spain is comparatively rich in minerals, producing iron, copper, lead, coal, zinc, cobalt, manganese, mercury, silver, phosphorus, sulphur and platinum. The total value of the mineral output in 1920 was 500,984,695 pesetas. There are in Spain 742 establishments with 2,614,500 spindles and 68,300 looms engaged in the manufacture of cotton goods and 8,800 looms and 662,000 spindles engaged in the woolen manufacture. There are 144 paper mills and 37 glass works. Cork manufacture averages 55,000 tons yearly. Sardines, tunny fish and cod are the chief catches of the fishing industry, the average yearly value of which is about 75,000,000 pesetas.

Commerce.—The value of the foreign commerce of Spain for the year 1921 was \$414,766,000, of which the imports represented \$252,278,000 and the exports \$162,488,000. The chief exports were grains, sugar and wines, glassware, pottery, metals and their manufactures, drugs and chemicals, cotton and cotton manufactures, wool, hair and their manufactures, timber and timber manufactures, animals and animal products, and paper. The chief imports were foodstuffs, machinery, vehicles and vessels, drugs, cotton manufactures, timber, animals and tobacco.

Shipping and Communications.—The Spanish merchant marine in 1922 consisted of 581 sailing vessels of 101,285 tons net and 621 steam vessels of 912,817 tons. The chief ports of the Spanish mainland are Bilbao and Barcelona. Spain has 45,972 miles of highways. The total length of the railways is 9,436 miles, of which 6,917 miles are of 5.48-foot gauge and 2,512 miles of metre-gauge mostly. About seven miles are cogwheel and funicular lines. The lines are privately owned but they receive subventions from the state. There are 8,495 post offices; 70,728 miles of telegraph lines; 192 urban telephone systems and 109 interurban systems, with a total number of 70,824 stations. There are ten large wireless telegraph stations.

Finance.—On 26 July 1922, the Spanish budget for the fiscal year 1922–23 was approved. It authorizes an expenditure of 3,044,000,000 pesetas and forecasts an income of 2,617,000,000 pesetas, leaving a deficit of 427,000,000 pesetas. This compared with the fiscal year 1921–22 with actual expenses of 3,630,000,000 pesetas and incomes exclusive of loans of 2,336,000,000 pesetas, leaving a deficit of 1,294,000,000 pesetas. On the same date there was passed a supplementary credit to the Minister of Public Works in the amount of 1,000,000 pesetas, for the improvement of Vigo harbor; a credit amounting to 5,000,000 pesetas for the encouragement of marine communication; and of 2,000,000 pesetas for the Minister of Marine, Fisheries and Naval Service. At the same time tax reorganization laws went into effect which, it was hoped, would increase the revenue by 305,000,000 pesetas. The peseta exchange was steady the latter half of 1922, averaging about 15.55 cents. Savings deposits of the Spanish people are on the increase. The most recent report is of savings amounting to 1,058,000,000 pesetas, an increase of 12 per cent over those of 1920.

At the beginning of the year 1922 the national debt of Spain amounted to 11,963,084,525 pesetas, or about \$2,000,000,000. Of this sum, 910,761,400 pesetas represented the external debt.

Defense.—Military service is compulsory with a term of service extending over 18 years. The peace establishment numbers 189,745 men of all arms, capable of expansion upon mobilization to 300,000. The navy consists of 3 battleships, 6 cruisers, 13 destroyers, 26 modern torpedo boats, 12 gunboats and 28 submarines (some of the last named still building). The naval personnel is fixed at 11,340 sailors and 4,106 marines, with 1,592 officers on the active list and 202 in the reserve.

Constitution and Government.—Spain is a constitutional monarchy, with the executive power vested in the King and the legislative power jointly in the King and the Cortes. The latter is composed of a Senate and Congress, equal in authority. There are three categories of Senators—Senators in their own right, such as the Princes of the royal house, and certain ecclesiastics, life Senators appointed by the Crown, and Senators elected by the Corporations of State. The last named group number 180 and must not be exceeded in number by the first two groups combined. Members of the Cortes are elected for five years, and voting is compulsory for all males over 25 years of age. There are 417 members in the lower house. The reigning King is Alfonso XIII, who succeeded by his birth, 17 May 1886.

History.—A cabinet crisis developed in January following the presentation by Senor de la Cierva to the King of a decree virtually amounting to dissolution of the military juntas or military committees. When the King refused to act the Maura cabinet resigned on 11 January. There was great excitement in the capital in consequence because of the attacks of the juntas upon the War Minister for the policy pursued by him in the campaign in Morocco, notably his refusal to take dictation from them in regard to the choice of those in command. The King consulted several party leaders on the situation. Meanwhile the junta leaders feared to precipitate a clash with the civil authorities, and the Infantry Committee was soon deserted by the other juntas. On 16 January M. Maura resumed the premiership after receiving the submission in writing of the Infantry Committee. Thus the civil power was victorious over the military cabals, which had caused ten changes of ministries since 1917. The life of the new Maura Cabinet was brief. On 7 March the Premier announced that his Liberal colleagues had withdrawn their support and consequently he would resign the Premiership. Senor Sanchez Guerra was summoned to form a new ministry. Public sentiment in Spain at this time was against further warfare in Morocco; the campaign up to this time had been most unsatisfactory. A policy of pacification was resolved upon and efforts were being made to make peace with Raisuli, the insurgent leader. The latter asked that he be made Governor of all the mountain tribes in the western part of the Spanish zone, that all former property held by him be restored, and that he be paid back some millions of pesetas due him for back pay before his

break with Spain. The Premier outlined before the Chamber of Deputies on 14 March the policy his government planned to follow. He promised to do his utmost to restore the constitutional guarantees in Spain and to consult with all Governors of affected Provinces in order to determine where the restoration of rights would be feasible. On 30 March Senor Guerra announced that the King had signed a decree restoring constitutional rights throughout Spain. The suspension of rights had been in force for nearly three years. The question of the tariff on imports was a cause of anxiety to the government. The protectionist policy of Spain had led to a commercial rupture with France, and it appeared expedient to enter less exacting agreements with Great Britain, Italy and France. On 7 April the Cortes authorized the Government to negotiate commercial treaties allowing a 20 per cent rebate of the customs tariff of the second category and an even greater rebate in exceptional cases. On 17 April a commercial agreement was concluded with Italy. The Marquis de Alhucemas, in an address to the Senate on 8 April, announced the formation of a Liberal coalition from all the Groups except that of ex-Premier Romanones. Beginning with the end of March Spain had considerable success in Morocco. On 14 May the bandit Raisuli, who had fled from Tazarut when the Spaniards took that village, sought refuge in the sanctuary of Abdessalam, where he was provisionally safe from attack. Lack of food would, however, soon force his surrender.

A debate on Morocco was held in the Cortes on 2 July. It was generally the opinion that Spain could not evacuate Morocco and that military action should continue. Efforts were made to have the Government establish a civil protectorate. An official report issued 19 June stated that all objectives in Morocco had been attained in the recent fighting there. Despite this announcement the Morocco campaign continued to disturb the people of Spain. General Berenguer, High Commissioner of Morocco, resigned suddenly in July and General Burguete was appointed his successor. It was soon apparent that General Berenguer had resigned merely to have an opportunity to reply publicly to the critics of his administration in Morocco. In the Senate he charged that the disastrous defeats were due to the failure of the Government to ship adequate munitions. The debate lasted through the month of August. The Government was greatly disappointed at the procedure of General Burguete in Morocco, for, instead of curtailing all forward movements and repatriating the troops as had been ordered, he issued fiery proclamations urging the soldiers to recover all Spanish prisoners taken by the Moors and to avenge the death of their comrades. On 22 October a military demonstration was made by Spanish forces near Punta Pescadores on the Moroccan coast, with the object of impressing the insurgent tribesmen. A naval division proceeded at the same time to Ceuta, and with an air force simulated a disembarkation and bombarded the enemy positions for nearly an hour.

A decree abolishing the juntas was read by the Premier at the opening of the Cortes on 14 November. The United Liberals continued their

attacks on the Government, being especially anxious to secure such reforms of the Constitution as would render it impossible for a Ministry to suspend Constitutional guarantees at will, and also to fix the responsibility for the military disasters in Morocco in 1921. On 5 November the Spanish Government denounced the commercial treaty concluded with the United States on 1 Aug. 1906. As it was provided in the body of the treaty that it would be operative for one year after its denunciation by one of the signatories, the treaty expires 5 Nov. 1923. Premier Guerra presented his resignation on 5 December. On the same day the Chamber, sitting as a committee of the whole, resolved to approve a motion demanding the impeachment of the members of the Salazar Ministry for their responsibility for the Moroccan disasters to Spanish arms.

SPANISH LANGUAGE AND LITERATURE. See PHILOLOGY; LITERATURE.

SPITSBERGEN, an archipelago in 10° 35' east long. and 74° 81' north lat., and including Bear Island. The area of the archipelago is about 25,000 square miles. The chief islands are: Mainland or West Spitsbergen; North East Land; Prince Charles Foreland; Edge Island; Barents Land; King Karl's Land; Hope Island; and Bear Island. For over three centuries the islands were visited by sailors of various nationalities engaged in seal and whale fisheries. With the decline of the whaling industry the claims to sovereignty over the islands were allowed to lapse, but the discovery of vast coal deposits recently renewed the question, and on 9 Feb. 1921, at Paris, Norway's sovereignty was recognized by the principal powers of Europe and by the United States. Coal of the Carboniferous, Cretaceous and Tertiary periods has been discovered, but only Tertiary seams are worked. There are three seams of this from 3 to 4 feet in thickness over an area of 460 square miles, with an estimated coal content of 2,000,000,000 tons. Coal shipments can be made only for about three months of the year. Asbestos, gypsum and iron are also found. In the summer of 1921 there were 1,503 persons in the region, which number was reduced in the winter of 1921-22 to 980. Coal shipments in the summer of 1921 amounted to 172,500 tons.

SPITZKA, Edward Anthony, American physician: b. New York City, 17 June 1876; d. Mt. Vernon, N. Y., 4 Sept. 1922. He was educated at The College of the City of New York and took his medical degree at the College of Physicians and Surgeons, Columbia University, in 1902. He was first demonstrator and thereafter professor of anatomy at Jefferson Medical College, Philadelphia, 1904-14; director of Daniel Baugh Institute of Anatomy, Philadelphia, 1911-14, and after 1914 was in private practice as a specialist in nervous and mental diseases in New York City. He performed the autopsy upon and examined the brain of Czolgosz, the assassin of President McKinley, and attended many electrocutions to make detailed observations of the effect of electricity on executed persons. Scientists and others frequently provided that, after death, their brains should be turned over to Doctor Spitzka for scientific study. He was considered one of the greatest brain anat-

mists. His revision of Gray's 'Anatomy' (18th American edition) is held as a great achievement. Doctor Spitzka's researches caused him to go deeply into the field of anthropology, and he studied the brains of Papuans, Negroes, Eskimos, Japanese, etc. From 1898-1906 he was a member of Company I, Seventh Regiment, New York National Guard. During the World War he went abroad as a member of the 311th Sanitary Train, and on his return became chief medical officer of the War Risk Bureau. He was active in planning a huge clinic for ex-soldiers in the Grand Central Palace, New York City. He was a collaborator on many journals of anatomy, anthropology and criminology and also an examiner in lunacy in New York State.

SPORTS. The increase in the number of international competitions and the recognition of women's athletics in America were the significant developments in sports during 1922. Formerly the major golf and tennis tournaments and an occasional boxing match about summed up the yearly athletic relations among nations. The year 1922 told a different story. There were all the old fixtures, such as the Davis Cup matches, and added to them were a host of other contests involving nearly every branch of sport.

An Argentine polo team invaded both England and the United States, a set of games for women were held in Paris in which America took part, an Oxford-Cambridge lacrosse team played a series of matches here, Harvard and Yale sent a combined tennis team abroad, the relay team of the University of Pennsylvania went to England, all the European billiard champions came to this country to compete, an English woman's soccer team played here and in Canada, American swimmers went to Bermuda, the Canal Zone and Hawaii and swimmers from Hawaii returned the visit, an American baseball team toured the Orient, British yachtsmen raced in this country, more golfers and tennis players went to Europe and more European players came here; these were some of the invasions which made 1922 a remarkable year in international sporting annals. Hardly a day during the spring and summer passed which was not marked by some meeting of nations on the athletic field. And in a year where there was so little agreement at the council tables of the world the value of these frequent, friendly meetings can hardly be overestimated.

The other important development—the recognition of women's athletics by the Amateur Athletic Union—was also highly significant, forecasting, as it does, the gathering of the girls and women of the United States with those of other nations.

The immediate effect of the action will be to increase the competition among women in this country. Hereafter, records of women athletes will be standardized and recognized. In the past only records made by school and college girls were accepted and little had been done toward standardizing even these. In the future there can really be representative, national competition among women. Heretofore, America had been behind many of the other countries of the world in this matter, but the action of the Amateur Athletic Union places the women athletes of this

country on an equal footing with those of Europe. Recognition on the part of the Amateur Athletic Union was unquestionably hastened, if not actually brought about, by the showing of the American team which competed in the "Women's Olympics" in Paris. The United States team finished second to Great Britain, leading France, Czechoslovakia and Switzerland.

Another honor fell to American women athletes when the International Women's Sport Federation decided to officially sanction world's records. Forty-nine records were approved and 21 of them had been created by Americans. In the face of these two achievements abroad, it was only fitting that American women athletes should be recognized at home.

Both among women and men, sports become each year more and more a part of the daily life of the average citizen. The truth of this is attested by the great stadiums which have sprung up like mushrooms in every part of the country during the last few years. The year 1922 saw more of these great athletic plants built and projected than had any preceding year.

The New York American League baseball club began work on a stadium in New York City which seats 75,000 persons and cost approximately \$2,000,000. Historic Franklin Field in Philadelphia was the site of a new stadium which will seat 55,000. Ohio State University at Columbus completed the finest stadium in the Middle West and dedicated it before a crowd of 62,000. Chicago has drawn plans for a huge municipal stadium. Vanderbilt University dedicated a great stadium in the South. Dozens of others are being built or planned. Some one has said that Americans enjoy watching games more than they do playing them. These stadiums and the crowds which gather at the professional baseball parks during the diamond season indicate the truth of the statement. The 1922 World's Series offers a concrete example. The total attendance at the series was 185,947 and the total receipts, \$605,475.

The series was decided in five games, the New York Giants of the National League winning from the New York Yankees of the American League with four straight victories. The second game was tied at 3 to 3 when it was called in the 10th inning because of darkness. There were 37,000 breathlessly interested fans in the stand when the contest was abruptly ended. The fans felt that at least one more inning could have been played.

One of the most unusual incidents ever recorded in American sports followed. Kenesaw Mountain Landis, high commissioner of baseball and a former Federal judge, was in a field box and when play stopped he started across the field toward the exit. The crowd seethed out behind him, hissing and cat-calling, shouting that baseball was crooked and that the game had been called so that the magnates might make money from an additional contest.

Commissioner Landis went immediately to his hotel and after a conference with the club owners of the two clubs, announced that the entire proceeds of the game would be given to charity as an evidence of the squareness and good faith of baseball. This promise was kept and the gate receipts of \$120,554 plus interest, were

later divided among three national soldier organizations and twelve New York City charities. Thus did baseball keep faith with the people and prove its right to the prosperous season which it enjoyed. A detailed review of the season follows:

Baseball.—During 1922 baseball proved that it is still America's national game. The sport has never known a more prosperous season. In many major and minor league cities all previous attendance and receipts records were broken. The values of club franchises were naturally increased and it was not surprising to find when Col. T. L. Huston threatened to sell his half interest in the New York Yankees that the club's franchise and property were worth close to \$3,000,000. High class players became more valuable than ever before and the Chicago American League Club set a new high-water mark for a minor leaguer when it paid \$100,000 for Willie Kamm of San Francisco. In the big leagues Heinie Groh was brought to the New York Giants at an expenditure equivalent to \$150,000 and \$250,000 was said to have been refused for another player.

But it was not only at the gate and in the exchequers of the various clubs that baseball records were made in 1922. Old marks made way for new on the diamond proper. "Babe" Ruth failed to equal his home run record of the previous season, but new sluggers came forward to take his place, although none of them equalled his 1921 mark of 59. In the American League Kenneth Williams of the Saint Louis Browns drove out 39 home runs and led the league in this department. Clarence Walker of the Philadelphia Athletics made 37 and Ruth, despite his long suspension early in the season, made 35. George Sisler of Saint Louis led the league in hitting with a percentage of .419 and Ty Cobb of Detroit equalled the major league record by hitting over .400 for the third year in succession.

Rogers Hornsby of the Saint Louis Cardinals proved the sensation of the season by making the highest number of home runs in either league, 42, and batting .401. This was the first time that a National League player had hit over .400 since Ed Delahanty batted his way to a percentage of .409 in 1899.

New York City again monopolized the World's Series and for the second year in succession the Giants won the championship from the Yankees. The victory of the National League club was a decisive one, the Giants winning four games with one resulting in a tie. This was the third time in the history of the World's Series that the losing club failed to win a game.

A remarkable pitching feat was accomplished early in the season by Charles Robertson, a recruit on the Chicago White Sox team, when he pitched a perfect game against Detroit. Not a hit was made off the young pitcher and only 27 batters faced him in nine innings. Jess Barnes, a veteran pitcher of the New York Giants, came close to duplicating Robertson's achievement. Barnes pitched a no-hit game against the Philadelphia Nationals but issued one base on balls and thus marred an otherwise perfect performance.

Urban Faber of the White Sox led the

American League pitchers in effectiveness and Wilfred Ryan of the Giants led the National League in this respect. Faber allowed 2.81 earned runs per nine innings, while Ryan's average was 3. In the matter of victories Joe Bush of the Yankees and Pete Donohue of the Cincinnati Reds were first in their respective leagues. Bush won 26 games and lost 7. Donohue won 18 and lost 9.

Two decisions which were important to baseball were handed down by the Supreme Court during the year. One of them held the reserve clause in players' contracts legal and the other decided that organized baseball was not a trust in violation of the Sherman anti-trust act.

Basketball.—Basketball, which was only 31 years old in 1922, gained favor by leaps and bounds during the year. As a team sport for both men and women it has few rivals and it would be as interesting to know, as it would be difficult to find out, just how many lives there were playing each season. If it were possible to assemble these figures, say for a period of 10 years, they would probably show the greatest growth in popularity that any sport has ever known.

The game has not only secured a hold on this country, but 1922 saw it reaching across the seas and being received with enthusiasm by the French. The game is also being played in England, South America, China, Japan and Rumania.

In the United States the 1922 professional title was won by the Original Celtics of New York. The Eastern Intercollegiate championship went to the Princeton five. Purdue University won the Western Conference title and the Lowe and Campbell team of Kansas City the National Amateur Athletic Union championship.

Billiards.—It is not the rule in sports, but now and again some one who has been counted a "has-been" does come back and in 1922 Willie Hoppe was the man. Hoppe held the world's professional 18:2 balkline billiard championship for 14 years—then lost it. For a season he was just a former champion. In the early part of November of last year, however, he took part in the international tournament in New York City and won back his title from the five greatest billiard players in the world. His opponents were Jake Schaefer of San Francisco, the defending titleholder; Edouard Horemans, champion of Belgium; Roger Conti, champion of France; Erich Hagenlacher, champion of Germany and Welker Cochran, who is rated third among the American players. Hoppe won all five of his matches and conclusively proved that even among the masters of the ivories he is still preeminent. In March 1923 he again successfully defended his title in a match with Schaefer defeating the latter 1,500 to 1,341.

Johnny Layton of Sedalia, Mo., successfully defended his three-cushion crown against Alfredo De Oro. Ralph Greenleaf carried off the diamond medal, emblematic of the national professional pocket billiard championship. These were the other important events in an interesting year on the green baize cloth.

Boxing.—There was no boxing match of World-wide interest, such as the Demoshev-Carpentier contest, during 1922. Jack Dempsey,

the heavyweight champion, spent the year in touring Europe and in fulfilling stage and motion picture contracts. Nevertheless, it was not altogether a lost year among the followers of the sport. While it was not another "battle of the century," Benny Leonard, the lightweight champion, had the time of his life protecting his title from the onslaughts of Lew Tendler. The bout was held at Boyle's Thirty Acres in Jersey City and attracted 70,000 spectators, evidence of the perennial popularity of boxing.

The Leonard-Tendler bout was settled in the ring and Leonard finally won, but another title bout, that between Carpentier and Siki in Paris, is still being debated and apparently will not be settled until it reaches some French court. The referee first announced Carpentier the winner on a foul, then reversed himself and declared Siki the light-heavyweight champion of the World. Siki, a black man from Senegal, soon ran amuck in Paris, and as a result of some of his escapades the French Boxing Federation suspended him and declared the title vacant.

The action of the French Federation in declaring the championship vacant was paralleled by the State Athletic Commission of New York. The New York body ruled that Johnny Wilson and Johnny Kilbane had forfeited the middleweight and featherweight titles respectively by not defending them. Thus, so far as New York State was concerned, new world's champions were made. Mike O'Dowd defeated Dave Rosenberg for the middleweight championship, and Johnny Dundee replaced Kilbane as the featherweight titleholder.

The situation, therefore, at the end of the year was this:

O'Dowd was the world's middleweight champion in New York State. Johnny Wilson of Boston, the former titleholder, still claimed the championship, and Bryan Downey of Cleveland was recognized in Ohio on the strength of his showing against Wilson in a bout in that State. Dundee was the featherweight champion of the world in New York, but Kilbane still held, or rather claimed, the title for the remainder of the world.

Two world's championships also changed hands as the result of actual bouts during the year. Joe Lynch of New York regained the bantamweight championship by defeating Johnny Buff and Mickey Walker won the welterweight championship from Jack Britton.

Amateur boxing had a successful season and some of the most interesting boxing seen during the year occurred in the various amateur tournaments.

Chess.—The International Congress in London was the event of the year in chess. Fittingly enough Jose R. Capablanca, the world's champion, was the winner in this tournament. Alexander Aljechin, the Russian expert, who afterward issued a challenge to Capablanca, was placed second.

America, too, held an international tournament, but it was limited to six competitors. While Edward Lasker of Chicago was first and C. Jaffe of New York second, the sensation of the tournament was little Samuel Rzechewski, the boy wizard of the chess board. This was the most severe test Rzechewski has ever faced, and

he demonstrated that he has the potentialities of a champion by finishing in a four-handed tie for third place with J. Bernstein, D. Janowski and H. R. Bigelow.

The annual tournament of the Western Chess Club was won by Samuel Factor of Chicago. Frank J. Marshall retained the United States title, but agreed during the year to a match in defense of it. The Massachusetts Institute of Technology won in the intercollegiate tournament played late in the year and Columbia defeated Harvard, Yale and Princeton in the thirtieth annual meeting of these four universities.

Football.—If there was any lingering doubt as to the truth of the statement that football is no longer just a piece of college foolishness, but a national sport, the year 1922 dispelled it. Not so much because of the number of fine contests, although there were plenty of those, but because there was more interest on the part of the general public than ever before. There was all the color of the past at the 1922 games, with the rival bands and rival cheering sections, and added to those who came to root were thousands of others who came to watch the games from a pure love of the sport itself.

On one Saturday early in the season 215,000 persons saw five games, and on 18 November, the height of the season, 500,000 watched the big games. There were never enough seats at the important games, such as the Chicago-Princeton match in Chicago, the annual clashes among Yale, Harvard and Princeton and the Army-Navy fixture in the East.

In addition to its gain in popular favor, the game also made progress along other lines during the year. Percy Haughton, the father of the Harvard system, contributed a notable book to the sport; there was an important change in the rules, relative to the point after touchdown, which improved the game from a spectacular and technical standpoint; there were more intersectional contests than ever before; these things, and the high type of sportsmanship which prevailed, made 1922 football's year.

There is no conclusive way to determine the championship of the East, but by common consent among sporting writers Princeton was placed at the top of the list, with Cornell second. Neither of these teams were defeated, but Princeton played a more exacting schedule than Cornell, and added to its prestige by winning the Big Three Championship from Yale and Harvard. Harvard defeated Yale, 10 to 3, in the classic struggle between the Crimson and the Blue.

Close behind Cornell in the ranking of Eastern teams was the eleven from the United States Military Academy at West Point. The cadets, like Princeton and Cornell, were undefeated, but they played two tie games, one against Yale and the other against Notre Dame. The soldiers took their main objective when they humbled their old rivals, the Navy, on Franklin Field, Philadelphia by 17 to 14. It was the first victory for the Army over the Navy since the World War.

The Western Conference season ended in a tie between Iowa and Michigan, with Chicago also undefeated in the conference, but with one

tie game on the records against it. In the far-West the University of California again boasted the outstanding eleven. Nebraska won the championship of the Missouri Valley and in the South, Vanderbilt and Georgia Tech produced strong teams.

Golf.—America came into her own at the old Scotch game of golf during 1922. For the second year in succession an American entrant won the British open championship at Sandwich and, for the first time in the history of the game, it was an American home-bred who turned the trick. Walter Hagen brought the title back, Jim Barnes finished just in his wake tied with George Duncan of England for second place and Jock Hutchison, the 1921 titleholder, was third. Hagen's score was 300 for 72 holes.

Duncan and Abe Mitchell, defeated in their own classic, sought to redeem themselves and Great Britain by coming here and competing in the American open at Skokie, but without success. Gene Sarazen, a mere stripling of 21 years and a former caddie at the Apawamis Club, won the title. Later on Sarazen led the field in the P. G. A. championship and then defeated Hagen in a special 72-hole match for the unrecognized championship of the world.

In addition to the open, the international element was present in the national amateur championship at Brookline, Mass. Practically all of the members of the British team which competed in the Walker Cup play were entered. Again the American players swept the boards. Jess Sweetser, the Yale star, was the victor after shooting some of the most brilliant golf ever seen in an amateur tournament. Cyril Tolley was the last survivor of the British team, going down to defeat at the hands of R. E. Knepper of Princeton. The Americans also scored a decisive victory in the Walker Cup matches.

Miss Glenna Collett, the 19-year old golf wonder of Providence, R. I., repelled the last of the British invasions when she defeated Mrs. W. A. Gavin on the thirty-second green in the final of the women's national championship. Miss Collett also won the Eastern women's title.

Eddie Held of Saint Louis won the first public links championship ever played in the United States. The tournament was held at Toledo, Ohio.

Horse Racing.—Clean, interesting competition and frequent upsets are the facts which stand out in the summing up of the year in the Sport of Kings. Morvich, Benjamin Block's colt which won eleven starts as a two-year old, provided the most sensational upset. Morvich was looked upon as the logical successor to the great Man o' War when the 1922 season opened, but after winning the Kentucky Derby he went wrong. Four defeats, each one marked by a dismal showing on the part of the Block colt, followed in quick succession. Convinced at last that his wonder colt had slipped, Block took him out of training and later sent him to the stud. Contrary to the usual custom in such cases it is expected that Morvich will be brought back to the races in 1923.

The upset of form in the case of Morvich sounded the keynote for the entire racing season. There was a succession of form reversals in all divisions. One week a prospective two-year old

champion would loom on the horizon only to go down to ignominious defeat the next. Such a situation makes it manifestly impossible to choose an outstanding champion. It was the consensus of expert opinion, however, that among the two-year olds W. S. Kilmer's Sally's Alley held a slight edge at the end of the season. Others which showed great promise and won important races were Martingale, a better mud runner than Sally's Alley; Zev; Edict; Enchantment and Blossom Time.

The same complicated situation existed among the three-year olds. Morvich faded twice before the startling speed of Whiskaway. Then Whiskaway was taken to Saratoga and beaten there by Rockminster. Rockminster, in turn, lost to Kai Sang. Lucky Hour, Bunting and Pillory were three others which showed class.

The last named was first among the money winners of the year with \$95,654. Sally's Alley was second with about \$94,000 and Exterminator third with \$71,075. Exterminator, a seven-year old gelding, is now within \$5,261 of equaling Man o' War's record as the greatest money winning race horse in the history of the American turf. Exterminator also ranks fifth among the money winners of the world and is still racing with the dash of a two-year old. "Old Slim," as he has been nicknamed by track devotees, also shares the honor of leading the handicap division for 1922 with Grey Lag.

Charles Lang led the jockeys during the year, piloting 180 winners. M. Fator brought 172 home in front and was second, while T. Wilson was third with 138. Earl Sande did not have so many victories as these three, but was accounted the most consistent jockey of the year and most track followers consider him in a class by himself as a rider.

In England, Sir J. Buchanan's Captain Cuttle, ridden by S. Donoghue, captured the great classic, the Epsom Derby, winning in a canter in the record time of two minutes and 34- $\frac{3}{4}$ seconds. Tamar, owned by Lord Astor was second. In France, Kefalin, belonging to M. Ambatielos won the Grand Prix de Paris.

Harness Races.—In the trotting division the outstanding feature of the year was the lowering by Peter Manning of his own world's record for one mile of one minute and 57- $\frac{3}{4}$ seconds, established at Lexington, Ky. on 6 Oct. 1921 to a new world's record of one minute and 56- $\frac{3}{4}$ seconds, established likewise at Lexington, Ky. on 4 Oct. 1922. Among the pacers, Margaret Dillon on 6 Oct. 1922, at Lexington, Ky., established a record for the best two one-mile heats paced by a mare, by pacing one heat in one minute and 59- $\frac{1}{4}$ seconds and another in one minute and 59 seconds flat. In 1922, the grand circuit season included 14 meetings, at which 274 races were decided. There were 161 events for trotters and 113 for pacers. Prize money distributed during the year amounted to slightly more than \$517,000. The largest individual winner on the circuit was Czar Worthy, with winnings totaling \$22,800.

Polo.—There was no competition between the United States and Great Britain during the year. However, it was not an idle season for either players or ponies. An Argentine team, an Anglo-American team and an all-Ireland

team came to America and competed against some of the strongest combinations that the United States could put together.

The Argentine four had previously played a long series of matches in England and brought the British championship here with them. They added the American open championship to their laurels and then were defeated, in what virtually amounted to a world's title series, by the Meadow Brook "Big Four." The series was decided in two straight matches. The score of the first was 7 goals to 4 and of the second 5 goals to 4. The American players were Devereux Milburn, J. Watson Webb, Thomas Hitchcock, Jr., and Louis E. Stoddard. The Argentine team consisted of David B. Miles, John B. Miles, Jack Nelson and Lewis L. Lacey.

Skating and Ice Hockey.—Three skaters shared the year's honors. They were William Steinmetz of Chicago, Joe Moore of New York City and Roy McWhirter of Chicago. Steinmetz won the international outdoor championship at Saranac Lake and the Diamond Trophy at Lake Placid; Moore won the international indoor at Milwaukee, the Canadian outdoor at Saint John's, N. B., and the Middle Atlantic outdoor at Newburgh, N. Y.; McWhirter won the National outdoor at Plattsburgh and the Western outdoor at Chicago.

Four records were broken. Art Staff of Chicago set new marks for outdoor competition at the quarter-mile, three-quarter mile and two mile distances. Steinmetz still further lowered the three-quarter mile mark.

The leading woman skater of the year was Miss Gladys Robinson of Toronto.

The national amateur hockey championship was won by the Westminster Hockey Club of Boston.

Swimming.—The name of Johnny Weissmuller, the phenomenal 18-year old star of the Illinois A. C., Chicago, just about dominates the review of the swimming season. Weissmuller just about swept the boards at every distance up to 500 meters and at any style. Among the most noteworthy of his achievements was the breaking of the long standing 100-yard record held by Duke Kahanamoku. Weissmuller swam the distance in 0:52 $\frac{3}{4}$, clipping $\frac{3}{4}$ of a second off the former mark. He swam 220 yards in 2:15 $\frac{3}{4}$, 4 and $\frac{1}{2}$ seconds faster than it had ever been done before. He swam 440 yards in 5:05 $\frac{1}{2}$, 8 seconds faster than any other swimmer had ever done it and 500 meters in 6:12 $\frac{3}{4}$, 9 seconds faster than the previous world's record. All these at free style. Weissmuller also broke some back-stroke records, among them the 100 and 150 yard marks.

Great swimmers also appeared among the country's mermaids, and the greatest of these were Miss Gertrude Ederle and Helen Wainwright of New York. Miss Ederle boasted of 15 years when she was making her new world's marks and Miss Wainwright was just one year older. Miss Sybil Bauer of the Illinois A. C. also established some new marks, being particularly speedy at the back-stroke.

Miss Ederle created six new international records in one 500-meter swim, in the course of which she covered 440 yards in 5:54 $\frac{3}{4}$, 22 seconds

faster than any girl or woman had ever swum the distance before. Miss Ederle also won the three and a half mile ocean swim for the Day Cup and defeated Miss Wainwright in this event.

Miss Wainwright swam a mile in 26:44½ during the season, thus cutting the former world's mark by nearly three minutes. She also showed great speed at shorter distances and won many important races, especially in the early part of the outdoor season.

Among the back-stroke records set by Miss Bauer were 1:15 for 100 yards, 3:06½ for 220 and 6:24½ for 440 yards.

Tennis.—Mrs. Molla Bjurstedt Mallory and William T. Tilden 2d, America's two great tennis champions, again swept everything before them in national competition. Tilden did not go abroad during the year to defend his world's championship at Wimbledon, but Mrs. Mallory again voyaged over seas and was once more defeated by Mlle Suzanne Lenglen for the women's world championship. On American courts Mrs. Mallory was still invincible and she captured the American title for the sixth successive year without undue effort. Tilden had to fight harder to retain his laurels and it was only after a closely contested match with William M. Johnston of San Francisco that he carried off his third national championship in a row. Tilden, Johnston and young Vincent Richards of Yonkers, N. Y., were rated in that order among the men players of the United States. Tilden and Richards retained the American championship in doubles.

Interest in tennis has grown so in recent years that it has become necessary to increase the seating capacity at the courts of the West Side Tennis Club at Forest Hills, L. I., where many of the major tournaments played in this country are held. This increased capacity will take the form of a new stadium which will stand as a monument to the growth of public interest in tennis in the United States and, from a more utilitarian viewpoint, comfortably seat 12,000 or more persons.

It was at Forest Hills that the challenge round of the Davis Cup matches was played last summer between the United States and Australia. The American team won, four matches to one. Tilden and Johnston were unbeatable in the singles, but Patterson and Wood won the lone doubles match from Tilden and Richards in straight sets.

Originally there was a record entry of 15 teams for the Davis Cup play. The British Isles, Japan, France, Belgium, Spain, Italy, Canada, Czechoslovakia, Roumania, India, Denmark, Hawaii and the Philippine Islands, beside the United States and Australia nominated teams. In the natural course of events some of these teams were forced to default their matches, but the nominations testify to the importance of tennis as an international sport.

An international conference was held in London late in the year and the tennis world was divided into two zones, European and American, to simplify Davis Cup play in the future. The zoning idea was advanced by the United States through Henry W. Slocum, its representative at the meeting.

Tennis also gained ground among the colleges and universities during the year. Several institutions employed coaches and the tendency in large and small colleges alike was toward a greater recognition of the game.

Track and Field.—The "Women's Olympic Games" in Paris redeemed an otherwise quiet year in this branch of sport. The only bit of international competition of any consequence so far as the United States was concerned, was the trip abroad of the relay team from the University of Pennsylvania. The Quaker quartet came out second best in its race against the Cambridge University four.

Two important world's records were made during the year. The two-mile relay team of the University of Pennsylvania, composed of Brown, Meredith, Holden and McMullen, ran the distance in 7:49½. The previous record was 7:50½. Joie Ray, Chicago distance runner, ran 3,000 meters in 8 minutes, 31½ seconds, thus establishing a new time for the distance indoors.

Charley Paddock, Pacific Coast sprint star, ran some remarkable races during the year and the California Association of the Amateur Athletic Union credited him with 11 new world's records. The national association, however, refused to accept the marks and they will not stand.

It was a bad year all around for Paddock. He failed to come East to defend his sprint title and Bob McAllister, a New York policeman and recognized as the fastest cop in the world, won the 100-yard championship. Al LeConey of Lafayette carried off the 220-yard championship. He also equalled the world's record for 60 yards and won the 100-yard and 220-yard dashes in the intercollegiates.

The best distance runner of the year was William Ritola of New York. Among other events he won the national 10-mile, the national senior cross-country and the metropolitan cross-country titles.

Willie Plant, also of New York, remained supreme among the walkers. He holds all records from one to 15 miles and is unquestionably the greatest walker America has produced in this generation.

S. Harrison Thompson of Los Angeles and Princeton won the Decathlon and E. O. Gourdin of Boston and Harvard the Pentathlon.

Yachting — Rowing — Motor Boating.—Three international events marked the yachting season. Probably the one of greatest general interest in America was the Fishermen's Race held off Gloucester, Mass. The United States entry was the *Henry Ford* and the Canadian, the *Blucnose*. The Canadian boat repeated its success of the previous year, but only after four races had been sailed, one of which was declared no contest.

A team of four British six-meter boats was brought to the United States to compete for the British-American Cup and was defeated by the American team. Six races were sailed on a point basis and the Yankee boats won, 111 to 104.

Later in the season, the *Coila III*, owned by J. G. Stephen of the Royal Northern Yacht Club, sailed a series of races at Marblehead, Mass., against Frank C. Paine's *Sakie*, for the

Seawanhaka Challenge Cup and carried it back to England.

Commodore Harold S. Vanderbilt's *Vagrant* was the most successful of the many yachts which competed in the various regattas sailed during the summer in American waters and, as she won both the Astor Cup and King's Cup, should be accounted the champion schooner of the year. The best sloop was Carroll B. Aiker's *Istalena*.

Walter Hoover's victory in the Diamond Sculls at the Henley Regatta in England brought America into great prominence in rowing. Hoover, who hails from Duluth, Minn., also won the Gold Cup at Philadelphia, but he did not defend his American title on the Schuylkill and the championship went to Paul Costello of Philadelphia. The Naval Academy crew again proved itself the strongest eight in college circles.

Motor boating had a busy year due largely to an improvement in the rules of the sport. The Gold Cup was won by Colonel J. G. Vincent's *Criscraft*. The best time for a runabout was made by Gar Wood's *Baby Gar II*, which averaged 48.95 miles an hour over a course of 150 miles. Edsel Ford's *Wood Fish* made the best time for a short distance by averaging 53.6 miles an hour for five miles.

Miscellaneous.—Jimmy Murphy of Los Angeles was the leading automobile race driver of the year. He won the 500-mile international sweepstakes at Indianapolis and in winning it broke all records for the intermediate distances. He also set a new record for 100 miles during the year. Tommy Milton was another successful driver. He was first in the national championship race, set new marks for 25 and 50 miles and captured the sprint championship at Los Angeles. Sid Haughdahl broke the old records for 1 kilometer and for 5 and 10 miles as his contribution to a race year which was marked with thrilling speed throughout.

Leo Nunes of the New York A. C. retained the national three-weapon championship in fencing. Miss Adeline Gehrig also retained the women's national title. The Scullins Steel Works of Saint Louis won the national soccer title and Princeton was first in the Intercollegiate League.

In the National A. A. U. handball championships played at Milwaukee in March, Arthur Schinner won the senior title and M. Laswell the junior.

Trapshooting, squash and court tennis, cycling, wrestling, fly casting, rifle and game shooting, all these and many minor sports that lack of space makes it impossible to review had a prosperous year filled with keen competition and interesting sport.

M. W. CORUM,

Sports Department, The New York Times.

SPRING HILL COLLEGE, a Catholic educational institution for men, founded in 1830 and located at Spring Hill, Ala. In 1922-23 it had a faculty of 18 members, 250 students, and property valued at \$400,000. Its gross income was approximately \$100,000. Michael McNally, S.J., is president.

STANDARDIZATION. See STANDARDS, NATIONAL BUREAU OF.

STANDARDS, National Bureau of. The Bureau of Standards was established by act of Congress 3 March 1901, and is charged with the development, construction, custody, and maintenance of reference and working standards of measurement, standard constants, standards of quality, standards of performance, and standards of practice.

The first class of standards includes such familiar ones as standards of length, weight, density, the various standards of electrical measurement, heat measurement, etc. As an example of a standard constant may be given the mechanical equivalent of heat, while standards of quality usually take the form of a specification for a given material.

Standards of performance enter into the rating of machinery of all kinds, mechanical devices, and, in fact, every sort of apparatus the efficiency of which can be measured.

Standards of practice are used as the basis of codes and regulations governing the installation and operation of appliances of all sorts.

It will be readily understood that the field covered by the Bureau's work is a very extensive one, and it has been found advisable to group together the experts in various lines entirely independent of the class of standards with which they deal. Thus, there is a division of electricity which handles all subjects in that field, no matter whether they are concerned with electrical measurements, standards of performance of electrical machinery, or standards of practice involving the safe wiring of factories and houses. This is true of every division of the Bureau of which there are 11 in all.

During the past fiscal year, the Bureau has paid particular attention to industrial standardization, the elimination of waste in industries, and the simplification of industrial products. It is not to be understood that less attention has been given to fundamental measurements than heretofore, but every line of work has been carried out with particular reference to its importance in some practical industrial operation. Work of this kind can only be conducted with the close co-operation of the industries, and it is gratifying to record that American manufacturers have given their aid to the Bureau in every possible way.

In considering the work of the past fiscal year, it is believed that more has been accomplished for the money expended than during any similar period in the past. The important standardization work which has been carried out in connection with the paper, textile, ceramic, and automotive industries—to mention only a few of them—is of the first importance and will have a direct effect on the future of almost all manufacturers of such products.

The Bureau's apparatus for accurate measurements, which had got into a somewhat unsatisfactory condition during the war and the period immediately following it, has been placed in first-class shape so that the very highest type of precision work can be undertaken.

A total of 92,568 tests was completed during the year, 62,104 of these being for the government and 30,464 for the public. Besides these tests a large number of investigations have been carried out in all the laboratories.

The results of the Bureau's work are made available through its publications, sixty-seven of which were issued during the year, including an elaborate revised list of all publications issued by the Bureau. These may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C.

SAMUEL W. STRATTON,
President, Massachusetts Institute of Technology; formerly Director, National Bureau of Standards.

STATISTICAL ASSOCIATION, American. The functions of the American Statistical Association are usually the encouragement of statistical research among its members and the making known of these results. Such research is the achievement of individuals or research bureaus, the service of the Association being largely the publication of such research in its *Journal* and the arrangement of an annual meeting at which papers dealing with research are read. Four issues of its periodical, the *Journal of the American Statistical Association*, were published in 1922, embodying 550 pages, containing articles dealing with economics, business, social conditions, demography, population, statistical method and mathematics. The annual meeting, under the presidency of W. S. Rossiter, was held in Chicago, 27-29 December. The program was varied and dealt with trends in prices, business, wages, labor and the standard of living; with population problems and with employment and unemployment. A section was held on the publication of a series of text books on statistical method for purposes of securing better training. The project may be further developed by the executive board. The several committees of the Association were active during the year. The Joint Advisory Committee on the Census, under the chairmanship of W. S. Rossiter, made a printed report of 25 pages. This committee has been very active during the past three years. It was resolved to make such a committee permanent. The Committee on Institutional Statistics, chairman Dr. H. M. Pollock, reported progress on standardization, institutional practice and census. Miss Mary Van Kleeck, chairman of the Committee on Employment Statistics, reported many meetings held in different cities and extended co-operation with Mr. Hoover's committee.

The Association gained slightly in membership—40—its total membership being now 986. Five members died including Dr. Jaques Bertillon. Upon the nomination of the Committee on Fellows, 16 fellows were elected. Four special meetings of the Association were held in New York City, the average attendance being 125. The last meeting on the Business Cycle attracted some attention because of its resumé of the various types of research on this problem.

STEAMBOAT INSPECTION SERVICE. During the fiscal year which ended 30 June 1922, the steamboat inspection force of the United States inspected and certificated 7,543 vessels, with a total gross tonnage of 13,931,877,

of which 7,206 were domestic vessels, with a total gross tonnage of 10,975,357, and 337 were foreign passenger steam vessels, with a total gross tonnage of 2,956,520. Of the domestic vessels there were 5,864 steam vessels, 771 motor vessels, 20 passenger barges, and 551 seagoing barges. There was a decrease of 552 in the total number of the vessels inspected and a decrease of 2,299,124 in the total gross tonnage of vessels inspected as compared with the previous fiscal year. There were 658 cargo vessels examined to carry persons in addition to crew, under the provisions of the Act of Congress approved 5 June 1920. Letters of approval of designs of boilers, engines, and other operating machinery were granted to 31 steam vessels, with a total gross tonnage of 1,016. There were inspected for the United States Government 56 hulls and 1,886 boilers. There were 2,770 re-inspections of steam vessels, motor vessels, and barges. Licences were issued to 26,044 officers of all grades. There were examined for visual defects 7,997 applicants for licenses, of whom 17 were found to be color blind or with other visual defects and were rejected. Certificates of service were issued to 10,253 able seamen, and 924 were rejected. Certificates of efficiency were issued to 17,804 lifeboat men, and 6,714 were rejected.

Steel plates for the construction of marine boilers to the number of 2,259 were inspected at the mills, and a large amount of other boiler material was inspected. There were examined and tested 160,894 new life preservers, of which number 3,356 were rejected. There were 206 balsawood life floats inspected, of which number 10 were rejected. There were inspected 6,113 cork ring life buoys, of which number 118 were rejected. There were inspected at factories 606 new lifeboats, of which number four were rejected. There were inspected at factories 87 new life rafts, all of which passed. There were tested by firing 102 line-carrying guns, all of which passed.

The total number of accidents resulting in loss of life was 231. The total number of lives lost was 266, of which 95 were passengers. Of the lives lost 178 were from suicide, accidental drowning, and other causes beyond the power of the service to prevent, leaving a loss of 88 as fairly chargeable to accidents, collisions, foundering, etc. There was a decrease of 64 in the number of lives lost as compared with the previous fiscal year. Passengers to the number of 235,802,603 were carried on vessels required by law to make report of the number of passengers carried. Dividing this number by 95, the total number of passengers lost, shows that 2,482,132 passengers were carried for each passenger lost. The number of lives directly saved by means of the life-saving appliances required by law was 1,357.

During the year, incident to the economy program, the office of local inspectors at Burlington, Vt., was discontinued, and the work of that district was taken over by the local inspectors at Albany, N. Y.; the office of local inspectors at Apalachicola, Fla., was discontinued, and the work of that district was taken over by the local inspectors at Mobile, Ala., and the office of the supervising inspector of the seventh district, Pittsburgh, Pa., was discontinued, and the work

of the district was taken over by the supervising inspector of the sixth district, Louisville, Ky.

STEEL. See IRON AND STEEL; METALLURGY.

STERLING COLLEGE, a United Presbyterian co-educational institution, founded in 1887 and located at Sterling, Kan. In 1922-23 it had a faculty of 15 members, 215 students, property valued at \$208,865, and an income from endowment and other sources, of \$39,024. Rev. Ross T. Campbell, D.D., is president.

STEVENS INSTITUTE OF TECHNOLOGY, a non-sectarian educational institution for men, founded in 1870 and located at Hoboken, N. J. In 1922-23 it had a faculty, including the teaching staff, of 52 members, 614 students, and property (plant and endowment) valued at \$3,325,000. Income figures for 1922-23 were not available but in 1921-22 they were \$296,902.84. Alexander Crombie Humphreys, M.E., E.D., Sc.D., LL.D., is president.

STEWART, John P.: d. 21 Jan. 1922. See HORTICULTURE.

STINNES, Hugo, German industrialist and financier; reputed to be the richest man in Germany: b. Mulheim, Germany, 12 Feb. 1870, the year of his country's triumph over France. The common impression that he is of Jewish ancestry appears to be inaccurate. His mother was Adeline Coupienne of a Huguenot family that fled to Germany from the persecutions of Louis XIV, while his father, also called Hugo, was the son of Matthew Stinnes who founded the firm of that name at Mulheim. Stinnes himself is classed as "an Evangelical." He belongs to the third generation of a prosperous Rhenish family.

Educated in a real gymnasium, he was sent to Karl Später in Coblenz, there to learn business. He also spent a period as a working miner. In 1889, he attended the School of Mines in Berlin and a year later joined the family firm of Matthew Stinnes in which his mother had one-fifth interest. There he only remained two years, for at the age of 23, he started for himself with a capital of 50,000 gold marks or \$12,500. He was fairly successful and in 1897, his father left him 9,000,000 gold marks or about \$2,000,000. It is estimated that when the war broke out he had increased this fortune to \$10,000,000. He was then rich but by no means so fabulously wealthy as he soon became.

Stinnes has been called the prince of war profiteers. While his assets abroad were sacrificed, he made huge sums of money at home. He sold coal to neutrals at a high price. At the German main headquarters, he was a favorite and thus obtained favorable concession by which he exploited French and Belgium properties in the occupied regions. His assets leaped up to a vast sum, even \$200,000,000 being mentioned.

His business before the war had consisted of coal mining, the chemical treatment of coal, briquettes, iron and steel. A fleet of 13 vessels had carried his products, which included wood and grain, to the Black Sea, the Mediterranean and the Baltic. During the war, his office at Rotterdam was put on the Allies' blacklist. In the Rhineland, he was interested in tramways and the development of electricity. But, with the war, he invested in numerous other undertakings.

He bought, it is said, as many as 60 newspapers, including the *North German Gazette* and the *Münchner Neuste Nachrichten*. He acquired paper factories and printing establishments. He purchased the Esplanade Hotel in Berlin and the Rathaus Hotel and Hamburger Hof in Hamburg. In Charlottenburg, he took over a motor factory. In 1916, he bought out Edward Woermann and so obtained possession of the German East African business of the Hamburg-Amerika and Nord Deutsche Lloyd interests. In 1917, he bought up the ships and warehouses of H. W. Heidmann, a firm founded in 1848. A year later, his son, Hugo, was in charge of a company in Hamburg capitalized at 5,000,000 marks. The capital of his interests on the Rhine and the Elb was then about 615,000,000 marks—and in 1919, Stinnes was responsible for 15.8 per cent of the coal and 13.1 per cent of the coke in the Rhineland and Westphalia. He was also busy picking up properties in Italy, Austria and Russia. Even the Armistice did not injure him for he was handsomely compensated for assets liquidated abroad.

It will thus be seen that Stinnes owes his success to the skill with which he exploited the opportunities which came to him as a result of the war. He sold his products at a high price. When others were ruined, he bought their businesses at a low price. Oils, skin, jute, peat—it mattered not what; all was fish that came to his net. In art and philanthropy, he is but little concerned. Of medium height, sturdy build, black bearded and sallow in complexion, he has lived at the Hotel Adlon in Berlin, a man of few words, seldom mentioned in his own newspapers, seldom addressing the Reichstag where he is a deputy of the People's Party—formerly the National Liberals. It cannot be pretended that he is a popular figure. His way of avoiding the income tax was characteristic. "Take the mines," he said "and run them if you can." A harassed government was in no position to fight him. If "I became a Socialist," he once declared, "I should lose my efficiency."

Stinnes has not been the head of a German Administration though he came near it when Chancellor Cuno was preferred. But he has exercised considerable political influence. In July 1920, he attended the Spa Conference where German coal deliveries were arranged with the Allies and his bearing was regarded as provocative. He denounced the use of "black troops" by France in the Rhineland. In February 1921, he exposed and helped to defeat the counter-revolution in Germany. And in August 1922, he entered into negotiations with Senator de Lubersac, President of the Federation of Co-operative Societies in the French Liberated Regions, the object being a working agreement between German and French industrialists—to include the provision of raw materials and labor by Germany. This scheme, cynically described as "six per cent patriotism" on the part of Stinnes did not commend itself to France, and it fell through.

STORER, Bellamy, American lawyer and diplomat: b. Cincinnati, Ohio, 28 Aug. 1847; d. Paris, France, 12 Nov. 1922. He was graduated from Harvard University with the degree of A.B. in 1867 and took his M.A. in 1870. During 1869 he was graduated from the Cincinnati Law School and was admitted to the Ohio bar the same year. He served as a member of the 52d and 53d Congresses (1891-95) and in 1897 was appointed Minister to Belgium which post he held for two years. He was then transferred to Spain to which country he was United States Minister until 1902 when he was made Ambassador to Austria-Hungary. This latter post he held until 1906. In 1886 Mr. Storer married Miss Maria Longworth, a daughter of Joseph Longworth and a granddaughter of Nicholas Longworth, one of the founders of Cincinnati.

STORER, Horatio Robinson, American physician: b. Boston, Mass., 27 Feb. 1830; d. Newport, R. I., 18 Sept. 1922. He was graduated from Harvard University A.B. in 1850, A.M., and M.D. in 1853 and LL.B., in 1868. From 1853-55 he studied medicine at Paris, London and Edinburgh. Returning to America during the latter year, he established a practice in Boston. From 1865-69 he was professor of obstetrics and medical jurisprudence in the Berkshire Medical College, where later he delivered post-graduate lectures on gynecology. He was consulting physician of the Newport Hospital and Saint John's Hospital, Providence, R. I. He devised a number of surgical and gynecological instruments and methods. He was life president of the Newport Medical and Natural History Societies, and the Gynecological Society of Boston; Fellow of the American Academy of Arts and Sciences; vice-president in 1868 of the American Medical Association and a delegate in 1887 to the ninth International Medical Congress. In 1871, he was president of the American Medical Editors' Association and also held memberships in various foreign societies. He was editor of 'Obstetric Memoirs of Contributions' of Prof. (Sir) James Y. Simpson, of Edinburgh (with Sir William O. Priestley, of London, 1855). He published 'Criminal Abortion in America' (1859); 'Criminal Abortion, Its Nature, Its Evidence and Its Law' (with F. F. Heard); 'Why Not?—a Book for Every Woman' (1865); 'It Is I?—a Book for Every Man' (1869); 'On Nurses and Nursing'; 'On Insanity in Women.' He received a gold medal from the American Medical Association in 1865 for an essay on "Physical Evils of Forced Abortions" and in 1918 received the gold Liberty Service Medal from the National Institute of Social Sciences for aiding in the control of pestilence among the soldiers and sailors in the United States. On his 91st birthday, the citizens of Newport presented him with a loving cup in recognition of the public health service rendered by him during a period of nearly 50 years.

STORY, George Henry, American artist: b. New Haven, Conn., 22 Jan. 1835; d. New

York City, 24 Nov. 1922. After serving a three years apprenticeship to a wood carver, Mr. Story took up painting and studied first under Charles Hines for three years, and thereafter in Europe for one year. Returning to the United States, he first located at Portland Me., and in 1859, received a medal from that State. In 1862 he established a studio in Washington, where he lived for two years and where he became a friend of President Lincoln, of whom he made sketches, from which in after years he painted several portraits of the martyred President. One of these portraits hangs in the National Museum in Washington, the gift of Mrs. E. H. Harriman. Leaving Washington, Mr. Story took up his residence in New York, which continued to be his home until his death. He was especially a painter of portraits and genre pictures. In 1876 he received a medal at the Centennial Exposition at Philadelphia; from 1889 to 1906 he was curator of the Department of Painting of the Metropolitan Museum of Art, New York, and from 1906 until his death, curator emeritus. During 1904-05 he was acting director at the Museum. He was also from 1899 curator of the Wardsworth Athenaeum of Hartford, Conn. He was President of the New York Artists Fund Society for nine years.

STRAITS SETTLEMENTS, a British Crown colony, comprising Singapore, Penang, Malacca, Christmas Island and the Cocos Islands. Singapore has an area of 217 square miles; Penang, 108 square miles; Province Wellesley, a strip on the mainland under Penang, 280 square miles and Malacca on the Malay Peninsula, about 450 square miles. The population in 1921 was 881,939, of whom about 9,000 were Europeans, 10,000 Eurasians and the remainder Asiatics. The colony is administered by a governor, assisted by an executive council. There is a legislative council of 10 official and eight unofficial members. The revenue in 1920 was £4,954,789 and the expenditure £4,580,370; exports the same year totaled £119,471,984 and imports £148,191,421. The chief exports are tin, pepper, nutmegs, sago, mace, tapioca, hides, horns, rubber, guttapercha, rattans, gums, and copra. The chief imports are cotton textiles, foodstuffs, sugar, tobacco and its manufactured products, coal, animals, hardware, etc. In 1920, 8,737 vessels, exclusive of native craft, entered at the ports of the colony. The aggregate tonnage of these vessels was 11,995,639 tons. The railways of the Federated Malay States extend to Malacca. Woodlands on the Johore Straits is connected with Singapore by rail. All roads are of metre gauge. Singapore and Penang have electric street railway systems. There are two wireless stations. Since 1907 Labuan, area 28½ square miles, has formed part of the colony. Christmas Island exports phosphate of lime, its sole source of wealth.

STRATTON, Samuel Wesley, American physicist and educator: b. Litchfield, Ill., 18 July 1861. He was graduated from the University of Illinois with the degree of B.S. in 1884, and in 1903 received the degree of D.Eng. from the same institution. The degree of D.Sc. was conferred upon him by the Western University of Pennsylvania (now the University of

Pittsburgh) in 1903, by the University of Cambridge, England, in 1909, and by Yale University in 1919. France made him a Chevalier of the Legion of Honor in 1909. From 1885 until 1892 Dr. Stratton was a member of the faculty of the University of Illinois, serving first as instructor in mathematics and thereafter as assistant professor and professor of physics and electrical engineering. He then joined the teaching staff of the University of Chicago with which he was connected as assistant professor, associate professor and professor of physics until 1901 when he was made director of the Bureau of Standards (q. v.) at Washington, D. C. He still held the latter position on 11 Oct. 1922 when he was elected president of the Massachusetts Institute of Technology to fill the vacancy created in November 1921 when Dr. Ernest Fox Nichols, who had been chosen to succeed the late Dr. Richard C. Maclaurin, resigned without taking office. Doctor Stratton entered upon the discharge of his new duties 1 Jan. 1923. During his administration of the Bureau of Standards he built it up from a rather inconsequential branch of the coast service of the Treasury Department, employing only three or four persons, to one of the most useful and highly efficient branches of the Federal government, under the Department of Commerce, with a staff of approximately 1,000 people, including many of the foremost scientists in the country. Under his direction, the Bureau co-operated closely with the aeronautical branches of the Army and Navy and conducted many experiments of the utmost value in solving the problems of aerial navigation. In recognition of his achievements, Doctor Stratton has been awarded the Elliott Cresson medal by the Franklin Institute and the welfare medal by the National Academy of Sciences. Aside from his work as director of the Bureau of Standards, Doctor Stratton's governmental activities have covered a wide field. He was a member of the interdepartmental board of the Council of National Defense, member of the board on ice observation and patrol and secretary of the National Advisory Committee for Aeronautics. He has long been interested in naval affairs. From 1895-1901 he served as ensign, lieutenant, junior grade; lieutenant and lieutenant-commander of the Illinois Naval Militia. During the Spanish-American War he served as a lieutenant in the United States Navy from May to November, 1898, and from 1904-12 he commanded the Naval Militia of the District of Columbia. Doctor Stratton is a member of the International Committee on Weights and Measures, member of the American section of the Standardization Committee of the International Chamber of Commerce, member of the American Institute of Electrical Engineers, member of the American Society of Mechanical Engineers, member of the American Physical Society, member of the American Philosophical Society, member of the American Association for the Advancement of Science and member of the National Academy of Sciences. He is a member, also, of the Cosmos, Chevy Chase and Army and Navy clubs of Washington.

STRAWBERRIES. See HORTICULTURE.

STRAW HATS, Manufacture of. According to the reports to the Bureau of the Census, in 1921 there were in the United States 110 establishments engaged primarily in the manufacture of straw hats, as compared with 143 such establishments in 1919, and 132 in 1914. The value of the products in 1921 amounted to \$28,617,000; in 1919, \$32,187,000; and in 1914, \$25,444,000. These figures indicate a decrease of 11.1 per cent from 1919 to 1921, and an increase of 12.5 per cent from 1914 to 1921. Of the 110 establishments that reported products valued at \$5,000 and more in 1921, 52 are in New York; 13 in Massachusetts; 9 in Missouri; 8 in Pennsylvania; 7 in Maryland. The rest were more or less scattered among 10 other States. The average number of wage earners in the 110 establishments, in 1921, was 5,924; in 1919 (143 establishments) the average number was 7,302; and in 1914 (132 establishments) the average number was 9,483. The wages paid in 1921, totaled \$6,415,000; in 1919, \$6,605,000; and in 1914, \$5,253,000. The aggregate of materials used amounted in value to \$14,559,000, in 1921; \$16,910,000 in 1919; and \$14,086,000 in 1914.

STREET RAILWAYS. See subsection Electric Railways under RAILWAYS.

STRIKES AND LOCK-OUTS. Outstanding developments in the American labor world in 1922 were the successful fight of the coal miners to retain the 1920 wage scales, the unsuccessful struggle of the railroad shopmen and the partially victorious efforts of New England cotton mill hands against lower wages and longer hours. Of these great strikes, the most stubbornly contested was that of the coal miners who on 1 April quit work in both the anthracite and bituminous fields. This general strike was a contest to maintain old wage scales. The operators in the soft coal fields desired a return to the scale fixed in 1917 to which 26 per cent was added in the 1920 scale fixed by President Wilson's bituminous commission. In the hard coal fields, the operators matched a demand for a 20 per cent increase on the part of the union with a demand for a 22 per cent reduction. Both groups of operators emphasized competition as the reason for demanding reductions, while the United Mine Workers of America, through their chief spokesmen, President John L. Lewis and Vice-President Philip Murray, urged the cost of living, the hazards of industry and that, as large as the increases of 1920 might be over pre-war wage, the existing rates were justified because the pre-war figures had been unreasonably low.

When the coal strike began 550,000 union miners quit work, followed shortly by 90,000 men in the non-union fields of Pennsylvania and West Virginia. The ability of the union to disable the Connellsville coke field, for a generation non-union, and to take thousands of miners out of other equally strong non-union districts in Central Pennsylvania proved to be, it is believed, the determining factor in enabling the union to emerge victorious. At the time of the strike, 120,000,000 tons of coal were available. Late in

summer, however, when it was discovered that non-union production of coal was 63,000,000 tons less than the national consumption, the Administration intervened by calling conferences in Washington at which President Harding proposed an immediate resumption of mining and the submission of all disputed points to arbitration. This was declined by the United Mine Workers. A meeting of Central Competitive Field operators and union leaders held in Cleveland 7 August also failed when operators refused to renew the old scale. A second conference, embracing operators and miners from all fields, agreed on 15 August to renew the old scales to run to 31 March 1923 and to set up machinery for the making of a new agreement to be signed before that date. Securing this victory against a reduction in wages, President Lewis waived the demand for a six hour day and five day week.

Following the bituminous settlement, the union chiefs and anthracite operators, headed by Samuel D. Warriner, resumed peace parleys in Philadelphia, first meeting 17 August. After a fortnight's negotiations during which operators insisted upon arbitration of future disputes as a condition of renewing old scales, it was agreed on 4 September, to extend the old scale to 23 Aug. 1923 without conditions. In these negotiations Senator George Wharton Pepper and Secretary of Labor James I. Davis actively participated. A fact-finding commission, authorized by Congress and named by President Harding, was organized with John Hays Hammond, the noted metallurgical engineer, as chairman to investigate all phases of the coal industry, including the advisability of nationalizing the mines. Its findings, however, are not to be binding on either side to the controversy.

While no figures could be obtained as to the cost of the strike in the soft coal field, the estimated cost of the strike in the anthracite regions was \$250,000,000 of which \$125,738,400 represented loss in wages. The loss to the public in tons of anthracite approximated 35,000,000 or about 45 per cent of the annual supply. As this could not be made up for months, the Atlantic seaboard consumers, chief users of hard coal, were forced to rely upon a 50 per cent supply of anthracite, the balance being made up in bituminous and other substitutes.

The Railway Shopmen's Strike.—Begun three months after the coal miners quit work, the railway shopmen's strike was a factor in forcing a settlement of the coal strike, through impeding the flow of non-union coal from the South. Threatening since the spring of 1920, when the roads were released from Government control, the causes of the strike were officially stated as the reduction of wages averaging 12 per cent, effective 1 July 1922; changes in working conditions previously ordered by the United States Railroad Labor Board, and the practice of some roads (condemned by the Board) of leasing shop and other work to private contractors to place it beyond the jurisdiction of the Board, and thereby permit lower labor costs. Of these grievances, the "contracting out" and changes in rules were regarded as the most serious. Actually, the strike was the outcome of the old struggle of the unions to retain as much as possible of what they had gained during Govern-

ment control, and of the executives to restore, as nearly as possible, pre-war conditions.

The roads had attained, in this struggle, two general reductions in wages and also changes in the rules in the national agreements which lessened the earnings of the railway shopmen. The Railroad Labor Board also approved abrogation of national agreements conditional on agreements between executives and unions, but this was not made effective because the unions insisted upon writing the national agreements into all system contracts. Following these decisions by the Board and the refusal of the Pennsylvania Railroad Company to obey one of its rulings a strike vote was taken. Union leaders argued that the Board was unwilling or unable to protect their unions, citing the contracting out practice and the Pennsylvania case as proofs. Union leaders, a day before the strike, disregarded subpoenas from the Board ordering them to appear before it and show cause why they should not be ordered to refrain from interrupting traffic. The Board, following a demand upon the roads by the unions for the restoration of the second wage cut which was refused, declared the strike on 11 July to be not against the roads but against its orders and that men who took strikers' places were not to be considered strikebreakers.

The programme of the strike leaders failed in that the Brotherhood of Maintenance of Way Men declined to authorize a strike of the 400,000 men under its jurisdiction, as did the International Brotherhood of Signalmen with 16,000 men. The Brotherhood of Clerks and Freight Handlers struck only in spots. Nevertheless, the shops of practically every road in the country were crippled and the movement of trains was made difficult, but with reserve rolling stock, and the drafting of men from supervisory and other forces, the roads maintained fairly close schedules while rebuilding their forces. Only in the West and South was any considerable number of trains cancelled.

After a proposal from President Harding and an offer to make peace from the "Big Four" railroad brotherhoods not involved in the strike had failed, an agreement known as the Willard-Jewell plan was reached 25 September, between the unions and roads that had been unable to rebuild their forces to their entire satisfaction. This agreement provided that the men should return to work in positions of the class they originally held at the existing rates of pay, the unions abandoning the claim to seniority save "as between themselves" and the earlier position that any settlement would have to be on a national basis. All suits at law which were pending as a result of the strike were cancelled by both parties. The process of settlement with individual roads was still under way at the close of the year and echoes of the strike were still being heard throughout the country, though so far as any visible effect on transportation was concerned, the strike, ceased in late summer.

The cost of the strike to the railroads is estimated at \$150,000,000. The cost of the strike in wages is estimated by the Labor Board at \$177,535,524. Against this loss, union leaders balance the claim that by striking they checked further reductions in wages. Though militia

were employed at several strike centres, the strike was remarkably free from violence.

Despite this circumstance, Attorney-General Harry M. Daugherty applied to the United States District Court in Chicago on 1 September, when the struggle was practically over, for a blanket injunction restraining the strike leaders, their associates and members from further interfering with transportation and forbidding, among other things, picketing. In many respects it was the most sweeping order ever asked for in a labor dispute. Judge Wilkerson issued the order over the bitter protests of the unions; it remained in force pending review by higher courts.

Both sides claimed gains from the Willard-Jewell settlement at Baltimore. Those carriers which did not sign the agreement claim complete victory; those that did claim victory because the shopmen went back to work at the wages and under the working conditions fixed by the Board against which they had struck, and because the strikers apparently retreated from their position that they would make no settlement except on a national basis and gave up the position that they must be taken back with their seniority rights unimpaired. The shopmen replied that those roads which failed to sign the pact will be forced to do so through inability to maintain equipment and that on roads which have signed, contracting out has been discontinued and disputes on rules and wages are to be taken up for adjustment locally or regionally. One of the most far-reaching results of the strike was the obvious dissatisfaction, particularly on the part of railway labor, with the labor provisions of the Transportation Act; the unions have announced their intention of returning to the pre-war methods of direct negotiations with the railway managements and of withdrawing from the Labor Board cases now before it.

The Textile Strike.—The cotton textile strike which broke 23 Jan. 1922 in the Pawtuxet Valley, R. I., and spread to Massachusetts and New Hampshire in a very short time, was the worst strike Rhode Island ever experienced in its industrial history. The cost to that State alone is fixed in excess of \$23,000,000, plus invisible costs of several million more in lost production and lost business. Fifty thousand textile workers of a half-dozen nationalities were involved in this New England industrial struggle.

Early in January it was reported to the Rhode Island mill men that the workers would accept a 20 per cent cut in wages and an increase in hours from 48 to 54 per week. Eight thousand members of the Amalgamated Textile Workers' Union walked out in the Pawtuxet Valley immediately upon the posting of the notices of wage reductions. They were followed two weeks later by 6,000 members of the United Textile Workers in the Blackstone Valley. It was an open secret that the managements, owing to the condition of the market, were willing to close the mills for as long as four weeks with the feeling that at the end of that time the strikers would be ready to return to work. But the strike spread to the mills in Lowell and Fitchburg, Mass., and Manchester, Nashua and Dover, N. H. The last of the strikers to come out were 11,000 workers in Lawrence, Mass.,

where leaders of the One Big Union, a radical industrial organization, acted as virtual spokesmen for the strikers, though the United Textile Workers' Union, an American Federation of Labor organization, was numerically in control.

After eight months of struggle, during which there were a number of clashes between strikers and State police, the strike in Rhode Island came to an end. The wage cut was rescinded, but in the Blackstone Valley the 48-hour week was lost, the workers going back to a 54-hour week. A settlement was then reached in the Massachusetts textile centres on the same wage basis; the 48-hour week fixed by the Massachusetts State Legislature prevented any controversy over the question of hours. The last mills to settle were the Amoskeag Mills at Manchester, employing 25,000 men. Here the 54-hour week is in force.

For the year 1922, approximately 3,000 strikes are recorded, involving 3,000,000 persons. This is an increase of 832 strikes over the previous year, affecting 1,000,000 more workers. During the six years ending 1922, there were 2,700 strikes in the building trades; 2,600 in the metal trades; 2,000 in the clothing industry; 1,400 in mining; 1,250 in the textile industry and 1,200 in steam and electric transportation.

Violence marked a number of industrial conflicts during the year, but no episode evoked as much national feeling as did the murders at Herrin, Ill., 22 June. As a result of the death of 24 non-union miners and mine guards and the wounding of many others, a special grand jury returned 214 indictments against 74 men: for murder, 44; for conspiracy to murder, 58; for rioting, 58, and for assault with intent to murder, 54. The trial began on 13 November. It took one month and the examination of 220 talesmen to obtain a jury. The opening speeches were made 13 December and the trial was in progress when the new year was ushered in. The miners' union raised a fund for the defense. Of the 74 men under indictment, 55 were at once arrested and admitted to bail, furnished in a blanket bail bond by prominent citizens of the locality in the State where the deaths occurred. The first of these trials resulted in acquittal. On 6 April 1923 six more of the union miners who were charged with murder were acquitted and on 7 April all of the untried indictments growing out of the Herrin mine massacre were *nolle prosequi*.

STUDENT FRIENDSHIP FUND. This fund is the American section of the European Student Relief. The latter organization grew out of the need of Austrian students after the war. Relief was first given in 1920 to students in Vienna and operations there were continued and enlarged in co-operation with the Society of Friends. During the summer of 1920 students in Poland, Germany and Czechoslovakia were being helped by the Friends and the Young Men's Christian Association. In August of that year a conference was held in Beatenberg and a decision was made that the World Student Christian Federation should inaugurate a student relief program for the needy students of the Baltic States, Poland, Germany, Czechoslovakia, Austria, Hungary, Asia Minor, and the foreign students in Switzerland and France; and that all the Student Christian Movements affiliated with

the Federation should co-operate by contributing funds, supplies and workers. Campaigns in most of the countries were immediately undertaken and the response of the students of the more fortunate lands to the appeal for their struggling brothers was immediate.

In the United States the campaign to raise funds began in the fall of 1920 under the name of Student Friendship Fund which was fostered and organized by the Young Women's Christian Association, Young Men's Christian Association and Student Volunteer Movement. It was felt that these contributions should represent real friendships and the appeal was based on this spirit. The call for help from the students abroad reached all the students of colleges and universities in the United States whether they actually belonged to a Christian organization or not, although in most cases it has been the members of the Christian Associations who have been the first to see the value of saving the students of these European countries.

The Student Friendship Fund's third campaign for funds was under way in January 1923. The funds from the first campaign, about \$300,000 went through the American Relief Administration and were administered by it for students in the Baltic States, Austria, Czechoslovakia, Hungary and Poland. The second drive brought in from 767 schools, colleges and a few outside sources \$360,000. No figures relative to the third campaign were available 20 Jan. 1923.

There were 41 countries which were associated with the Student Friendship Fund in contributing in 1922 to the support of the European Student Relief program and 12 countries which received aid. The organization has been endorsed by Secretary Hoover, of the Department of Commerce, Frank A. Vanderlip, Col. W. H. Haskell, Lord Robert Cecil, and the National Information Bureau. John R. Mott, is chairman, Helen Ogden, executive secretary. National headquarters is at 347 Madison Avenue, New York City.

STURZO, Luigi, Italian clergyman and political leader: b. Caltagirone, Sicily, 1871. After a preliminary education in the seminaries of his native Sicily, he entered the Gregorian University at Rome, from which he was graduated with the degree of D.D. in 1898. While still a student he engaged in politico-social work, serving on diocesan committees, parochial clubs, savings and loan associations, co-operative societies, all of which later became the framework of the Christian Democratic Party, the purpose and aim of which were the same as the Popular Party which succeeded it. For many years Don Luigi, as he is called in Sicily, served as mayor of Caltagirone doubling its bank balance, building community houses for workmen, and constructing an electric light and power plant. He founded a technical and zoological institute, a school of ceramics, and doubled the number of primary schools. During the same period he taught philosophy, literature and canon law in the local seminary, studied administrative law and was made vice-president of the Association of Italian Communes. In 1905 he withdrew from the political arena for a time but under the sur-

face he was planning a union of the Christian forces whose purpose should be "to reanimate and perpetuate the magisterial thought and accomplishment of the days when the fortunes of the Church were in full flood, and to band together all those who have in common the Latin and Christian mind of Rome, and who share the sense of exaltation of having lived with the same profundity of faith, with the same ideal, seeking the same goal."

On 13 Jan. 1919, he sent out his famous appeal which resulted in the formation of the Popular Party. It made a triumphant entry into Parliament in the first election held after the war. Don Luigi became the director of this party. He nurtured it and directed it with the imperiousness of an experienced master. For a time it had over 100 members in Parliament. Don Luigi's aim may be gathered from his reply to the question asked by an American journalist of what he would do for Italy if he were all-powerful: "Make her again the cultural light of the world; decentralize governmental administration; eviscerate bureaucracy; give the people education and teach them to understand organic liberty." In Mussolini's first cabinet the Popular Party had four members. In April 1923, Don Luigi and his party drew aloof from the Fascisti and Mussolini asked for the resignation of the four cabinet officers of the party.

STYRIA, a division of the Republic of Austria, formerly a Crownland of the Austrian-Hungarian Monarchy. Its area is 6,327 square miles with a population of 953,684. Pre-war Styria had an area of 8,665 square miles. See AUSTRIA.

SUBMARINES. See UNITED STATES NAVY; WASHINGTON CONFERENCE.

SUDAN, Anglo-Egyptian, an African territory extending southward from the frontiers of Egypt and the Belgian Congo for 1,650 miles and from the Red Sea inland to Wadai in Central Africa. The Territory is under British authority. It has an area of 1,014,400 square miles. The population is estimated at 3,400,000. Khartum, the capital, has a population of 23,083. Omdurman, the old Dervish capital has 50,429. According to the budget estimates for 1921 the revenues and expenditures balanced at £E4,026,000. The Egyptian pound (par value, \$4.9431) equals 100 Egyptian piasters. The Sudan is the principal source of the world's supply of gum arabic and ivory. An increasing acreage is being planted to Egyptian cotton and the quality of the yield is equal to that of Egypt. Other products are sesame, ground nuts, dates, hides and skins, senna leaves and dura, a variety of millet. Cattle raising is increasing under the fostering care of the Government. The region is rich in forests which include ebony, gum acacia, bamboo, and the rubber creeper. Gold is also found but only a single mine is being exploited. In 1922, imports were valued at £E4,252,890 and exports at £E1,993,436. Exports of gum hashab in 1922 totaled 13,012 tons valued at £E490,173 and exports of ivory, 57 tons valued at £E63,308. The Sudan has a total length of railways of about 1,500 miles, of which the chief line is that from Wadi Halfa to Khartum, which was originally

built for military purposes. A branch was subsequently constructed to the Red Sea port of Port Sudan. The gauge is 3 feet 6 inches. There are over 2,500 miles of waterways on the Nile and its tributaries between Assuan and Rejaf, on which Government steamers maintain regular schedules. There are 4,650 miles of telegraph line and 81 post and telegraph offices and 11 traveling post offices.

The Sudan is administered under the terms of a convention between Egypt and Great Britain. The Governor-General is appointed by Egypt with the assent of Great Britain. The flags of both countries are used jointly and laws are made by proclamation. There are 15 Provinces, the governors of which are British officers of the Egyptian army or British civil officials of the Government. Under present policy an increasing number of natives are being employed in administrative posts. The Governor-General is assisted by a Council in his executive and legislative functions.

The Governor-General and Sirdar in 1922 was Major-General Sir L. O. F. Stack; Legal Secretary, Wasey Sterry and Financial Secretary, Sir E. E. Bernard.

SUGAR. Production.—Estimates of the sugar crop of the world by Willett & Gray of New York City indicate production for the 1922-23 season amounting to 18,046,396 tons, compared with 17,650,662 tons in the season of 1921-22, an increase of 395,734 tons. The Cuban crop is estimated at 4,000,000 tons, or slightly over the 3,996,387 tons produced in 1921-22. Pre-war world production was about 18,697,331 tons and pre-war Cuban production, 2,597,732 tons.

The beet-sugar crop of the United States is placed at 625,000 tons, compared with 911,190 tons for the season of 1921-22; and the European beet-sugar crop at 4,710,500 tons, compared with 4,066,042 tons in 1921-22. European pre-war beet-sugar production was in excess of 8,000,000 tons.

At the beginning of 1923, Cuba, it was said, had on hand, only 8,500 tons of old-crop sugar in contrast with the 1,200,000-ton carryover that was causing grave anxiety a year before. This meant says an analysis by the Foodstuffs Division of the Department of Commerce, that with its record crop of 4,000,000 tons, Cuba disposed of 5,200,000 tons of sugar in 1922. The distribution was effected through the exportation of over 4,000,000 tons to the United States, some 850,000 tons of which (in terms of raw sugar) went to Europe after refining, and the shipment of another 850,000 tons to Europe direct. Thus Europe was supplied with 1,700,000 tons toward her deficit of 2,300,000 tons, most of the remainder coming from Java. The 3,000,000 tons of Cuban sugar that remained in the United States, combined with the production of the United States and its possessions, was just about sufficient to supply the record United States consumption of nearly 5,500,000 tons (raw sugar).

The following table from the *Weekly Statistical Sugar Trade Journal* (Willett & Gray) gives the latest estimates of the sugar crops of the world:

Countries	1922-23 Tons.	1921-22 Tons.
United States:		
Louisiana.....	215,000	289,669
Texas.....	2,875	2,920

Total beet sugar crops.....	5,370,500	4,985,164
Grand total—cane and beet sugar.....	18,046,396	17,650,662
Estimated increase in the world's production.....	395,734	883,351

Cuba's ability in 1922 to distribute both a record crop and a record carryover was thus due in the main to a record consumption in the United States and to a European crop that

fell far short of the consumption needs of that Continent. The year 1923 started with another 4,000,000-ton Cuban crop in sight, a big crop in Java, and a greatly increased production in Europe. But various decreases elsewhere, notably in the United States, brought the world production only 125,000 tons higher than it was in 1922, to supply consumption needs estimated at 350,000 tons more than in 1922.

The following table shows the situation in sugar. Figures are in long tons and in terms of raw sugar:

COMPARATIVE WORLD SUPPLIES AND CONSUMPTION. (Dept. of Commerce Estimates.)

PERIODS	Estimated production Tons	Estimated consumption Tons	Final carry over, end of year Tons
Pre-war.....	17,500,000	17,500,000	750,000
1920-21.....	16,682,000	16,198,000	1,700,000
1921-22.....	18,183,000	18,680,000	1,203,000
1922-23.....	18,308,000	19,035,000	476,000

Consumption figures for 1923 are necessarily rough estimates and the figures given are made somewhat conservative to allow for increases over last year in visible and invisible stocks and for unfavorable economic conditions in some countries. Thus the increase in world consumption in 1922 over 1921 was more than 16 per cent; the estimated increase in 1923 over 1922 is only 2 per cent.

The following table shows the pre-war and 1922 sugar consumption of the principal countries of the world, with estimates for 1923. Figures are in long tons of raw sugar.

PRE-WAR, 1922, AND 1923 CONSUMPTION OF IMPORTANT SUGAR-CONSUMING COUNTRIES, IN LONG TONS OF RAW SUGAR.

COUNTRIES	Pre-war average, 1912-1914 Tons	1922 Tons	1923 estimates Tons

Total.....	17,500,000	18,680,000	19,035,000

European consumption of sugar in the pre-war years averaged about the same as its production. Both declined and after the war period both have greatly increased from 1920-21 to the present time. But while the consumption did not decline so sharply as the production, it recovered to an even greater extent in 1921 and

1922 and reached the pre-war total (exclusive of Russia).

From the data now available it looks as if 1923 would see a decrease in Europe's import needs amounting to 350,000 to 400,000 tons; but the United States supplies will have to be supplemented by about the same amount in order to make up for the decrease in the domestic beet and cane crops.

The consumption figure for the United States in 1922 broke all previous records of the kind. It showed the tremendous increase over the year 1921 of 985,430 tons, which is a per capita consumption of 103.18 lbs., as compared with 84.47 lbs. per capita in 1921. Sugar market quotations increased from 3.540 and 4.704 for 96' centrifugals and granulated respectively on 11 Jan. 1922 to 5.400c and 6.762c on 11 Jan. 1923. On 17 March 1923 these quotations had risen to 7.41 for the centrifugals and 9.30 for fine granulated.

Early in 1923, speculators misinterpreted a statement of the Department of Commerce relative to the sugar situation, and the market became panicky with the result that prices of sugar went soaring, refined being quoted at 10¼ cents wholesale (11¼ in Canada), on 24 April 1923. Secretary Hoover, on 23 March, had announced that his Department had been investigating the sugar situation and found no justification for the current high prices. On 25 March, he wrote Representative Dallinger that there was no sugar shortage, but there would be a surplus of 476,000 tons at the close of 1923. The Government applied for an injunction against the New York Coffee and Sugar Exchange and others to prohibit dealing in futures. The application was denied by the lower court and notice of appeal was given.

SUGAR CANE MOSAIC. See PLANT INDUSTRY, BUREAU OF.

SUICIDES. According to a report issued by Dr. Harry M. Warren, president of the Save-a-Life League, 12,000 persons committed suicide in the United States in 1922. Seventy-nine were millionaires. One-third of the total were women. The oldest was a great-great-grandmother, aged 100 years; the youngest a child of five. In New York City 839 persons killed themselves. Some parts of the country reported waves of suicides and one girls' suicide club was discovered. Among those who committed suicide were 38 college students, 50 college professors and school teachers, 19 preachers and religious workers, 52 judges and lawyers, 84 physicians, 100 presidents and heads of large business concerns, and a number of bank presidents. In many cases the causes assigned were trivial. One girl killed herself after having her hair bobbed; a man because he was forced to quit playing golf; a woman because she missed two trains; a young man "for the fun of it"; a girl "just to get a thrill." Doctor Warren stated that the suicide of children is a serious problem. In 1919 child suicides reported numbered 477; in 1920, 707; in 1921, 858; in 1922 over 900, or nearly 3,000 in four years. The average age of boy suicides, according to Doctor Warren, is 16; girls, 15. Most of the girls use poison; the boys, guns.

SULGRAVE INSTITUTION, The. An organization formed in England in 1913 to unite the English-speaking peoples of the world. It takes its name from Sulgrave Manor, the home of George Washington's ancestors in Northamptonshire, England, which Manor, including the house, outbuildings and ten acres of land was purchased in 1913 by a body of English people who turned the estate over to a board of trustees "to be forever maintained as a place of pilgrimage for all who venerate that Colonial Englishman who became the Father of the American Republic." The Manor House was formally dedicated on 21 June 1921, the principal address being made by the Marquis of Cambridge, brother of Queen Mary, in the presence of a distinguished gathering of English and Americans.

On this occasion a letter was read from Mrs. Victoria Woodhull Martin, a pioneer in advocating friendship between America and Great Britain announcing her intention to deed to the Sulgrave Institution the Bredon's Norton Manor House and adjacent property as a centre of work for the Sulgrave movement. Mrs. Martin and Miss Woodhull, her daughter, also announced that it is their intention to cause the whole of the Bredon's Norton property to fall to the Sulgrave Institution. This property consists of more than two square miles of beautifully situated land in Worcestershire, 35 miles distant from both Sulgrave Manor and Stratford-on-Avon. Shakespeare's river meanders through the property and on the crest of Bredon's Hill, Boadicea, the British Queen, built a camp from which she withstood for several years the onslaughts of the Romans. The remains of this camp, as well as the Roman camp which succeeded it, are still to be seen. There are three Manor Houses on the property, their respective dates being the Thirteenth Century, the Fifteenth Century and the Eighteenth Century. In the two Manor Houses transferred to Sulgrave there are accommodations for about 40 persons, exclusive of the serving-staff. The interior of a tithe-barn adjoining the Manor has been transformed by Mrs. Martin into an auditorium accommodating 250 persons. It is the intention of the Sulgrave Institution to use Bredon's as a working-centre of the Society and as a place for conferences.

Branches were immediately organized for the definite work of furthering friendship between the English-speaking peoples. The work of restoring Sulgrave Manor was also undertaken. The house has already become a museum for valuable relics and documents associated with the Washington family. Furniture and other gifts have been received from both England and America.

The American branch of the Institution is incorporated under the laws of the State of New York.

The purposes of the Institution are: (1) "To foster friendship among English-speaking peoples; (2) To inform our mutual peoples in the arts and practices of peaceful intercourse for the benefit of our respective nations and as a help and an example to all mankind; (3) To bring together into a closer community of

interest those societies, associations, and general organizations, together with all individuals, that are engaged in any work which tends towards the understanding of the Anglo-Saxon-Celtic point of view, culture, laws and related institutions; and (4) to aid in upholding and maintaining the fundamental institutions of the English-speaking world and in fostering the ideals which inspired that creation." The work already achieved includes the rehabilitation and furnishing of Sulgrave Manor; the foundation of a lectureship on American History and Institutions under endowment of \$100,000 given by Sir George Watson (this lectureship was inaugurated by the late Viscount Bryce at the Mansion House, London on 30 June 1921, and was given in 1922 by Dr. Arthur T. Hadley of Yale University); holding of annual service commemorative of Washington's birthday in St. Paul's Chapel, New York, where Washington attended during his residence in New York; and the establishment of scholarships at the State School of Agriculture, Morrisville, New York, through gift from the Lafayette Fund, John Moffat, chairman.

Among the gifts sent to England from America were: replica of St. Gauden's statue of Abraham Lincoln, by Nicholas Murray Butler, Elihu Root, Henry White and others, unveiled opposite Westminster Abbey, London, July 1920; gift of Mr. and Mrs. Charles Phelps Taft of a replica of Barnard's statue of Lincoln to the city of Manchester; gifts of busts of George Washington to St. Paul's Cathedral and the Town Hall, Liverpool; and Lincoln Gettysburg Memorial Tablets to Hingham and Birmingham, from the Hingham Memorial Association.

England's gifts to America were a painting of Sulgrave Manor, by Stephen Reid, to the President and Mrs. Harding; A. Forestier's famous painting "The Signing of the Treaty of Ghent"; Reid Dick's bust of William Pitt, to the people of Pittsburg (Sir Charles Wakefield's donation); statue of Edmund Burke to the city of Washington; and bust of James Bryce to Trinity Church, New York. The last three memorials were brought to the United States and unveiled by a delegation from the Sulgrave Institution headed by Sir Charles Wakefield in September-October, 1922. The delegation visited Mont Vernon and placed on the tomb of Washington a wreath of ivy-leaves and flowers from the grounds of Sulgrave Manor.

A moving picture (entitled "The Cradle of the Washingtons") produced under the auspices of the Sulgrave Institution, had its first public presentation in November 1922, at the Museum of Natural History, New York, (with a lecture by Arthur Branscombe) and is in the hands of the National Non-Theatrical Motion Pictures.

In the coming year a bust of the late Joseph H. Choate by J. Massey Rhind of New York, a good-will offering from the Sulgrave Institution of the United States, to the Benchers of the Middle Temple, London, will be unveiled in the Middle Temple, London, of which great legal body Mr. Choate was a distinguished member.

SUNDAY-SCHOOL UNION, American.

An organization formed in 1824, for the purpose of establishing and equipping "a Sunday school in every community where there are no churches or religious services, and for publishing and circulating moral and religious literature of a Scriptural character and upon a Scriptural basis." It also promotes co-operation among Christians and Evangelistic workers in rural communities. It is an outgrowth of the First-Day Society, founded in 1791, which led to the establishment of the Philadelphia Sunday and Adult School Union in 1817, the latter organization with similar societies of other States being merged into the present National body in 1824. During the year which ended 28 Feb. 1922, the American Sunday-School Union commissioned 229 missionaries, organized 1,443 new Sunday-schools and reorganized 568. These schools have 6,696 teachers and 63,894 scholars. In addition to their pioneer work, the missionaries visited 11,603 schools consisting of 51,314 teachers and 618,881 scholars. Sermons and addresses delivered numbered 22,056. Bibles delivered numbered 6,335, while 8,706 copies of the New Testament and 9,024 copies of the Gospel of John also were distributed. The total number of books, booklets, maps, charts and other Sunday-school requisites issued was 156,435. The combined circulation of 11 different Sunday-school periodicals was 1,938,420. During the past year, 49 churches of various denominations grew out of the Union Sunday schools. Two hundred and seventy-five young people's societies, and 341 prayer meetings were established, while 335 regular preaching stations were opened. Conversions reported numbered 7,270. The organization has its headquarters at 1816 Chestnut St., Philadelphia, Pa.

SUNFLOWER SEED. A production in 1922 of approximately 8,000,000 pounds of sunflower seed (used extensively as a poultry food) was estimated by the Department of Agriculture for the three large producing sections of Missouri, Illinois and California. This is about twice the production of 1921. The increase was due primarily to increased acreage and a larger yield per acre in Southeast Missouri which produced approximately 6,000,000 pounds against 3,000,000 pounds the previous year. California produced about 700,000 pounds and Illinois around 1,000,000 pounds. Prices ranged from \$3 to \$6 per hundred pounds. Importations of sunflower seed at New York during 1922 totaled 3,700,000 pounds between 1 January and 21 October. Most of the imported stock came from Argentina.

SURINAM. See **DUTCH GUIANA.**

SUSQUEHANNA UNIVERSITY, a Lutheran co-educational institution, founded in 1858 and located at Selinsgrove, Pa. In 1922-23 it had a faculty of 29 members, 340 students, property valued at \$350,000 and an income of \$80,000. Charles T. Aikens, D.D., is president.

SUTHERLAND, George, American jurist: b. Buckinghamshire, England, 25 March 1862. While he was still in his infancy his parents brought him to the United States and settled in Utah. There he received his rudimentary education in common schools and academies. He studied law at the University of Michigan. 1882-83, and in the latter year was admitted to practice in the Michigan Supreme Court. From that time on, he practiced law continuously; from 1893 to 1922 he practiced in Salt Lake City, Utah. He received the degree of LL.D., from Columbia University in 1913, from the University of Michigan in 1917, and from George Washington University in 1921. He was State senator from the sixth senatorial district in the first Utah Senate (1896); delegate to the Republican national conventions of 1900, 1904, 1908, 1912 and 1916; member of the 57th Congress (1901-03); declined renomination to the 58th Congress; was United States Senator from Utah for two terms (1905-17). Because of the rare reputation he had acquired as an authority on constitutional law, in 1918 he was invited by Columbia University to lecture on the Constitution, in a series of eight lectures, which were later published under the title 'Constitutional Power and World Affairs.' This book is generally considered by lawyers one of the great works on the Constitution. In 1916-17 he was president of the American Bar Association. On 5 Sept. 1922 he was nominated by President Harding as Associate Justice of the Supreme Court of the United States, to fill the vacancy caused by the resignation of former Associate Justice John H. Clarke, of Ohio. His appointment was at once confirmed by the United States Senate, and he was inducted into office 2 Oct. 1922. In the Senate he was considered one of the great orators, primarily because of the power and clarity of his arguments. He has won an enviable reputation as an advocate of the fundamental integrity of the Constitution, and as an opponent of "every attempt, however insidious or indirect, to destroy personal liberty in the name of order, or order in the name of liberty," and as an ardent exponent of comparatively few but intelligently framed laws, together with strict adherence to them by the people, and rigid enforcement of them by the judiciary.

SWARTHMORE COLLEGE, a non-sectarian co-educational institution, founded in 1864 and located at Swarthmore, Pa. In 1922-23 it had a faculty of 53 members, 516 students, and property valued at \$2,070,945.91 including land, buildings and equipment. Its income for 1921-22 was \$318,849.24. Frank Aydelotte, A.M., is president.

SWAZILAND, a British Protectorate in South Africa, located to the southeast of the Transvaal and north of Zululand. Its area is 6,678 square miles and in 1921 the population included 111,106 natives of Zulu type, seven Asiatics, 456 colored persons, and 2,200 Europeans, a total of 133,563. The seat of the government is at Mbabane. Agricultural products of the region include tobacco, Indian corn, beans, ground nuts, pumpkins, millet, and sweet potatoes. Cotton growing is being introduced and stock raising is thriving. Sheep are

brought from the Transvaal every year for winter grazing. There are 230,000 head of cattle. The region is reported rich in minerals but development has proceeded only with tin. There are four gold mines. Revenue for 1921 amounted to £88,372 and expenditure to £111,139. There are no separate returns for the external trade of Swaziland. The export trade consists mostly of tin. The Resident Commissioner in 1922 was D. Honey.

SWEDEN, a kingdom of northwestern Europe, occupying with Norway the Peninsula of Scandinavia. It has an area of 173,035 square miles and a population of 5,903,762 on 31 Dec. 1920. The population is entirely Swedish, with the exception of 25,290 Finns and 7,138 Lapps and about 20,000 other foreigners of more or less temporary residence. The movement of the population was as follows in 1920: births, 138,505; marriages, 42,829; deaths, 78,112, leaving a surplus of births over deaths of 60,393. In 1920, there were 10,841 immigrants to Sweden and 10,242 emigrants departed therefrom, of whom 6,691 came to the United States. The urban population is on the increase, having grown from 1,103,951 in 1900 to 1,744,797 in 1921 or about 30 per cent of the entire population. The chief cities of the kingdom, with their populations, are the following: Stockholm, the capital, 419,429; Goteborg, 202,366; Malmo, 113,558; Norrkoping, 58,101; Halsingborg, 47,074; Gavle, 37,746; Orebro, 36,033; Vasteras, 30,633; Eskilstuna, 30,253; Jonkoping, 29,284; Upsala, 28,897; Boras, 28,233; Karlskrona, 27,055; Linkoping, 26,920; Lund, 23,211; Landskrona, 20,173; and Karlstad, 19,246.

Religion.—The Lutheran Protestant Church is the state church, which has 5,497,689 adherents. This church has 12 bishoprics with Upsala as the metropolitan see. Other creeds are the Roman Catholic with 3,070 adherents; and 14,715 Protestant Dissenters, Baptists and Methodists; 6,112 Jews and the remainder of no stated faith.

Education.—Primary education is free and compulsory between the ages of 7 and 14 years. In the primary schools of the kingdom there are 24,833 teachers and 708,821 pupils. There are 77 public secondary schools with 28,562 students; 15 normal schools with 2,695 pupils; 51 people's high schools with 2,944 pupils; two high and seven elementary technical schools with 4,000 students; five navigation schools with 378 students; and a number of special schools, agriculture, veterinary science, for deaf mutes, the blind, etc. For higher education there are the universities of Upsala and Lund with 2,493 and 1,423 students respectively. In addition there are private universities at the capital and at Goteborg and a state faculty of medicine at the capital.

Finance.—In the fiscal year 1922 the revenue of the government amounted to \$253,796,990 and the expenditure to \$258,576,989. The total public indebtedness of the kingdom 1 March 1923 amounted to 1,566,000,000 kronor (kronor at par equals 26.8 cents; about 24 cents in 1922).

As a result of the rearrangement of the Swedish fiscal year to include the months between 1 July and 30 June, instead of the

calendar year, it is impossible to compare the budget presented for the first six months of 1923 with the preceding budget, which included 12 months. The 1923 budget provided for revenues of 336,900,000 crowns (1 crown = \$0.2680) and expenditures of 372,300,000 crowns, or a deficit of 35,400,000 crowns, to be made up by loans. At the same time an additional budget of 300,000,000 crowns was voted for 1922.

If it be assumed that the last half of the year will cost the same amount as the first six months, the budget for 1923 will total 744,000,000 crowns. If an average "additional" budget of 300,000,000 crowns be added, the total for 1923 exceeds 1,000,000,000 crowns.

Production.—The population is about equally divided between those engaged in agriculture and those who pursue commerce and industry. There are 428,026 farms in the country, of which 119,899 are of two hectares or under in extent (hectare equals 2½ acres approximate), 270,625 are from two to 20 hectares; 34,926 from 20 to 100 hectares and 2,576 above 100 hectares. The acreage and yield of the chief crops for the year 1921 follow:

Crop	Hectares	Yield (tons)
Wheat.....	145,645	342,293
Rye.....	369,607	706,445
Barley.....	161,974	268,361
Oats.....	711,045	1,111,828
Mixed corn.....	263,235	493,889
The legumes.....	44,747	67,417
Potatoes.....	147,582	1,864,974
Sugar beets and fodder roots.....	136,752	4,402,773
Hay.....	1,354,877	4,268,166

The value of the entire crop of 1920 was estimated at 2,016,000,000 kronor and that of 1921 at 1,384,000,000 kronor. The latest livestock census showed 2,550,828 head of cattle, 1,563,654 sheep, 716,783 hogs and 715,681 horses.

Iron mining is one of the oldest and most important of Swedish industries. Lack of coal has retarded this industry somewhat in recent years but the advent of electric smelting has again raised it to a first place. In 1920, Sweden produced 4,519,112 tons of iron ore; in 1921, 308,600 tons of pig-iron were produced and 230,900 tons of ingot iron. In 1920 there were produced 2,901 tons of lead and silver ores; 1,136 tons of copper ore; 47,674 tons of zinc ore; 14,926 tons of manganese ore and 107,326 tons of sulphur pyrites; and 439,584 tons of coal. The mining industries in that year gave employment to 44,401 persons, of whom nearly 4,000 were under 18 years of age. The chief manufacturing industries with the number of establishments, working operatives and value of output are as follows: Mechanical workshops, 859 establishments, with 51,532 operatives producing goods to the value of 545,138,152 kronor; 115 bar iron and steel works, with 22,348 hands producing 339,972,937 kronor; 924 flour and grain mills with 3,245 hands, value of output, 280,780,668 kronor; 413 chemical works with 16,079 hands producing goods valued at 272,848,627 kronor; 69 cotton-spinning and weaving works with 11,640 hands producing goods valued at 179,361,281 kronor; 400 iron and steel goods works with 15,500 hands, producing goods to the value of 174,959,519 kronor; 19 tobacco

factories with 5,645 hands, products valued at 157,778,181 kronor; 113 wool-spinning and weaving works with 9,342 hands, products valued at 138,325,742 kronor; 103 shoe factories with 6,966 hands, products valued at 117,244,668 kronor; and 26 sugar works with 7,817 hands and products valued at 114,926,942 kronor.

Commerce.—In 1921 Swedish imports were valued at 1,266,237,485 kronor and exports at 1,097,273,992 kronor. In the first nine months of 1922 imports were valued at \$220,966,270 as compared with \$256,895,763 for the same period in 1921. Exports for the same period were valued at \$209,842,877 as compared with \$210,943,035 in the first nine months of 1921. The bulk of the foreign commerce is with Great Britain, Germany, Denmark and the United States.

Communications.—The merchant marine of Sweden, on 1 Feb. 1923, consisted of 2,901 vessels of 1,253,000 tons. Sweden has 9,420 miles of railways, of which 3,459 miles are the property of the state; 49,080 miles of telegraph lines served by 3,434 telegraph offices; and 389,830 telephone instruments with a total of 410,000 miles of wire. The profits of the State railways in 1922 came to 24,000,000 crowns.

Defense.—There is universal military service coupled with voluntary enlistment. The peace strength of the land forces consists of 2,660 officers, 1,987 non-commissioned officers, 14,378 men voluntarily enlisted and 72,700 conscripts. The total number on roll is about 655,000 men. The navy is merely for the purpose of coastal defense. It consists of 13 light-armored cruisers, 10 destroyers, four old torpedo boats, 27 modern torpedo boats, and 14 submarines. The naval personnel is about 5,000 officers and men.

Government.—The King, who must be a member of the Lutheran Church, enjoys the executive power, which is exercised through the Council of State, and also a measure of legislative power in conjunction with the bicameral Diet or Parliament. The First Chamber of the latter has 150 members, elected for terms of eight years by the members of the Landstings or provincial representations and certain qualified electors of six cities. The Second Chamber has 230 members elected for four years by universal suffrage. The Council of State or Ministry is headed by the Minister of State. In 1922, the Minister of State was Hjalmar Branting. The reigning sovereign was Gustaf V, who succeeded on the death of his father, 8 Dec. 1907.

History.—The bankers of the country and the financial experts succeeded in stabilizing the currency at the beginning of the year. The result of their efforts was that the Swedish money was placed almost on a par with the American dollar and hopes were raised of an early business revival in all Scandinavian countries. Trade negotiations with Soviet Russia were initiated but proceeded slowly. The Swedish Communist Party sent a delegation to Moscow and there reported that the prospects for a revolution in Sweden were slight and on their return the party decided to support the Socialist administration of Branting. When the result of the Washington Conference on the Limitation of Armament was announced, Sweden acquiesced in

the main features but stated officially that she "could not accept the banning of the submarine, which is the most efficient weapon of defense for small nations." The Government extended the period of suspension of gold payments to 31 March. In the capital there were established schools for the unemployed at which a free meal was served daily to each jobless pupil. Professors, engineers and others donated their services as lecturers. On 25 February a trade agreement was made with Soviet Russia. It followed the lines of the agreements between Russia and England and between Russia and Italy. It did not touch on the question of compensation for damages to Swedish parties nor with the recognition of the Soviet Government. Navigation along the east coast of Sweden was practically at a standstill during the winter which was the most severe that northern Europe had experienced in a quarter of a century. By the middle of February, Gotheborg was shut in by ice and the navigation of the Cattegat and the Sound was well nigh impossible. On 18 March there convened at Stockholm the representatives of those countries that had been neutral during the Great War to discuss a common policy for the neutrals at the forthcoming Genoa Conference. The Swedish-Soviet agreement encountered considerable opposition in the Riksdag because of its failure to settle the question of compensation pending between the two nations. As a result of this opposition the Parliamentary Commission on 31 March advised against the conclusion of a treaty of commerce with Soviet Russia. On 8 April the Riksdag repealed the sliding tariff on imported grain and re-established the old system of fixed tariffs. Measures were taken by the government against the dumping of foreign goods on the Swedish market. Industrial and commercial recovery were greatly hastened by the termination, on 19 May, of the lumber mill lock-out. The dispute was composed by agreement of both parties to a 33 per cent wage reduction below the agreement of 1921.

Diplomatic methods failed to settle the two shipping questions between Sweden and the United States and Sweden appeared to seek the consent of the Washington administration to submit both questions to the Hague World Court. One question concerned vessels of the United States Shipping Board; America claiming that since these vessels are government-owned they are entitled in Swedish waters to the same extra-territoriality as vessels of war, while Sweden holds that they are entitled to privileges no greater than those ordinarily conceded to non-Swedish merchantmen. The second question was the Swedish claim for indemnity for the Swedish vessels building in the United States and requisitioned by the American government as a war measure. In August there developed friction with Denmark over the visit to Flensburg of the Swedish war fleet. The Danish press accused Sweden of "selecting Flensburg for demonstrating Sweden's everlasting friendship and loyalty toward Germany." On 27 August a plebiscite was held on the prohibition of alcoholic liquors. The returns showed such a defeat for prohibition that the question is considered dead in Sweden for at least a generation. The

rationing of liquors by the Government won such popularity by its economic and moral success that the majorities in favor of continuing it were in many districts overwhelming. The Russian Soviet Government granted a concession for a private bank to a Swedish capitalist, the bank to be established in Moscow with a capital of 10,000,000 gold roubles and with the privileges of a state bank. Professor Gustav Cassel accepted the commission of adviser to the bank. The bank is to relieve the Soviet Government of all financial management and issuance of bank notes and to manage all banking accounts and business on a purely banking basis. From 5 November, Sweden prohibited radio operation on foreign vessels in Swedish waters within 10 miles of a coastal radio station, exceptions being made in cases of emergency. Foreign ships in Swedish harbors are forbidden to receive radio messages without permission from the Telegraph Directorate. In the elections to the Provincial Councils held in October the Liberal Party seats dropped from 291 to 192 while the Social Democrats rose from 322 to 346 and the Communists from 21 to 31. Several agricultural and economic associations petitioned the government to prohibit the importation of American wheat and rye but the petition was denied on 10 November. At the close of the year the Government party (the Social Democrats) under the leadership of Hjalmar Branting was in a stronger position than at the beginning due to the elections referred to above and to the firm policy of the Government in its foreign relations.

SWEDENBORGIANS. See CHURCH OF THE NEW JERUSALEM.

SWEET BRIAR COLLEGE, a non-sectarian educational institution for women, founded 1906 (chartered 1901), and located at Sweet Briar, Va. In 1922-23 it had a faculty of 33 members, 321 students, property which cost \$620,374; but is estimated now as being worth over \$1,000,000, and an income of \$191,511.24. Emilie W. McVea, A.M., Litt.D., LL.D., is president.

SWEET POTATOES. The Department of Agriculture estimated the 1922 sweet potato crop of the United States at 109,534,000 bushels, as compared with the 1921 crop of 98,654,000 bushels, and the 1920 crop of 103,925,000 bushels. The acreage for the three years was 1,116,000 in 1922, 1,066,000 in 1921 and 992,000 in 1920. Based on 1 December prices the farm value of the 1922 crop was estimated at \$84,492,000. Alabama led the States in production with a total yield of 13,490,000 bushels. Georgia produced 12,616,000 bushels; North Carolina, 12,430,000; Mississippi, 11,445,000; South Carolina, 9,568,000; Texas, 8,715,000; Louisiana, 7,820,000; Virginia, 6,210,000; Tennessee, 4,180,000; Arkansas, 3,760,000; New Jersey, 3,500,000; Florida, 2,720,000; Oklahoma, 2,052,000; Kentucky, 2,020,000; Delaware, 1,720,000; Maryland, 1,530,000; Missouri, 1,330,000; California, 880,000; and Illinois, 855,000. No other State produced as much as 500,000 bushels.

SWITZERLAND, a Federal Republic of Europe, bounded on the north by Baden, northeast by Bavaria and Wurtemberg, east by Lichtenstein and the Tyrol, south by Italy and west and northwest by France. The Republic has an area of 15,976 square miles with a population of 3,880,320 on 1 Dec. 1920. German is the language of 2,600,000; French of about 800,000; Italian of about 350,000 and the Romansch of about 45,000. There are about 400,000 foreigners in the Republic. In 1920, there were 83,623 births, 34,973 marriages and 58,427 deaths, leaving a surplus of births over deaths of 25,196. Illegitimate births were 4.2 per cent of the total in 1920. The chief cities are: Zurich (207,161); Basle (135,976); Geneva (135,059); Bern, the Federal capital (104,626); Saint Gallen (70,437); Lausanne (68,533); Winterthur (49,969); and Lucerne (44,029).

Religion.—While nominally there is full liberty of conscience, no bishoprics may be created on Swiss territory without the consent of the Federation, nor can the order of the Society of Jesus and its affiliated societies exercise any functions either clerical or scholastic in the Republic. The same prohibition may be extended to any other religious orders whose actions may be deemed dangerous to the state, nor may new convents or religious orders be founded. Protestants are a majority in 12 of the Cantons and Roman Catholics in 10. The latter number 41 per cent of the total population, and the former 57 per cent. Jews number 20,955. The Roman Catholics have five bishops immediately subject to the Holy See. The Protestant Church is Calvinistic in doctrine and Presbyterian in form and is under the supervision of the magistrates of the Cantons.

Education.—Education is not centralized but is left in great part to the communes. Primary education is free and compulsory. There are 4,222 schools with 16,753 teachers and 545,135 pupils; 516 secondary schools with 2,301 teachers and 49,692 students. In addition there are commercial and technical schools, schools for the teaching of domestic economy, schools of agriculture and horticulture, viticulture, and dairy management and special schools for the blind, deaf, etc. The total expenditures on primary education in 1920 was 2,377,529 francs. For higher education there are seven universities—with an aggregate student body of 6,649. These institutions are located at Basle, Bern, Zurich, Geneva, Lausanne, Fribourg and Neuchatel. There is a Polytechnic School at Zurich with 281 members of the faculty and 2,267 students. Switzerland has 5,798 libraries with 9,385,000 volumes.

Production.—About 28 per cent of the total area of the country is unproductive, while nearly 30 per cent of the remainder is under forest; 35 per cent under grass and pasture; 18 per cent under fruit and 16 per cent under crops and gardens. In 1921, wheat was planted on 111,275 acres and yielded 97,282 tons; rye was planted to 50,000 acres and yielded 39,599 tons; oats on 53,075 acres yielded 44,063 tons. Potatoes are also a staple crop. Cheese making and the manufacture of condensed milk are the chief industries

connected with agriculture. Wine is produced in five Cantons and tobacco in three Cantons. The last live stock census showed 1,382,116 head of cattle, 729,999 dairy cows, 240,553 sheep, 546,112 swine, 333,852 goats, 3,581 mules, 129,269 horses, and 891 donkeys. There are 2,105,214 acres under forest, which area may not be reduced. There are very strict regulations regarding the forests, the cutting of timber thereon, gathering of firewood, etc. Bee-keeping is increasing in importance, 29,377 persons being engaged at present in this industry. There are five salt-mining districts, the output from which was 591,558 quintals in 1919. There are 8,787 factories in the Republic, of which those connected with the watch and clock-making industries are the most important.

On 6 Dec. 1921, the Swiss Federal Council (Bundesrat) appropriated 5,000,000 francs as a temporary subsidy to aid Swiss watch manufacturers in competing in countries having depreciated currencies.

From December 1921, to July 1922, Switzerland exported 7,350,000 francs worth of watches and clocks to Germany, 2,480,000 francs to France, 1,775,000 francs to Belgium, 1,642,000 francs to Italy, 1,639,000 francs to Argentina, and 1,526,000 francs to Czechoslovakia. The filling of these orders would make possible the reinstatement of 2,399 unemployed workmen. Switzerland exported \$1,299,432 worth of watches, clocks, and parts to the United States during the last quarter of 1921, and \$1,391,000 worth during the first quarter of 1922.

About 381,000 persons are employed in the several manufacturing industries. Brewing and embroidery-making are also among the important industries.

Commerce.—The total import trade of Switzerland in 1922 (exclusive of minted precious metals) was valued at 1,914,465,119 francs, compared with 2,296,288,894 francs in 1921. Exports amounted to 1,761,576,533 and 2,140,141,442 francs, respectively, in the same years. The decrease in imports was 16.6 per cent, and in exports 17.7 per cent. Exports of watches and clocks in 1922 amounted to 168,535,985 francs compared with 157,958,605 francs in 1921.

Communications.—Switzerland has 3,881 miles of state railways and about 40 miles of foreign line within the country. The state rail lines are being electrified. At the close of 1922 about 325 miles had been electrified and it was estimated that the entire system would be electrified at the end of 30 years. There are 3,941 post-offices; 1,664 miles of telegraph line with 20,145 miles of wire and 2,404 offices; 941 telephone systems with 13,917 miles of line and 272,667 miles of wire.

Finance.—The accounts of the Swiss Confederation for the fiscal year 1921, made public in August 1922, showed expenses of 508,431,226 francs and receipts amounting to 380,859,356 francs, leaving a deficit of 127,571,870 francs, as against a deficit for the year 1920 of 99,536,730 francs. This was the largest deficit shown up to that time by the Federal account. It brought the total excess of expenses over income to about 500,000,000 francs since 1914, as follows: In 1914, 22,533,117 francs; 1915, 21,551,507 francs; 1916, 16,645,456 francs; 1917, 50,-

747,865 francs; 1918, 61,894,688 francs; 1919, 95,655,687 francs; 1920, 99,536,730 francs; and 1921, 127,571,870 francs.

There has been no budgetary balance in Switzerland since the war. Before the war the Government had a net surplus of 102,512,575 francs. This was entirely wiped out in meeting successive deficits. Moreover, service on the debt was increased by about 25,000,000 francs per year.

According to the *Neue Zürcher Zeitung* of Zurich, Switzerland, the Swiss budget for 1923 estimates revenue at 430,700,000 francs and expenditure at 511,500,000, leaving a deficit of 80,800,000. This compares with an actual deficit of 99,400,000 in 1922 and of 127,571,870 in 1921.

It is stated that the postal, telegraph and railway departments contribute 7,000,000 francs to the deficit and that interest on the national debt now amounts to 114,600,000 francs, against 113,400,000 in 1922.

Defense.—Service in the national militia is compulsory and universal there being few exceptions allowed. Liability extends from the 20th year to the 48th. The number of combatant troops in the field army is about 140,000 officers and men, while the total possible mobilization is about 200,000. An aviation service was inaugurated in 1919.

Government.—The Federal Government is supreme in matters of peace, war and treaty-making, the administration of the army, railways, posts and telegraphs, coining of money and issue of bank notes. The supreme executive and legislative authority are vested in a parliament of two chambers—a State Council and a National Council. The former has 44 members or two from each Canton. Their mode of election and their term of office depend entirely on the Canton. The National Council has 189 representatives chosen by direct election and proportionally to the population, one for every 20,000. In the elections held 29 Oct. 1922, 153 members of the Coalition Party were returned while 45 members of the Opposition were elected. The new National Council has 10 Protestant Liberals, 44 Roman Catholic Conservatives, 59 Radicals, 35 deputies of the Farmers and Middle Class Party, 5 Social Reformers, 43 Socialists, and 2 Communists. The result of the election which tended to stabilize the conservative forces of the nation was attributed to the feeling against the Socialist demand for a levy on capital, which among all classes met with increasing opposition and was rejected by a vote of 7 to 1 in the referendum held for the purpose on Sunday, 3 Dec. 1922.

The President and Vice-President of the Swiss Confederation are elected by the Federal Assembly in joint session for terms of one year; the President being ineligible for the term following, but the Vice-President is usually elected to succeed the outgoing President. The President for 1922 was Dr. Robert Haab; the Vice-President Charles Scheurer.

Some Recent Issues.—A popular referendum in which 90 per cent of the citizens voted in September, defeated a drastic law which aimed to repose in the authorities powers to deal with revolutionaries. The vote was 373,000 against to 300,000 for the law. The rejection came as a

surprise since both chambers of the Parliament had voted for the measure. The law would have given power not only to repress acts against the public security but even general strikes of a political character. The Catholic cantons were the only ones to vote acceptance of the law. An agreement was sought with France on the improvement of the Rhine as suggested in the Treaty of Versailles. Switzerland was not bound by the treaty but continues to adhere to the established custom which calls for a navigable Rhine from Basle to the sea. France seeks the use of part of the upper river for water power which necessitates dams. As soon as plans for the project are arranged parleys will take place with the states concerned. The Socialists were defeated in the elections for the National Council and the defeat settled the fate of the Socialist bill for a levy on capital. The reduction of armament engaged the attention of the National Council in October on the relation between the Swiss National Assembly and the Third Assembly of the League of Nations. Throughout the campaign on the capital levy the country was on the verge of a financial panic. Bank deposits were withdrawn and capital amounting to over 5,000,000,000 francs was exported; stocks fell rapidly; industrial enterprise stopped and business was virtually halted. A printers' strike was fomented by the Socialists in a vain effort to throttle the campaign against the levy and many newspapers were not published for over two weeks. Troops patrolled Lausanne to keep the radicals in order. The result—704,785 to 101,057—was so decisive that labor leaders and Socialists felt that they could count on little popular support for their threatened strikes should the vote be adverse to them.

SYPHILIS. See MEDICINE AND SURGERY, ADVANCEMENT OF; PUBLIC HEALTH SERVICE, UNITED STATES.

SYRACUSE UNIVERSITY, a co-educational institution, founded in 1870 and located at Syracuse, N. Y. Though founded and patronized by the Methodist Episcopal Church, it is nevertheless, non-sectarian. In 1922-23 it had a faculty of 450 members, 7,000 students, property valued at \$7,000,000, and an income of \$900,000. Charles W. Flint, D.D., LL.D., is president.

SYRIA, a province of Turkey in Asia, which by the Treaty of Peace with Turkey following the World War signed 10 Aug. 1920, was recognized as an independent state to be placed under a mandatory power. The mandate was given to France by the Supreme Council. Man-

dated Syria is bounded north by Turkey, south by Palestine, east by Mesopotamia and west by the Mediterranean. The total area is about 60,000 square miles with a population of 3,000,000. Arabic is the principal language of the inhabitants. The chief towns are Aleppo and Damascus (250,000); Beirut (180,000); Hama, Hama and Aintab, with about 65,000 each; Tripoli, Latakia and Antioch, with 30,000 each. Agriculture is the chief occupation of the inhabitants. Cereals, vegetables and fruits are grown in great quantities. The wheat crop averages over 1,000,000 tons yearly. Barley, Indian corn, oats and rye are grown in lesser quantities. The tobacco crop is about 3,000,000 pounds yearly, valued at \$1,000,000. Cotton, hemp and sugarcane are among the lesser crops. The principal fruits are the olive, vine, mulberry, and orange. The mulberry is cultivated especially in the north for the feeding of the silk worm. The last census of live stock showed 270,000 horses, mules and asses, 500,000 head of cattle, 4,500,000 sheep and goats and 200,000 camels. The mineral resources are not well known but iron and lignite are worked. Gypsum, marble and building stone are widely distributed. In pre-war years the commerce of Syria averaged £3,636,000 for exports and £6,653,000 for imports. The exports consisted mostly of raw silk, sheep, goats and cattle, oranges and lemons, wool, tobacco and sesame. The principal imports were cotton textiles, coffee, sugar, flour, metals and their manufactures. About 200 miles of the Bagdad Railway runs through Syria and 600 miles of the Hejaz Railway.

The French policy is to retain permanently the entire province of Syria. Palestine was formerly included as a vilayet of the province but was released under separate mandate to Great Britain. France seeks to give the natives an ever increasing share in the administration of the country and the flag chosen is the French tricolor with a cedar on the white ground. In 1922, the trade of Syria with the United States amounted to \$3,920,771. The French High Commissioner of Syria in 1922 was General Gouraud. A French army is in full occupation. On 22 July 1922 the Council of the League of Nations confirmed the mandate of Syria to France. The victory of the Turks over Greece interfered with the Allied plans for effecting a settlement of the Turkish question and France toward the close of the year viewed the revived Turkish aspirations toward a restoration of her former territories with anxiety.

T

TACNA-ARICA DISPUTE. See PEACE AND ARBITRATION, INTERNATIONAL.

TAHITI. See OCEANIA, FRENCH ESTABLISHMENTS IN.

TAIWAN, or FORMOSA, an island belonging to Japan and situated off the coast of Fukien, China. Its area is 13,911 square miles and its population, 3,654,398 in 1920. The chief city, Taihoku, has a population of 107,706. The island produces rice, sugar, tea, potatoes, jute and turmeric. About 8,000,000 acres are yearly planted to rice with a normal yield of 38,000,000 quarters. In 1921 the wheat crop was 3,564,418 quarters; barley, 5,758,393 quarters; rye, 4,518,984 quarters and rice 33,750,000 quarters. Placer gold is worked. Silver, gold and copper are also found in commercial workings. Coal and oil fields are a recent development. Sulphur and magnetic iron ore are also important. The fisheries are extensive. Flour milling, sugar, tobacco, oil, spirits, soap, bricks, glass and iron work are among the chief manufactures. There are 60 sugar mills. Trade is mostly with Japan, but there is a large trade with the United States and China. Tea, camphor, sugar and coal are the chief exports. Opium, rice, oil cake, beans, and tea seed are the principal imports. Trade with Japan amounts to 225,000,000 yen yearly. The budget was estimated to balance at 94,368,309 yen for the year 1921. The island was called Formosa while under China's regime. It was ceded by the latter to Japan in 1895 and Japanese civil administration was set up 31 March 1896.

TAKAMINE, Jokichi, Japanese-American chemist: b. Takaoka, Japan, 3 Nov. 1854; d. New York, 22 July 1922. He was the son of a Samurai of the Kanagawa clan, also physician to the Prince of Kaga. At the age of 12 he was sent to Nagasaki to study under the Portuguese consul and later went to Osaka to study medicine. He was one of the first graduates from the Imperial University of Japan at Tokio in 1879, taking his degree in chemistry and engineering. He then was sent as a government student to the University of Glasgow, and the Andersonian University of Glasgow, where he remained three years. On his return to Japan, he was appointed head chemist of the Department of Agriculture and Commerce, Tokio, where he did much to improve the brewing of saké and the making of indigo. His appointment as Japanese Commissioner to the Cotton Centennial at New Orleans in 1884-85 was the turning point in his life. Here he met Miss Caroline Hitch, whom he married and then planned to spend the rest of his life in the United States. In 1887 he went to Tokio to erect the first superphosphate works in Japan, and on his return to America in 1890 began that research work which brought him worldwide recognition. In 1894 he discovered taka diastase, which is obtained from a fungus growth mainly on the rice plant (known as

"*aspergillus oryzae*") largely used in the fermentation of saké (or rice-beer) in Japan, and used by physicians for starch digestion. A company was formed in Chicago for the manufacture of this product, which soon became very profitable. In 1900, through experiments with the glands of sheep, he discovered adrenalin. He also introduced many industries into Japan, among which were soda works, fertilizer works, dye, alkali and aluminum and also founded a large pharmaceutical corporation. He established a chemical and physical research laboratory in Tokio and also one of his own at Clifton, N. J. In 1906 he was made doctor of chemical engineering in the University of Japan and Doctor of Pharmacology. He was decorated by the Japanese Emperor with the Fourth Order of the Rising Sun in 1915. He became a member of the Japanese Royal Academy of Science in 1913. He founded the Nippon Club of New York, of which he was president, the Japan-American Society, the Chemical and Physical Research Society of Japan and was one of the founders of the Japan Society of New York and the Japanese Association of New York. Doctor Takamine was also a member of numerous clubs and societies. Doctor Takamine was probably the best known Japanese in this country. He labored very earnestly to promote better relations between Japan and the United States.

TALLADEGA COLLEGE, a co-educational institution for colored students, under the auspices of the Congregational Church. It was founded in 1867 and located at Talladega, Ala. In 1922-23 it had a faculty of 45 members, 520 students, and property valued at \$800,000. Income not given. Frederick A. Sumner, B.D., is president.

TANGANYIKA TERRITORY, formerly German East Africa, now under mandate to Great Britain. The former colony was divided after the war into Belgian and British spheres of influence. The provinces of Ruanda and Urundi on the shores of Lake Tanganyika were included in the Belgian sphere with headquarters at Kigali. The remainder was included in the British sphere with headquarters at Dar-es-Salaam. The area of the colony is 365,000 square miles with a native population of 7,659,898 at the time of the last German enumeration. The population of the British section, or Tanganyika proper, is about 4,000,000 and consists mostly of tribes of mixed Bantu race. In the Territory there are 45 Government schools with 71 native teachers and 3,500 pupils. There are Protestant and Roman Catholic missionary societies at work in the Territory. There is a considerable area under forest, about 2,700,000 acres, in which grow cedars, yellow woods, a species resembling teak, ebony, bamboo, etc. In the Territory are several plantations of coffee, coco-palms, rubber, cotton, sugar, cinchona and fibre plants. There are about 3,000,000 head of cattle and 5,000,000 sheep and goats. The chief

exports are sisal, cotton, hides, skins, copra, coffee, wax, ground-nuts, grain, rubber and ivory. The imports are mostly cotton textiles, rice and other foodstuffs, kerosene, tobacco and spirits. The revenue of the Territory is approximately £1,150,000 yearly balanced by an equal amount of expenditure. The chief port of the Territory is Dar-es-Salaam. This port is connected by railway with Kigoma, 780 miles. Another line runs from Tanga to New Moshi, a distance of 220 miles. There are 43 post offices and telegraph stations. The Governor and Commander-in-Chief in 1922 was Sir H. A. Byatt. He is assisted by an Executive Council, the members of which are all nominated. No provision has been made for the representation of the white settlers.

TANTALUM. See CHEMICAL MANUFACTURING; METALLURGY.

TARKIO COLLEGE, a co-educational institution under the auspices of the United Presbyterian Church, founded in 1883 and located at Tarkio, Mo. In 1922-23 it had a faculty of 18 members, 235 students, property valued at \$690,000, which includes an endowment of \$435,000, and an estimated income of \$85,000. Rev. J. A. Thompson, D.D., LL.D., is president.

TARIFF OF 1922. A tariff is a more or less selfish proposition, and the making of one arouses all sorts of selfish antagonisms and disputes. The Fordney-McCumber Tariff Act, which became a law, 22 Sept. 1922, was no exception to its predecessors in the amount of bickering and contention which its framing involved. After being framed by the House of Representatives and passed 21 July 1921, it went to the Senate, was hung up in the Finance Committee until 11 April 1922, and reported with 2,082 amendments. The amendments so increased that when it was passed by the Senate 19 Aug. 2,436 amendments had been tagged on. The bill then went to conference, got to the House 12 September was sent back by the House to conference 13 September a large majority voting to instruct the conference to eliminate the embargo on dyestuffs and the duty on potash. Being modified, the bill passed the House by 210 to 90 on 15 September. Four days later it was passed by the Senate by a 43 to 28 vote, and 21 September President Harding signed it, and it went into operation at 12:01 the next morning.

The measure was put through by the Republican party, by a nearly complete party vote. It is obviously a high tariff, designed to increase revenue and to extend more "protection" to certain industries. Only experience can demonstrate just what will be its effect on business; but it is safeguarded in a way absolutely unprecedented in the history of American tariff legislation. The President is authorized to make the basic tariff flexible, in accordance with proved differences in costs of production, to prevent unfair practices in import trade, and to meet discriminating duties or practices against American export trade.

Under section 315 broad powers are granted the President to change classifications and to increase or decrease the basic duties within a range of 50 per cent, upon proof that the duties fixed do not measure the "differences in costs of

production in the United States and the principal competing country." In cases of goods subject to ad valorem duties, when an advance in the rate is not found to equalize the differences in costs of production, the President may order the duty to be assessed upon the American instead of the usual foreign valuation.

Under section 316 the President is empowered to impose additional duties up to 50 per cent ad valorem, or even prohibit the importation of certain articles by particular persons, upon proof of unfair methods of competition in import trade which tend to injure an efficiently operated industry in the United States, to prevent the establishment of such an industry, or to restrain trade within the United States.

Section 317 is designed to assist in the promotion of American export trade by providing that the President may impose additional duties up to 50 per cent, and in exceptional cases even exclude, under penalty of seizure, the products of a particular country, upon proof of the existence and continuance of foreign practices which discriminate in any way against American commerce or shipping as compared with those of any other foreign country.

In order to assist the President in the exercise of his new discretionary authority, the Tariff Commission is granted larger powers and directed to undertake such investigations into foreign or domestic conditions of production and marketing as may be necessary. In order to minimize any commercial uncertainty resulting from the operation of the flexible provisions of the tariff, all such changes are made subject to full investigation and public hearings by the United States Tariff Commission, and announcement of all such changes as are ordered by the President is to be made a period of time before their enforcement.

By Executive order, dated 7 October, President Harding directed that all requests, applications, or petitions for action or relief under the provisions of sections 315, 316 and 317 of Title III of the Tariff Act approved 21 Sept. 1922, should be filed with or referred to the United States Tariff Commission for consideration and for such investigation as shall be in accordance with law and the public interests under rules and regulations to be prescribed by such Commission. In accordance with this order the United States Tariff Commission, under date of 26 October, issued the rules of procedure under which applications and investigations are to be made and hearings held. Copies of these rules are obtainable from the United States Tariff Commission, Washington, D. C., upon request.

Another remarkable provision of this tariff is the extension of the right of seizure and search of vessels along the coast from the old three-mile limit to four leagues, or about 13 miles. This section reads in part:

Sec. 581.—Boarding Vessels.—Officers of the customs or of the Coast Guard, and agents or other persons authorized by the Secretary of the Treasury, or appointed for that purpose in writing by a collector may at any time go on board of any vessel or vehicle at any place in the United States or within four leagues of the coast of the United States, without as well as within their respective districts, to examine the

manifest and to inspect, search, and examine the vessel or vehicle, and every part thereof, and any person, trunk, or package on board, and to this end to hail and stop such vessel or vehicle, if under way, and use all necessary force to compel compliance, and if it shall appear that any breach or violation of the laws of the United States has been committed, whereby or in consequence of which such vessel or vehicle, or the merchandise, or any part thereof, on board of or imported by such vessel or vehicle is liable to forfeiture, it shall be the duty of such officer to make seizure of the same, and to arrest, or, in case of escape or attempted escape, to pursue and arrest any person engaged in such breach or violation.

A further paragraph of this section gives similar authority to officers of the Department of Commerce and other persons authorized by such department.

To enable the reader to form his own judgment of the alterations made in the tariff at different periods, the preceding table has been compiled, quoting on important articles the rate under the three tariffs—Payne-Aldrich, 1911, Republican; Underwood, 1914, Democratic, and Fordney-McCumber, 1922, Republican.

Free List.—Among the common articles listed as free, are: Agricultural implements, breeding animals, Bibles, bread, household effects of immigrants, linotype and typesetting machines, typewriters, cocoa, coffee, cotton, guano, ice, India rubber, leather boots and shoes, crude petroleum, platinum, quinine, radium, sodium nitrates, silk, tar, tea, tin and pig ore, wax, barbed wire, works of art, cyanide, fish for fertilizer, gunpowder, shingles, unmanufactured lumber and potash.

It is a little early to say what the income from this new tariff will be, or its exact effect on business. Revenue officials at the outset figured that it should bring the Government \$445,000,000 a year, which is \$100,000,000 more than any other tariff returned. That they are right, is suggested by the first month's returns, \$40,868,266, which predicate an even higher total for the year. There is, of course, a great deal of grumbling. Clothing and dress goods already appear somewhat stiffer in price; the minor metals have all gone up in price, manganese has had the tariff added to the price, which permitted the local producers to resume, and will add a trifle to the cost of steel. The chemical trade is reported as not being affected noticeably by the changes. The President has such wide authority in the matter of unfair practices that there seems little chance of serious injury to the public at any point. Further, the great mass of the American public has become so used to high prices and high taxes that they accept a few more with a shrug.

CHARLES H. COCHRANE.

TASMANIA. See AUSTRALIA.

TAYLOR, Hannis. American diplomat and lawyer: b. Newbern, N. C., 12 Sept. 1851; d. Washington, D. C., 26 Dec. 1922. He was educated at the University of North Carolina, studied law and was admitted to the bar in 1870, from which time until 1892 he practiced at Mobile, Ala. From 1893-97 he served as Minis-

ter to Spain. In 1902 he appeared before the Spanish Treaty Claims Commission as special counsel for the United States Government; he also represented the United States before the Alaskan Boundary Commission in 1903. The honorary degree of LL.D. was conferred upon him by Dublin University in 1900, by University of Edinburgh in 1904 and by eight American universities. He published: 'The Origin and Growth of the English Constitution'; 'International Public Law' (1902); 'Jurisdiction and Procedure of the Supreme Court of the United States'. 'The Science of Jurisprudence' (1908); 'The Origin and Growth of the American Constitution'; 'Cicero—A Sketch of His Life and Works'; 'Due Process of Law' (1916).

TAYLOR UNIVERSITY, a non-sectarian, co-educational institution, founded in 1848 as Fort Wayne College. It was moved to Upland, Ind., and renamed Taylor University in 1891. In 1922-23 it had a faculty of 32 members, 300 students, property valued at \$400,900 and an income of \$58,500. John Paul is president.

TEACHERS COLLEGE, a non-sectarian, co-educational institution, founded in 1888 and located in New York City. It is a part of Columbia University. In 1922-23 the college faculty numbered 238 members, while the Schools of Observation and Practice connected therewith, had a faculty of 133 members. Final figures of the student enrollment were not available on 15 January but the registration up to that time was 4,100. The value of the institution's property and its income for the year 1922-23 are not given. James E. Russell, LL.D., is dean.

On 10 Feb. 1923 it was announced that Teachers College had succeeded in raising a fund of \$2,000,000, which it was required to raise by 1 Jan. 1923 in order to enable it to obtain a conditional gift of \$1,000,000 from the General Education Board. The \$3,000,000 will be divided and \$2,000,000 be used for new library building while \$1,000,000 will go to endowment purpose. Toward the \$2,000,000 the College raised, and in order to complete the amount John D. Rockefeller contributed \$171,697, and George F. Baker and Edward S. Harkness \$1,000,000 each. The trustees of the College gave \$1,512,365; students, patrons, members of the faculty and alumni, \$90,686.92.

TELEGRAPH AND CABLE COMPANIES, Mileage and Revenues of. According to a report of the Interstate Commerce Commission, made public 9 Jan. 1923, the telegraph and cable companies of the United States, in 1921, had 1,858,172 miles of wire and a capital investment in plants of \$270,975,730. Investments in other property totaled \$20,548,943. The operating revenue of the companies for the year amounted to \$136,663,438 and their operating income to \$18,667,408. Their net income was \$13,310,975, out of which they paid dividends amounting to \$9,078,399. The Western Union and the Mackay companies owned the bulk of the mileage and, of course, produced the bulk of the revenue, operating and net income. The Western Union Company had a mileage of 1,522,062. Its plant investment was given as

amounting to \$187,488,638 and its other investments as \$19,210,378. Its net income totaled \$9,685,512, out of which it paid dividends amounting to \$6,982,623, at the rate of 7 per cent. The Mackay companies had a mileage of 302,810; a plant investment of \$50,187,902, and a net income of \$1,042,294, out of which they paid dividends totaling \$499,520 at the rate of 10 per cent.

TELEPHONE PROGRESS. An outstanding recent development in telephony has been the rapid extension of the use of machine switching apparatus in central offices. Means have been developed for operating full mechanical central offices in conjunction with manual switchboards in the same exchange area which permit the subscribers connected to the full mechanical switchboard to dial calls to the manual switchboards in the same way as calls to the full mechanical switchboards. With this arrangement, the mechanical apparatus selects a trunk to the manual switchboard and by means of lamps and illuminated figures indicates to the operator at the manual switchboard the trunk selected and the subscriber's number desired. She thereupon connects the trunk to the called subscriber's line in the usual way. On calls from the manual office to the machine switching office, the subscribers pass the number desired to their operators in the usual way. Under one arrangement the operator at the manual switchboard thereupon operates a set of keys which control the selection of a trunk to the machine switching office and of the proper subscriber's line at that office. Under another arrangement, the operator passes the call to a second operator at the machine switching office who assigns a trunk and operates keys causing the machinery to select the desired subscriber's line and connect it to the trunk assigned.

These developments have made it practicable to introduce the full mechanical system gradually into large cities by using it for extensions and replacements. Apparatus of this sort is already in operation in New York, Omaha, Kansas City, Philadelphia, Providence and other large cities and is under installation in many other places, working in conjunction with the manual switchboards in the same cities.

Another important application of machine switching apparatus in large cities is in connection with calls requiring tandem trunking, that is, the switching together of two trunks to reach the desired point. When machine switching apparatus is applied to this service, the calling subscriber, if he is in a manual office, passes the call to his operator, and she passes it in the usual way to an operator at the intermediate switching point. This second operator operates a set of keys which controls the selection of a trunk to the terminating office, and, if this is a machine switching office the selection of the subscriber's line by the machine switching apparatus. If the terminating office is manual, the number desired is indicated to an operator in that office by illuminated figures. This apparatus is also adapted to handling calls originating at a full mechanical office without requiring an operator at the intermediate switching point.

For use in large cities, the selectors are built in the form of large panels with 500 lines

connected to one frame and with 60 pairs of brushes provided for each frame, 30 on each side of the panel. A frame of this sort is illustrated in Fig. 1.

There has been a rapid extension in America of the use of improved arrangements for long distance telephony which are described in the article TELEPHONE, in 'The Americana.'

The Boston-Washington underground cable route has been extended by cable, largely aerial, running now as far west as Pittsburgh and Cleveland and to be extended to Chicago. In this way, the Atlantic Coast cities will be connected together and with Chicago, Toledo, Detroit and other mid-western cities by a telephonic route providing a large number of telephone circuits of high efficiency and very free from interruptions.

The transcontinental circuits have been further improved by the use of improvements in telephone repeaters. With these improvements, best results are now obtained on large gauge open wire circuits without loading coils and with the use of repeaters at an average spacing of 250 or 300 miles. There are now 12 repeaters in tandem in a circuit between New York and San Francisco.

The year 1921 marked the completion of a project to connect Cuba with the United States by means of submarine telephone cables between Havana and Key West. As the distance is about 115 miles and the water over 6,000 feet deep, these cables are the longest and deepest submarine telephone cables in the world. It was necessary that these cables should not only give satisfactory communication between Havana and Key West but serve as a high efficiency link between points in Cuba and distant points in the United States. This fact and the physical conditions necessitated the solution of a large number of difficult and involved problems. Three cables were laid, each containing a single stranded conductor surrounded by a close spiral of very fine iron wire, a layer of insulation composed of a special compound of gutta percha, and a heavy non-insulated return copper conductor outside the gutta percha insulation. The outside of the cables consist of heavy, steel or iron armor wires, designed to have the requisite mechanical strength. In order that a sufficiently high overall efficiency shall be obtained, the cables are provided at both ends with special amplifying apparatus. Arrangements are made for carrying on four duplex telegraph conversations over each cable, simultaneously with the telephone conversation. The makeup of the cables is indicated in Fig. 2 which shows the differences in construction for shallow and for deep water.

The results which can be obtained with the arrangements which have been developed for long distance telephony are illustrated by a conversation over a distance of 5,600 miles, which was demonstrated in connection with the establishment of service between the United States and Cuba. This talk was from Havana to Santa Catalina Island off the Pacific Coast, and the circuit included the cables between Key West and Havana, and high efficiency overhead wires up the coast from Key West to New York, across the continent to San Francisco and down the Pacific

Coast to Los Angeles. This talk was completed through the radio telephone link from Los Angeles to Santa Catalina Island, which is operated regularly as a part of the commercial telephone system for providing telephone connection between those two points. It is interesting to note that if speech were to be transmitted over an equal distance by acoustic means through the air, seven hours would be required for its transmission, whereas over the electric telephone cir-

cuit, the transmission required less than one-tenth of a second.

Multiplex telephony by the use of carrier current systems has had a considerable application, there being now in commercial service, the equivalent of over 16,000 circuit miles. In one system, the frequencies of the carrier currents used to transmit the telephone conversations are 10,000, 15,000, 20,000 and 25,000 cycles; in another system they are 6,000, 9,000, 12,000, 15,-

FIGURE 2.

000, 18,000 and 21,000. In some cases, the same frequency is used for transmitting in opposite directions; in others, different frequencies are used.

Supplementing the statistics given in 'The Americana' article, the following are the statistics regarding the number of telephone stations in the United States:

TELEPHONE DEVELOPMENT IN UNITED STATES
1 JAN. 1923.

Bell owned telephones.....	9,514,813
Bell connected telephones.....	4,535,752
Independent telephones.....	445,288
Total telephones.....	14,495,853
Total population.....	110,661,000
Total telephones per 100 population.....	13.1
Total Bell stations.....	14,050,565

The following tables give the telephone development of the world by countries, as of 1 Jan. 1921:

TELEPHONE WIRE MILEAGE OF THE WORLD
1 JAN. 1921.

COUNTRY	Miles of wire	Per cent of total
United States.....	32,000,000	60.77
Canada.....	2,105,101	4.00
Europe.....	14,730,273	27.97
All other countries.....	3,826,798	7.26
Total.....	52,662,172	100.00

NUMBER OF TELEPHONE STATIONS IN THE WORLD
1 JAN. 1921.

COUNTRY	Number of stations	Per cent of total world	Stations per 100 population
United States.....	13,329,379	63.92	12.4
Canada.....	856,266	4.11	9.8
Central America.....	15,950	.08	0.3
Mexico.....	44,784	.21	0.3
Other North American places.....	3,200	.02	0.8
Cuba.....	34,376	.16	1.1
Porto Rico.....	7,970	.04	0.6
Other West Indies places.....	10,138	.05	0.2
South America.....	286,950	1.38	0.4
Europe.....	5,289,606	25.37	1.2
Asia.....	493,645	2.37	0.1
Africa.....	102,206	.49	0.1
Oceania.....	376,080	1.80	0.6
Total.....	20,850,550	100.00	1.2

Telephone apparatus, known as the loud speaking telephone, has been perfected which gives a very large volume of sound and which practically removes the physical limitations on the size of audience which a man may address. The telephonic public address system consists of a special transmitter very free from distorting effects, an amplifier to greatly increase the telephonic energy and a group of loud speaking telephones provided with suitable horns. The horns may be placed directly over the speaker and the transmitter inconspicuously in front of him. By means of apparatus of this sort, President Harding at the time of his inauguration addressed 125,000 people. The telephone currents of the public address system can be transmitted to distant points over selected wire telephone circuits by the use of special arrangements and used there to operate loud speaking telephones.

A striking example of use of this sort is given by the ceremonies on Armistice Day, 1921, which were made audible by means of loud speaking telephones locally installed to about 100,000 people in Arlington, Va., and by connection over wire circuits to loud speaking telephones in distant cities, were heard by 35,000 people in New York City and 20,000 people in San Francisco.

BANCROFT GHERARDI,
Vice-President and Chief Engineer, American Telephone and Telegraph Company.

TEMPLE UNIVERSITY, a non-sectarian co-educational institution, founded in 1884 and located at Philadelphia, Pa. In 1922-23 it had a faculty of 408 members, 8,042 students, property valued at \$760,683.92, and an income of \$734,950.23. Russell H. Conwell, D.D., LL.D., is president.

TENNESSEE, an east south-central State, bounded north by Kentucky and Virginia, east by North Carolina, south by Mississippi, Alabama, Georgia and North Carolina, and west by Arkansas and Missouri. The area of the State is 42,022 square miles and in 1920 its population was 2,337,885. The State is 34th in order of size and 19th in order of population. In 1920 the population included 1,885,993 whites, 451,758 negroes, 78 Asiatics and 56 Indians. Foreign-born residents in the State the same year numbered 15,478 and included 2,159 Germans, 1,665 English and 1,295 Irish. About three-fourths of the population is rural. The chief cities, with their populations in 1920, are: Memphis, 162,351; Nashville, the capital, 118,342; Chattanooga, 57,895; Knoxville, 77,818; Jackson, 18,860 and Johnson City, 12,442.

Religion.—The principal Christian denominations have a combined membership of 840,133. Of these, 320,442 are Baptists, 286,143 are Methodists, 71,821 are Presbyterians, 23,015 are Roman Catholics, 9,910 Episcopalians and 2,185 Congregationalists.

Education.—Primary education is free and compulsory throughout the State and the employment of children under 14 years of age in factories, workshops or mines is illegal. The State maintains separate schools for white and for colored children. There are 7,313 primary schools with 591,346 pupils and 12,947 teachers. In addition there are two public normal schools with 914 students preparing for teaching in elementary schools. There are 226 high schools with 30,534 pupils and 1,396 teachers. For higher education there are in the State 26 universities and colleges, the chief of which are the University of Chattanooga, State University of Tennessee, Fisk University, Vanderbilt University, Cumberland University and the University of the South. In addition there are seven colleges for women, a manual training school,

eight commercial schools and three universities for colored students.

Finances.—At the beginning of the last fiscal year there was on hand in the State treasury a balance of \$2,780,100.78. Receipts during the year amounted to \$15,806,492.22. Disbursements for the same period amounted to \$13,709,657.48, leaving a balance on hand at the beginning of the current fiscal year amounting to \$4,876,935.52. The bonded debt of the State in 1922 was \$15,623,000. The assessed value of real property was \$1,561,680,185.14; of personal property, \$166,187,195.

Agriculture.—The Federal Census of 1920 reported 252,774 farms, having a total acreage of 19,510,836 acres, of which 11,185,302 acres was improved land. The same year the value of all farm property was \$1,251,964,585. The chief crops, with their acreage, yield and value, for the year 1922 were: corn, 3,280,000 acres, 75,440,000 bushels, \$59,598,000; winter wheat, 472,000 acres, 4,484,000 bushels, \$5,515,000; barley, 14,000 acres, 315,000 bushels, \$252,000; clover seed, 5,000 acres, 9,000 bushels, \$99,000; oats, 229,000 acres, 4,351,000 bushels, \$2,306,000; buckwheat, 3,000 acres, 44,000 bushels, \$35,000; rye, 20,000 acres, 180,000 bushels, \$214,000; hay, 1,382,000 acres, 1,866 tons, \$30,602,000; sorghum sirup, 35,000 acres, 2,940,000 gallons, \$2,293,000; potatoes, 32,000 acres, 2,560,000 bushels, \$2,816,000; sweet potatoes, 44,000 acres, 4,180,000 bushels, \$3,260,000; cotton, 1,007,000 acres, 400,000 bales, \$49,000,000; tobacco, 130,000 acres, 94,250,000 pounds, \$20,735,000; peanuts, 13,000 acres, 9,100,000 pounds, \$410,000; apples, 4,250,000 bushels; peaches, 2,002,000 bushels, and pears, 180,000 bushels. There are about 27,300 square miles of wooded land within the State. Within recent years stock raising has diminished. On 1 Jan. 1923 there were in the State 309,000 horses, valued at \$22,557,000; 343,000 mules, valued at \$28,812,000; 495,000 milk cows, valued at \$16,830,000; 627,000 other cattle, valued at \$9,844,000; 340,000 sheep, valued at \$1,870,000, and 1,654,000 swine, valued at \$15,382,000.

Mining and Manufactures.—The chief mineral product of the State is coal, of which 4,600,000 tons were mined in 1922. Coal fields occupy a total area of about 4,400 square miles. Other minerals worked are pig iron, copper, zinc, oil, manganese, marble and limestone. In 1922, 25,709 tons of iron ore were produced and 25,219 tons were shipped. The 1922 petroleum output was 9,800 barrels. The chief manufacturing industries are iron and steel making, flour milling, lumbering, cotton by-products, tanning and the manufacturing and curing of tobacco. The last census showed 4,589 industrial establishments, capitalized at \$410,203,000, employing 113,000 persons and producing goods valued at \$556,253,162. Woolen goods, automobiles, furniture, cotton textiles and farm implements are new and flourishing industries.

Communications.—The State has a steam railroad mileage of 4,078 miles and 454 miles of electric railways. The Mississippi and Tennessee Rivers are natural waterways for considerable commerce.

Legal Holidays.—New Year's Day; 19 January (Lee's Birthday); 12 February; 22 February; Good Friday; Memorial Day (30

May); Confederate Memorial Day (3 June); 4 July; Forrest's Birthday (13 July); Labor Day; General Election Day; Thanksgiving Day; Christmas Day.

Charities and Corrections.—The chief institutions with their locations are: Tennessee Girls Vocational School, Tullahoma; Eastern Hospital for the Insane, Knoxville; Central Hospital for the Insane, Nashville; Western Hospital for the Insane, Bolivar; Home for Confederate Veterans, Hermitage; Main Prison, Nashville, and Brushy Mountain Prison, Petros.

Government.—The State executive is a Governor, elected for two years and who receives a salary of \$4,000. The legislature, known as the General Assembly, comprises a Senate of 33 members, elected for two years, and a House of Representatives of 99 members, elected for two years. No clergyman of any denomination is eligible for membership in either House. For local administration the State is divided into 96 counties. The legislature meets the first Monday in January of odd years.

Officials.—(1922) Governor, A. A. Taylor; Secretary of State, E. N. Haston; Attorney-General, Frank M. Thompson; Auditor, Tim W. Wade; Comptroller, John B. Thomason; Treasurer, Hill McAllister, and Superintendent of Education, John B. Brown. The officials entering office in 1923 are: Governor, Austin Peay; Speaker of Senate, Eugene Bryan; Secretary of State, E. N. Haston; Attorney-General, F. M. Thompson; Comptroller, J. B. Thomason; Treasurer, Hill McAllister, and Superintendent of Education, J. B. Brown.

Judiciary.—Members of Supreme Court: D. L. Lansden, Chief Justice; N. L. Bachman, C. P. McKinney, F. S. Hall and Grafton Green, Associate Justices.

TENNESSEE, University of, a State co-educational institution founded 1794 and located at Knoxville, Tenn. In 1922-23 it had a faculty of 247 regular members, a student enrollment of 1,655 regular—3,066 including short course and summer session. Property valued at \$2,840,000 and an income of \$600,000 from all sources. President, H. A. Morgan, LL.D.

TENNIS. See SPORTS.

TERHUNE, Mary Virginia ("MARION HARLAND"), American novelist and writer on domestic science: b. Amelia County, Virginia, 31 Dec. 1831; d. New York City, 2 June 1922. She was a daughter of Samuel Pierce Hawes and was educated under tutors, governesses, and in private schools. She began writing for the press at the age of 14 years and was but 22 years old when her first novel, 'Alone,' a pronounced success, was published. On 2 Sept. 1856 she was married to the late Rev. Edward Payson Terhune and went to live at Charlotte Court House, Va. She had a genius for home-making and her experiences as a housekeeper soon taught her that existing books on cookery and household management were not only badly written but were also impractical. The result was that she went to a well-known publishing house with a manuscript for a book on domestic science which bore neither of these defects. Under the title 'Common Sense in the Household' the

book was published and within 10 years 100,000 copies were sold. Mrs. Terhune was vice-president of the Association for the Preservation of Virginia Antiquities; vice-president of the Pocahontas Memorial Association; a member of the Virginia Historical Society, and a member also of the Society of American Authors. She was a frequent contributor to magazines and newspapers, for two years conducted *Babyhood*, thereafter conducted *The Home-Maker* and departments in *Wide-Awake* and *Saint Nicholas*, and for a time was on the staff of the *Chicago Tribune*. Mrs. Terhune collaborated with her daughter, Christine Terhune Herrick, in writing 'The National Cook Book,' 'Breakfast, Lunch and Tea,' and 'The Helping Hand'; with her daughter, Virginia Terhune Van de Water, in writing 'Everyday Etiquette,' and with her son, Albert Payson Terhune, in writing 'Dr. Dale—A Story Without a Moral' (1900). In addition to the books written in collaboration with her children, Mrs. Terhune published 'The Story of Mary Washington'; 'Alone'; 'Moss-Side'; 'The Hidden Path'; 'Common Sense in the Household'; 'Common Sense in the Nursery'; 'The Cottage Kitchen'; 'The Dinner Year Book'; 'Loitering in Pleasant Paths'; 'Old Field School-Girl'; 'Judith'; 'Handicapped'; 'Nemesis'; 'At Last'; 'Helen Gardiner's Wedding Day'; 'Jessamine'; 'With the Best Intentions'; 'True as Steel'; 'Sunnybank'; 'From My Youth Up'; 'My Little Love'; 'A Gallant Fight'; 'The Royal Road'; 'His Great Self'; 'Mr. Wayt's Wife's Sister'; 'Eve's Daughters'; 'When Grandmamma Was New'; 'Some Colonial Homesteads'; 'More Colonial Homesteads' (1899); 'Where Ghosts Walk'; 'Literary Hearthstones'; 'Marion Harland's Complete Cook Book'; 'When Grandmamma Was Fourteen' (1905); 'The Distractions of Martha' (1906); 'Where Ghosts Walk' (Second series, 1910); 'Marion Harland's Autobiography' (1911); American edition 'Reader's Handbook'; 'A Long Lane—A Chronicle of Old New Jersey'; 'The Carringtons of High Hill, An Old Virginia Chronicle.'

TEXAS, a west south-central State, popularly known as the Lone Star State, bounded north by New Mexico and Oklahoma, east by Oklahoma, Louisiana and the Gulf of Mexico, south by the Gulf of Mexico and Mexico, and west by Mexico and New Mexico. It is the largest State of the North American Union, having an area of 265,896 square miles. In 1920 it ranked fifth in population with 4,663,228. The population of 1920 included 3,918,165 whites, 741,694 negroes, 2,109 Indians and 1,260 Asiatics. The foreign-born residents of the State the same year numbered 360,519, of whom 249,652 were Mexicans, 31,062 Germans, 26,441 Austrians and 7,685 English. The chief cities, with their populations in 1920, are: Houston, 138,276; San Antonio, 161,379; Dallas, 158,976; Fort Worth, 106,482; El Paso, 77,560; Waco, 38,500; Beaumont, 40,422; Galveston, 44,255; Wichita Falls, 40,079; Austin, the capital, 34,876; Port Arthur, 22,251 and Denison, 17,065.

Religion.—The principal Christian denominations have a combined membership of 1,784,620, of whom 646,494 are Baptists, 418,121

Methodists, 402,874 Roman Catholics, 68,229 Presbyterians, 19,187 Lutherans, 17,116 Episcopalians, and 2,377 Congregationalists.

Education.—The State supplies separate schools for white and for colored children. There are 8,401 elementary schools with 28,350 teachers and 1,297,991 pupils, and 2,621 high schools with 4,766 teachers and 107,779 pupils. For the training of elementary teachers there are six normal schools. For higher education there are several institutions, the principal of which are the State University of Texas, the State Agricultural and Mechanical College, the College of Industrial Arts, Denton; Baylor University, Waco; Texas Christian University, Southern Methodist University, Howard Payne University, Southwestern University, Austin College, Texas Women's College, the University of Dallas, Daniel Baker College and Rice Institute.

Finances.—At the beginning of the last fiscal year the State treasury had on hand a balance of \$5,610,865.36. Receipts during the fiscal year amounted to \$58,559,142.89. Disbursements for the same period totaled \$61,367,872.32, leaving a balance on hand at the beginning of the current fiscal year amounting to \$2,802,135.93. The bonded debt of the State in 1922 was \$4,002,200. The assessed value of all property was \$3,350,000,000.

Agriculture.—Texas is one of the great agricultural States of the Union. The last Federal census reported 436,033 farms with a combined area of 113,518,716 acres, of which 32,377,929 acres was improved land. The total value of all farm property in 1920 was \$4,461,579,497. Irrigation is being increased by various projects. There are almost 3,000,000 acres of irrigable lands in the State, of which less than 1,000,000 are actually irrigated. In all lines of agriculture Texas is a heavy producer. It is the great cotton State. Other crops are rice, sorghums, sugarcane, fruits, tobacco, most of the cereals, forage crops, potatoes, etc. In 1920 Texas was the only State reporting a total value of all crops in excess of \$1,000,000,000. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 5,729,000 acres, 114,580,000 bushels, \$95,101,000; winter wheat, 1,249,000 acres, 9,992,000 bushels, \$10,991,000; oats, 1,455,000 acres, 33,465,000 bushels, \$18,406,000; rye, 13,000 acres, 117,000 bushels, \$146,000; broom corn, 12,000 acres, 2,200 tons, \$440,000; tame hay, 671,000 acres, 1,074,000 tons, \$12,351,000; sorghum sirup, 35,000 acres, 2,415,000 gallons, \$1,739,000; rice, 191,000 acres, 5,959,000 bushels, \$8,760,000; potatoes, 39,000 acres, 2,418,000 bushels, \$3,869,000; sweet potatoes, 105,000 acres, 8,715,000 bushels, \$7,408,000; cotton, 12,125,000 acres, 3,290,000 bales, \$386,575,000; peanuts 172,000 acres, 96,320,000 pounds, \$3,853,000; grain sorghums, 1,970,000 acres, 39,400,000 bushels, \$39,400,000; apples, 2,640,000 bushels; peaches, 1,920,000 bushels, and pears, 390,000 bushels. Livestock raising is an immense industry. The wool clip is about 20,000,000 pounds annually. The State leads the Union in the cattle breeding industry. On Jan. 1, 1923 there were in the State 971,000 horses, valued at \$51,463,000; 863,000 mules, valued at \$69,040,000; 1,052,000 milk cows, valued at \$37,872,000; 5,041,000 other cattle, valued at \$93,763,000; 2-

862,000 sheep, valued at \$14,882,000, and 2,326,000 swine, valued at \$20,469,000.

Mining and Minerals.—Texas is one of the great oil producing States. Oil is found from the northwest to the southeast on the Gulf and the Texan field appears to be part of the great Mexican oil field. The total petroleum output in 1922 was 116,670,000 barrels. Approximately 1,000,000 tons of coal were mined in 1922. Other products are quicksilver, natural gas, salt, cement, granite, limestone and sandstone, pottery clays, silver, lead and copper. Potash is a recent find in the northwestern part of the State.

Manufactures.—The last manufacturing census reported 5,724 industrial establishments in Texas, employing 130,911 persons and capitalized at \$585,776,451. These establishments paid in salaries and wages \$147,907,778, and used raw materials valued at \$701,170,898, and turned out goods valued at \$999,995,796, making the value added by manufacture \$298,824,898. The principal industries ranked by value of products are: oil refining, slaughtering, meat packing, oil and cake cottonseed, flour mill and grist mill products, lumber and timber products, cars and railroad shop repairs, foundry and machine shop products, bread and bakery products, printing and publishing newspapers and periodicals, ship building and body building, cleaning and polishing of rice, cotton goods, confectionery and ice cream, book printing and publishing, and manufactured ice.

Communications.—Galveston is one of the chief cotton ports of the United States and as a commercial port is second only to New York. Its foreign trade is about \$500,000,000 yearly. The State has 13,117 miles of steam railways, 1,241 miles of electric railways and 91 miles of gasoline railways. Houston is the most important railroad centre, 15 systems radiating there. The State has 1,047 miles of navigable waterways. The State has 5,122 miles of improved State highways, on which \$27,600,000 has been spent.

Legal Holidays.—New Year's Day; Washington's Birthday; 2 March, Texas Independence Day; 21 April, San Jacinto Day; Decoration Day; 3 June, Jefferson Davis's Birthday; 4 July; Labor Day; 12 October, Columbus Day; Armistice Day; Thanksgiving Day, and Christmas Day.

Charities and Corrections.—The chief institutions in the State with their locations and number of inmates in 1922 are: Confederate Home (Men), Austin, 372; Confederate Woman's Home, Austin, 90; State Orphans' Home, Corsicana, 483; Girls' Training School, Gainesville, 72; Juvenile Training School, Gatesville, 1,186; Feeble Minded Colony, Austin, 243; E. Texas Hospital for Insane, Rusk, 771; N. Texas Hospital for Insane, Terrell, 2,197; S. W. Insane Asylum, San Antonio, 2,279; State Lunatic Asylum, Austin, 1,959; State Epileptic Colony, Abilene, 700; American Legion Memorial Sanatorium, Kerrville, 58, (Incomplete, will have capacity of 600 beds); Tuberculosis Sanatorium, Carlsbad, 317; Texas School for the Blind, Austin, 227; Texas School for the Deaf, Austin, 474; Deaf, Dumb and Blind for Colored, Austin, 168; N. W. Texas Insane Asylum, Wichita Falls, 211, (New Institution); Home for De-

pendent and Neglected Children, Waco, (New, not yet open), and State Hospital for Crippled Children, located in connection with John Sealy Hospital at Galveston and partially maintained by the State, with a patient population of about 15 children.

Government.—The executive is a Governor, elected for two years, who receives a salary of \$4,000. The legislature consists of two chambers, the Senate of 31 members, elected for four years, and a House of Representatives of 150 members, elected for two years. Texas sends two Senators and 18 Representatives to the Federal Congress. For local administration the State is divided into 253 counties. The legislature meets biennially in January of odd years.

Officials.—The State officials in 1922 were: Governor, Pat M. Neff; Lieutenant-Governor, Lynch Davidson; Secretary of State, S. L. Staples; Attorney-General, W. A. Keeling; Comptroller, Lon A. Smith; Treasurer, C. V. Terrell, and Superintendent of Education, Annie Webb Blanton. The State officials in 1923 are: Governor, Pat M. Neff; Lieutenant-Governor, T. W. Davidson; Secretary of State, S. L. Staples; Attorney-General, W. A. Keeling; Comptroller, Lon A. Smith; Treasurer, C. V. Terrell, and Superintendent of Education, S. M. N. Maes.

Judiciary.—Members of Supreme Court: C. M. Cureton, Chief Justice; Wm. Pierson and T. B. Greenwood, Associate Justices.

TEXAS AGRICULTURAL AND MECHANICAL COLLEGE, a State educational institution for men, founded in 1876 and located at College Station, Texas. In 1922-23 it had a faculty of 155 members, 2,000 students, property valued at \$4,000,000 and an income of \$1,200,000. William B. Bizzell, LL.D., is president.

TEXAS FEVER. See VETERINARY MEDICINE AND SURGERY.

TEXAS PRESBYTERIAN COLLEGE, a Southern Presbyterian educational institution for women, founded in 1902 and located at Milford, Texas. In 1922-23 it had a faculty of 25 members, 145 students, property valued at \$450,000 and an income of \$57,000. French W. Thompson, D.D., is president.

TEXAS, University of, a State co-educational institution, founded in 1881 and located at Austin, Texas. In 1922-23 it had a faculty of 260 members, 5,000 students, property valued at \$5,650,000 and an income of \$1,875,000. Robert Ernest Vinson, D.D., LL.D., is president.

TEXAS WOMAN'S COLLEGE, an educational institution for women, under the auspices of the Methodist Episcopal Church, South; founded in 1914 and located at Fort Worth, Texas. In 1922-23 it had a faculty of 35 members, 400 students, property valued at \$900,000 and an income of \$150,000. Henry Elbert Stout, Ph.B., is president.

TEXTILE MACHINERY, Manufacture of. According to a report issued by the Department of Commerce on 24 Jan. 1923, 416 establishments engaged chiefly in the manufacture of textile machinery in the United States in 1921 turned out products valued at \$128,820,000, as compared with products valued at \$122,089,000 turned out by 391 establishments in 1919. In ad-

dition, establishments engaged primarily in the manufacture of other articles reported textile machinery of a value of \$3,612,000 in 1919. Corresponding figures for 1922 were not available, it was stated, at the time the report was issued. Persons engaged in the industry, including proprietors, firm members, salaried employees and wage earners, numbered 34,739 in 1921 and 36,126 in 1919. Salaries and wages paid out in 1921 amounted to \$47,298,000, and \$44,627,000 in 1919. Materials used cost \$44,849,000 in 1921, compared with \$45,637,000 in 1919. Of the 450 establishments which reported products valued at \$5,000 or more in 1921, 127 were located in Massachusetts, 67 in Pennsylvania, 55 in New Jersey, 52 in Rhode Island, 29 in New York, 16 in Connecticut, 14 in North Carolina, 12 in Georgia, eight each in New Hampshire and Vermont, six each in Maine and South Carolina, four in Alabama, two each in Delaware, Illinois and Iowa and one each in Indiana, Kentucky, Maryland, Michigan, Ohio and Tennessee.

TEXTILES. Somewhat better conditions prevailed in the textile industries of the United States in the opening months of 1923 than existed during the depressing year of 1921. The great cotton and woolen mills of New England have had to deal with a serious strike situation, with agitation over the 48 or 54 hour week. The slump in the pound price of cotton from 35.9 cents in 1920 to 11.5 cents in 1921, ruined many, and gravely affected the entire textile industries of the world. The fall of wool from 53.3 cents in 1920 to 19.6 cents in 1921 was almost as depressing. The cotton situation is fully described under Cotton. The article on clothing also contains facts bearing on the general situation. See also SILK AND WOOL.

The Department of Commerce gathered some figures of the industry, in 1921, which are given below, as the latest complete and authoritative, yet to be considered in light of the fact that all these minor activities in the textile industry are known to have much improved since the census was completed. The woolen and worsted report for 1921 covered 814 establishments, employing 171,600 persons, paying salaries and wages totaling \$201,243,000, using materials valued at \$400,046,000, with a total production of \$755,884,000, less than three-fourths the \$1,065,434,000 production of 1919. Of this production \$230,945,000 was woolen goods, and \$524,639,000 worsted goods. In carpets and rugs 70 establishments were reported in 1921, employing 23,418 persons, paying salaries and wages of \$34,472,000, using materials valued at \$47,842,000, and turning out products valued at \$101,358,000, against \$123,254,000 in 1919. In dyeing and finishing, the 593 establishments reporting as operating outside the great textile mills in 1921, gave employment to 54,000 persons, paid salaries and wages totaling \$72,690,000, and yielded products valued at \$272,837,000, as compared with \$323,968,000 in 1919. Jute production fell off from \$34,443,000 to \$17,506,000 during the same period. The minor industry of cotton lace making fell off from \$16,321,000 to \$14,559,000, in the same two years; while wool scouring reduced its production from \$13,680,000, to \$6,520,000. The only minor industry dependent on textiles that scored a gain in these two years was textile machinery manu-

facture. Evidently many of the mills used the dull season to improve their plants. See TEXTILE MACHINERY, MANUFACTURE OF.

An indication of the improvement in the textile industry as a whole is shown in the consumption of grease wool. The year 1921 started with only 30,000,000 pounds a month, rose to 53,000,000 in April, and 62,000,000 in September. January, 1922, started with 62,000,000, rose to 71,000,000 in March, fell off to 53,000,000 in April, and thereafter rose almost steadily to 77,600,000 in November, 1922. Sheep-raising is a declining industry in the United States, and of course we have less wool. See Wool.

There is a decided tendency of cotton mills to move southward, where they are nearer to the cotton supply, where labor is cheap, and the workers willing to put in more hours than is customary in New England. Early in 1923 it was reported that \$40,000,000 was being expended in new cotton mill construction in the two Carolinas alone, mostly with Northern capital. This means about 575,000 new spindles and 12,000 new looms.

With a tariff of 31 cents a pound on raw wool, and with high protection on nearly all articles manufactured into fabrics, the textile industries of the United States are expected to maintain prices that will make the various branches of the trade profitable for some years to come. As in other trades there is tendency toward standardization of sizes and grades of fabrics, with simplification and reduced cost. Textiles of all kinds imported into the United States in 1922 had a value of \$857,136,787, as compared with \$673,540,000 in 1921. Raw silk imports alone were valued at \$365,787,400 in 1922 against \$259,054,000 in 1921.

TEXTILE STRIKE. See STRIKES AND LOCK-OUTS.

THIEL COLLEGE, a co-educational institution under the auspices of the Evangelical Lutheran Church, founded in 1870 and located at Greenville, Pa. In 1922-23 it had a faculty of 22 members, 320 students, property valued at \$350,000 and an income of \$60,000. Carl A. Sundberg is president.

THURINGIA (officially Einheitsstaat Thuringen), a federal state of the Republic of Germany, comprising the republics of Saxe-Weimar-Eisenach, area, 1,397 square miles; pop. 270,015; Saxe-Meiningen, area, 953 square miles; pop. 191,491; Gotha, area, 548 square miles; pop. 433,959; Saxe-Altenburg, area, 511 square miles; pop. 211,638. Reuss, area, 441 square miles; pop. 212,007; Schwarzburg-Rudolstadt, area, 363 square miles; pop. 99,339; Schwarzburg-Sonderhausen, area, 333 square miles; pop. 93,427. Total area, 4,546 square miles and pop. 1,511,876. Weimar, the capital, has 37,237 inhabitants. See GERMANY.

THYSSEN, August, German manufacturer and capitalist; b. 1842. He is often referred to as the "king" of the Ruhr Valley in the Rhineland, occupied (January 1923) by French troops. Born only three years later, Thyssen was thus a contemporary of John D. Rockefeller, whom, in many ways, he resembles. The two men are deeply religious, Rockefeller being a Baptist and Thyssen a Roman Catholic, whom the Pope has

decorated. Both men are socially democratic, Thyssen refusing all honors from the Kaiser. Both men are simple and even parsimonious in their personal tastes, Thyssen using an automobile made in the year 1909, and wearing the cheapest clothes. Both men have exhibited a passion for organizing business along the lines of what has come to be called "the vertical trust" namely, a management which takes the raw material and carries the processes of manufacture and distribution right through to the ultimate consumer, so eliminating the middleman and all preventable waste.

In the sixties, while Rockefeller was dealing with oil, Thyssen started his first rolling mill at Hamborn, with 60 men and a capital of \$6,000. His great Deutsche Kaiser Works, there situated, now employ 26,000 men, and in his mines and plants as a whole, 66,000 men are normally employed.

In 1914, Thyssen owned coal and iron mines, furnaces, plants, warehouses, ships, barges and docks, with salt and potash fields, not only in the Rhineland, but at Caen, in Normandy, at the French towns of Montegnny and Maisières, at the Russian port of Nikoleieff on the Black Sea, at Buenos Aires, in India and the British Dominions. Among Germans, his only rival in wealth has been Stinnes. What exactly Thyssen is worth cannot be stated, first owing to the vagaries of the German mark and secondly, because, like Henry Ford, he reinvested his profits in his various enterprises, financing them by bonds, which remained under his personal control. During the troubles with the French, he indignantly refused to sell them a 60 per cent interest in his ventures. While the war cost him the ownership of many foreign properties, he made profits out of the manufacture of munitions, including big guns, and at the armistice, he transformed his new armament works into plants for manufacturing electrical machinery. He has also been busy opening new coal mines to take the place of those in the Saar Valley which are held by France.

Whether Thyssen wanted the war is very doubtful. He was one of the big industrialists who had to be talked over by the Kaiser. His method was conquest by purchase rather than by military force, a good example of which was his attempt in July 1914 thus to acquire the Dutch port of Naar Dingen near Rotterdam for his Vulcan Iron Works. When, however, war was raging, Thyssen, like the rest, was out for whatever could be won from France, himself urging that Nancy, Longwy and ample territories around them be annexed. It cannot be argued that the French are doing anything to him that he would not have done to them.

Short, squarely-built and thicknecked, Thyssen somewhat resembles Carnegie in physique. Castle Landberg, where he lives, is a gothic edifice, adorned with statues by Rodin of whom Thyssen was one of the earlier and most generous patrons. Adjoining his bedroom is an office where he works; and in another and still dingy office at his steel plant, he toils incessantly. Travelling second class and economizing on tips, he wishes to die in harness, his motto being: "If I rest, I rust." While he runs his business on three eight-hour shifts a day, he thinks that

an eight hour day is too short. For the Communists who, in December 1918, arrested him for high treason, he has no use; and if the French keep them in order, it will be a blessing, he thinks, in disguise. Indeed, his complaint of the French is not so much that they are French as that they fail to be, in his opinion, scientific industrialists. His claim is that the French made a loss in the Saar Valley until they summoned German engineers to their assistance.

Thyssen's domestic life has been unhappy. He and his wife are divorced and over the settlement of the property on the children, there was a lawsuit, extending for 10 years and costing a fabulous sum in fees. What aggravated the quarrel was the conduct of Thyssen's second son, August, Jr., who spent freely in Berlin on the strength of his father's fortune and attempted to set up in businesses that would compete with his father. Fritz, the eldest son, is associated with his father in the Ruhr and was arrested by the French and fined when he declined to authorize shipments of coal into France.

TIBET, a dependency of China extending from the Pamir region eastwards to the Chinese frontier. Its area is estimated at 463,200 square miles with a population of from 1,500,000 to 6,000,000. A census, the only one ever taken, of 1737 showed 316,300 lamas or monks and 635,950 laity. Lhasa, the capital, has about 20,000 inhabitants. Agriculture is carried on in some places, cereals and vegetables being grown but Tibet is mainly a pastoral country, the domestic animals being sheep, yak, a kind of cattle, buffalo, camels and pigs. Wool spinning and knitting are carried on. Gold, borax, and salt deposits are worked. There is a large trade with China and India. In 1921 imports to India amounted to £313,400 and Indian exports to Tibet to £613,200. After the establishment of the Chinese Republic in 1911 the Tibetans expelled the Chinese garrison and Great Britain was later instrumental in preventing China from re-establishing her authority there. At present only the suzerainty of China is recognized.

TIGERT, John James, American educator: b. Nashville, Tenn., 11 Feb. 1882. His father was the late Bishop John James Tigert of the Methodist Episcopal Church, South, and his mother, prior to her marriage, was Miss Amelia McTyeire. He was graduated from Vanderbilt University in 1904 with the degree of B.A., and from the Honor School of Jurisprudence, Oxford University, England, with the same degree in 1907, being the first Rhodes scholar from Tennessee to be graduated from Oxford. In 1915 he took the degree of A.M. at Oxford. In 1916 he attended the Graduate School of the University of Minnesota and in 1921 the degree of LL.D. was conferred upon him by the University of Kentucky. He was professor of philosophy at Central College, Mo., 1907-09; president of Kentucky-Wesleyan College, Winchester, Ky., 1909-11; professor of philosophy, 1911-17, and thereafter professor of psychology, at the University of Kentucky until 1921 when he was appointed United States Commissioner of Education. From June 1918 until July 1919, he was engaged in Y. M. C. A. work with the American Expeditionary Forces; was a member of the Army Educational Corps from April to

July and extension lecturer at the A. E. F. University, Beaune, France. On 25 Aug. 1909 he married Miss Edith Jackson Bristol, a daughter of M. C. Bristol of Chicago. He has published 'The Philosophy of the World War'; also many addresses and articles on education. He is a member of the Federal Board for Vocational Education. He is a member of the council of the National Educational Association, a member of the American Association for the Advancement of Science, and of the Phi Beta Kappa, Phi Delta Theta, and Alpha Delta Sigma Greek letter fraternities.

TIN. The production of tin metal in the United States is negligible. Great effort has been expended to find a local supply, but wherever located the quantity has been too small to be profitably worked. In 1920 the total mined was 22 tons, valued at \$22,000, and in 1921 four tons only were obtained, of the value of \$2,400. It was reported early in 1923 that a new source of tin ore had been found in New Mexico, but its possibilities are not yet apparent. The tin needed for American industries is imported, about two-thirds from the Straits Settlements, the remainder from Banka and Billiton, Bolivia, etc. Much of it comes in blocks and pigs, but Bolivia sends concentrates. The importation for 1922, partly estimated, was: tin ore, value \$6,000,000, about 2 per cent less than for 1921; tin blocks and pigs, 127,325,000 pounds, valued at \$38,950,000, or nearly three times the importation of 1920. The visible supply of tin has increased, the latest estimate being at the close of 1922:

VISIBLE TIN SUPPLY	Long tons	
	1922	1921
Straits Settlements.....	62,903	36,107
Australia.....	1,420	1,175
Banka and Billiton.....	16,099	11,874
Standard.....	11,481	10,537
	<u>91,903</u>	<u>59,693</u>

In addition there is believed to be an "invisible supply" of about 19,000 tons in the Far East.

The tin ore that comes into the United States is refined, mainly at the American Smelting and Refining Company, Perth Amboy, N. J.; Williams Harvey Corporation, Brooklyn, N. Y.; and Richards & Company, Malden, Mass.

The manufacture of tin and terneplate and of tinware became a considerable industry in the United States through the assistance of the McKinley Tariff. In 1919 the tin and terneplate product was valued at nearly \$100,000,000, and the tinware product at \$300,000,000. The metal tin sold as low as 13 cents in 1896, and rose to 46 cents in 1912. In 1922 the 3 January opening price was 32.7 cents, the lowest figure was in March, 28.4 cents, and it closed 30 December at the highest figure of the year 39 cents. The exportation of American tin and terneplate is declining, being valued at \$7,950,000 in 1922, against \$17,415,000 in 1921. Japan and Canada are the largest buyers.

C. H. COCHRANE.

TOBACCO. There were, according to the United States Department of Agriculture, 1,324,840,000 pounds of tobacco produced in the United States during 1922. Production in 1921

amounted to 1,069,693,000 pounds and in 1920 to 1,582,225,000 pounds. The tobacco area in 1922 totaled 1,725,000 acres, as compared with 1,427,000 acres in 1921 and 1,960,000 acres in 1920. The farm value of the crop, based on 1 December prices, was \$306,179,000 in 1922, compared with \$212,728,000 in 1921, and \$335,675,000 in 1920. The per pound price of the 1922 crop varied from 47 cents for Florida-grown tobacco to 16 cents for some of the Pennsylvania crop. The average per pound price on 1 December for the whole country was 23.1 cents, compared with 19.9 cents in 1921 and 21.2 cents in 1920. Kentucky, as it has done for at least the last three years, led in production in 1922 with 446,250,000 pounds. Its 1921 crop amounted to 325,710,000 pounds and its 1920 crop to 476,000,000 pounds. North Carolina produced 306,940,000 pounds in 1922, 252,450,000 pounds in 1921 and 433,750,000 pounds in 1920. Virginia, grew 156,750,000 pounds in 1922, 91,850,000 pounds in 1921 and 179,580,000 pounds in 1920. Production in pounds in the other States in 1922, was as follows: Massachusetts, 11,925,000; Connecticut, 35,000,000; New York, 2,200,000; Pennsylvania, 56,760,000; Maryland, 26,950,000; West Virginia, 7,425,000; South Carolina, 57,600,000; Georgia, 5,940,000; Florida, 3,300,000; Ohio, 46,800,000; Indiana, 16,200,000; Wisconsin, 45,600,000; Missouri, 4,500,000; Tennessee, 94,250,000; Louisiana, 450,000.

Tobacco Manufacturing.—The total number of cigarettes produced in 1922 was 53,582,028,982, as compared with 50,899,048,366 in 1921 and 44,645,823,212 in 1920. Cigars produced in 1922 numbered 6,892,597,657, as compared with 6,758,630,824 in 1921 and 7,967,021,692 in 1920. Manufactured tobacco produced in 1922 totaled 382,070,512 pounds, as compared with 350,835,000 pounds in 1921 and 363,688,795 pounds in 1920. Snuff manufactured in 1922 amounted to 38,162,198 pounds, as compared with 35,661,435 pounds manufactured in 1921 and 36,126,387 pounds manufactured in 1920. According to figures made public by the Federal Bureau of Census in February, the leaf tobacco in the possession of manufacturers and dealers in the United States on 1 Jan. 1923 was 1,491,000,000 pounds. Chewing, smoking, snuff, and export types of tobacco constituted the bulk of the amount referred to, totaling slightly over 1,000,000,000 pounds. Cigar types of tobacco held by the manufacturers and dealers on 1 January amounted to 346,000,000 pounds, while imported tobaccos held by the dealers and manufacturers at that time amounted to 76,000,000 pounds. The above figures cover the holdings of dealers in and manufacturers of tobacco, other than original growers, who, according to the returns of the Commissioner of Internal Revenue, manufactured during the preceding calendar year more than 50,000 pounds of tobacco, 250,000 cigars or 1,000,000 cigarettes, and by dealers in or manufacturers of leaf tobacco, who, on an average, had more than 50,000 pounds of leaf tobacco in stock at the end of the four quarters of the preceding calendar year, and include also all the imported tobacco in the United States and bonded manufacturing warehouses.

Tobacco Exports.—Exports of leaf tobacco

from the United States in 1922 were 431,907,578 pounds, valued at \$145,984,896. This was a decrease of 83,445,489 pounds as compared with the amount of tobacco exported in 1921, and was the lowest amount exported from the United States in any year since 1918. Although this is a pronounced decrease from the figures for 1921 it is approximately 17,000,000 pounds more than the amount of tobacco exported in 1913. The exports of stems and scrap tobacco were 10,960,906 pounds, an increase of nearly 3,500,000 pounds over 1921. The number of cigarettes exported was 11,470,179,000, or approximately 3,000,000,000 more than were exported in 1921. There was also a slight increase in the number of cigars and cheroots exported. Exports of plug tobacco amounted to 3,797,038 pounds, as compared to 2,586,781 pounds in 1921. The exports of smoking tobacco decreased from 7,656,700 pounds in 1921 to 1,285,765 pounds in 1922.

Cuba's Crop.—According to reports to the United States Department of Commerce from Cuba, which produces most of the fine tobacco used in the manufacture of cigars, the 1922 crop of that country was about 50,000 bales short of the 1921 crop and 400,000 bales short of the 1920 crop. In the year last mentioned Cuba produced 700,000 bales of tobacco. In 1921 production dropped to 355,000 bales, while the latest estimates placed the 1922 crop at but 304,000 bales.

Late in the fall reports from Paraguay indicated a falling off in the tobacco crop of that country, which normally produces about 24,000,000 pounds. The 1921 crop amounted to 21,280,000 pounds.

Tobacco, Production and Consumption in Europe.—Based on official returns, the European tobacco crop of 1922 was estimated at 274,405,000 pounds as compared with the 1921 crop of 264,039,200 pounds. The production of Russia and Italy is not included in this estimate. Italy's production in 1921 was 43,116,688 pounds, and though there was increased planting, it was believed that the 1922 crop, owing to damage by drought, would not greatly exceed the crop of the year before. Bulgaria's crop was estimated at 44,593,532 pounds. Germany leads all countries in Europe in tobacco production with an estimated crop of 77,140,000 pounds in 1922 as compared with the 1921 crop of 65,961,312 pounds. Czechoslovakia's 1922 crop was estimated at 4,778,272 pounds; Hungary's at 4,383,756 pounds. The production of Turkish tobacco in the two districts of Samsun and Smyrna was estimated at 21,956,248 pounds, a considerable portion of which was destroyed by fire and by the retreating Greek army during their pursuit in Asia Minor by the Turks. Consumption of tobacco throughout Europe still shows a rising tendency with the probability of an increase in the imports of American tobacco by Italy and France. Despite the chaotic conditions which have obtained in Germany during the past three years, the imports of tobacco have increased from 179,405,600 pounds in 1913 to 250,154,000 pounds during the fiscal year which ended 3 April 1922. Figures given out in February 1923 by the French Tobacco Monopoly, in regard to its sales of tobacco in 1922 and 1921, show a large increase

in the popularity of all of the most expensive forms of tobacco. Sales in 1921 totaled 115,194,969 pounds as compared with 102,290,700 pounds in 1920.

TOBACCO INSECTS. See ENTOMOLOGY, UNITED STATES BUREAU OF.

TOBAGO. See TRINIDAD AND TOBAGO.

TOGOLAND, former colony of Germany in west Africa, lying between the Gold Coast Colony on the west and French Dahomey on the east. After the World War it was divided between Great Britain and France. The total area of Togoland, is 33,700 square miles with an estimated native population of 1,032,000 and 125 Europeans. The chief products are palm oil, palm kernels, cocoa, copra, and cotton; the chief imports consist of cotton goods, foodstuffs, salt and tobacco. Of the total area, 12,600 square miles were allotted to Great Britain. There are native industries, such as straw plaiting, weaving coarse fabrics, pottery, etc.

TOMATO WEEVIL. See ENTOMOLOGY, UNITED STATES BUREAU OF.

TONGA, or FRIENDLY ISLANDS, a British Protectorate consisting of three groups of islands—Tonga, Haabai, and Vavau and some neighboring islands—in the Pacific Ocean, between 15 and 23° 30' south Lat., and 173° and 177° west Long. The total area is about 385 square miles. The capital is Nukualofa. The population is 23,562, including 22,689 Tongans, 250 half castes, 247 other islanders and 376 Europeans. The natives are Christians, 16,000 Free Church, 4,000 Wesleyan Methodists and 3,000 Roman Catholics. Native products are confined almost entirely to copra, of which 10,992 tons were exported in 1920. Foodstuffs, hardware, timber, sugar, are the principal imports. There is a legislative assembly of 21 members—seven nobles elected by their peers, seven ministers of the Crown, and seven representatives elected by the people. The British High Commissioner exercises civil and criminal jurisdiction over all foreign citizens and supervises the finances. The queen reigning in 1922 was Salote, who succeeded to the throne in 1918. The British High Commissioner in 1922 was Sir Cecil Hunter Rodwell.

TONGASS NATIONAL FOREST. See FOREST SERVICE, UNITED STATES.

TONKING, a French Protectorate in Indo-China. Its area is 40,530 square miles and its population 6,470,250, of whom 6,875 are Europeans. The capital, Hanoi, is a modern city of 90,303 inhabitants. The local budget for 1921 balanced at 13,131,390 piastres. Rice is the chief crop. Other crops are Indian corn, sugarcane, coffee, tea, tobacco and arrowroot. Fruit trees are numerous. Raw silk is produced in large quantity. Hard coal and rich limestone deposits constitute most of the mineral wealth. Rice, Indian corn and animal products are the chief exports. Imports consist of metals and machinery, beverages, textiles, yarns and tissues. See FRENCH INDO-CHINA.

TORONTO, University of, a non-sectarian, co-educational institution, founded in 1827 and located at Toronto, Canada. In 1922-23 it had a faculty of 567 members, 4,855 students, and property valued at \$8,740,002. Its income for

1921-22 was \$1,914,545. Sir Robert Falconer, K.C.M.G., is president.

TOWNSEND, Horace, American art critic and author: b. Claughton, Cheshire, England, 3 Feb. 1859; d. New York City, 9 May 1922. He was educated at Birkenhead School, England, and thereafter studied architecture under Charles Barry, President of the Royal Institute of British Architects. He moved to New York in 1880, took up journalism, and from 1882-90 was a member of the staff of the *New York Tribune*. From 1890-1900 was the London correspondent of the *New York Herald* and the *Philadelphia Public Ledger*. He was regarded as an authority on works of art. He published 'A Little Girl in Groy' (1898); 'A Handful of Silver' (1902); 'Old Wedgwood' (1907); 'Old English Potteries and Porcelains' (1914); and the play 'Child of Naples' produced by Alexander Salvini in 1889. He was joint author of the plays 'Myles Aron' and 'Mavourneen.' He also edited 'Some Letters of R. L. Stevenson' (1902).

TRANSATLANTIC RECORDS. Finishing her trip on the first day of December, the White Star liner *Majestic*, in 1922, established a new transatlantic time record by making the run from New York to Cherbourg (3,100 miles) in five days, six hours and 13 minutes. This was one hour and 56 minutes faster than the record run of the Cunard liner *Mauretania*, made on 24 July 1922 when she covered the route in five days, eight hours and 9 minutes. During the first day of her record run, the *Majestic* made 554 miles, at an average speed of 24.57 nautical miles an hour; on the second day she made 564 miles, averaging 24.53 miles per hour; on the third day she made 572 miles, averaging 24.87 miles per hour; on the fourth day she made 568 miles, averaging 24.70 miles per hour and up to noon of the fifth day she made 562 miles, averaging 24.43 miles per hour. Her average for the entire trip was 24.59 knots per hour. The *Majestic* left Ambrose Channel lightship at 12:57 p. m. on the 25 November, and passed the buoy off Cherbourg breakwater at 12:10 midnight on the 1 December. Allowing five hours difference in time between New York and Cherbourg, her running time was as given above, i. e., five days, six hours and 13 minutes. In 1910 the *Mauretania* made the trip from Queenstown to New York in four days, ten hours and 41 minutes, having the previous year made the trip from New York to Queenstown in four days, 13 hours and 41 minutes. In April 1922 the *Mauretania* made the trip from New York to Cherbourg in five days, eight hours and 56 minutes. In 1909 the *Cronprinzessin Cecilie* made the run from New York to

Plymouth in five days, seven hours and 25 minutes. In 1904 the *Deutschland* made the trip from New York to Naples in seven days, 16 hours and 44 minutes.

TRANSVAAL, a province of the Union of South Africa. Area, 110,450 square miles and population, 2,085,837 in 1921. Johannesburg is the largest city with 149,678 inhabitants. Other cities are Pretoria, 45,163; Benoni, 14,474; and Krugersdorp, 13,494. See SOUTH AFRICA, UNION OF.

TRANSYLVANIA, a district of south-eastern Europe formerly part of the Kingdom of Hungary but since the World War annexed by Rumania. Its area is 22,312 square miles with a population of 2,678,367. See RUMANIA.

TRANSYLVANIA COLLEGE, a co-educational institution founded in 1783 and located at Lexington, Ky. In 1922-23 it had a faculty of 30 members, 296 students, property valued at approximately \$1,000,000 and an income of \$74,000. Andrew D. Harmon, LL.D., is president.

TRASK, Katrina. See PEABODY, MRS. GEORGE FOSTER.

TRIESTE, city and district near the head of the Adriatic Sea acquired by Italy from Austria-Hungary as a result of the Treaty of Saint Germain. The area of the district is 37 square miles with a population of 229,510. See ITALY.

TRINIDAD AND TOBAGO, islands off the coast of South America belonging to Great Britain. Trinidad has an area of 1,863 square miles and Tobago 114 square miles. The population in 1920 was 391,279. Port of Spain on Trinidad is the capital. English is generally spoken. The inhabitants are about two-thirds natives of the West Indies of African descent. The white inhabitants include English, French, Portuguese and Spanish. There is a large asphalt lake on Trinidad. Asphalt and oil are the chief products of the colony. In 1920, 113,697 tons of asphalt were exported and 31,905,833 gallons of crude petroleum. Petrol spirit exports the same year amounted to 21,420,821 gallons. Other exports were cocoa, 60,723,623 pounds, copra 2,134,570 pounds, 47,967 tons of sugar, 54,965 gallons of rum, and 557,491 gallons of molasses. The revenue from asphalt in 1920 amounted to £47,708. There are 124 miles of railways. In Tobago are grown cotton, tobacco, rubber, and cacao. Trade with the United States in 1922 amounted to \$4,882,268 for imports and \$4,565,575 for exports. The two islands form a single colonial unit of administration. The governor—Sir H. S. Wilson in 1922—is assisted by an Executive Council of seven members and a Legislative Council of 21 members.

TRINITY COLLEGE, an educational institution for men located at Hartford, Conn. It was founded in 1823, and though non-sectarian, is of Episcopal affiliation. In 1922-23 the faculty numbered 26 and the students enrolled, 264. The institution's property is valued at \$1,416,472.86 and its income for the current year was given as \$99,182.97. Its president is R. B. Ogilby.

TRINITY UNIVERSITY, a co-educational institution, non-sectarian but under Presbyterian control, founded in 1869 and located at Waxahachie, Texas. In 1922-23 it had a faculty of 26 members, 385 students, property valued at \$350,000 and an income of \$118,000. John Harmon Burma, D.D., is president.

TRIPOLITANIA. See LIBYA.

TRUST COMPANIES. According to the 1922 edition of 'Trust Companies of the United States' published by the United States Mortgage and Trust Company of New York, there were in the United States, in that year, 2,372 trust companies with resources aggregating on 30 June \$12,739,620,733.25, as compared with 2,390 trust companies which in 1921 reported assets totaling \$12,323,430,513.35. The deposits of these companies aggregated \$10,470,477,813.01 in 1922 as compared with \$9,554,012,518.71 in 1921. The States showing the largest gains for the year were: New York, \$227,757,000; Illinois, \$109,000,000; California, \$77,292,000; New Jersey, \$53,331,000; Maryland, \$34,222,000; Massachusetts, \$33,214,000; Rhode Island, \$15,257,000; Virginia, \$15,254,000. The North Atlantic and North Central States showed the largest sectional gains. The number of trust companies in each State with their combined resources is as follows: Alabama, 33, \$43,821,971.77; Arizona, 12, \$10,520,856.68; Arkansas, 40, \$52,068,286.51; California, 26, \$879,831,752.02; Colorado, 19, \$58,723,554.98; Connecticut, 75, \$186,416,810.28; Delaware, 15, \$45,120,497.85; District of Columbia, 7, \$77,613,821.93; Florida, 30, \$39,523,015.25; Georgia, 18, \$45,769,980.62; Hawaii, 6, \$6,632,281.12; Idaho, 9, \$9,138,593.73; Illinois, 102, \$1,263,537,383.76; Indiana, 166, \$227,431,550.94; Iowa, 93, \$94,394,351.79; Kansas, 13, \$15,902,939.96; Kentucky, 60, \$75,500,478.17; Louisiana, 53, \$246,708,717.09; Maine, 54, \$127,695,501.81; Maryland, 28, \$209,126,627.32; Massachusetts, 101, \$786,119,148.17; Michigan, 11, \$49,855,642.54; Minnesota, 25, \$48,651,348.26; Mississippi, 32, \$35,398,016.30; Missouri, 105, \$393,442,041.61; Montana, 19, \$33,745,256.08; Nebraska, 24, \$17,363,355.97; Nevada, 3, \$4,449,775.03; New Hampshire, 13, \$18,108,368.06; New Jersey, 133, \$682,807,190.55; New Mexico, 8, \$6,351,519.49; New York, 198, \$3,556,356,518.09; North Carolina, 102, \$120,349,533.92; North Dakota, 4, \$2,157,947.66; Ohio, 76, \$970,778,773.86; Oklahoma, 11, \$5,868,477.42; Oregon, 8, \$9,783,177.82; Pennsylvania, 367, \$1,563,473,528.64; Rhode Island, 12, \$211,062,884.11; South Carolina, 22, \$18,495,855.78; South Dakota, 13, \$9,544,455.49; Tennessee, 103, \$126,047,726.58; Texas, 69, \$69,018,849.85; Utah, 7, \$23,035,152.16; Vermont, 39, \$67,005,384.97; Virginia, 35, \$78,720,017.25; Washington, 19, \$31,309,902.08; West Virginia, 31, \$64,080,683.37; Wisconsin, 14, \$14,913,536; Wyoming, 9, \$5,847,647.56. The capital of the 2,372 companies, which reported in 1922, totaled \$810,262,013.93 while surplus and undivided profits totaled \$918,150,843.57. The year 1922 was the one hundredth anniversary of the trust company activities in the United States, the first grant of fiduciary powers to a corporation having been made in 1822.

TUAMOTU ISLANDS. See FRENCH ESTABLISHMENTS IN OCEANIA.

TUBERCULOSIS. The best available statistics clearly indicate that the death rate from tuberculosis has been cut in half since the National Tuberculosis Association opened its office in January 1905. To be exact, the decline has been from 200.4 per 100,000 population in 1904 to 99.4 in 1921. Stated otherwise, this means that in the year 1922, if the same death rate were prevailing that did prevail in 1904, there would have been 100,000 more deaths from tuberculosis than actually occurred this last year.

The development of a more cordial relationship with the other national health agencies in this country and with international agencies has been one outstanding feature of the year's work. From the point of view of one of the individual members of the National Health Council, it is still difficult to say what have been the financial gains achieved through that body. It is certain, however, that the gain is in better understanding that comes inevitably from working together and living together, which, while it cannot be measured in dollars and cents, is of incalculable benefit. One might say the same thing of the development of relations between the National Association and the International Union against Tuberculosis. The business man might find it difficult to justify any considerable expenditure of money in promotion of international tuberculosis relations. It is unquestionably true, however, that the National Tuberculosis Association and its affiliated organizations have just as much to gain from the promotion of such cordial relations as have the foreign organizations.

This last year has also been one of binding into a more coherent whole the State associations with the National Association. The agitation of the last three years particularly has been productive in bringing the National and State associations as well as the National and local associations into a closer working relationship than at any previous stage in the history of the tuberculosis movement. The State associations now definitely become the distributing and selling centers of the National Association. They also become in a real sense the Association itself. While the National Association is not a federation of State associations, it is more and more becoming the servant and leader of the State associations.

In the field of education, probably the most significant achievement of the year has been the increased effort toward standardizing the Modern Health Crusade movement. The work of the committees in this direction has been of signal significance. The Modern Health Crusade is now at that stage of development where it can and should be sold as a basis for a system of health education to the different State departments of education. Realizing this possibility the National Association with the help of the State organizations is reducing the essence of the Crusade to a teaching syllabus which in turn will, it is hoped, become the basis of education in personal hygiene and health habit-forming instruction.

The announcement of the Milbank Fund in May of its entrance into the field of tuberculosis demonstration is an outstanding feature of the year's development. Most of the income of this

fund of \$10,000,000 is now available for the conduct of a series of tuberculosis demonstrations in New York State, the first of which is about to be inaugurated. Framingham has accomplished no more significant result than this, that it has stimulated another series of demonstrations of a similar character. These Milbank Fund demonstrations will in turn answer the many questions that Framingham because of its restricted area could not answer and will prove conclusively to the American municipalities whether tuberculosis can or cannot be controlled provided sufficient funds are available for the purpose.

In the hospital and sanatorium field probably the most significant development has been the establishment of the Ida Potts Memorial at Hudson, N. Y., which it is hoped will be the nucleus of a great industrial and vocational colony for arrested cases of tuberculosis emulating and developing further the ideals of Varrier-Jones at Papworth Village in England.

No outstanding scientific discoveries in the field of research or treatment can be recorded. The increasing number of studies being made all over the world is steadily improving our knowledge of the *tubercle bacillus* and its activities in the human body.

PHILIP P. JACOBS,

Publicity Director, National Tuberculosis Association.

TUBERCULOSIS IN ANIMALS. See ANIMAL INDUSTRY, UNITED STATES BUREAU OF; VETERINARY MEDICINE AND SURGERY.

TUFTS COLLEGE, a non-sectarian educational institution, founded in 1852 and located at Tufts College, Mass. The Liberal Arts and Engineering schools are for men. The medical and dental departments are co-educational. In 1910, Jackson College for women, with liberal arts and secretarial courses, was opened as a department of Tufts College. In 1922-23 the college had a faculty of 368 members, 2,094 students, property valued at \$4,456,333.02 and an income of \$615,305.74. John A. Cousens, LL.D., is president.

TULANE UNIVERSITY OF LOUISIANA, a non-sectarian, State institution founded in 1834 and located at New Orleans, La. It is co-educational in professional schools with separate department for women in the undergraduate courses. In 1922-23 it had a faculty of 374 members, 4,250 students, property valued at \$1,951,403.31 and an estimated income of \$800,000. Albert B. Dinwiddie, Ph.D., LL.D., is president.

TULARAEMIA. See MEDICINE AND SURGERY, ADVANCEMENT OF; PUBLIC HEALTH SERVICE, UNITED STATES.

TULSA, University of, a co-educational institution of the Presbyterian Church of the United States of America, founded in 1894 and located at Tulsa, Okla. In 1922-23 it had a faculty of 25 members, 400 students, property valued at \$500,000 and an approximate income of \$80,000. James M. Gordon, A.M., LL.D., is president.

TUNNELS. The most important tunnel under construction in 1923 is the twin vehicular

tunnel under the Hudson river, connecting the City of New York with Jersey City, and designed to carry the enormous automobile and other vehicular traffic that exists between the States of New York and New Jersey at this point. After 20 years of planning and discussions, the laws under which the tunnel is being constructed were passed by the legislatures of the States, and commissions were appointed to carry on the work. A Congressional resolution, approved by the President was also essential to establish legality. Each State appropriated \$1,000,000 to start the work. The contracts were let in March, 1922, and actual work began at the Canal and West street terminal in New York 31 March. Booth & Flinn, Ltd., the contractors, are to receive \$19,331,723 for the work on the west end, and the total cost of the twin tunnels is expected to be over \$30,000,000.

The total length of this pair of tunnels is 9,250 feet. The circular tubes are 29½ feet outside diameter, made of cast-iron segments, bolted to form three-foot rings; each ring is lined with concrete. The tubes pass under the river 60 feet below low water mark, and they will lie in a bed of loose rock and mud, supported by combination steel and concrete piles running down to bedrock. The roadways are 20 feet wide and 12 high, the large half-moon spaces above and below being used principally for ventilation. They have an annual capacity of 15,800,000 vehicles, but the expected traffic is about one-third of this total. The Manhattan terminal has its entrance at Broome Street, and its exit at Canal and Varick streets. The Jersey City terminal has entrance on 12th Street and exit on 14th Street. The ventilation problem was exceedingly difficult to work out, involving conditions beyond previous experience, as most of the vehicles would be delivering their gasoline exhausts continually into the traffic tubes. The accepted plan is to provide four shafts, two on each side of the river; two of these shafts will be on the edge of the river at the pierhead lines, the others close to the portals. Fresh air will be pumped continually into the ducts on the under side of the tunnels and the vitiated air will be sucked out from the ducts on the upper side of the tubes. The system provides 40 complete changes of air per hour.

Electric power houses were completed in advance to supply the power and compressed air for tunneling. The method is to make each advancing shield a working head, within which the men form the iron and concrete rings, one at a time, working under compressed air, so the water cannot get in on them. When a ring is completed it is forced ahead by air-pressure, there being no digging. The advancing head simply forces its way through the loose rock, silt and mud. The supporting piles involve novel construction. They are primarily steel cylinders, ¾ inches thick and 24 inches diameter, made in convenient lengths, closely fitted and forced down to the bedrock, 250 to 260 feet. Then the water that has flowed into them is pumped out, and concrete blown into its place. When completed the top portion of 60 to 110 feet is cut off by rotary cutting tools working within the pipe. From 1,000 to 1,500 men are employed continuously on the work, which is scheduled

to be completed in April 1925, beyond that time involving penalties for the contractor.

Since the tunnel heads are pushed into the river mud quite near the water line, the river bottom is strengthened as the work proceeds by dumping layers of rock and clay over the places where the tunnel-heads are progressing, thus lessening the chances of water getting into the working heads. When the tunnels were built under the East River at New York, one of the "sand-hogs" as the workers are colloquially called, was actually blown out of the tunnel head, and into the river, where he swam to the surface and escaped, badly frightened but not seriously injured.

The cost of these vehicular tunnels is to be recovered by a system of tolls, and these are expected to pay for maintenance and wipe out the original investment within 20 years. The tolls will be practically the same as the ferry charges, and as there will be no waiting, the vehicular traveling public is sure to patronize the tubes as soon as they are open. Incidentally, coal, food supplies and merchandise coming into New York from the West will reach its destination several hours sooner. The actual driving of the tunnel shields was begun on the New York side at the close of 1922, and the driving from the Jersey side a few months later.

An even more costly project than this vehicular tunnel is the long-agitated tunnel connecting Brooklyn with Staten Island, passing beneath the Narrows. It is for both passenger and freight transit, and will cost \$60,000,000. A start was made 3 Jan. 1923, when Mayor Hylan of New York signed a contract for the preliminary work of constructing the Brooklyn shaft at a cost of \$494,539. This shaft is at 68th Street and Shore Road, Bay Ridge, in the Borough of Brooklyn, and trains on the Fourth Avenue subway will eventually run through the tunnel two miles under the Narrows, to a terminal at St. George, near the Municipal ferry. The total length between terminals will be about three miles. It is to be a double tunnel with two tubes.

A third ambitious scheme for tunneling in the metropolitan district of New York is seeking legislative approval in New York and New Jersey. It is proposed to tunnel from Queens, under 125th street, New York, right under the Hudson, then under the Palisades, and on to Paterson, N. J. The estimated cost is \$75,000,000. It is believed that such a thoroughfare would afford immense relief to the great traffic that now crosses New York City several miles to the south.

Among interesting tunnels and tunnel projects in other parts of the United States is the Shandaken tunnel, a part of the new Catskill water supply system. This is expected to be completed about the end of 1923. It is 18 miles long, cut through solid rock to a diameter of $11\frac{1}{2}$ by $10\frac{1}{4}$ feet, and is to carry the overflow of water from the great Gilboa dam. It dips during its length, so that it operates on the siphon principle, delivering the water again at the exit only slightly below the level of entrance. The Moffat tunnel, under James Peak, Colorado, has been authorized by the State legislature, and is to be financed by a bond issue of \$6,720,000. This is to pass under

what is known as the Continental Divide, about 50 miles west of Denver. It will shorten the rail distance between the Atlantic and Pacific about 70 miles, and bring Denver and Salt Lake City in about 100 miles closer by railway connection. The tunnel length will be six and a half miles, and the eastern portal will be 9,190 feet above sea level, the western 9,100 feet. It will save 2,500 feet in grades, as the present route via Corona carries the tracks to a high point of 11,660 feet. The plan of boring this tunnel is novel. It is first to be cut through with a "pioneer bore" eight by ten feet, to permit the transit of men, material and tools, before the full size bore is begun. The motive power in the tunnel will be electric, so that there will be no smoke nuisance to take care of.

A notable rock tunnel is nearing completion in 1923, around Niagara Falls, on the American side. It is 32 feet inside diameter and 4,300 feet long. Starting at the upper river level it dips 130 feet, then rises again at the forebay of the hydraulic plant No. 3 of the Niagara Falls Power Company. The water carrying capacity of this tunnel is 10,000 feet a second and it will eventually deliver 70,000 added horse-power at the reaction turbines.

Many rock tunnels are in course of construction in the Western United States in connection with hydroelectric development. The tunnels built years ago for the famous Kern River development in California are being enlarged to four times their original capacity. The Great Western Power Company is constructing a 21,900 foot tunnel as a part of the Caribou project, on the Feather River. The East Bay Water Company is running a 14,553 foot tunnel from San Pablo dam to Oakland. The Skagit project, near Seattle, involves two tunnels one of 2,675 the other of 10,978 feet.

Two important tunnels are in progress in Japan. The largest is the Tanna tunnel, a railway shortening project. The main tunnel is to be five miles long, horseshoe shape, 28 feet wide and $22\frac{1}{4}$ feet high. Twenty-two smaller tunnels on this short line bring the total tunneling up to over 50,000 feet. The other Japanese tunnel is an under-water project, for railway connection between the two larger islands of the empire, at Shimonoseki and Moji. The water channel to be spanned is about a mile in width, and the cutting is through solid rock.

In England, the City and South London Railway, the oldest of the tube systems, is enlarging the diameter of its tunnels, and maintaining traffic at the same time, an engineering feat of some quality. There is also projected a railway tunnel under the Thames at Gravesend to connect the railways north and south of the river. The estimated cost is about \$20,000,000. The Thames is 54 feet deep and 2,400 feet wide at the point of crossing.

The famous Simplon tunnel, under the Alps, $12\frac{1}{4}$ miles long, the most noteworthy tunneling project of its time, proved inadequate for the traffic to be carried, and there was completed in October 1922, a parallel or twin tunnel that will greatly expedite international travel.

CHARLES H. COCHRANE.

TURKESTAN. See CHINA; RUSSIA.

TURKEY, a country of southeastern Europe and western Asia, the greater part of which lies in the Peninsula of Asia Minor. Its borders were still undefined at the close of 1922.

Area and Population.—Before the World War Turkey or the Ottoman Empire consisted of Turkey in Europe, Turkey in Asia (Anatolia, Arabia, Syria, Mesopotamia, Palestine and Kurdistan). The Balkan War of 1912 resulted in a loss of considerable Turkish territory in Europe, the cessions going to Bulgaria, Serbia, Montenegro and Greece. During the World War Cyprus and Egypt, formerly suzerainties of Turkey were lost to it, Cyprus being annexed by Great Britain and Egypt being declared a Protectorate. The Treaty of Peace with the Allied and Associated Powers, signed 10 Aug. 1920, reduced the territory of Turkey still further, practically all of Turkey in Europe being ceded to Greece together with the administration of Smyrna and a surrounding strip of territory; Mesopotamia, Palestine, Syria, were made independent under mandates and the Hejaz and Armenia were made independent. Constantinople was to be retained by Turkey but the coastal area of the Dardanelles was placed under a Commission of the Straits. This Treaty was never ratified and in 1921 certain concessions were made to Turkey in an effort to make the Treaty acceptable. Soon after hostilities broke out between Greece and the Turkish Nationalist forces under Kemal Pasha and continued into 1922 when the Nationalist Turks defeated the Greeks, captured Smyrna and threatened the Zone of the Straits. These events prevented the Allied Powers from bringing about a general settlement as to Turkish territory. Finally in November 1922 the Near East Conference was gathered at Lausanne, Switzerland, in an attempt to harmonize Turkish National aspirations with the rival claims of the nations adjoining Turkey and with those of the Great Powers. For the Turkish claims and the results of the Lausanne Conference see section on History below. Old Turkey had an area of 613,724 square miles with a population of 20,973,900. Had the Treaty of Sevres become operative, Turkey would be deprived of a territory of 438,750 square miles with a population of about 12,000,000, leaving to the new Turkey 174,900 square miles and a population of 8,000,000. In European Turkey in addition to Turks there are numbers of Greeks, Bulgars, Armenians, Gipsies and Jews, while in Turkey in Asia there are about 4,000,000 Arabs, besides Armenians, Syrians, Kurds, Circassians, etc. Constantinople, the capital, has a population of 1,000,000. Other chief cities are Brusa (110,000); Kaisariyeh (54,000); Konia (45,000); Trebizond (55,000); Bitlis (40,000); and Sivas (65,000).

Religion.—The established religion is Mohammedanism of which the head until 1922 was the Sultan. After the flight of Sultan Mohammed VI on 17 Nov. 1922, his cousin, Abdul Mejid was elected Caliph of Islam, or head of the state religion apart from the headship of the state. Mohammedans form the vast majority of the population, but at least until 1922 there existed a number of non-Mohammedan native communities or "millets," including Orthodox

Greeks, Latin Catholics, Armenians of two rites, Chaldean Catholics, Syrian Catholics, Protestants, Melchites and Jews.

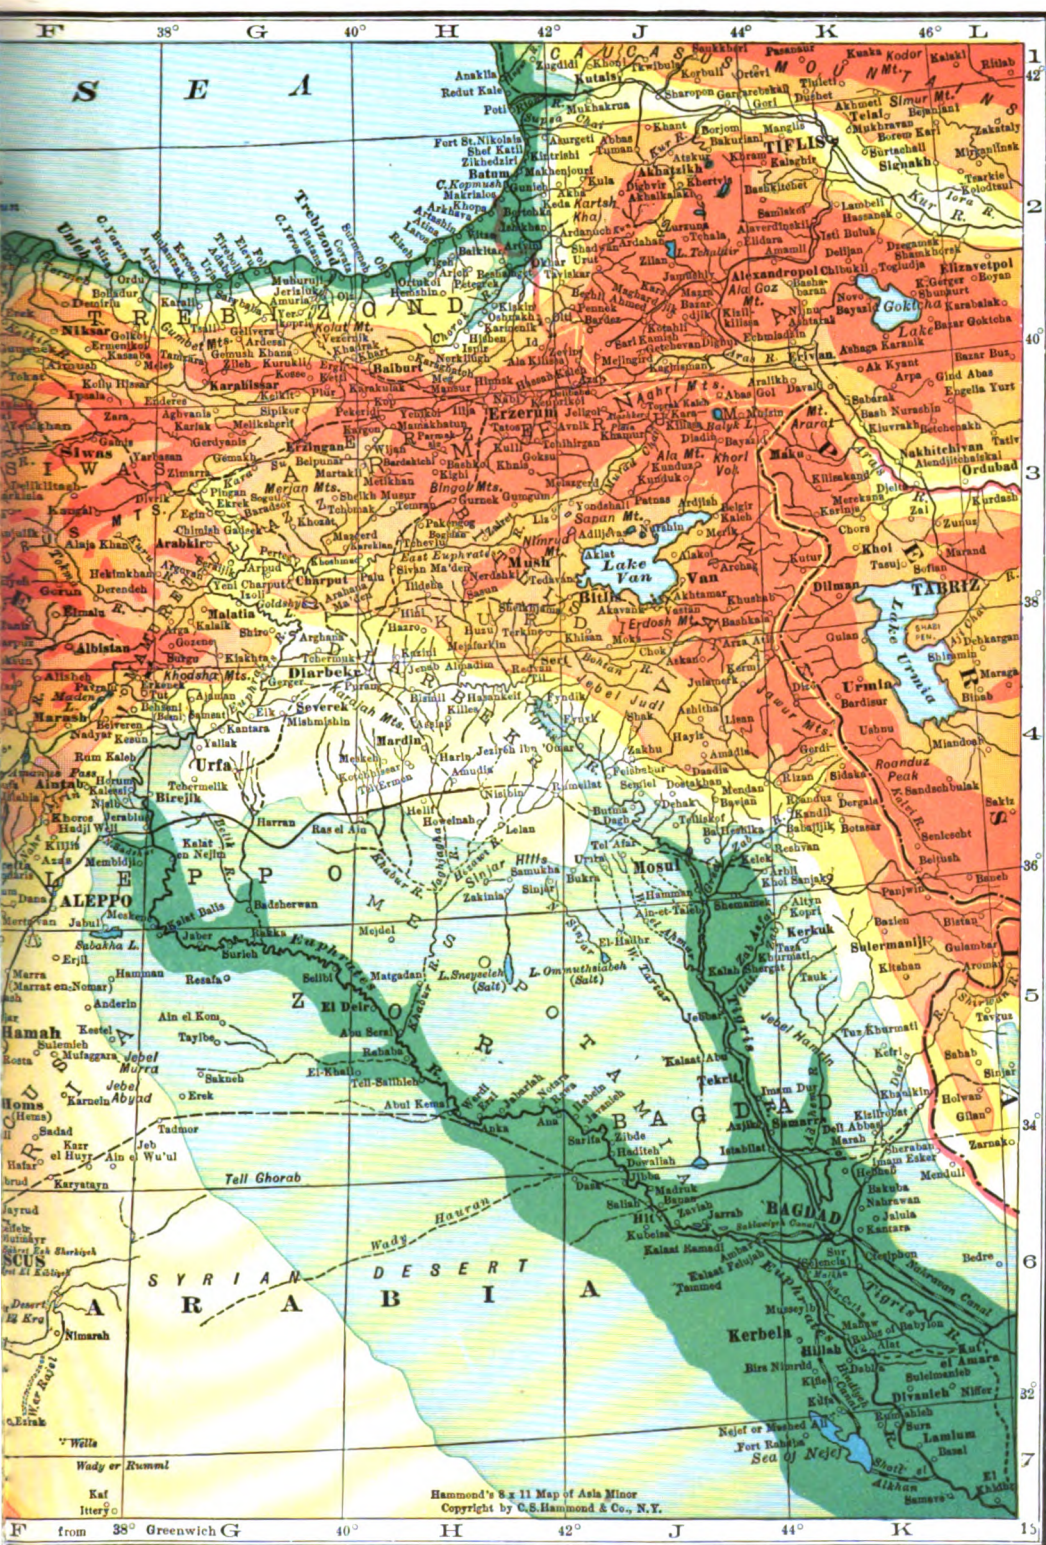

Education.—Elementary education is compulsory in Turkey at least nominally for all children from seven to 16 years of age. There are several kinds of schools, the total number of which has been estimated at 36,230 with 1,331,200 pupils. There are several schools maintained by foreign missionaries. There is a university at Constantinople with faculties of art, theology, law, medicine, and science. In addition there are a number of higher special schools.

Production and Industry.—Land is held under three forms of tenure—Miri, or crown lands; Vakuf or pious foundations, and Mulk or simple freehold. Agriculture is carried on in the most primitive fashion, though the land is very fertile. The chief crops are the cereals, tobacco, cotton, figs, nuts, almonds, grapes, olives, coffee, and all varieties of fruits. Anatolia produces wool and mohair; the coffee centre is in the Hodeida district; opium is an important crop about Konia, while tobacco is grown both in Turkey in Europe and Turkey in Asia. The Brusa and Constantinople areas are noted for the production of silk, the production of cocoons in 1921 amounting to 1,350,000 kilos. The tobacco crop of 1919 amounted to 4,273,000 kilos. There are 21,000,000 acres under forest but the conservation regulations are poorly enforced with the result that the country is being rapidly denuded of its timber. Pine, oak, cedar, fir and larch are the chief trees in the forests. Turkey is rich in minerals but its mines are little worked. Silver, lead, antimony, copper, manganese, borax, coal and lignite, salt, are among the chief mining products. Chrome, emery and meerschaum are other products of commercial importance. The production of coal and lignite reaches about 400,000 tons annually; of silver about 2,500 kilos annually; of borax 7,500 tons annually; of kaolin 40,000 tons yearly. The fisheries are well developed, the annual value of the catch of the Bosphorus region alone being valued at \$1,200,000 yearly. Sponge and pearl-fishing are important branches of this industry. The manufacturing industries are still in a primitive state. Wool and cotton-spinning are the chief industries. There are 50,800 cotton spindles in operation, while the output of the woollaryn mills is about 2,750,000 pounds yearly.

Commerce.—In 1920 Turkey imported goods to the value of 169,396,267 Turkish-pounds and exported goods to the value of 47,625,882 Turkish pounds (normal exchange, Turkish pound equals \$4.50). In the first nine months of 1921 Turkish imports were valued at 73,237,199 Turkish pounds and exports at 19,756,524 Turkish pounds. Petroleum, sugar, and coffee were the chief imports, while opium, raisins, dried fruits, wool, carpets and tobacco were the chief articles of export. In 1920 the United States stood second in the list of countries furnishing Turkish imports, the United Kingdom being first.

Trade of the United States with Turkey and the Turkish people amounts to over 100 million dollars a year. This figure, according to the *Trade Record of The National City Bank of New York*, is based in part upon our own official

records and in part upon those of the Turkish Government, which puts its imports of United States merchandise in 1920 (the latest year for which its reports are available) at 25,953,000 Turkish pounds sterling. The value of its exports to the United States in the latest available year are put at 4,981,000 pounds sterling. Our own figures of trade with Turkey, which are based upon trade with the Turkish area outlined by the Treaty of Sevres (not yet ratified), are much less than those of the Turkish Government, which presumably accredits to the United States many articles of American origin entering Turkey through other countries, while our own figures only include those of the direct trade with the newly outlined and greatly reduced area now officially known as Turkey. Our own records of the fiscal year 1922 put the imports from "Turkey in Europe" at \$8,627,000 and the exports thereto \$19,217,000. The 1922 figures of trade with "Turkey in Asia" no longer include Hejaz, Arabia, Mesopotamia, Armenia, Kurdistan or "Greece in Asia" (all of which are separately stated) and as a result the official total of imports from Turkey in Asia is only \$1,372,000 and exports thereto \$760,000. The figures of our trade with "Greece in Asia," which apparently has now again fallen under Turkish control, are, imports therefrom \$10,802,000 and exports thereto \$3,156,000. While all of these figures, says the *Trade Record*, are of course "subject to revision" by reason of the recent developments in Smyrna and the Asiatic area formerly controlled by Greece, they at least justify the conclusion that our trade with the area now claimed by the Turks is in the vicinity of 100 million dollars.

Considerably more than half of our trade with the Turkish people consisted of imports, for the "trade balance" with that country has always been against us. We buy freely its tobacco, fruits, nuts, wool, mohair, coffee, and rugs; and while it wants manufactures in exchange for its raw products it quite naturally finds it more convenient to buy them from nearby Europe, with which it has been accustomed to trade for generations. Yet we do export limited quantities of certain manufactures to Turkey, including cottonseed oil, oleo oil, illuminating oil, cotton cloths, refined sugar, and miscellaneous manufactures. Tobacco is one of the largest of our imports from Turkey, amounting to about five million dollars in 1922 from Turkey in Europe and eight millions in 1921 from the area then designated as Turkey in Asia. The fruits and nuts from that area are also important and include figs, dates, and almonds in large quantities.

Finance.—According to the Treaty of Sevres of 10 Aug. 1920, Turkish finances were to be controlled by a Finance Commission composed of representatives of England, France and Italy. As a result of the chaotic state of the Turkish administration in the years following the war the financial system collapsed utterly. The Nationalist Assembly at Angora, however, voted a budget in 1921 with revenue estimates of 79,333,440 Turkish pounds and estimated expenditures of 86,519,650 Turkish pounds. The war with Greece in 1921–22 made further inroads on the Nationalist treasury and the deficit was even

greater than these figures would indicate. In 1920 the external debt of Turkey was placed at 171,527,034 Turkish pounds.

Defense.—The Treaty of Sevres imposed severe limitations on the number of Turkish troops, limiting the grand total of all arms to 50,000 men. The non-ratification of the Treaty and the rise of the Nationalist forces under Kemal left these prohibitions a dead letter. For the number of the Kemalists forces see article below on History.

Government.—During the year 1922 the Sultan's government at Constantinople was displaced by the Nationalist Assembly at Angora. On 3 Nov. 1922 the Assembly dethroned the Sultan and declared the Ottoman Empire at an end. At the same time the Assembly reserved the right to elect the Caliph as the religious head of the Mohammedan faith. There is to be no other Government in Turkey than that of the National Assembly, which declaration was regarded as equivalent to the establishment of a Turkish republic. For further details of the changes inaugurated in Turkey see following section.

History.—The Turkish people saw the year 1922 dawn with Turkey under two governments — that of the Sultan at Constantinople in virtual subjection to the Allied nations and that of Angora under the leadership of Mustapha Kemal in deadly struggle with the Greek forces in Asia Minor. The Angora Government late in 1921 concluded a treaty with France which heartened the Nationalist Turks as much as it depressed Greece and her ally, Great Britain. The Moslem nations were in full sympathy with the Nationalist movement in Turkey and recognized Angora as the centre of the Moslem world. They turned their eyes and hopes to the new Turkish capital, sent representatives there, and asked the leadership of the Nationalist Assembly for the Moslem world. The Angora government which adopted the friendliest attitude toward them all, signed political and commercial treaties with Persia, Afghanistan and Turkestan. The Allies decided to use their best efforts to bring about an armistice between the Greeks and Turks in Asia Minor and the text received in Athens 23 March of a tentative armistice asked the belligerents to accept an immediate cessation of hostilities. In reply the Greek government accepted the armistice proposals in principle conditional on certain reservations of a strictly military character. The Turkish Nationalists notified the Great Powers that their acceptance of the armistice was conditional on the withdrawal of the Greek army from the railway of Eski-Shehr to Afiun-Kara-Hissar within two weeks, and on the complete evacuation of Asia Minor by the Greek army within four months. This attitude drew from the Greek staff the declaration that under no circumstances would the Greek army abandon its present positions or evacuate Asia Minor. At the same time the Allies notified the Turkish Nationalists of their opposition to the evacuation of Asia Minor by the Greeks and declared that the Turks must accept the armistice as it was without new conditions. The problem was interrupted by the Genoa Conference. Meanwhile the non-Turkish elements in Asia Minor prepared to resist any and all attempts of the Turks or the

Allies to dislodge the Greek forces there. The Near East Conference at Paris in March modified the terms of the Sevres Treaty and Italy concluded a treaty with the Angora government which strengthened the position of the latter. Turkey was denied representation at Genoa but the Conference foundered on the Bolshevik demands though the Greek demands for Thrace and Smyrna continued a stumbling block to a settlement with Turkey. Little fighting took place during the summer but it was known that the Turks were improving their military strength from unnamed sources. On the Black Sea the Greek naval forces bombarded Samsun on 7 June on the ground that munitions were stored there. Late in June the British government in a note to the French government intimated that the long delay in effecting peace in Anatolia must come to an end and that the March proposals should be answered one way or the other. In June there were made charges that the Turk Nationalists were committing atrocities against the Greek populations remaining in their power. The menace of the situation in Anatolia was emphasized in July when the Greeks determined to bring about a solution of their long conflict in that quarter. An advance on Constantinople was determined upon but the project was frustrated by the British commander. Thereupon the Greeks issued a decree declaring Smyrna and the surrounding territory autonomous. In the last week in August the entire situation was changed by the sudden attack of the Turks on the Greeks along the front in Asia Minor. The Greek forces were routed and fell back on Smyrna where thousands of refugees gathered from the inland region. The Turks entered Smyrna on 9 September without resistance from the Greeks remaining there. The effects of the victory were far reaching. In Greece Constantine lost his throne within a few weeks and in Constantinople there was great rejoicing. A fire swept the city of Smyrna three days after the entrance of the Turks. It started in the Greek and Armenian quarter and was plainly of incendiary origin. The total loss was \$200,000,000 and about 1,000 lives. Thousands of Greeks were transported in Greek and Allied vessels to the Greek islands nearby. It was now feared that the Turks would cross the Straits and pursue the Greeks into Thrace and another Balkan war loomed on the horizon. Rumania, Bulgaria and Yugoslavia remained quiescent and the fear did not materialize. Greece marshalled her forces in Thrace but the Turks were insistent and demanded that Thrace be returned to Turkey. The Turks were incensed when they brought their forces near the Straits preparatory to crossing into Thrace to find the way barred by British forces at Chanak. The British remained firm in maintaining the neutral zone. For days it appeared that a clash between the British and Turks was inevitable but finally a joint note of the Allies from Paris to Kemal on 23 September promised the Turks full sway over Anatolia and Thrace to the Maritza River and possession of Constantinople, and that the Straits should be placed under the guardianship of the League of Nations. The note urged an immediate meeting of the Allies, Turkish and Greek generals at Mudania to formulate the terms of an armistice

pending a peace conference. Thus came to an end the Greek aspirations in Asia Minor. The Turkish reply was delayed until 5 October but it agreed to try to find some satisfactory solution of the Straits problem but it insisted on the right of Russia to be consulted on the Straits. The Mudania Conference concluded its labors on 10 October with the signing of an armistice convention providing for the evacuation of Thrace and the taking over of that territory by the Turkish civil authorities. Following the Mudania Conference events came fast one upon the other. The Turkish Nationalists on 1 November abolished the Sultanate, thereby ending a dynasty dating back to 1299. At the same time the Angora Assembly claimed the right to continue the Caliphate but to make it subject to its own control. The Turks were determined to secure the fullest control possible of what remained of Turkey in Europe and set about raising an army of 30,000 in Thrace despite the objections of the Allies. On 5 November came the news that the Nationalists had seized Constantinople and ordered the Allied forces to evacuate. The Allied commissioners accepted the new regime and the Sultan's ministry resigned. The Allies at the same time were informed that the Straits would be closed to Allied shipping except under special permits. A succession of similar demands showed the spirit of the now victorious Turks. Invitations were issued on 26 October to a conference at Lausanne, Switzerland, on 13 November to bring peace in the Near East. Russia and Bulgaria were among the nations summoned to discuss the question of the Straits. Ismet Pasha, the Angora Foreign Minister, headed the Turkish delegation to Lausanne and bore instructions from the National Assembly to obtain the realization of the following program: First, the frontiers of Turkey to be in accordance with the national pact; second, Greece to pay an indemnity; third, suppression of the capitulations, or extraterritorial rights for foreigners; fourth, modification of the frontiers of Iraq (Mesopotamia); and, fifth, complete independence for Turkey, financial, economic and political.

On 16 November the National Assembly accused the ex-Sultan, Mohammed VI, of treason and ordered that he and his cabinet ministers be placed on trial. The Sultan determined to escape and on 17 November escaped on board the British dreadnought *Malaya*. He was taken to Malta. Abdul Medjid Effendi, second son of the late Sultan Assiz, was elected Supreme Caliph of the Moslems by the National Assembly at Angora on 18 November and was invested with the sacred mantle of the Prophet on 24 November. For the first time in history the ceremonial prayers were said in Turkish instead of Arabic. Adrianople was taken over by the Turks on 25 November. Eight of the leading Turkish opponents of the Nationalist government were hanged at Angora on 12 November. Many others had escaped to Egypt and Europe. The deliberations of the Lausanne Conference in which the national status of Turkey was finally determined are fully chronicled elsewhere. See NEAR EAST.

TURKO-GRECIAN WAR OF 1921-22.
See NEAR EAST; PEACE AND ARBITRATION; INTERNATIONAL.

TUSCULUM COLLEGE, a non-sectarian co-educational institution, founded in 1794 and located at Greeneville, Tenn. In 1922-23 it had a faculty of 25 members and 200 students. No information given as to value of institution's property or its income. Charles Oliver Gray, D.D., LL.D., is president.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE, a non-sectarian co-educational institution for colored students, founded in 1881 and located at Tuskegee Institute, Ala. In 1922-23 it had a faculty of 231 members, and property valued at \$4,017,714.33. Number of students enrolled and the institution's income not given. Robert R. Moton, LL.D., is president.

TYPOGRAPHICAL UNION OF NORTH AMERICA, International. A society of typesetters, compositors and linotypers, banded together for mutual protection. It was founded in 1852 as the National Typographical Union and took the name International in 1869. Officers' reports for the fiscal year 1922 show a total membership of 68,450. Total

receipts from all sources for the year were \$11,498,451.89. The total expenses were \$10,253,145.75. For the support of its pension fund the organization collected \$655,721.44. It expended in pensions and the administration of the fund \$729,869.90. The receipts of the mortuary fund were \$648,475.54. The expenditures for mortuary benefits and administration of the fund aggregated \$393,906.98. For the support of the Union Printers Home at Colorado Springs there was collected \$247,486.90. A special assessment collected for defensive purposes amounted to \$9,539,648.61. The expenditures for defensive purposes were \$8,708,320.79. The general fund receipts of the organization were \$407,115. The expenditures from said fund were \$171,797.08. At the close of the fiscal year the organization had a balance of \$3,263,032.93 in bank and invested in government and municipal bonds. The union has its headquarters in the Bankers Trust Building, Indianapolis, Ind. The officers of the organization are as follows: President, John McParland; First Vice-President, Charles P. Howard; Second Vice-President, William R. Trotter; Third Vice-President, Charles N. Smith; Fourth Vice-President, Hugo Miller; Secretary-Treasurer, J. W. Hays.

TYROL, a former Crownland of Austria-Hungary, which was divided between Italy and the republic of Austria at the close of the World War. See AUSTRIA; ITALY.

U

UBANGI-SHARI. See FRENCH EQUATORIAL AFRICA.

UGANDA PROTECTORATE, a British possession in East Africa bounded north by the Sudan, south by Tanganyika Territory, west by the Belgian Congo and east by Lake Rudolf, and Kenya Colony. Its total area is 110,300 square miles with an estimated population of 3,071,608, of whom 3,064,735 are natives, 5,604 Asiatics, and 1,269 Europeans. About 785,000 of the Baganda race are Christians. There are 80,000 children attending the French and British mission schools. Cotton is the principal product, but coffee, rubber, cocoa and oil seeds are grown. There are extensive forests with very valuable timber. In normal years the revenue balances the expenditures at about £455,000. The seat of the British administration is at Entebbe but the native capital is Mengo. There is a steamer service on Lake Victoria and the Uganda Railway connects the Protectorate with the Nile boats below the rapids. The exports of the Protectorate in 1920 were valued at £1,828,537. Cotton, coffee, oil seeds, rubber, ivory, hides and skins formed most of the exports. The Governor and Commander-in-Chief in 1922 was Sir R. T. Coryndon.

UKRAINE, a Socialist Republic of southern Russia in economic and military alliance with the Moscow Soviet state. Area, 174,510 square miles; population, 26,000,000. The republic produces barley, wheat, oats, rye, beets and potatoes. The manufacture of sugar is the chief industry. Cereals form nearly two-thirds of the exports and sugar 22 per cent. Of the imports textiles are over one-half of the total. The Ukraine has 11,070 miles of railways. See RUSSIA.

UNAFLOW, or UNIFLOW ENGINE. See ENGINE, UNAFLOW, OR UNIFLOW.

UNEMPLOYMENT. At the beginning of 1923 unemployment in the United States had ceased to exist in any serious proportions, as shown by data published in the January 1923, *Industrial Employment Information Bulletin*, of the United States Employment Service. No State reported any really serious unemployment situation, and of the 18 States that reported some unemployment, half of them explained it as coming from seasonal causes, while the other half reported unemployment in certain localities only, or as prevailing mostly among unskilled labor or in certain trades, temporarily. These facts are all the more striking when it is borne in mind that less than two years ago it was estimated that as many as between 5,000,000 and 6,000,000 workers were without jobs. The United States Employment Service carries out an important purpose—to foster and promote the welfare of wage-earners of the United States, including juniors legally employed, and specifically to improve their opportunities by regularly collecting and publishing data relative to employment opportunities; maintaining a sys-

tem for clearing labor between the several States; and co-operating with and co-ordinating the public employment offices throughout the country. Congress provides an annual appropriation of \$225,000 for the furthering of these ends. That the service was of decided value in relieving the unemployment situation is made clear by the following concrete figures as to what was accomplished; 2,874,785 registrations recorded under direction of, and by co-operation with, the Federal service; 1,810,490 applications for help received, to which were referred 1,734,493 persons from among those registered. Of these as many as 1,458,746 persons actually obtained employment.

The following facts and figures indicate conditions of unemployment in some of the leading foreign countries. The *Gazette* of the British Ministry reports that during 1922, there were fewer trade disputes than in any year since 1918. The proportion of total British trade union membership unemployed at the end of December 1922, was 14.0 per cent, as against 16.8 at the end of January of that year. To be sure, there were fluctuations in the percentage, throughout the year, but the steady trend was downward. The high level for 1922 was 17.0 per cent (for April). On 19 Feb. 1923 the total number of registered unemployed in Great Britain was 1,340,000; these figures represent an average decline of more than 20,000 a week since 1 Jan. 1923. In Italy the number of unemployed 31 Jan. 1923 was 392,000, as compared with 382,000 on 31 Dec. 1922, and 617,000 on 31 Jan. 1922. It is to be noted that seasonal unemployment in Italy generally reaches its peak about the end of January. In France, the number of persons granted relief does not infallibly indicate the number of unemployed since not all localities have relief funds, and not all unemployed are registered even where such funds do exist. Still, the following data regarding such funds and relief bureaux do serve as an index to the situation: 264 public relief funds were established, of which 31 were departmental, and 233 municipal. In March 1921 the high point in unemployment relief was attained; at that time 91,225 persons were receiving assistance from public funds. The decline in unemployment has been steady, and on 23 Nov. 1922 only 2,077 persons were receiving assistance. At that time, moreover, there were in operation only three departmental unemployment relief funds and 32 municipal funds. In Austria, the number of unemployed in the Vienna industrial district, at the end of January 1923, was 101,000 (23 per cent being from among metal workers), as compared to 90,000 at the end of December 1922. The total number of unemployed in Austria was estimated, at the time mentioned, as being 150,000. In Czechoslovakia at the beginning of January 1923, unemployment was estimated at 420,000, as compared to 330,000 on 1 Dec. 1922, and 267,000 at the beginning of November 1922. The number of employes receiving government benefits was estimated at 190,000.

In Germany there was reported a continued increase in the unemployment among union labor. On 1 Feb. 1923, 252,873 workmen, or 4.4 per cent of the membership were totally unemployed as compared with 2.8 per cent on 1 January. Unions reported that at the end of January 13 per cent of their membership were working on a part time basis.

UNION CHRISTIAN COLLEGE, a co-educational institution, under the auspices of the Christian Church, founded in 1860 and located at Merom, Ind. In 1922-23 it had a faculty of eight members, 92 students, property valued at \$300,000 and an income of \$24,000. W. S. Alexander is president.

UNION COLLEGE, a non-sectarian educational institution for men, founded in 1795 and located at Schenectady, N. Y. Statistics for 1922-23 show a faculty of 60 members, 709 students, property valued at \$2,000,000 and an income of \$300,000. Charles Alexander Richmond, A.M., D.D., LL.D., is president.

UNION UNIVERSITY, a Baptist, co-educational institution founded in 1842 and located at Jackson, Tenn. In 1922-23 it had a faculty of 32 members, 1,000 students, property valued at \$700,000 and an income of \$90,000. Henry E. Watters, D.D., LL.D., is president.

UNION OF SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

UNITARIAN CHURCH. See CHURCHES IN THE UNITED STATES, STATISTICS OF THE.

UNITED BRETHREN IN CHRIST, Church of the. During 1922, this Church received into membership over 37,000, with a net gain of 10,536, giving the Church a total membership of 374,965. The number of churches at the close of the year was 3,348. The increase in the enrollment in the Sunday schools was 15,677, making a total Sunday school enrollment of 439,066. The increase in the number of Christian Endeavor societies was 239, the Church having 1,636 societies, with a total membership of 101,154, an increase of 8,893. The value of churches and parsonages was \$21,433,862, an increase in valuation of \$882,367. The total contributions for church support and benevolences was \$5,880,968. The principal periodical of the Church is the *Religious Telescope*. Other publications are the *Watchword*, the young people's paper, and the *Evangel*, a missionary monthly. Sunday school publications include: *Boy's Friend*, *Girl's Friend*, *Our Little Folks*, *Otterbein Teacher*, *Advanced Quarterly*, *Youth's Quarterly*, *Junior Quarterly* and *Primary Quarterly*. These have a circulation of approximately 387,000. The Church headquarters and publishing house are located at Dayton, Ohio. The denomination conducts missions in Africa, China, Japan, Philippine Islands, and Porto Rico. Eight educational institutions are maintained, and three homes for the aged and orphans. The Bishops are W. M. Bell, Harrisburg, Pa.; A. R. Clippinger, Dayton, Ohio; H. H. Fout, Indianapolis, Ind.; C. J. Kephart, Kansas City, Mo., and W. H. Washington, Portland, Oregon.

H. F. SHUPE,
Editor, *The Watchword*.

UNITED CONFEDERATE VETERANS. The first reunion of the United Confederate Veterans was held at Chattanooga 3 July 1890. It was the result of a "convention" which was held in New Orleans 10 June 1889 where delegates representing the Confederate Veterans, and their State organizations which were already in existence, met and adopted a "Constitution of the United Confederate Veterans" and likewise elected Gen. John B. Gordon, then Governor of Georgia, General Commanding. This convention was held in response to a call, issued from New Orleans and signed by F. S. Washington as chairman of the general committee, in which ex-Confederate soldiers and sailors were asked to meet at New Orleans 10 June 1889, for the purpose of forming "a federation of associations."

At this first reunion Gen. John B. Gordon, General Commanding, presided and Col. D. A. Given was secretary. It was at this meeting that the United Confederate Veterans placed on record their formal recognition and approval of the patriotic organizations of Sons and Daughters of Confederate Veterans. The strong and patriotic organizations, United Daughters of the Confederacy and the Sons of Confederate Veterans soon followed. The second reunion was held at Jackson, Miss., 2 June 1891 with General Gordon commanding and Col. D. A. Given as secretary. The third reunion was held at New Orleans 8-9 April 1892. Here General Gordon again presided as General Commanding and for the first time in the minutes of the organization, the title "Adjutant General and Chief of Staff" appears. George Moorman was announced as holding these positions. This reunion was perhaps the real birth of the United Confederate Veterans, or rather its emergence from the chrysalis of the earlier organization. There was a huge crowd in attendance and among the distinguished men present were Generals Longstreet, Stephen D. Lee, John B. Gordon, E. Kirby Smith and Senator John W. Daniel of Virginia. Senator Daniel was the orator of the occasion. Following this, reunions have been held at the following cities: Birmingham, Houston, Nashville, Atlanta, Charleston, Louisville, Memphis, Dallas, New Orleans, Memphis, Louisville, New Orleans, Richmond, Birmingham, Memphis, Mobile, Little Rock, Macon, Chattanooga, Jacksonville, Richmond, Birmingham, Washington, D. C., Tulsa, Atlanta, Houston, Chattanooga, Richmond, New Orleans, for the fifth time will entertain the Veterans in 1923.

Gen. John B. Gordon served as Commander-in-Chief from 1889 to 1903. Other Commanders-in-Chief have been: Stephen D. Lee, W. L. Cabell, C. A. Evans, C. W. Gordon, C. Irvine Walker, Bennett H. Young, George P. Harrison, K. M. Van Zandt and Julian S. Carr. Commander-in-Chief in 1922-23. The headquarters of the United Confederate Veterans is in New Orleans. Edgar D. Taylor, of Richmond, Va., was Adjutant-General and Chief-of-Staff in 1922-23.

UNITED STATES OF AMERICA, a Federal Republic of North America, bounded north by Canada, east by the Atlantic Ocean, south by the Gulf of Mexico and the Republic of Mexico, and west by the Pacific Ocean. Con-

tinental United States comprises the Federal District of Columbia and 48 States. The outlying possessions of the United States include the territories of Alaska and Hawaii, the Philippine Islands, Porto Rico, Virgin Islands, Samoa, Guam, Wake and some smaller islands in the Pacific, and the Panama Canal zone. Continental United States has an area of 3,026,789 square miles, while the outlying possessions have a combined area of 716,721 square miles, giving a total area of 3,743,510 square miles. In 1920 the population of Continental United States was 105,710,620; of the outlying possessions the population was 12,148,875, making a grand total of 117,859,495. The population of Continental United States in 1920 included 94,820,915 whites, 10,463,131 negroes, 244,437 Indians, 111,010 Japanese, 61,639 Chinese, 5,603 Filipinos, 2,507 Hindoos, 1,224 Koreans, and 110 Hawaiians. Of the white population in 1920 the total native whites was 81,108,161; native whites of native parentage numbered 58,421,957; native whites of foreign parentage numbered 15,694,539; native whites of mixed parentage numbered 6,991,665, and foreign-born whites numbered 13,712,754. Of the foreign-born white population of 13,712,754, 1,686,102 were Germans, 1,610,109 Italians, 1,400,489 Russians, 1,139,978 Poles, 1,117,878 Canadians, 1,037,233 Irish, 812,828 English, 625,580 Swedes, 575,625 Austrians, 478,383 Mexicans, 397,282 Hungarians, 362,436 Czechoslovakians, 363,862 Norwegians, 254,567 Scotch, 189,154 Danes, 131,766 Hollanders, 118,659 Swiss, 118,569 French, 34,321 from Alsace-Lorraine, 135,068 Lithuanians, 149,824 Finns, 102,823 Rumanians, 175,972 Greeks, 67,453 Portuguese, 67,066 Welshmen, 62,686 Belgians, 169,437 Yugoslavians, 51,900 Syrians, 49,247 Spaniards, 38,984 from the Atlantic Islands, 36,626 Armenians, 26,369 West Indians, exclusive of Porto Rico, 20,929 from Central and South America, 13,801 Australians, 13,242 New Foundlanders, 12,585 Luxemburgians, 10,477 Bulgarians, 5,608 Albanians, 5,284 European Turks, 8,610 Asiatic Turks, 3,202 from Palestine, 2,404 from Asia Minor, etc. Of the population ten years of age and over (82,739,315), 4,931,905 were illiterate, making a percentage of 6.0 as against 7.7 per cent in 1910. Illiterate native whites numbered 1,242,572, or 2 per cent of that class; foreign-born white illiterates numbered 1,763,740, or 13.1 per cent of that class; negro illiterates numbered 1,842,161, or 22.9 per cent of this class. The population in 1920 was housed in 20,697,204 dwellings. The number of families in the country on the date of the census was 24,351,676. The birth rate is estimated at 22.3 per thousand population and the death rate at 14.2 per thousand. The marriage rate per ten thousand is 105. The divorce rate per ten thousand is 112. The centre of the United States population in 1920 was in north latitude 39° 10' 21" and west longitude 86° 43' and 15". This point is 1.9 miles west of Whitehall, Clay township, Owen County, Indiana. During the decade from 1910 to 1920 the centre of population shifted 9.8 miles from point to point in direct line and westward 9.8 miles and 0.2 miles northward. The percentage of increase of the population from 1910 to 1920 was 18.6 for native whites, and 2.8 for foreign-born whites. The percentage for all

whites was 16 and for negroes 6.5. In 1920 there were in the United States 25 cities having a population of 250,000 or more and with a combined population of 20,910,139. There were 43 cities of from 100,000 to 250,000 with a combined population of 6,519,187. There were 76 cities of from 50,000 to 100,000 and with a combined population of 5,265,947. There were 143 cities of from 25,000 to 50,000 and with a combined population of 5,075,041. This makes a total of 287 cities of 25,000 and over with a combined population of 37,770,114. The Federal capital of the United States is Washington, D. C., which in 1920 had a population of 437,571. The principal cities of the United States, with their populations in 1920, are: New York, 5,620,048—Boroughs, Manhattan, 2,284,103; Bronx, 732,016; Brooklyn, 2,018,356; Queens, 469,042; Richmond, 116,531. Chicago, Ill., 2,701,705; Philadelphia, Pa., 1,823,779; Detroit, Mich., 993,678; Cleveland, Ohio, 796,841; Saint Louis, Mo., 772,897; Boston, Mass., 748,060; Baltimore, Md., 733,826; Pittsburgh, Pa., 588,343; Los Angeles, Calif., 576,673; Buffalo, N. Y., 506,775; San Francisco, Calif., 506,676; Milwaukee, Wis., 457,147; Washington, D. C., 437,571; Newark, N. J., 414,524; Cincinnati, Ohio, 401,247; New Orleans, La., 387,219; Minneapolis, Minn., 380,582; Kansas City, Mo., 324,410; Seattle, Wash., 315,312; Indianapolis, Ind., 314,194; Jersey City, N. J., 298,103; Rochester, N. Y., 295,750; Portland, Oregon, 258,288; Denver, Colo., 256,491; Toledo, Ohio, 243,164; Providence, R. I., 237,595; Columbus, Ohio, 237,031; Louisville, Ky., 234,891; Saint Paul, Minn., 234,698; Oakland, Calif., 216,261; Akron, Ohio, 208,435; Atlanta, Ga., 200,616; Omaha, Neb., 191,601; Worcester, Mass., 179,754; Birmingham, Ala., 178,806; Syracuse, N. Y., 171,717; Richmond, Va., 171,667; New Haven, Conn., 162,537; Memphis, Tenn., 162,351; San Antonio, Texas, 161,379; Dallas, Texas, 158,976; Dayton, Ohio, 152,559; Bridgeport, Conn., 143,555; Houston, Texas, 138,276; Hartford, Conn., 138,036; Scranton, Pa., 137,783; Grand Rapids, Mich., 137,634; Paterson, N. J., 135,875; Youngstown, Ohio, 132,358; Springfield, Mass., 129,614; Des Moines, Iowa, 126,468; New Bedford, Mass., 121,217; Fall River, Mass., 120,485; Trenton, N. J., 119,289; Nashville, Tenn., 118,342; Salt Lake City, Utah, 118,110; Camden, N. J., 116,309; Norfolk, Va., 115,777; Albany, N. Y., 113,344; Lowell, Mass., 112,759; Wilmington, Del., 110,168; Cambridge, Mass., 109,694; Reading, Pa., 107,784; Fort Worth, Texas, 106,482; Spokane, Wash., 104,437; Kansas City, Kans., 101,177; Yonkers, N. Y., 100,176; Lynn, Mass., 99,148; Duluth, Minn., 98,917; Tacoma, Wash., 96,965; Elizabeth, N. J., 95,783; Lawrence, Mass., 94,270; Utica, N. Y., 94,156; Erie, Pa., 93,372; Somerville, Mass., 93,091; Waterbury, Conn., 91,715; Flint, Mich., 91,599; Jacksonville, Fla., 91,558; Oklahoma City, Okla., 91,295; Schenectady, N. Y., 88,723; Canton, Ohio, 87,091; Fort Wayne, Ind., 86,549; Evansville, Ind., 85,264; Savannah, Ga., 83,252; Manchester, N. H., 78,384; Saint Joseph, Mo., 77,939; Knoxville, Tenn., 77,818; El Paso, Texas, 77,560; Bayonne, N. J., 76,754; Peoria, Ill., 76,121; Harrisburg, Pa., 75,917; San Diego, Calif., 74,683; Wilkesbarre, Pa., 73,833; Allentown, Pa., 73,502; Wichita, Kans.,

72,217; Tulsa, Okla., 72,075; Troy, N. Y., 72,013; Sioux City, Iowa, 71,227; South Bend, Ind., 70,983; Portland, Me., 69,272; Hoboken, N. J., 68,166; Charleston, S. C., 67,957; Johnstown, Pa., 67,327; Binghamton, N. Y., 66,800; East Saint Louis, Ill., 66,767; Brockton, Mass., 66,254; Terre Haute, Ind., 66,083; Sacramento, Calif., 65,908; Rockford, Ill., 65,651; Little Rock, Ark., 65,142; Pawtucket, R. I., 64,248; Passaic, N. J., 63,841; Saginaw, Mich., 61,903; Springfield, Ohio, 60,840; Mobile, Ala., 60,777; Altoona, Pa., 60,331, and Holyoke, Mass., 60,203.

Religion.—For statistics and other information relative to the various religious denominations in the United States see the articles on the principal denominations and the article **CHRISTIAN CHURCH IN THE UNITED STATES, STATISTICS OF THE**.

Education.—Each State has a free public school system maintained by public funds. In most States the work of these primary schools is supplemented by private and parochial schools. In the newer States the Federal government has set aside from two to four sections in each township six miles square, the proceeds from the sale of which form the chief part of the permanent school funds of those States, the income alone being used to support the schools and being supplemented by taxation either State or local. In a recent year it was estimated that the amount expended on public schools of elementary and secondary grades was \$644,595,145. For further information relative to education see **EDUCATION, UNITED STATES BUREAU OF**, and articles on the several States and **EDUCATION, PROGRESS IN**. See also **SCHOOL OFFICERS, STATE**; and articles on the more important colleges and universities, Columbia, Chicago, Harvard, Princeton, etc.

Outlying Possessions.—For the outlying possession of the United States of America see the articles **ALASKA, GUAM, HAWAII, PHILIPPINES, PORTO RICO, VIRGIN ISLANDS OF THE UNITED STATES**, etc. See also **CUBA, HAITI**, etc., for countries with which the United States government has closer relations than ordinary.

Agriculture.—For a detailed discussion of this subject see **AGRICULTURE IN THE UNITED STATES**. See also **AGRICULTURE, UNITED STATES DEPARTMENT OF**; **CO-OPERATIVE MOVEMENT**; **DAIRY PRODUCTS, VALUE OF, IN THE UNITED STATES**; **FARM PRODUCTS**; **POULTRY**; **FOOD STANDARDS, FEDERAL**; **HORTICULTURE**; **LIVING, COST OF**; **FOREST SERVICE, UNITED STATES**; also articles on special crops, **COTTON, CORN, WHEAT**, etc.; and sections in the articles on the various States dealing with Agriculture, in which the area, crop yield, and value of the chief crops in 1922 are given.

Manufactures.—In this volume all the principal industries are treated under their own headings. See **AUTOMOBILES**; **BOOT AND SHOE INDUSTRY**; **CANDY AND CONFECTIONERY**; **CANNING AND PRESERVING**; **IRON AND STEEL**; **PAPER**; **PRINTING**; **RUBBER**; **SHIPBUILDING**; **SILK INDUSTRY**; **TEXTILE INDUSTRY**; etc.

Mineral Production.—The general industrial depression that began late in 1920 continued throughout 1921, although improvement in some industries began late in the year. This improvement became more marked in 1922; but the mining industry as a whole lacked stability and

in the summer of 1922 was affected by the most widespread coal strike in the country's history, added to which, and aggravating the situation, of the railway shopmen, which almost paralyzed freight movement for several weeks. For information as to the production in 1922 of the more important minerals, see **COAL, COPPER, GOLD, IRON (AND STEEL), LEAD AND ZINC, SILVER**, etc. See also subsections on Minerals in the articles on the several States and Territories.

The table on pages 844 and 845, compiled by the United States Geological Survey, shows the quantity and value of mineral products in the United States in 1920 and 1921, the last year for which complete figures are available.

Commerce, Foreign.—During the 12 months ending 30 June 1922, the foreign trade of the United States suffered in common with the general world depression, according to the Annual Report of the Department of Commerce for the fiscal year 1921-22. The monetary value of United States exports and imports during the period in question, in comparison with the previous fiscal year, is shown in the following table:

	1920-21	1921-22
Imports.....	\$3,654,459,346	\$2,608,079,008
Exports.....	6,516,510,033	3,771,286,428
Total foreign trade.....	\$10,170,969,379	\$6,379,365,436
Balance of exports over imports.....	2,862,050,687	1,163,207,420

The fall in the monetary value of imports was therefore 28.6 per cent, in exports 42.1 per cent, and in total trade 37.3 per cent. The great decline in value from the previous year was due in a large degree to a fall in prices rather than in quantities, as indicated by the table of quantity movements of larger commodities. From this table it will be seen that our agricultural exports were actually larger in quantity during the year of depression, although they decreased in value by about \$700,000,000. A study of the whole export and import list, so far as quantitative statistics are available, indicates that, roughly, our trade in 1922, if it was valued at 1921 prices, would have shown a decrease in exports of 12 per cent, an increase in imports of 29 per cent, or an increase in total trade of about 2.7 per cent. The report continues with some interesting observations regarding invisible items of exchange. It says:

"The influence of the balance of invisible exchange in our whole trade and financial relationships is of growing importance. It is possible to estimate roughly some elements in invisible exchanges, such as public issues of foreign loans, tourist traffic, remittances of immigrants, and freights; but other items, such as private loans, reciprocal interest payments, investments, and loss by speculation in foreign currencies, are unknowable factors. Foreign loans were issued publicly during the fiscal year to the amount of \$1,015,000,000, as compared with \$618,000,000 during the previous year. What the ebb and flow of private loans may have been is, of course, unknown. It would appear that the net balance of the other items against us amounted to a minimum of from \$400,000,000 to \$500,000,000 a year. In any event, the invisible exchange against us could

MINERAL PRODUCTS OF THE UNITED STATES IN 1920 AND 1921¹

Total value of nonmetallic products (approximate).....		\$5,184,240,000		\$3,395,460,000
SUMMARY				
Total value of metallic products.....		\$1,762,350,000		\$657,540,000
Total value of nonmetallic products (exclusive of mineral fuels).....		1,021,260,000		686,830,000
Total value of mineral fuels.....		4,162,980,000		2,708,630,000
Total value of "unspecified" (metallic and non-metallic) products (partly estimated).....		4,820,000		²⁰ 3,000,000
GRAND TOTAL APPROXIMATE VALUE OF ALL MINERAL PRODUCTS.....		\$6,951,410,000		\$4,056,000,000

¹ In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1921 are estimates.

² From both domestic and foreign ores.

³ From all sources. Values excluded from metallic totals as the values of the antimony contained in antimonial lead are included in the antimonial lead values, and the remainder under last item ("Unspecified").

⁴ Product from domestic ores only.

⁵ Figures not yet available; producers' reports for 1921 being received through Bureau of the Census; estimate of value included in total value of metallic products.

⁶ Value, \$20,671,834,625,323 an ounce.

⁷ Value not included in total value.

⁸ Including ore used for fluxing.

⁹ Figures showing values not available.

¹⁰ Figures for 1921 not yet available.

¹¹ Value included in total value of metallic products. Survey not at liberty to publish figures.

¹² Figures not yet available; canvass being conducted by Bureau of the Census; estimate of value included in total value of nonmetallic products.

¹³ Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

¹⁴ Canvass continued after 1915. Value of iron ore sold for paint included under last item ("Unspecified").

¹⁵ Sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide.

¹⁶ Figures not yet available; canvass being conducted by Bureau of the Census; estimate of value included in total value of nonmetallic products.

¹⁷ Includes 23,728 tons of stronger acid, not converted to 60° Baumé.

¹⁸ Value included under last item ("Unspecified"). Survey not at liberty to publish figures.

¹⁹ Figures not yet available. Estimate of value included under last item ("Unspecified").

²⁰ Includes in 1921 the value of the following products: Bismuth, cadmium sulphide, chata, columbite, flint lining for tube mills, iron ore sold for paint, lithium minerals, marls, pebbles for grinding, selenium, silica sand and sandstone (finely ground), sodium salts (sodium carbonate, sodium sulphate, trona, and borax) from natural sources, tellurium, and an estimate of the value of miscellaneous mineral products, statistics for which are not collected annually by the Survey.

be approximated at not less than \$1,000,000,000 or \$1,100,000,000 in 1920-21 and about \$1,400,000,000 or \$1,500,000,000 in 1921-22.

"The balance of goods in our favor drew a net amount of \$449,000,000 in gold and silver during the fiscal year 1922, as compared with \$511,000,000 during the previous year.

"For the year 1920-21 the excess of export goods over imports, that is, the total trade balance of \$2,862,000,000, was liquidated in part by \$511,000,000 in precious metals shipped to us, and in part by invisible exchange of, say, \$1,100,000,000, leaving an apparently unliquidated balance of about \$1,200,000,000 to \$1,300,000,000 for that fiscal year. A study of the banking returns of unfunded foreign ad-

vances at this time does not bear out the conclusion that such an amount of private financing of exports, as indicated above, was ever undertaken, and thus the probabilities are that the speculative losses in European currencies and other investments and other forms of invisible exchange were even larger than has been estimated.

"For the year 1921-22 the excess of exports over imports of \$1,163,000,000 was liquidated in part by \$449,000,000 net imports of precious metals, and this together with the additional estimated balance against us of \$1,500,000,000 of invisible exchange, exceeds the amount necessary to square accounts by some \$750,000,000. No doubt this was at least partly absorbed in

repayment of private loans because even a smaller amount of private export financing existed in July 1922, than in July 1921. Generally this change indicates a much sounder and firmer basis of trade.

"The gold situation in the world is a matter of a great deal of economic thought and no doubt the heavy drain to America has contributed to the instability of foreign currencies, not only by the diminution of their essential guaranties, but also by their fluctuation involved in liquidating trade balances in this fashion. Our gold stocks amount to about \$3,077,000,000. Of this, the minimum legal necessities at the moment for assurances to our currency and credits amount roughly to about \$1,600,000,000, but for a 60 per cent reserve of security, we would require about \$2,400,000,000. Therefore, our surplus amounts to something over \$700,000,000. While this is an asset, it nevertheless would be more advantageous to us if it were in active use. The automatic tendencies in our international trade and financial relations are, however, setting strongly toward rectification of this whole situation without artificial action.

"There is a steady increase in the ratio of imports to exports of goods, as indicated by the decrease in the average monthly balance in our favor over the last two and one-quarter years during which our trade balances have been as follows:

	Average monthly balance in our favor
Six months, 1 July to 30 December, 1920...	\$274,674,811
Six months, 1 January to 1 July, 1921.....	202,333,636
Six months, 1 July to 30 December, 1921....	126,980,328
Six months, 30 December to 1 July, 1922....	66,887,576
Three months, 1 July to 1 October, 1922.....	51,623,542

"At this rate we would, theoretically, reach a balance in the movement of goods in another few months. However, economic movements do not proceed on time schedules, although their trends are no less positive. Many uncertain factors naturally affect commodity movements and but little beyond tendencies can be noted. It would, at least, appear that the invisible exchange is certainly able to take care of commodity balances, and that we are reaching the end of the gold import stage of war readjustments. Continued trend in the general direction now evident would soon produce gold exports even in the face of payments on account of Allied debts.

"There have been several important shifts in our foreign trade due to the war. The export of foodstuffs has immensely increased, due partially to the demoralization of Russia. There is at best no probability of Russian exports of large volume for another two or three years, not only because of the condition of agriculture but also because of the demoralization of her railways. There has been a decrease in raw cotton exports, due to various causes, chiefly short production, but partly due to steady increase in our cotton manufactures.

"The following table shows the quantitative movement of major agricultural exports, pre-war and for the last fiscal year:

	1913	1922
Grain and grain products (bus).....	258,343,629	544,220,964
Meats, dairy products, animal and vegetable fats (lbs).....	1,610,053,715	2,192,174,236
Tobacco, leaf (lbs).....	418,796,906	451,555,221
Cotton, raw (bales).....	8,724,572	6,541,841
Fruits (lbs).....	620,423,027	491,227,140
Oil cake and meal (lbs).....	2,049,361,136	1,099,246,797
Total values.....	\$1,029,967,344	\$1,557,372,997
Total values at 1913 prices	\$1,029,967,344	\$1,168,521,140

"About 55 per cent of our total exports are agricultural produce and raw materials and 45 per cent are manufactured and partly manufactured goods (excluding manufactured foodstuffs).

"About 75 per cent of our exports of agricultural produce and raw materials go to Europe and about 25 per cent to the rest of the world.

"About 26 per cent of our manufactured goods go to Europe and 74 per cent elsewhere.

"Our exports of agricultural produce comprise, roughly, 15 per cent of the entire crop value on the farm, while our exports of manufactured goods comprise less than 4 per cent of our production. Our exports of agricultural produce to Europe comprise 11 per cent of the value of our agricultural production, and less than 1 per cent of our manufactured production.

"The last fact has much to do with our ability to shake loose from European economic currents in the manufacturing industries and with the strengthening of employment in our home industries, we will, no doubt increase home consumption in agricultural products.

"A pronounced shift in our foreign trade during the past few years is the increasing ratio of imports from tropical countries. A study of this situation reveals that over one-half of our imports are of tropical origin (rubber, sugar, coffee, woods and so forth), as against about one-third of such imports before the war. The balance of trade is heavily against us in the tropics as a whole. A study of the trade of these particular countries indicates that the excess of our imports from those areas over our exports to them is about \$500,000,000 per annum, which is largely used by them for the purchase of manufactured goods from Europe, thus to a considerable extent liquidating the excessive balance in our favor in our European trade created by shipping to Europe our agricultural produce. This triangular operation seems likely to increase, as tropical goods do not materially conflict with our own production, and our consumption of these commodities is likely to increase steadily."

The several tables given herewith show the remarkable changes in the foreign trade record of the United States during and since the World War.

A tabulation showing the foreign commerce of the United States from 1790 to 1919, prepared by the author of the table which follows appears on page 501 of Vol. 27 of the new 'Encyclopedia Americana.' In view of the fact that the period beginning with the great European war shows remarkable changes in the record of

our trade with other countries it has been deemed proper, in presenting the figures of the recent years to include those of each fiscal year beginning with the year ending 30 June 1914, all of which preceded the beginning of the war.

IMPORTS AND EXPORTS OF MERCHANDISE INTO AND FROM THE UNITED STATES, 1914-1922

(Compiled by O. P. Austin, Statistician, National City Bank of New York)

FISCAL YEARS ENDING JUNE 30	Total imports	Total exports, including foreign mdae. re-exported
1914.....	\$1,893,926,000	\$2,329,684,000
1915.....	1,674,170,000	2,716,178,000
1916.....	2,197,884,000	4,272,178,000
1917.....	2,659,355,000	6,227,164,000
1918.....	2,946,655,000	5,838,652,000
1919.....	3,095,720,000	7,232,283,000
1920.....	5,238,352,000	8,108,989,000
1921.....	3,654,459,000	6,516,510,000
1922.....	2,608,009,000	3,771,182,000

During the fiscal year 1921-22 exports showed a decrease to almost every country, but in the month of June 1922 registered substantial increases everywhere, except into Mexico and a few South American countries. This was taken to indicate that our foreign trade had reached the end of its downward trend and had begun to climb upward.

For the fiscal year ended 30 June 1922, the total value of exports was \$3,771,181,000 as compared with \$6,516,510,000 in 1921. Imports for the same period were valued at \$2,608,009,000 as compared with \$3,654,459,000 in 1921. However, this upward trend was not sufficient to bring up the total trade for the calendar year to the level of that for 1921, as shown by the following tables, compiled by the United States Department of Commerce, giving the total values of exports and imports by grand divisions and principal countries for the calendar years 1921 and 1922.

Grand divisions	EXPORTS	
	1921	1922
Europe.....	\$2,363,898,936	\$2,083,417,290

The following tables give an analysis of the foreign commerce of the United States for the calendar years 1921 and 1922.

	EXPORTS	
	1921	1922
Crude materials for use in manufacturing.....	\$983,962,354	\$981,357,279
Foodstuffs, crude, and food animals.....	692,248,671	458,353,860
Foodstuffs partly or wholly manufactured.....	669,665,598	588,242,722
Manufactures for further use in manufacturing.....	399,236,948	437,764,031
Manufactures ready for consumption.....	1,625,967,456	1,292,373,412
Miscellaneous.....	7,846,997	7,100,831
Total domestic exports.....	\$4,378,928,024	\$3,765,192,135

	IMPORTS	
	1921	1922
Crude materials for use in manufacturing.....	\$853,048,000	\$1,161,728,000
Foodstuffs, crude, and food animals.....	304,135,000	329,817,100
Foodstuffs partly or wholly manufactured.....	368,841,000	388,287,000
Manufactures for further use in manufacturing.....	344,059,000	550,246,000
Manufactures ready for consumption.....	619,043,000	663,651,000
Miscellaneous.....	20,022,000	18,820,000
Total imports.....	\$2,509,148,000	\$3,112,549,000

The following table shows the values of the principal commodities entering into the foreign commerce of the United States for the fiscal year ending 30 June 1922:

EXPORTS	
[Values in thousands of dollars; three ciphers omitted.]	
COMMODITIES	Total fiscal year 1922
Animals and animal products, except wool and hair (total).....	\$429,907
Animals.....	\$14,972
Meats.....	131,953
Dairy products.....	36,375
Fish.....	16,846
Lard and neutral lard.....	97,428
Lard compounds containing animal fats.....	3,515
Oleo oil.....	12,367
Hides and skins, except furs.....	4,573
Leather.....	41,245
Leather manufactures.....	17,648
Furs and manufactures of.....	24,014
Vegetable food products, oil seeds, expressed oils, and beverages (total).....	\$812,824
Corn.....	\$115,862
Wheat.....	
Grain.....	279,656
Flour.....	97,386
Other grains and preparations of.....	98,391
Oil cake and oil-cake meal.....	22,771
Vegetables.....	18,044
Fruits and nuts.....	
Canned fruits.....	16,368
Other fruits and nuts.....	50,260
Vegetable oils, expressed, and fats.....	13,455
Sugar.....	77,447
Glucose (corn syrup).....	6,110
Other vegetable products, except fibers and wood (total).....	\$251,501
Rubber manufactures.....	\$31,024
Naval stores, gum, and resins.....	15,232
Leaf tobacco.....	156,729
Manufactures of tobacco.....	23,563
Starch.....	8,199
Hops.....	4,852
Textiles (total).....	\$764,268
Cotton, unmanufactured.....	\$596,379
Cotton cloth.....	76,935
Cotton wearing apparel.....	18,528
Other manufactures of cotton.....	27,475
Binder twine.....	7,234
Wool and hair, manufactures of.....	7,037
Silk, manufactures of.....	10,163
Wood and paper (total).....	\$130,045
Boards, planks, and scantlings.....	\$52,677
Other wood and manufactures of.....	36,437
Paper, except printed matter.....	20,669
Books, maps, pictures, and other printed matter.....	17,328
Nonmetallic minerals (total).....	\$471,156
Anthracite coal.....	\$32,201
Bituminous coal.....	67,915
Petroleum, crude.....	16,366
Gasoline, naphtha, and other light products.....	117,630
Illuminating oil.....	76,389
Gas and fuel oil.....	32,099
Lubricating oil.....	78,110
Paraffin wax.....	9,006
Glass and glass products.....	8,727
Clay and clay products.....	5,320
Sulphur or brimstone.....	6,070
Ores, metals, and manufactures of, except machinery and vehicles (total).....	\$312,358
Iron and steel plates, sheets, skelp, and strips.....	\$49,078
Structural iron and steel.....	9,495

COMMODITIES — (Continued)		Total fiscal year 1922

Trade, Insular Possessions.—Trade of the United States with its insular possessions in the first quarter century of our occupation totals about 5½ billion dollars against a little more than one-half billion in the 25 years preceding our occupation, according to the *Trade Record* of the National City Bank of New York.

It was on 7 July 1898 that the United States Congress adopted the resolution annexing the Hawaiian Islands in accordance with the expressed wishes of their people; on 12 August of the same year the protocol providing for the cession of Porto Rico to the United States was signed; and on 10 December of that year was signed the treaty with Spain ceding the Philippines to the United States. Guam, formerly a Spanish island, was also occupied by the United States in the same year, while the tiny Samoan island, Tutuila, with the best harbor in all the South Pacific, passed completely under our control in 1899 after several years in which we had co-operated with certain other countries in the control of the Samoan group.

Thus the year 1923 marks distinctly our first quarter century of control of these tropical islands, with a population of about 12 millions. The record of our trade with these islands in the 25 years since occupation is in marked contrast with that of the quarter century prior to our control, while their total trade is also

several times as much since our occupation as that of the preceding 25 years. Our total purchase of their products in the past 25 years has been \$3,350,000,000 against \$502,000,000 in the 25 years preceding our occupation, and our sales to them \$2,038,000,000 against \$134,000,000 in the 25 years prior to our occupation. Of course, our purchases from them were more than they took of our products, for in the islands there are only 12 million people to feed and clothe while we have a population of 108 millions, all wanting tropical products.

The United States supplies a very large proportion of the imports of all these islands, 65 per cent of those of the Philippines, and over 90 per cent of those of Porto Rico and Hawaii. We take about 60 per cent of the exports of the Philippines, 90 per cent of those of Porto Rico, and 95 per cent of those of the Hawaiian group.

Sugar, tobacco and Manila hemp are our chief imports from the Philippines; sugar and pineapples from Hawaii; and sugar, tobacco and tropical fruits from Porto Rico. To all of the islands we export manufactures of every sort and also limited quantities of food, especially flour and meats.

Treasury of the United States.—During the fiscal year 1922, the Treasury accomplished a reduction of about \$1,000,000,000 in the gross debt; a balanced budget with a surplus of over \$300,000,000 above expenditures, and successful refunding operations which have reduced the early-maturing debt to manageable proportions. On 30 June 1921, there was outstanding over \$7,000,000,000 of debt maturing within two years. During the fiscal year 1922, about \$1,000,000,000 was retired through the operation of the sinking-fund, the reduction of the balance in the general fund of the Treasury, and the application of surplus revenues, leaving about \$6,000,000,000 to be refunded. The Treasury undertook to meet the problem squarely by financing the maturities on a straight investment basis. It met with such success in the development of its refunding program that about six billion dollars of the seven billion dollars outstanding on 30 June 1921, have been retired or refunded, leaving only about a billion dollars to be refinanced during the balance of the fiscal year 1923. The gross public debt had been reduced to \$22,986,000,000 on 31 Dec. 1922.

In refunding the early-maturing debt, the Treasury on 15 June 1921, made an offering of Treasury notes which met with hearty response

from the investing public, as did also the six subsequent offerings of Treasury notes shown by the following table:

DATE OF ISSU 1921	Date of maturity	Interest rate, per cent	Amount of allotment
June 15.....	June 15, 1924	5½	\$311,191,600
Sept. 15.....	Sept. 15, 1924	5½	390,706,100
1922			
Feb. 1.....	Mar. 15, 1925	4½	01,599,500
Mar. 15.....	Mar. 15, 1926	4½	17,769,700
June 15.....	Dec. 15, 1925	4½	335,141,300
Aug. 1.....	Sept. 15, 1926	4½	486,940,700
Dec. 15.....	June 15, 1925	4½	469,215,100
TOTAL.....			\$3,212,564,000

A longer term refunding operation was announced on 9 Oct. 1922, when the Secretary of the Treasury, under authority of the Act of Congress approved 24 Sept. 1917, as amended, made a popular offering of 4½ per cent 25-30 year bonds, dated 16 Oct. 1922, maturing 15 Oct. 1952, and redeemable at par and accrued interest, in whole or in part, at the option of the United States, on and after 15 Oct. 1947. The bonds were issued in both coupon and registered form, in denominations of \$100 and upward. Although the offering was largely over-subscribed, the Treasury held down allotments on cash subscriptions to \$511,863,800, and in addition subscriptions aggregating \$252,098,500 were received on exchange for 4¾ per cent Victory notes or Treasury certificates of indebtedness of the series maturing 15 Dec. 1922, making total allotments on the offering aggregating about \$764,000,000.

The Victory Liberty Loan, which amounted to \$3,913,000,000 on 30 June 1921, has been reduced by purchase for the sinking fund, by acceptance of Victory notes in exchange for new Treasury notes, and by calls for redemption before maturity. As a result of these operations, the 3¾ per cent Victory notes have been retired and the amount of outstanding 4¾ per cent Victory notes reduced to \$854,000,000 on 31 Dec. 1922.

The gradual reduction in the amount of outstanding loan and tax certificates resulting from refunding operations, appears from the following table:

DATE	Loan and tax certificates outstanding
August 31, 1919.....	3,938,295,000
June 30, 1920.....	2,485,550,500
June 30, 1921.....	2,450,601,000
June 30, 1922.....	1,754,787,500
December 31, 1922.....	1,073,485,900

On 16 Oct. 1922, the last of the loan certificates were retired, leaving only tax issues outstanding. Every issue of Treasury certificates of indebtedness has been over-subscribed.

Owing to economy and retrenchment in expenditures, the Government was able to balance the budget for the fiscal year 1922 and to close the year with a surplus of about \$321,000,000 on the basis of daily Treasury statements, revised. This was accomplished notwithstanding a shrinkage of about \$1,100,000,000 in cash receipts from income and profits taxes as compared with the previous year.

The revenue Act of 1921 repealed the old

excess profits tax, effective 1 Jan. 1922, and, as a substitute, levied an additional tax of 2½ per cent on the net income of corporations. It also repealed most of the transportation tax and some of the nuisance taxes and made some adjustments in the income tax, including revisions of the rates and of the exemptions. These changes have been operating during the calendar year 1922.

The obligations of various foreign governments held by the Treasury on 31 Dec. 1922, aggregated \$10,044,802.73, principal amount. During the year ending 31 Dec. 1922, the following payments of principal and interest were received:

	Principal	Interest
Belgium.....	\$534,556 70	\$1,379,429 06
Cuba.....	792,500 00	397,187 50
France.....	111,378 04	20,367,057 25
Great Britain.....	30,500,000 00	103,812,500 00
Russia.....		534,465 99
	<u>\$31,938,434 74</u>	<u>\$126,490,639 80</u>

During the last year the Agricultural Credits Act, approved 24 Aug. 1921, was administered by the War Finance Corporation with beneficial results in the agricultural and livestock districts of the country. The Corporation's activities have been conducted on a nation-wide scale. It has approved advances for agricultural and livestock purposes aggregating about \$444,000,000 in 37 States. These advances to farmers have been made through approximately 4,400 banks. 32 co-operative marketing associations and 113 livestock loan companies. In addition, since January, 1921, the War Finance Corporation has authorized advances aggregating \$58,000,000 to assist in financing exports.

For the 12 months ending 1 Nov. 1922, the Federal Land Banks made loans to 70,993 farmers, in the aggregate sum of \$219,780,649 and sold to the investing public Federal Farm Loan bonds aggregating \$278,150,000.

The Treasury has encouraged the growth of the Thrift Movement in the country. While preparing to pay off great maturities, such as Victory Notes and War Savings Stamps, the Treasury has urged that these funds, representing largely the savings of the people, should not be wasted in foolish expenditures or invested in worthless or fraudulent stocks, but should be reinvested in sound securities, particularly those of the Government itself. As of special interest to holders of maturing War-Savings Certificates, it is offering the new Treasury Savings Certificates on an attractive basis, in the belief that those who saved during the war will wish to keep their money invested in Government securities of the same general character but in more convenient form. The new certificates are issued in denominations small enough to meet the demands of all classes of investors; may be purchased up to \$5,000 maturity value of any one series by any one person; yield an attractive rate of interest; and are exempt from the normal Federal income tax and from all State and local taxes (except estate and inheritance taxes). The Treasury considers it of the utmost importance that the habits of thrift and sound investment, acquired by millions of people during the war, should not be lost in the

succeeding period of reconstruction, when the need of avoiding waste and extravagance is as great as ever.

The transactions of the Treasury of the United States for the fiscal year ended 30 June 1922, and its condition at the close of the year, the ordinary receipts and expenditures, by warrants drawn, classified for 1922 and adjusted to the basis of the daily Treasury statements, revised, are shown in the following table:

United States Budget.—The budget system was introduced in 1921 and marked the culmination of years of effort to provide for executive control over Federal expenditures. With the appointment of the Director on 23 June 1921 the Bureau of the Budget began to function. In order to promote economy and efficiency in the routine business administration of the Government the President designated a Chief Co-ordinator and charged him, under the general direction of the Director of the Bureau, with the responsibility of representing the President in the application of uniform business principles and methods to the expenditure of public funds. In order to provide the necessary interdepartmental contact and to develop business information, there were established under the Chief Co-ordinator a number of co-ordinating boards relating to certain specific business activities of the Government. On 5 Dec. 1921, President Harding transmitted to Congress the budget for the fiscal year ending 30 June 1923—the first complete year under the new system. In this budget the estimated receipts for the fiscal year 1922 were \$3,943,453,663, and the estimated expenditures \$3,967,922,366, thus forecasting an apparent excess of expenditures over receipts of \$24,468,703. At the close of business on 30 June 1922, it was found that the actual receipts for

the fiscal year 1922 were \$4,109,104,150.94 and the actual expenditures \$3,795,302,499.84, making an excess of receipts over expenditures of \$313,801,651.10.

While the estimate of receipts and expenditures for the fiscal year 1923, as made at the time of the presentation of the budget in December, 1921, indicated that the receipts would be \$3,338,182,750 and the expenditures \$3,505,754,727, a revision of the prospective receipts and expenditures made on 1 July 1922, indicated that the receipts would be \$3,073,825,311 and the expenditures \$3,771,258,542. That revised estimate indicated an excess of expenditures over receipts of \$697,433,231.

As a result of the operations of the first five months of the fiscal year 1922-23, a revised estimate of receipts was made at the beginning of December 1922 showing a total of \$3,429,862,959. The considerable increase over the July estimate was due to the stimulation in the collection of ordinary receipts, aided by an increase in the customs receipts. On the other hand, due to continued pressure for economies and a revision of the expenditure program based on five months of actual operation, it was estimated in December that the expenditures for the same year would be \$3,733,801,671. These revised figures indicated an apparent prospective deficit of \$273,938,712.

In the budget for the fiscal year ending 30 June 1924, transmitted to Congress by President Harding on 5 Dec. 1922 it was estimated that the total ordinary receipts from all sources, excluding the Postal Service, will be \$3,361,812,359, or \$747,291,791.94 less than the actual receipts for 1922 and \$68,050,600 less than the estimated receipts for 1923. The estimate of expenditures for the fiscal year 1924 is \$3,180,843,234.

The foregoing does not include expenditures for the Postal Service and the Post Office

996,841.69, an estimated deficiency of \$31,502,570.76 being included in the estimated ordinary expenditures for 1923. The estimated expenditures from postal revenues for 1924 are \$584,653,151.50, and it is estimated that through proper readjustments there will be a surplus of postal revenues over expenditures amounting to \$952,439.56 for that year.

The following table shows the sources whence the government revenues are derived. For 1922 actual figures are given; for 1923 and 1924 estimated.

	RECEIPTS		
	1924	1923	1922
Internal revenue receipts.....	\$2,425,000,000	\$2,400,000,000	\$3,213,253,256 79
Customs receipts.....	425,000,000	450,000,000	356,443,387 18

Public domain receipts.....	16,149,650	16,214,600	16,334,595 64
Franchise tax, Federal Reserve Banks.....	10,000,000	10,000,000	59,974,465 64
Profits on coinage, bullion deposits, etc.....	10,000,000	17,000,000	21,660,921 07
Fees, fines and forfeitures.....	33,000,642	31,295,357	32,539,339 35
Repayments of foreign loans and other investments.....	59,175,000	58,643,000	120,658,726 93
District of Columbia receipts.....	15,506,500	16,363,415	15,235,016 44
Panama Canal receipts.....	14,224,000	13,924,000	11,747,092 47
Trust fund receipts.....	65,319,179	61,196,522	57,939,581 32
Other sources.....	20,169,715	21,566,485	29,569,693 22
Total miscellaneous receipts.....	\$511,812,359	\$579,862,959	\$539,407,506 97
Total receipts, all sources.....	3,361,812,359	3,429,862,959	4,109,104,150 94

Department payable from postal revenues. Such expenditures for the fiscal year 1922 were \$545,666,532.28, a deficiency of \$64,346,234.52, payable from ordinary receipts, being included in the ordinary expenditures for 1922 hereinbefore mentioned. The estimated expenditures from postal revenues during 1923 are \$559,-

The following table shows the appropriations for the several great divisions of the Federal government for 1923 and 1924. In the estimates of the year 1924 the 67th Congress made several changes, increasing the appropriations for some departments and reducing others.

COMPARATIVE STATEMENT OF ESTIMATES OF APPROPRIATIONS FOR 1924 AND APPROPRIATIONS FOR 1923		
	Estimates of appropriations, 1924	Appropriations, 1923
Legislative establishment.....	\$14,418,912 60	\$14,504,164 95

Total, including Post Office Department and Postal Service.....	\$3,669,106,523 19	\$3,838,763,457 33

* Including \$125,000,000 discount accruals of war savings stamps, series of 1918, due 1 Jan. 1923.

The summary of the Budget in the United States as contained in the President's message of 5 Dec. 1922 is as follows:

BUDGET SUMMARY

(Exclusive of postal revenues and postal expenditures paid from postal revenues)

	Estimated	
	1924	1923
Total receipts.....	\$3,361,812,359	\$3,429,862,959
Total expenditures (including reduction of the public debt required by law to be made from ordinary receipts).....	3,180,843,234	3,703,801,671
Excess of expenditures.....		\$273,938,712
Excess of receipts.....	\$180,969,125	
		\$313,801,651 10

Defense.—See ARMY OF THE UNITED STATES; MARINE CORPS, UNITED STATES; UNITED STATES NAVY.

Communications.—See articles on POST OFFICE; RAILWAYS; TELEGRAPH AND CABLE COMPANIES, MILEAGE AND REVENUE OF; ROADS, PUBLIC, UNITED STATES BUREAU OF.

Shipping.—See MERCHANT MARINE OF THE UNITED STATES.

Diplomatic Representatives.—The following is a list of the diplomatic representatives to and from the United States:

EMBASSIES AND LEGATIONS TO THE UNITED STATES

ARGENTINA.—Tomas A. Le Breton, Ambassador Extraordinary and Plenipotentiary.
 AUSTRIA.—Edgar L. W. Procknik, Counselor of Legation and Chargé d'affaires ad interim.
 BELGIUM.—Baron de Cartier de Marchienne, Ambassador Extraordinary and Plenipotentiary.
 BOLIVIA.—Adolfo Ballivian, Envoy Extraordinary and Minister Plenipotentiary.
 BRAZIL.—Augusto Cochrane de Alencar, Ambassador Extraordinary and Plenipotentiary.
 BULGARIA.—Stephan Panaretoff, Envoy Extraordinary and Minister Plenipotentiary.
 CHILE.—Don Beltran Mathieu, Ambassador Extraordinary and Plenipotentiary.
 CHINA.—Sao-Ke Alfred Sze, Envoy Extraordinary and Minister Plenipotentiary.
 COLOMBIA.—Dr. Enrique Olaya, Envoy Extraordinary and Minister Plenipotentiary.
 COSTA RICA.—Dr. Don Octavio Beeche, Envoy Extraordinary and Minister Plenipotentiary.
 CUBA.—Dr. Carlos Manuel de Cespedes, Envoy Extraordinary and Minister Plenipotentiary.
 CZECHOSLOVAKIA.—Dr. Bedrich Stepanek, Envoy Extraordinary and Minister Plenipotentiary.
 DENMARK.—Constantin Brun, Envoy Extraordinary and Minister Plenipotentiary.
 DOMINICAN REPUBLIC.—Licdo. Emilio C. Joubert, Envoy Extraordinary and Minister Plenipotentiary.
 ECUADOR.—Dr. Don Rafael H. Elizalde, Envoy Extraordinary and Minister Plenipotentiary.
 FINLAND.—Axel Leonard Astrom, Envoy Extraordinary and Minister Plenipotentiary.
 FRANCE.—J. J. Jusserand, Ambassador Extraordinary and Plenipotentiary.
 GERMANY.—Dr. Otto Wiedfeldt, Ambassador Extraordinary and Plenipotentiary.
 GREAT BRITAIN.—The Right Honorable Sir Auckland Geddes, G.C.M.G., K.C.B., Ambassador Extraordinary and Plenipotentiary.
 GREECE.—George Dracopoulos, Secretary of Legation and Chargé d'affaires ad interim.
 GUATEMALA.—Don Francisco Sanchez Latour, Envoy Extraordinary and Minister Plenipotentiary.
 HAITI.—Albert Blanchet, Envoy Extraordinary and Minister Plenipotentiary.
 HONDURAS.—Don R. Camilo Diaz, Secretary of Legation and Chargé d'affaires ad interim.
 HUNGARY.—Count Laszlo Szechenyi, Envoy Extraordinary and Minister Plenipotentiary.
 ITALY.—Don Gelasio Caetani.
 JAPAN.—Masanao Hanihara.
 LATVIA.—C. Louis Seya, Chargé d'affaires ad interim.
 LITHUANIA.—Valdemaras Carneckis, Chargé d'affaires ad interim.
 LUXEMBURG.—Baron Raymond de Waha, Chargé d'affaires.

MEXICO.—Don Salvador Diego-Fernandez, Minister Plenipotentiary, Chargé d'affaires ad interim.

NETHERLANDS.—Dr. J. B. Hubrecht, Secretary of Legation and Chargé d'affaires ad interim.

NICARAGUA.—Don Emiliano Chamorro, Envoy Extraordinary and Minister Plenipotentiary.

NORWAY.—H. H. Bryn, Envoy Extraordinary and Minister Plenipotentiary.

PANAMA.—Dr. Don Ricardo J. Alfaro, Envoy Extraordinary and Minister Plenipotentiary.

PARAGUAY.—Wm. Wallace White, Consul General of Paraguay in New York City, in charge of the Legation.

PERSIA.—Mirza Hussein Khan Alai, Envoy Extraordinary and Minister Plenipotentiary.

PERU.—Don Federico Alfonso Pezet, Ambassador Extraordinary and Plenipotentiary.

POLAND.—Dr. Ladislas Wroblewski, Envoy Extraordinary and Minister Plenipotentiary.

PORTUGAL.—Viscount d'Alte, Envoy Extraordinary and Minister Plenipotentiary.

RUMANIA.—Prince A. Bibesco, Envoy Extraordinary and Minister Plenipotentiary.

RUSSIA.—Serge Ughet, Financial Attaché.

SALVADOR.—Don Salvador Sol, M., Envoy Extraordinary and Minister Plenipotentiary.

SERBS, CROATS, AND SLOVENES.—Dr. Ante Tresich Pavichich, Envoy Extraordinary and Minister Plenipotentiary.

SIAM.—Phya Prabha Karavongse, Envoy Extraordinary and Minister Plenipotentiary.

SPAIN.—Don Juan Riano y Gayangos, Chamberlain to His Majesty the King of Spain, Ambassador Extraordinary and Plenipotentiary.

SWEDEN.—Captain Axel F. Wallenberg, Envoy Extraordinary and Minister Plenipotentiary.

SWITZERLAND.—Marc Peter, Envoy Extraordinary and Minister Plenipotentiary.

URUGUAY.—Dr. Jacobo Varela, Envoy Extraordinary and Minister Plenipotentiary.

VENEZUELA.—Dr. Don Pedro Manuel Arcaya, Envoy Extraordinary and Minister Plenipotentiary.

DIPLOMATIC SERVICE OF THE UNITED STATES

ALBANIA.—Ulysses Grant-Smith, Envoy Extraordinary and Minister Plenipotentiary.

ARGENTINA.—John W. Riddle, Ambassador Extraordinary and Plenipotentiary.

AUSTRIA.—Albert Henry Washburn, Envoy Extraordinary and Minister Plenipotentiary.

BELGIUM.—Henry P. Fletcher, Ambassador Extraordinary and Plenipotentiary.

BOLIVIA.—Jesse S. Cottell, Envoy Extraordinary and Minister Plenipotentiary.

BRAZIL.—Edwin V. Morgan, Ambassador Extraordinary and Plenipotentiary.

BULGARIA.—Charles S. Wilson, Envoy Extraordinary and Minister Plenipotentiary.

CHILE.—William Miller Collier, Ambassador Extraordinary and Plenipotentiary.

CHINA.—Jacob Gould Schurmann, Envoy Extraordinary and Minister Plenipotentiary.

COLOMBIA.—Samuel H. Piles, Envoy Extraordinary and Minister Plenipotentiary.

COSTA RICA.—Roy T. Davis, Envoy Extraordinary and Minister Plenipotentiary.

CUBA.—Maj.-Gen. Enoch H. Crowder, Envoy Extraordinary and Minister Plenipotentiary.

CZECHOSLOVAKIA.—Lewis Einstein, Envoy Extraordinary and Minister Plenipotentiary.

DENMARK.—John Dyneley Prince, Envoy Extraordinary and Minister Plenipotentiary.

DOMINICAN REPUBLIC.—William W. Russell, Envoy Extraordinary and Minister Plenipotentiary.

ECUADOR.—Gerhard A. Bading, Envoy Extraordinary and Minister Plenipotentiary.

EGYPT.—J. Morton Howell, Envoy Extraordinary and Minister Plenipotentiary.

ESTONIA.—Frederick W. B. Coleman, Envoy Extraordinary and Minister Plenipotentiary. See Latvia.

FINLAND.—Charles L. Kagey, Envoy Extraordinary and Minister Plenipotentiary.

FRANCE.—Myron T. Herrick, Ambassador Extraordinary and Plenipotentiary.

GERMANY.—Alanson B. Houghton, Ambassador Extraordinary and Plenipotentiary.

GREAT BRITAIN.—George Harvey, Ambassador Extraordinary and Plenipotentiary.

GREECE.———, Envoy Extraordinary and Minister Plenipotentiary.

GUATEMALA.—Arthur H. Geissler, Envoy Extraordinary and Minister Plenipotentiary.

HAITI.—Arthur Bailly-Blanchard, Envoy Extraordinary and Minister Plenipotentiary.

HONDURAS.—Franklin E. Morales, Envoy Extraordinary and Minister Plenipotentiary.

HUNGARY.—Theodore Brentano, Envoy Extraordinary and Minister Plenipotentiary.

ITALY.—Richard Washburn Child, Ambassador Extraordinary and Plenipotentiary.

JAPAN.—Cyrus E. Woods, Ambassador Extraordinary and Plenipotentiary.

LATVIA.—Frederick W. B. Coleman, Envoy Extraordinary and Minister Plenipotentiary.

LIBERIA.—Solomon Porter Hood, Minister Resident and Consul General.

LITHUANIA.—Frederick W. B. Coleman, Envoy Extraordinary and Minister Plenipotentiary. See Latvia.

LUXEMBURG.———, Envoy Extraordinary and Minister Plenipotentiary.

MEXICO.———, Ambassador Extraordinary and Plenipotentiary.

MOROCCO.—Joseph M. Denning, Agent and Consul General.

NETHERLANDS.———, Envoy Extraordinary and Minister Plenipotentiary.

NICARAGUA.—John E. Ramer, Envoy Extraordinary and Minister Plenipotentiary.

NORWAY.—Laurits S. Swenson, Envoy Extraordinary and Minister Plenipotentiary.

PANAMA.—John Glover Smith, Envoy Extraordinary and Minister Plenipotentiary.

PARAGUAY.—William J. O'Toole, Envoy Extraordinary and Minister Plenipotentiary.

PERSIA.—Joseph Saul Kornfeld, Envoy Extraordinary and Minister Plenipotentiary.

PERU.—Miles Poindexter, Ambassador Extraordinary and Plenipotentiary.

POLAND.—Hugh S. Gibson, Envoy Extraordinary and Minister Plenipotentiary.

PORTUGAL.—Fred Morris Dearing, Envoy Extraordinary and Minister Plenipotentiary.

RUMANIA.—Peter Augustus Jay, Envoy Extraordinary and Minister Plenipotentiary.

SALVADOR.—Montgomery Schuyler, Envoy Extraordinary and Minister Plenipotentiary.

SERBS, CROATS, AND SLOVENES, KINGDOM OF.—H. Percival Dodge, Envoy Extraordinary and Minister Plenipotentiary.

SIAM.—Edward E. Brodie, Envoy Extraordinary and Minister Plenipotentiary.

SPAIN.—Alexander P. Moore, Ambassador Extraordinary and Plenipotentiary.

SWEDEN.—Robert Woods Bliss, Envoy Extraordinary and Minister Plenipotentiary.

SWITZERLAND.—Joseph C. Grew, Envoy Extraordinary and Minister Plenipotentiary.

TURKEY.———, Ambassador Extraordinary and Plenipotentiary.

URUGUAY.—Hoffman Philip, Envoy Extraordinary and Minister Plenipotentiary.

VENEZUELA.—Willis C. Cook, Envoy Extraordinary and Minister Plenipotentiary.

Congress.—The first session of the Sixty-Seventh Congress began 11 April, 1921; recessed 24 Aug. to 21 Sept. 1921 and adjourned 23 Nov. 1921. The second session began 5 Dec. 1921, recessed 30 June 1922 to 15 Aug. 1922 and adjourned 22 Sept. 1922. The third session began 20 Nov. 1922. The fourth session began 4 Dec. 1922 and ended 4 March 1923. The President of the Senate of the 67th Congress was Calvin Coolidge. The Speaker of the House of Representatives in the same Congress was Frederick H. Gillett of Massachusetts. In the Senate of the 67th Congress there were 36 Democrats and 60 Republicans. Of special note was the appointment of Mrs. Rebecca Latimer Felton of Georgia temporarily to fill the place

of Senator Thomas E. Watson, deceased. Mrs. Felton was sworn in 21 Nov. 1922 and served one day, then giving place to her successor, Walter F. George, who was elected 7 Nov. 1922.

The terms of Representatives to the 68th Congress began 4 March 1923 and end 4 March 1925. In the 68th Congress there are 53 Republican Senators, 42 Democratic Senators and one Farmer-Labor Senator. The House of Representatives of the 68th Congress has 435 members, of whom 224 are Republicans, 207 Democrats, one Farmer-Labor Party, one Independent, one Socialist.

The following is a list of the State delegations to the 68th Congress.

[Note: Since the list was compiled the following members of Congress have died: Senators: Samuel D. Nicholson, Colo., 24 March; Knute Nelson, 28 April; Representatives: John R. Tyson, Ala., 27 March; J. M. C. Smith, Mich., 20 March; Daniel J. Riordan, N. Y., 27 April, 1923.]

ALABAMA: SENATORS.—Oscar W. Underwood, D; J. Thos. Heflin, D. REPRESENTATIVES.—John McDuffie*, D; John R. Tyson*, D; Henry B. Steagall*, D; Lamar Jeffers*, D; William B. Bowling*, D; William B. Oliver*, D; Miles C. Allgood, D; Edward B. Almon*, D; George Huddleston*, D; William B. Bankhead*, D.

ARIZONA: SENATORS.—Henry F. Ashurst, D; Ralph H. Cameron, R. REPRESENTATIVE.—Carl Hayden*, D.

ARKANSAS: SENATORS.—Thad. H. Caraway, D; Joe T. Robinson, D. REPRESENTATIVES.—William J. Driver*, D; William A. Oldfields*, D; John N. Tillman*, D; Otis Wingo*, D; Heartsill Ragon, D; L. E. Sawyer, D; Tilman B. Parks*, D.

CALIFORNIA: SENATORS.—Hiram W. Johnson, R; Samuel M. Shortridge, R. REPRESENTATIVES.—Clarence F. Lea*, D; John E. Raker*, D; Charles F. Curry*, R; Julius Kahn*, R; Mrs. Mae Nolan, R; James H. MacLafferty, R; Henry E. Barbour*, R; Arthur M. Free*, R; Walter F. Lineberger*, R; Henry Z. Osborne*, R; Philip D. Swing*, R.

History.—When the Harding Administration came into power it was embarrassed, Secretary Hughes has said, by a technical state of war; but within a few months thereafter treaties of peace were signed with Germany, Austria, and Hungary. These treaties received the assent of the Senate, and were ratified. The treaty with Germany was followed by an agreement for the determination of the amount of American claims, under the treaty, by a Mixed Commission,—a Justice of the Supreme Court of the United States, William Rufus Day, being appointed to serve as Umpire. An acute difference (the Secretary observed) with respect to the island of Yap in the North Pacific having special advantages as a cable-center was adjusted by a treaty with Japan relating to that island and the other islands held by Japan under mandate. The question of naval armament, i. e., the naval competition upon which the United States had entered with Great Britain and Japan, was dealt with at the Conference for Limitation of Armament, an account of which is given under the title WASHINGTON CONFERENCE. Nations interested in Far Eastern questions participated in that Conference; treaties were negotiated, binding those participants to respect the territorial and administrative integrity of China; and the Conference afforded an opportunity for good offices which enabled Japan and China to settle the Shantung controversy. Then also the Four-Power Treaty was negotiated, in relation to insular possessions and dominions in the region of the Pacific Ocean; and, as a part of this treaty, there was provision for abrogating the Anglo-Japanese Alliance. At the same Conference a treaty was negotiated, condemning the use of submarines against merchant vessels, and of asphyxiating or poisonous gases whenever it should become necessary for gentlemen to fight one another on land. Great Britain and Japan ratified all the Conference treaties before 30 Oct. 1922. Panama and Costa Rica were about to engage in war (for their territorial disputes, consult 'Encyclopedia of Latin America'). Peace was maintained upon the basis of the arbitral award of the Chief Justice of the United States. The Treaty with Colombia received the assent of the Senate. The President extended to the government of Peru and Chile an invitation to send their representatives to Washington to meet in conference for the purpose of dealing with the unfulfilled provisions of the Treaty of Ancón (See articles PERU and CHILE in the 'Encyclopedia of Latin America'). In Cuba, administrative reforms wrought by the Cuban Government in the interest of stability were not unrelated to the efforts of General Crowder, President Harding's Commissioner. A confer-

ence of the representatives of the Central American Republics was (with the approval of their Governments) called to meet at Washington. Withdrawal of the Military Government of the Dominican Republic was planned; and, under the agreement that had been made with that purpose, a provisional Dominican Government was established to superintend the election of more permanent incumbents.

Thus far, we have confined our attention to diplomatic activity on the part of the Administration,—an introductory gradient, simply, enabling us now to proceed more rapidly from event to event in 1922.

On 1 January a delegation at Washington, representing the Chita or Far Eastern Republic, asserted that a secret agreement in regard to Russia had been entered into by France and Japan. The existence of such a pact was denied, the following day, by representatives of France at Washington. Thus throughout the year, players of the Old World political games (eventually playing up to Labor's self-determination) were not silent, were not inactive in the United States. And this circumstance may be remembered rather constantly while we recall domestic as well as foreign happenings, affairs, and topics, such as the following: About a fortnight later, in the same city, a mass meeting of the Woodrow Wilson Foundation was held—from which several thousand persons marched, cheering, to the home of the distinguished American advocate of the League of Nations. On 17 January Secretary Hughes suggested maintenance of a Far Eastern "open door" by means of an International Board of Reference at the Chinese capital. On 25 January Cuba asked the government of the United States to withdraw marines from Camaguey. (Compare the reference to Cuba, above.) The following day, the Anti-Lynching Bill was passed by the House of Representatives, 230 to 119. On 31 January the bill authorizing the refunding of the \$11,000,000,000 foreign debt into securities maturing in 25 years or less was passed by the Senate, 39 to 26. The embargo on the shipment of arms to Mexico was ended by a joint resolution of Congress the same day. On 1 February the Washington Conference (see article so entitled) in plenary session approved treaties of the United States, Great Britain, France, Italy, and Japan, imposing limits on capital warships, restricting the employment of submarines, and abjuring misuse of poisonous gases. Marines in the service of the United States were withdrawn from Camaguey, Cuba, on 7 February.

The *Northern Pacific*, fastest American troopship during the war, was destroyed by fire, and four of the crew were lost, 8 February. On the following day 4,000 Navy Yard men who had been employed in building battle-ships were discharged, when the President's order suspending work of this character took effect, in execution of the treaty just mentioned. The United States and Japan signed the treaty relating to Yap, the North-Pacific island "having special advantages as a cable-center." 11 February. The President received, 20 February, a delegation of students representing 235 colleges, all supporting the naval disarmament plan. On the following day, the dirigible airship *Rome* built in Italy for the Army of the United States,

* Served in the 67th Congress.

† Served in a previous Congress.

exploded at Hampton, Virginia—11 survivors; 34 killed. An extradition treaty with Costa Rico, Central America, was ratified by the Senate the next day. And afterward nothing particularly noteworthy until we come to 27 February, — when the Supreme Court of the United States upheld the Suffrage Amendment to the Federal Constitution. On 28 February a plan for the establishment of an American merchant marine was outlined by President Harding, and a bill embodying the Administration's advice in this matter was introduced in the Senate and the House. On 1 March, at Bogotá, the treaty between the United States and Colombia, in relation to Panama, was ratified. On 8 March Secretary Hughes notified Italy that the United States would not take part in the proposed Genoa Conference. Suspension of mining operations in the unionized anthracite and bituminous coal-fields was ordered 21 March,—the order proceeding from headquarters of the United Mine Workers, in Indianapolis, and directing discontinuance of coal-production after ten days only should have passed. On 23 March the House of Representatives voted in favor of the Soldiers' Bonus Bill, 333 to 70. The coal miners' strike, at first affecting 500,000 men, began at midnight, 31 March. On 6 April,—this being the 13th anniversary of the discovery of the North Pole,—a memorial to Rear Admiral Robert E. Peary was unveiled at Arlington. On 10 April, Federal courts enjoined union organizers in the non-union coal regions of West Virginia. The following day, the Fordney-McCumber Tariff Bill was submitted to the Senate. On 16 April Marshal Joffre was the object of enthusiastic demonstrations at Chicago; and three days later he reached Washington and called on the President. That day, in the House of Representatives, it was proposed, with almost due formality, that the personnel of the navy should be limited to 86,000. On 22 April, Ambassador Houghton presented his credentials at Berlin. That day, at Princeton, Professor Harvey exhibited cold light, or luciferin. Marshal Joffre received the freedom of New York City on 24 April. At Charles Town, West Virginia, 25 April, several hundred striking miners were tried on charges of treason. Marshal Joffre and his family, returning to France, left New York, 29 April. On 1 May a railway bridge near a non-union mine was blown up by coal strike partisans. On 4 May Field Marshal Earl French arrived in New York. On 11 May the President signed a bill extending for two years from 30 June the three per cent immigration restriction act. On 13 May France invited the United States to join an international commission which should investigate the state of affairs in Russia. The same day the first German Ambassador to the United States, since the war, arrived at New York. The Federal Child Labor Law was declared to be unconstitutional by the Supreme Court, 15 May. On 19 May the Haiti —(Dominican Republic, or Santo Domingo) Independence Society announced at Washington that a passive war against the American occupancy and a boycott of goods from America were expedients to be adopted by Haiti. On 24 May a general horizontal reduction of 10 per cent in freight rates below the rates that went into effect 26 August 1920 was ordered by the Interstate Commerce Commission. In West Virginia

12 coal mines were dynamited—also on 24 May. On 30 May the Lincoln Memorial Building at Washington, D. C., was dedicated. The Supreme Court of the United States decided 5 June, that labor organizations are liable to be sued, and to judgment for damages in the event of injury to property during strikes; further, that strike funds are subject to levy. Next day, officials of 11 railway unions authorized a nation-wide strike vote, returnable 30 June. The wages of 400,000 railway employees were cut \$60,000,000, approximately, by the Railway Labor Board, and thus the total of such wage reductions was brought to \$110,000,000, approximately. Strike ballots, returnable 1 July, were therefore, on 11 June mailed to the 400,000 shopmen employed by the railways. On 13 June the estimate was published that the number of aliens to be admitted into the United States during the fiscal year was (see note of 11 May, above) limited to 357,903. On 16 June announcement was made of another cut in wages of railway employees, namely, \$26,500,000 a year subtracted from payments to 320,000 persons, chiefly in the clerical and station forces; the aggregate of reductions including this Labor Board ruling (effective 1 July) amounting to \$134,988,900. For the settlement of the Tacna-Arica dispute, Peru and Chile at this time requested the State Department's assistance. On 17 June President Harding received the Philippine mission's appeal for a grant of independence to the Filipino people. On 21 June striking miners attacked strikebreakers employed by the Southern Illinois Coal Company near Herrin, Illinois; and more than a score of the latter, who had surrendered, were shot, hanged, or beaten to death. Next day, the Filipinos desiring independence received an unfavorable reply. One day later, the House of Representatives concurred with the Senate in fixing the size of the army at 125,000 enlisted men and 12,000 officers. On 26 June the indefinite continuance of the military occupancy of Haiti, though with a reduction of the force, was recommended in a report of the special Senate committee appointed to investigate the American administration in Haiti and the Dominican Republic. On 28 June the factions in the coal miners' strike were summoned to a conference at the White House. But on 1 July nearly all of the 400,000 railway shopmen belonging to the union went on strike. Whereupon the Labor Board adopted, 2 July, a resolution outlawing shopmen who left their work. And on 3 July leaders of the factions in the coal strike, called into conference as mentioned above, adjourned after a stormy session which indicated an utter failure to reach an agreement. Two days later the President of the striking shopmen offered to consider any settlement the Labor Board might propose. And on 7 July that Board notified the shopmen that they could secure hearing for their grievances by returning to work. Next day, the Missouri National Guard was mobilized and Illinois troops made ready for service as a result of disorders connected with the railway shopmen strike. On 12 July anthracite mines operators accepted the President's arbitration plan, but operators and miners in the bituminous fields were unyielding.

The same day, at Washington, Secretary Hughes and Premier Mackenzie King of Canada were discussing a treaty for the permanent limitation of armament on the American-Canadian frontier. The next day, the President ordered the use of Federal troops to maintain order on railways. The coal miners rejected, 15 July, the President's arbitration plan to end the coal strike. However, two days afterward, that plan was, in principle, accepted by the operators in bituminous fields. On 18 July the President called on the Governors of 28 coal-producing States to guard miners and mines against interference or injury by the unions; and on the following day favorable response came to that appeal. National Guard troops were called out, 20 July, in Ohio and Pennsylvania to protect coal-miners who were willing to work. On 1 August the Association of Railway Executives rejected the President's plan to end the shopmen's strike. On 2 August leaders of the shopmen accepted the same plan. Whereupon there came to the President (naturally from those who accepted his proposals) a request for a conference. On 7 August, Secretary Hughes stated that the recognition of the Mexican administration would have to be preceded by a written guaranty that American holdings would not be subject to confiscation. On 9 August 1,300 engineers, firemen, conductors, brakemen, switchmen, and maintenance-of-way employees of the Elgin, Joliet and Eastern R. R. walked out in protest against the use of armed guards and of defective rail equipment. On 10 August an interstate joint conference of operators and workers organized in Cleveland for the settlement of the bituminous coal strike. In many cities members of rail brotherhoods protested, 11 August, against the armed guards, and 12 transcontinental trains were marooned, some in the Arizona desert. On 12 August railway shopmen declined the President's proposals that the seniority issue should be submitted to the Labor Board, if reinstatement of striking shopmen should be realized. The miners' strike, in bituminous coal fields, came to an end when, 15 August, operators from many coal-producing States and the leaders of the United Mine Workers of America agreed that work should be resumed at the old wage scale, and that a new wage scale should become effective 1 April 1923. On 19 August the Fordney-McCumber tariff bill was accepted by the Senate, 48 to 25. On 23 August the executives of railways refused to take the strikers back with full seniority rights. On 24 August Secretary Hughes and a number of delegates sailed for Rio de Janeiro, to represent the government of the United States at the Brazilian Centennial Exposition. On 31 August the Senate voted, 47 to 22, in favor of the Soldiers' Bonus Bill. On 1 September a temporary injunction restraining the shopmen from interfering in any manner whatever in the operation of the railways was granted by Judge Wilkerson, in Chicago. (The order was subsequently extended.) Anthracite mines were reopened 10 September, but there was said to be a shortage of skilled labor, and the mines were not in good condition. On 15 September the House of Representatives adopted the conference report on the Soldiers' Bonus Bill.

President Harding vetoed that measure on 19 September. The Pennsylvania and the New York Central, 15-19 September, concluded arrangements with the men to end the rail shop strike. Shopcraft unions of the New York Central agreed, 19 September, that shopmen should return to work within 30 days, accepting the wage cut of 1 July. On 20 September the Senate sustained the President's veto of the Soldiers' Bonus Bill, which the House had repassed, 258 to 54. Next day, the President signed the Fordney-McCumber Tariff Bill. On 23 September the special grand jury investigating the Herrin affair made its final report, returning 214 indictments for murder, attempt to commit murder, or for other offenses. On 27 September the obligation to protect American interests in Near East, and to carry on relief work there, claimed the attention of the Navy Department, which ordered a squadron of 12 destroyers and one supply ship to be prepared to go to Constantinople. On 4 October the President of the shopmen's union stated that the shopmen's strike had been settled on 83 railroads, extending 65,000 miles, approximately. On 23 October the governments of Nicaragua, Honduras, Costa Rica, Guatemala and Salvador were invited by Secretary Hughes to send plenipotentiaries to a conference at Washington. Five days later the United States received an invitation, presented to the State Department by a joint Allied committee, to participate in the Near East conference to be held in November at Lausanne. And on 31 October the State Department announced that the American government would not participate, but would send official observers. (The chief observers selected were the Ambassador to Italy and the Minister to Switzerland; and the American High Commissioner at Constantinople was associate observer.) Ex-Premier Georges Clemenceau declared, 21 November, in an address in New York, that Germany was again preparing for a war in which Russia and Turkey should or would serve as the Fatherland's allies. On 22 November the American Federation of Labor declined an invitation to participate, with the International Federation of Trade Unions, in a general labor anti-war conference at The Hague. On 13 December the House Appropriations Committee, when reporting the Naval Appropriation bill, requested the President to negotiate with Great Britain, France, Japan, and Italy for extension of treaty limitations to swift cruisers, submarines, and aircraft—in which directions, the committee report asserted, "competition is on again."

UNITED STATES MILITARY ACADEMY, a national institution for educating officers for the Regular Army. It was founded in 1802 and is located at West Point, N. Y. In 1922-23 the faculty numbered 12 and the cadets approximately 1,260. The Academy's property is valued at \$23,105,225. Being a component part of the Army, the Academy is maintained entirely by Federal appropriations. The appropriation granted it in the Military Academy Appropriation bill for 1922-23 totaled \$2,059,629. Brig.-Gen. Fred W. Sladen is superintendent.

UNITED STATES NAVAL ACADEMY, a government institution for the education of officers for the Navy, founded 10 Oct. 1845 and located at Annapolis, Md. In 1922-23 the faculty numbered 251 members, while the number of midshipmen enrolled was 2,395. The institution's property is valued at \$16,000,000. It is supported entirely by government appropriations, the appropriation for 1922-23 being \$2,229,461, not including the pay of officers attached to the Academy. Rear Admiral Henry B. Wilson, United States Navy, is president.

UNITED STATES NAVY. There is a strong probability that any future war in which the United States may be involved will be one in which the issues will be largely decided on the sea or in the air. Not many years ago America's great naval writer, Mahan, made clear for the first time the tremendous influence which naval activities have exerted upon the history of the world. The present post-war period cries aloud for some equally authentic exponent of the reverse of Mahan's deductions who will convincingly reveal what result the history of the Great War will have upon naval science. The Washington Conference of 1921-22 resulted in an agreement among the leading naval powers for an era of comparative economy to be achieved through a period of mutual limitation in the building of fighting ships. This halt in the headlong race for the expansion of the fleets along the lines of pre-war building programs was welcomed as a sign of peace by nations weary of war and taxes. It may, however, be well to recall how heavy has been the cost of long drawn out wars which might have been much briefer and cheaper if adequate preparation had made prompt and efficient action possible. Some shrewd observers of the Conference have suspected that when the experiences of 1914-18 shall have been thoroughly digested we may conclude that the naval warfare of the future is likely to demand fleets radically different from those which fought in that war. Some of these critics believed that the great powers which had been competing in the building of superdreadnoughts at a cost of from 14 to 18 million dollars each welcomed an opportunity to mark time until it has become more clearly determined just what types will be the most efficient for the sea fighting of the future. A year ago the *Ostfries-*

land and other former German ships were the targets of an air attack off the Virginia Capes when it became evident that one of the major missions of the air forces in the future will be the attack upon hostile fleets. It was demonstrated conclusively that aircraft bombs could put out of commission and actually sink any naval vessel that has yet been launched. Of course it will not do to accept too confidently the results of these peace time experiments, for the bombers were meeting no resistance from the objects of their attack. We all recall the supreme pre-war confidence of the American artillery service in its 3-inch field piece which performed beautifully on the artillery practice ranges. Not one of those guns was used in France where actual battlefield conditions showed them to be utterly useless. However the efficiency of the service of the air is constantly improving and there is strong reason to question the ability of battleships to resist successfully such a bombing attack as will be likely to come out of the skies a few years hence.

It may not be inopportune to draw a lesson from a very old historic source. Rome was undoubtedly inferior to Carthage in the naval science of their day and yet was able to triumph completely over the better manoeuvred and better built fleets of her rival. The introduction of a clumsy but efficient device for boarding more than offset the superior nautical skill of the Carthaginian sailors. Carthage had failed to visualize anything beyond the quinquereme and the Roman corvus changed the history of the world because the previous masters of the sea were unable to revise their naval architecture and tactics sufficiently to cope with the new factor.

Naval science in our day has adopted as its common denominator the super-dreadnought, a logical lineal descendant of the Carthaginian quinquereme which had seemed to its designers to be the invincible successor of the older trireme. So far as the world at large has been permitted to observe the pre-war dependence upon the heavy unit as the essential factor in the fighting fleet continues to fill the vision of naval constructors. It may require the younger generation of a decade hence to revise their program. The ten year vacation prescribed by the Washington Conference should afford ample opportunity for the experts to devise efficient weapons less costly than the great floating fortresses which have been blinding the vision of naval designers for a generation.

When it was fleet against fleet in the great war there can be no question that victory perched on the side of the heaviest and the fastest. In the operations against land fortifications battleships have never seemed so inefficient. They dared not attack Heligoland and they failed signally at the Dardanelles. Zeebrugge proved safe from all but light raiders. Doubtless it will always be necessary for warring nations to drive from the seas the naval forces of an enemy in order to protect the merchant marine and to accomplish that will require the best naval fighting machinery. It is, however, to be remembered that after the high seas fleets of the Germans had been destroyed

the ocean roadways continued to be decidedly dangerous for both merchantmen and warships. The submarine threatened both and the efficacy of the threat is illustrated by a comparison of tonnage losses among war ships which up to Armistice Day totalled 803,000 displacement tons for the Allies against 415,000 for the Germans (not including the Scapa Flow losses). The total tonnage sunk during the war by German submarines amounted to approximately 15,000,000 tons. It may readily be conceded that had Germany possessed greater coastal base advantages the menace of the submarine to the heavy warship might have been even more serious. In this connection it will be of interest to consult the following statistics:

WARSHIP LOSSES 1914-18

	England	United States	France	Italy	Japan	Germany	Austria
Battle ships	13	3	4	3	1	1	3
Battle cruisers	3	1	5	2	4	24	2
Cruisers	25	1	5	2	4	24	2
Monitors	6	2	14	10	3	72	3
Destroyers	64	2	14	10	3	72	3
Torpedo boats	10	1	8	5	1	51	4
Submarines	59	1	14	8	...	216	8
Small craft	27	...	9

The naval pre-war budgets were in sterling.

	£
Great Britain	46,309,000
France	18,452,000
Australia	2,456,000
Italy	9,068,000
Russia	22,817,000
United States	29,464,000
	<u>128,566,000</u>
Germany	24,012,000
Austria	3,100,000
	<u>27,112,000</u>

It appears from a consideration of the above facts that the Germans were able on a budget of 27 million pounds sterling to develop a naval fighting organization which seriously menaced the navies which the allies had prepared at an annual cost nearly five times as much. So far as their weight in the determination of the war was concerned the Germans might better have converted all of their heavy ships into sea going submarines which had they been built and ready for service in the summer of 1914 would have been far more dangerous to the Allies than were their battleships and cruisers. The squadrons of American destroyers which escorted the fleets of transports in 1917-1918 were much more suited to that duty than the best battleships and cruisers. They defended both themselves and their convoys against enemy submarines far more efficiently than had cruisers and battleships in the earlier years of the war. It seems safe to assume that the sentiment in the United States will always approve the maintenance of an efficient defensive fleet on both

exposed coasts. The country has inherited the group instinct to hold apart from other nations and will doubtless always demand a navy competent to defend that desired aloofness. The naval strategist will defend the fighting ships of great offensive power and cruising capacity by pointing out the desirability of carrying the war to the opponents' coasts and harbors instead of awaiting his attack upon our own. If we are to maintain our far-flung island possessions and also defend the merchant marine which the country requires we must be able to keep our warships out on the high seas and they must be able to outsail and outfight any rival. Thus far the weight of expert naval opinion as to the means for attaining these purposes is decidedly in favour of the balanced fleet whose units shall include all types of warships for service afloat, in the air, or under water. The merchant marine which will require their protection has increased from a total tonnage of 5,164,839 in 1900 to 18,462,967 in 1922. Considerably more than half of our merchant marine is engaged in foreign trade and fisheries. The Navy Department recognizing its dependence upon the support of merchant auxiliaries in wartime is giving every possible aid to the development of the American Merchant Marine. Opportunity is freely offered to observe the methods developed at the naval testing plants for the use of fuel oil as well as systems devised for the most advantageous handling of merchant ships in the various ports of the United States and the island possessions.

The unavoidable haste in the assignment of recruits to the naval forces at the time of the World War naturally resulted in numerous errors of classification and there is evident need now for some organized effort to enroll and classify young men suited by inclination and vocational training for naval service. The records of the Navy Department show only those who have had service. There is no record of the generation now maturing many of whom would be suitable to and valuable in this service although meanwhile through geographical location debarred from joining either the Federal Naval Reserve or the Naval Militia. This situation appears to offer an excellent opportunity for a valuable patriotic service on the part of some national organization interested in the growth of the country and its naval defenses. Should the misfortune of another great war occur it is most unlikely that America would enjoy immunity for a leisurely preparation. There would more probably be sudden need for increasing the naval personnel and the recruits ought to be chosen from the ranks of those already qualified in some degree at least for this service.

In 1922 practically every maritime country in the world showed a decrease in ship building and there is now but a fraction of our working population employed in this industry. The 1922 decrease was sharpest in American yards where the production declined to 119,138 gross tons as against 1,006,413 gross tons in 1921. Launchings in Germany in 1922 amounted to 525,829 gross tons and in the same year Great Britain and Ireland produced 1,031,081 gross tons. In

1913 American shipyards produced only 8 per cent of the world total but in 1917 57 per cent of the aggregate output was American. In 1920 American yards turned out 40 per cent of the world's total. In 1921 23 per cent and in 1922 less than 5 per cent of the total in a year when throughout the world the production showed a loss of almost 900,000 tons below the last pre-war year, 1913. In 1913 German launchings were nearly 1,500,000 tons less than those of Great Britain but in 1922 Germany was within 500,000 tons of the British record and produced nearly five times the American total. The figures indicate a serious shrinkage in American physical equipment as well as personnel adaptable to naval needs in an emergency.

Deep Sea Explorations.—In December 1922 two naval vessels were assigned for sounding operations off the west coast of the United States which may reveal the cause of earthquakes. Under the direction of the hydrographic office of the Navy Department the destroyers *Hull* and *Corry* were fitted with apparatus for measuring ocean depths by sound waves and had aboard scientific observers from the Carnegie Institution of Washington. One of the scientific theories regarding the successive earthquakes of the Pacific coast region has been based upon the belief that there is in progress a receding movement of the contiguous coast of California. Both the Carnegie Institution and the Navy Department having studied the possibilities of the sonic depth recorder believe that developments of great importance may result from the work now beginning. The apparatus installed at a cost of about \$18,000 for each of the two vessels consists of a standard navy sound receiver; Submarine Signal Company's Fessenden type of sound oscillator for transmitting sound signals; and navy sonic depth finder recently developed at the engineering experiment station, Annapolis. The destroyer *Stewart* recently gave the new sounding device an exhaustive service test in a voyage from Newport to Chefoo, China via the Mediterranean and Suez when daily reports on soundings obtained were communicated by radio to the Navy Department at Washington. During the whole of the cruise the apparatus worked without apparent error and in nine days between Newport and Gibraltar over 900 soundings were taken at frequencies varying between 20 and two minutes while the ship steamed steadily at 15 knots. During a two hour halt it was shown that successful soundings can be taken at intervals of one minute in the deepest water. The deepest hole found on this cruise was 3,200 fathoms, sounded in about four minutes as compared with about three hours which would have been required to obtain the same result at that depth by the old lead method of sounding. The outline of the bottom of the sea was minutely recorded between Josephine and Gettysburg Banks. The sea bottom there was found to consist of an extensive plane bordered by mountains and table lands some of which rose 4,000 feet above the plane. Several deep depressions hitherto unshown on the charts were discovered and positive depth data secured where only negative data had been recorded near the Azores.

The thorough exploration of the sea floor is made possible by the use of this new device which seems likely to revolutionize piloting and navigation. The universal sounding apparatus was designed principally by Harvey C. Hayes, physicist of the Naval Engineering Experiment Station who accompanied the *Stewart* to Gibraltar. The sound transmitter develops a high-frequency vibration in a diaphragm which is in contact with sea water and the high pitched note carries many miles.

Two methods of obtaining soundings will be used by the vessels engaged in the Pacific coast work. One for depths up to 90 fathoms and the other for greater depths. The first, called the angle method, uses the ships propellers as a sound source and the echo is received in the compensator from the sound receivers. The depth scale is graduated by obtaining a number of points on the curve when the set is calibrated after which the depths may be read directly off the scale. The second, or deep water method, uses the speed of sound in water as a means of obtaining the depth. An impulse is sent out on the oscillator and the elapsed time between the sending and receiving of the oscillation is automatically recorded when the echo completes the electrical circuit.

The Washington Conference.—The Washington Conference of 1921-22 sought to secure a harmonious agreement among the five principal sea powers for the limitation of naval armament. The agreement upon a 5-5-3 capital-ship navy met with prompt ratification in Great Britain, the United States and Japan in 1922. The year 1923 dawned without the expected official concurrence of France and Italy although favourable action in both countries had been promised by Poincaré for France and Mussolini for Italy. The sincerity of the signatory powers was demonstrated by prompt measures on the part of all three for the scrapping of surplus warships and the suspension of such parts of their building programs as was required by the treaty. Japan assigned a considerable part of the savings amounting in this year's budget to about \$58,500,000 to an increased support of compulsory public education, returned the Shantung Peninsula to China, proceeded with the evacuation of Saghalien and came to an amicable agreement with the United States as to the island of Yap. No man can detect anywhere on the most clouded political horizon a suggestion that any sound interest of either of the three agreeing powers has suffered the slightest jeopardy because of the reduction of warlike navies. At the outset of the conference the United States proposed not only to stop the ruinous race of competition in the building of battle ships and battle cruisers but to destroy about 40 per cent of the existing strength of capital ships of the principal naval powers in such a way as to leave the relative proportions of naval strength unchanged and that proposal became substantially the final agreement. No restrictions were placed upon first line cruisers, light cruisers, destroyer leaders, destroyers, first line submarines and fleet submarines. Naval intelligence indicates that in ships building and projected among these types the position of the five powers is as follows:

	Great Britain	United States	Japan	France	Italy
First line light cruisers..	None	10 = 75,000 tons	15 = 81,900 tons	3 = 24,000 tons	2 = 16,000 tons
First line cruisers.....	None	10 = 75,000 tons	None	None	None
First line destroyers.....	3 of 3,725 tons	3 = 3,645 tons	50 = 58,500 tons	12 = 16,800 tons	12 = 11,680 tons
Destroyer leaders.....	1 of 1,750 tons	None	None	6 = 14,400 tons	6 = 12,270 tons
First line submarines....	* 4 of 5,800 tons	36 = 31,561 tons	52 = tonnage unknown; 23 = 30,394 tons	12 = 13,200 tons	4 = 2,600 tons
Fleet submarines.....	None	3 = 6,375 tons	None	None	None

It is believed that the above construction with vessels retained will make Japan superior to the United States in light cruisers and submarines.

The completed capital ships to be scrapped by the United States are: *The Virginia, New Jersey, Rhode Island, Georgia, Nebraska, Connecticut, Louisiana, Vermont, Minnesota, Kansas, New Hampshire, Michigan, South Carolina, and the Delaware* or the *North Dakota*. The *Kentucky* and *Ohio* while not listed under the terms of the treaty are understood to be among the completed capital ships to be scrapped. The old battleship *Iowa* was sunk in gunnery practice during the fleet maneuvers in Panama Bay on 22 March 1923. The *Maine* and the *Missouri* have been sold. The two most advanced battle cruisers, the *Lexington* and the *Saratoga* are to be converted into airplane carriers.

The United States had under construction at the time of the conference seven battle ships and four battle cruisers on which work was suspended.

The battleship *Washington* under construction by contract and launched is to be scrapped. The capital ships to be retained by the United States are the following:

	Tonnage	Main battery		Year completed	Cost
		No.	In.		
<i>Maryland</i>	32,600	8	16	1920
<i>California</i>	32,300	12	14	1919
<i>Tennessee</i>	32,300	12	14	1919	\$18,437,154
<i>Idaho</i>	32,000	12	14	1917	14,443,957
<i>New Mexico</i>	32,000	12	14	1917	15,988,216
<i>Mississippi</i>	32,000	12	14	1917	14,625,979
<i>Arizona</i>	31,400	12	14	1915	12,993,579
<i>Pennsylvania</i>	31,400	12	14	1915	13,793,009
<i>Oklahoma</i>	27,500	10	14	1914	11,770,946
<i>Nevada</i>	27,500	10	14	1914	11,555,410
<i>New York</i>	27,000	10	12	1912	11,365,808
<i>Texas</i>	27,000	10	14	1912	11,179,195
<i>Arkansas</i>	26,000	12	12	1911	10,207,090
<i>Wyoming</i>	26,000	10	12	1911	10,242,362
<i>Florida</i>	21,825	10	12	1910	10,357,628
<i>Utah</i>	21,825	10	12	1909	8,954,076
<i>North Dakota</i>	20,000	10	12	1908	8,685,928
<i>Delaware</i>	20,000	10	12	1909	8,458,978
Total tonnage	500,650				

On the completion of two new ships of the *West Virginia* class and the scrapping of the *North Dakota* and *Delaware* the total tonnage of capital ships retained by the United States will be 525,850 tons; when similar changes among the retained capital ships of Great Britain have been completed the total British

tonnage for this class will be 558,950 tons. The similar tonnage for Japan will be 301,320 tons. Vessels completed after the signing of the treaty are to be rated at their displacement tonnage when in the standard condition as follows: Fully manned, engined and equipped ready for sea including all armament and ammunition, equipment, outfit, provisions and fresh water for crew, miscellaneous stores and implements of every description that are intended to be carried in war, but without fuel or reserve feed water on board. Vessels previously completed are to retain their present ratings of displacement tonnage in accordance with their national system of measurement. In January 1923 Congress voted \$6,500,000 to be made immediately available for modernizing by increasing the elevation and range of turret guns of the following battle ships: *Florida, Utah, Arkansas, Wyoming, Pennsylvania, Arizona, Oklahoma, Nevada, New York, Texas, Mississippi, Idaho* and *New Mexico*.

(Since to increase the range and elevation of the turret guns was believed to involve a breach of the Washington naval treaty the matter was held in abeyance.)

At the same time the House Naval Committee voted to report favorably a bill increasing the authorized cost of the two battleships under construction—the *Colorado* and the *West Virginia*—and the ten scout cruisers now building.

The first of these new cruisers to be completed was the *Omaha* ordered to the Vashon Island course in Puget Sound for a six hour trial run early in February 1923. A remarkable feature of the *Omaha* is the enormous power of the four Westinghouse turbines that propel her. When operating at full capacity these engines develop a total of 90,000 horsepower. These new cruisers are designed to attain a high speed of 35 knots, have a displacement of 7,500 tons and carry batteries of twelve 6-inch guns. They are practically exaggerated destroyers with a beam of 53 feet, mean draft of 13 feet 6 inches, and length over all of 556 feet giving a ratio of beam to length of one to ten.

The Navy Department points to a serious deficiency in the total lack of mine-laying submarines in the United States Navy. War statistics indicate that a very large percentage of the destruction accomplished by submarines can be credited to this type of vessel. Mine laying is an important factor in modern war and can be carried out more safely and effectively by the submarine than any other type of vessel. Of another important type—the scout submarine—there are but three under construction and these admittedly are not of the most approved design.

UNITED STATES NAVY

1. U. S. Scout Cruiser Omaha

International Newsreel

2. U. S. Battleship California

3. U. S. Aeroplane Carrier Langley

The number of officers, commissioned and warrant, in the Navy as of 28 Dec. 1922 was as follows:

	Regular	Additional	Total
Total line.....	4,235	53
Total staff.....	1,930	7
Total chief warrant.....	479
Total warrant.....	887
	<u>7,531</u>	<u>60</u>	<u>7,591</u>

The enlisted strength now authorized is 86,000 men. In 1921 the enlisted strength was 119,205. The following figures indicate the approximate average length of service of officers in each grade and corps before promotion to next higher grade:

Line from —	Years	Total service to date since entry
Captain to rear admiral.....	6	36 yrs., 2 mos.
Commander to captain.....	4	26 yrs., 4 mos.
Lieutenant-Commander to commander.....	4	20 yrs., 8 mos.
Lieutenant to Lieutenant-Commander.....	4	18 yrs., 6 mos.
Lieutenant (j. g.) to lieutenant.....	2½	10 yrs., 7 mos.
Ensign to lieutenant (j. g.).....	2½	6 yrs., 7 mos.
Medical corps, from —		
Commander to captain.....	4½	23 yrs., 3 mos.
Lieutenant-commander to commander.....	6½	18 yrs., 7 mos.
Lieutenant to lieutenant-commander.....	5	11 yrs., 10 mos.
Lieutenant (j. g.) to lieutenant.....	2½	3 yrs., 1 mo.
Dental corps, from —		
Lieutenant to lieutenant-commander.....	4	6 yrs., 9 mos.
Lieutenant (j. g.) to lieutenant.....	2½	3 yrs., 1 mo.
Supply corps, from —		
Commander to captain.....	4	22 yrs., 9 mos.
Lieutenant-commander to commander.....	5	18 yrs., 6 mos.
Lieutenant to lieutenant-commander.....	3½	13 yrs., 6 mos.
Lieutenant (j. g.) to lieutenant.....	2½	3 yrs., 4 mos.
Ensign to lieutenant (j. g.).....	2½	3 yrs., 1 mo.

Following is a table showing the number of appointments of midshipmen allowed to the Naval Academy as now provided by law and as limited (but not repealed) by the appropriation act for the fiscal year of 1924:

	As provided by present law, Class entering, 1923	As limited by appropriation, Class entering, 1924
Each Senator.....	5	3
Each Representative.....	5	3
Each Delegate in Congress.....	5	3
Governor of Porto Rico.....	1	1
Resident Commissioner of Porto Rico.....	5	1
District of Columbia.....	5	2
Enlisted personnel (annually).....	100	100
At-large by President (annually).....	15	15
From Philippines for each naval academy class.....	<u>1</u>	<u>1</u>

The appropriation for the United States Navy for 1923 amounted to \$298,324,265.25. The

budget for 1924 submitted to Congress with the approval of the President called for \$289,-880,993 and provides for the maintenance of the present enlisted personnel of 86,000 men, the upkeep of the ships now in commission and will increase the steaming radius of capital ships from 13,080 miles to 16,200 miles and other ships proportionately, will provide for training of 2,000 officers and 7,000 men in the Naval Reserve, will make provision for continuing new ship construction in privately owned yards. It will necessitate reduction in speed on construction of several light cruisers and submarines.

Reorganization of the Fleet.—In December 1922 a general plan for the organization of the navy afloat was embodied in a general order approved by the President and announced at the Navy Department. The fleet is organized under the title "The United States Fleet" and one commander in chief will command all the various elements. The principal titles of the organization are: The Battle Fleet, The Scouting Fleet, The Control Force, and The Fleet Base Force.

The naval policy proposes that the various units of the fleets shall meet annually for three months for drills, manœuvres and gunnery exercises. For the winter of 1922-23 Panama Bay was selected as place of assembly of the newly organized fleet. Admiral Hilary P. Jones commanding the Atlantic fleet became, for all purposes, the commander in chief of the United States fleet in peace and in war whether the units of the fleet are in juncture or apart. The Battle Fleet which would oppose any enemy main fleet in war was in command of Admiral E. W. Eberle with the title Commander in Chief, Battle Fleet which will be composed of battleship Divisions under a vice admiral, light cruiser divisions, destroyer squadrons, aircraft squadrons, and such submarine divisions as may be assigned.

The Scouting Fleet whose duty in war is to locate the enemy main fleet and later unite with the Battle Fleet to join in action was commanded by Vice-Admiral J. D. McDonald with the title of commander Scouting Fleet composed of battleship divisions, light cruiser divisions, destroyer squadrons, submarine divisions, aircraft squadrons and train.

The Control Force aids in the seizure of bases and exercises control of these when gained. It is then under command of a Rear Admiral with the title commander, Control Force, and is composed of cruiser divisions, destroyer squadrons and mine squadrons.

The Fleet Base Force defends fleet bases, and is commanded by Rear-Admiral J. V. Chase

THE NAVAL EXPENDITURES BY THE PRINCIPAL SEA POWERS IN RECENT YEARS

	Great Britain	United States	Japan	France	Italy
1912-1913.....	\$224,443,296	\$129,787,233	\$46,510,216	\$81,692,832	\$41,893,420
1913-1914.....	237,530,459	136,858,301	48,105,152	90,164,625	49,550,147
1914-1915.....	260,714,275	142,959,092	69,111,653	123,828,872	56,920,440
1915-1916.....	1,001,202,544	152,821,540	63,000,000	135,736,207
1916-1917.....	1,020,003,279	261,403,176	73,000,000	161,482,062

NOTE.—Displacement not included for 12 destroyers, 12 fleet submarines, 1 tug, 3 unclassified.

with the title Commander, Fleet Base Force. It is composed of mine squadrons, destroyer squadrons, aircraft squadrons and train.

It is believed that this plan meets the modern demand for a peace time organization which will be practical in war time and further provides for one commander in chief of the United States Fleet for strategy and tactics, not assigned to the command of any sub-division but free to exercise general supervision. The Control and Fleet Base Forces will be in peace time largely skeleton organizations but prepared for rapid expansion in time of war.

The Naval War College.—In December 1922 Col. Theodore Roosevelt, assistant secretary of the Navy, announced that it had become vitally necessary that the scope of the Naval War College should be enlarged to embrace a close co-operation with the General Staff College of the Army. A conference of the ranking officers of the Navy was called and a tentative plan drawn up by Rear-Admiral W. V. Pratt who is a graduate of both the Naval War College and the Army War College. This plan at the end of January 1923 was in course of development but is essentially based upon the ever growing importance of the position of the United States in international world politics with the resultant need for a broader knowledge among naval officers and a thorough grounding in the principles of tactics and strategy.

EDWIN WINTHROP DAYTON,
Lieut-Colonel, Staff Specialist, United States
Army Reserve Corps.

UNIVERSALISTS. See CHURCHES IN THE UNITED STATES, STATISTICS OF THE.

UNIVERSITIES AND COLLEGES. See separate articles on the principal universities and colleges under their respective headings.

UPPER SENEGAL AND NIGER. See FRENCH WEST AFRICA.

UPPER SILESIA. See GERMANY; POLAND; SILESIA.

UPSALA COLLEGE, a Lutheran co-educational institution, founded in 1893 and located at Kenilworth, N. J. In 1922-23 it had a faculty of 12 members, 105 students, property valued at \$67,000 and an income of \$32,000. Rev. Carl G. Erickson, Ph.D., is president.

URSINUS COLLEGE, a co-educational institution, founded in 1869 and located at Collegeville, Pa. The college is affiliated with the Reformed Church in the United States, but is non-sectarian. In 1922-23 it had a faculty of 22 members, 261 students, property valued at \$545,900 and an income of \$193,246.16. George L. Omwake, Ph.D., is president.

URUGUAY, a Republic of South America, lying in the fork between the River Uruguay and the Atlantic Ocean. On the south is the

broad estuary of the Rio de la Plata into which the Uruguay empties. Across the river to the west are the Argentine provinces of Entre Rios and Corrientes and to the north is the Brazilian state of Rio Grande do Sul from which Uruguay is separated by the rivers Cuareim and Yaguron, Lake Merim and a line through the Santa Ana hills.

Area and Population.—Uruguay has an area of 72,153 square miles and a population of 1,494,953 on 31 Dec. 1920. The great majority of the people are of pure European descent. The last census showed 181,222 foreigners in the republic, of which number 64,000 were Italians, 55,000 Spanish, 28,000 Brazilians, 20,000 Argentines, 9,000 French, 1,400 British, 1,400 Swiss, 1,200 Germans and about 4,000 other nationalities.

Religion.—There is complete separation of Church and state and full liberty for all denominations. Roman Catholicism is the faith of the majority of the people. This church is governed by an archbishop at Montevideo, the capital, and two bishops—at Melo and Salto.

Education.—Elementary education is compulsory. There are 1,005 public elementary schools with 102,889 pupils; 195 private schools with 21,223 pupils and 6,060 students in secondary schools. There are also a number of evening schools which are attended by 6,000 adults. For higher education there is a university at the capital with over 5,000 students and 344 members of the faculty. There are several special schools throughout the republic.

Production and Industry.—Agriculture and kindred industries are the chief sources of the country's wealth and furnish employment to about 100,000 of the population. In 1921 wheat was planted on 758,762 acres and yielded 303,505 metric tons; barley was planted on 4,178 acres and yielded 1,589 tons; oats was planted on 76,730 acres and yielded 28,871 tons; and flax was planted on 94,250 acres and yielded 26,811 tons of linseed. Cattle-raising is a main industry; there are in the country 8,000,000 head of beef cattle, 11,472,852 sheep, 303,958 swine and 567,154 horses. Grapes, tobacco and olives are cultivated with success. The grape crop of 1920 amounted to 56,482,000 kilos of grapes and 7,919,000 gallons of wine were produced. Among the metals found are gold and silver, copper, lead and magnesium. Lignite coal is mined also. The generation of electricity for light, heat and power is now a state monopoly. The republic has 16,017 industrial and commercial establishments, capitalized at 134,383,782 pesos.

Commerce.—The foreign trade of the republic in 1920 amounted to \$128,916,632, of which \$80,751,718 represented the value of the exports. Exports for the year 1921 were slightly above this amount. In 1922 the exports of wheat amounted to 1,094 tons as compared with 560 tons in 1921; corn exports of 1922 totaled 1,690 tons as compared with 1,296 tons the year previous; linseed exported in 1922 amounted to 126 tons as compared with 3,708 tons the year before; flour exports totaled 672 tons in 1922 compared with 841 tons in 1921; in 1922 9,000 bales of sheep skins and 1,289

bales of wool were exported, as compared with 8,000 bales of skins and 6,000 bales of wool for 1921. For the first nine months of 1922 the export of mutton carcasses amounted to 275,407, as compared with 287,790 in the same period of 1921. Beef quarters exported totaled 711,570 in 1922 as compared with 821,579 in 1921. Exports in 1922 were valued at \$76,000,000 and imports at \$43,000,000. As a result of floods, caused by heavy rains in August, the grain crop of 1922 was greatly damaged, wheat being damaged the most. Much of the land was still under water at the end of October and the planting of the new crop was greatly delayed. The planters endeavored to make up part of their losses by planting late corn with the aid of fertilizers.

Shipping and Communications.—The merchant marine of the republic consists of 22 steam vessels of 42,114 tons and 254 coast vessels of 18,061 tons. In 1920 there cleared at Uruguayan ports 5,670 vessels (steam) of 8,380,302 tons and 3,954 vessels (sail) of 512,568 tons. There is considerable river transport. Uruguay has 2,240 miles of national roads and 3,100 miles of departmental roads. There are 1,572 miles of main railways mostly British owned. One line included above (78 miles) and three minor lines are state-owned. The total rail mileage is 1,625 miles to which must be added 170 miles of tramways. Telegraph lines have an aggregate length of 4,819 miles served by 258 offices. There are 995 post offices.

Finance.—The budget for the fiscal year 1922-23 as approved by the National Administrative Council and submitted for enactment to the Chamber of Deputies, totaled 41,868,474 pesos. The present revenues being calculated at 34,705,474 pesos, there would be a deficit of 7,163,000 pesos. In its message of transmittal the National Administrative Council recommended the following new taxes to cover the above deficit:

	Pesos
Tobacco, perfumery and toilet articles	400,000
Reform of customs tariff of duties	1,000,000
Ten per cent increase on existing duties	716,000
Luxury tax	2,000,000
Import duties on gasoline	400,000
Consular fees	200,000
Tax on foreign drafts	200,000
Additional tax on stock companies	200,000
Tax on horse racing	520,000
Total	6,336,000

On 1 Jan. 1921 the public debt of the republic was stated to be 172,202,766 dollars, of which 2,135,500 dollars was given as international \$126,598,574 as foreign and \$43,468,692 as internal.

Defense.—Uruguay has a small standing army and also a National Guard. The standing army is recruited by voluntary enlistment lasting from 2 to 5 years. It has a peace strength of 10,500 men and a war strength of about 50,000. Service in the National Guard is compulsory, beginning at the age of 17 and lasting to the 45th year. It is divided into three classes—the First Ban, consisting of youths from 17 to 30 years is a mobile force

more or less well organized and of a total strength of about 20,000 men; the Second Ban is made up of men aged from 30 to 45 years who are fit for service and is the provincial or departmental guard; the Third Ban, containing all men between 19 and 45 years, is the territorial army and is liable only for garrison duty in its own districts. The total strength of the entire Guard is about 100,000 men. The naval forces consist of the armored cruiser *Montevideo*, the *Uruguay* and the yacht *18 de Julio*.

Government.—The executive power is vested jointly in a President and the National Administrative Council. The President is elected for a term of four years by direct vote of the people and is ineligible for re-election for eight years following his last term of office. The National Administrative Council consists of nine members, six from the majority party and three from the largest minority party and three retiring every two years. The President controls the Departments of Foreign Affairs, War and Marine, the Interior, and appoints the Ministers of these departments. The Council controls the Departments of Finance, Public Works, Education and Industry, and appoints the Ministers or heads of these Departments. The legislative power is vested in a Parliament of two chambers, the Senate and Chamber of Representatives, which meet in regular session from 15 March to 15 December. In the interval there is a permanent committee of two senators and five deputies, which has charge of the legislative branch until the next following regular session. Senators are chosen by members of an Electoral College, the members of the latter being chosen by direct popular vote. There is one senator to each Department, of which there are 19. Members of the lower chamber are elected for three years and are 90 in number. Senators are elected for six years, one-third of the senate retiring every two years. There is universal male suffrage for adults 18 years and over who can read and write.

History.—José Serrato, leader of the Colorado party, elected President of Uruguay 26 Nov. 1922, succeeded President Brum, 1 March 1923, for the ensuing four years. He found the smallest republic in South America in a prosperous condition with a population of 1,500,000 bent on developing the country and extending relations with the outside world. While Uruguay has been largely pastoral and agricultural, the past few years have brought her a notable extension in foreign trade with large increase in exports and imports. The importation of fine breeding stock from 1920 to 1923 tended to improve greatly cattle ranches and stock farms. Exportation of wool and hides increased and over 6,000 vessels called at Uruguayan ports in 1922, augmenting the general foreign and domestic shipping business. Better class immigrants continued to arrive and to gravitate to the farm lands of the interior, swelling the population and increasing the prosperity of the country. Considerable attention was given, in 1922, to the improvement of the railway system of the republic and to the encouragement of foreign capital in new railway enterprises. The comparatively small extension of Uruguayan

territory has enabled the government to attack successfully the problem of illiteracy and the general improvement and extension of the educational system. Though Uruguay is considerably smaller than Paraguay, the income of the Uruguayan government was nine times that of Paraguay in 1922. This, with her less intractable land configuration, gave her a great advantage over her inland neighbor of which she took full advantage. This was reflected in the very large attendance, for a South American country, of students at her national free schools. The National University at Montevideo had over 5,000 students in 1922, which was considerably larger than that of the University of Mexico with some three times the population to draw from; and over ten times that of the National University of Paraguay. Public education made a long step to become effectively compulsory in Uruguay in 1922, with perfected educational machinery for continuing the fight for the total obliteration of illiteracy in the next few years. The educational department and the government did much effective work in behalf of social welfare in 1922. The legislature added to the excellent laws passed previously to this end and the University and the educational department put into movement more effective machinery for the eradication of numerous unfavorable conditions and evils existing among the working classes. The national budget for 1922 showed nearly \$40,000,000 income while the expenditure was considerably less. The fact that the exports, \$76,000,000 were very much larger than the imports, \$43,000,000, tended to the stability of the national currency. One feature of the development of Uruguayan foreign trade in 1922 was the remarkable decline in imports from and exports to the United States over those of 1920-21. The imports from the United States were, in round numbers, \$28,000,000 in 1920-21 as against less than \$9,000,000 in 1922, a decrease of 66 per cent. The decline in exports, while not so notable, was still heavy, dropping from \$17,500,000 in 1920-21 to \$11,000,000 in 1922. This was due to a variety of causes. Europe provided better shipping facilities, cheaper transocean rates, more experienced salesmen and more favorable credit terms. Another factor of importance was the return to the South American market of Great Britain, France, Belgium and Italy, with the former far in the lead.

UTAH, one of the mountain group of States of the far West, bounded north by Idaho and Wyoming, east by Colorado, south by Arizona and west by Nevada. Its area is 84,990 square miles and in 1920 it had a population of 449,396. It ranks 10th in order of size and 40th in order of population. The population of 1920 included 441,901 whites, 3,338 Asiatics, 2,711 Indians and 1,446 negroes. The foreign-born residents in the same year numbered 56,455 and included 14,836 English, 3,589 Germans, 6,073 Swedes, 3,029 Greeks and 1,207 Irish. Fifty-two per cent of the total population in 1920 was rural. The largest cities, with their populations in 1920, are Salt Lake City the capital, 118,110; Ogden, 32,804, and Provo, 10,303.

Religion.—The principal Christian denominations have a combined membership of 280,848. Of these about 75 per cent are members of the Church of Latter Day Saints, 10,000 are Roman Catholics, 2,254 Presbyterians, 1,848 Methodists, 1,616 Congregationalists, 1,469 Episcopalians and 1,305 Baptists.

Education.—Illiteracy is low in the State, being only 1.9 per cent. Among native whites it is three-tenths of one per cent. School attendance is compulsory for 20 weeks of the year and in large cities for 30 weeks for children between the ages of 8 and 16. There are 637 elementary schools in the State with 3,180 teachers and 83,276 children. There are 46 high schools with 642 teachers and 14,130 pupils. The Mormon Church maintains a church teachers' summer school. For higher education there are the University of Utah, the State School of Mines and the State School of Arts and Science, Utah Agricultural College, Brigham Young University, Brigham Young College, the Latter-Day Saints' University and seven academies.

Finances.—At the beginning of the fiscal year 1922 the State had on hand a balance of \$1,823,929.11. Receipts during the fiscal year amounted to \$10,298,381.22. Disbursements during the same period amounted to \$10,817,955.81, leaving a balance on hand at the beginning of the current fiscal year of \$1,304,354.52. Estimated receipts for the fiscal year 1923 amount to \$10,150,000. The bonded debt of the State at the end of 1922 was \$9,910,000; the floating debt, \$125,000, making a total indebtedness of \$10,035,000. The assessed value of real property was \$508,869,619, and of personal property, \$126,662,638.

Agriculture.—In 1920 there were in the State 25,662 farms, having a combined area of 5,050,410 acres, of which 1,715,380 acres was improved land. The total value of all farm property that year was \$311,274,728. The value of all crops in 1920 was \$57,890,000. The State produces all the cereals of the temperate zone. The wool clip of 1920 was 16,150,000 pounds. The chief crops, with their acreage, yield and value for the year 1922 were: Corn, 32,000 acres, 781,000 bushels, \$664,000; spring wheat, 135,000 acres, 3,456,000 bushels, \$3,110,000; winter wheat, 159,000 acres, 2,226,000 bushels, \$2,003,000; barley, 18,000 acres, 630,000 bushels, \$346,000; oats, 86,000 acres, 3,354,000 bushels, \$1,576,000; rye, 12,000 acres, 120,000 bushels, \$72,000; tame hay, 503,000 acres, 1,459,000 tons, \$11,964,000; potatoes, 21,000 acres, 4,137,000 bushels, \$1,655,000; apples, 1,085,000 bushels; peaches, 885,000 bushels, and pears, 98,000 bushels. On 1 Jan. 1923 there were in the State 128,000 horses, valued at \$8,832,000; 3,000 mules, valued at \$186,000; 90,000 milk cows, valued at \$5,670,000; 455,000 other cattle, valued at \$12,467,000; 2,340,000 sheep, valued at \$20,826,000, and 108,000 swine, valued at \$1,177,000.

Mining.—The mineral resources of the State are varied and include gold, silver, lead, manganese, gypsum, oil, coal, copper, salt, and zinc. The total value of the mineral output in 1920 was \$45,169,328. The coal mined in 1922

was 4,864,000 tons. The value of the gold, silver, copper, lead and zinc produced from mines in Utah in 1922 was \$39,738,000; in 1921 it was \$22,023,790. The production of all metals increased decidedly, though the value was not great compared with the average of the last 10 years. The outstanding features of the year were the abnormal increase in the production of silver, which makes a record for the State, and the resumption of copper mining on a large scale at Bingham. The mine production of gold increased from \$1,769,905 in 1921 to \$2,201,500 in 1922. The gold produced from copper ore was greatly increased, as the Utah Copper and Utah Consolidated properties were again active. The mine output of silver increased from 12,251,998 ounces in 1921 to 16,800,000 ounces in 1922. This marked increase of more than 4,500,000 ounces was generally distributed, but the gain was especially noticeable in the Park City and Tintic districts. The mine production of copper increased from 30,891,403 pounds in 1921 to 95,500,000 pounds in 1922, and the value from \$3,984,991 to \$12,797,000. The mine output of lead increased from 89,187,269 pounds in 1921 to 134,000,000 pounds in 1922, and the value increased from \$4,013,427 to \$7,638,000. The average price of lead was about 5.7 cents a pound. The mine output of recoverable zinc in 1922 was 5,290,000 pounds. Most of the zinc was produced from lead-zinc ore mined at the United States mine, at Bingham, and milled at Midvale. In 1922 the mines in Utah produced about 5,500,000 tons of ore, an increase from 2,137,522 tons in 1921. Of this total the Bingham district produced 4,773,800 tons, as compared with 1,538,309 tons in 1921. The estimated production of the district was 57,889 ounces of gold, 1,349,500 ounces of silver, 91,298,000 pounds of copper, 37,000,000 pounds of lead, and more than 4,000,000 pounds of zinc.

Manufactures.—The chief manufactures are the smelting and refining of lead and copper, and the manufacture of sugar from sugar beets. Salt Lake City and Ogden are the chief manufacturing centres. In 1920 there were 1,159 industrial establishments, capitalized at \$143,666,000 and turned out products valued at \$156,804,000.

Communications.—The steam railroad mileage of the State is 2,161 miles and 448 miles of electric railroads.

Government.—The State executive is a Governor, elected for four years, who receives a salary of \$5,000. The legislature consists of a Senate and a House of Representatives, but the initiative and referendum features of the constitution restrict the power of the legislature. The Senate has 20 members, elected for four years and the House has 55 members, elected for two years. For local administration the State is divided into 28 counties.

Officials.—Governor, Chas. R. Mabey; Secretary of State, H. E. Crockett; Attorney-General, H. H. Cluff; Auditor, Mark Tuttle; Treasurer, Wm. D. Sutton, and Superintendent of Education, D. C. Jensen.

Judiciary.—Members of Supreme Court: Albert J. Weber, Valentine Gideon, Samuel R. Thurman, J. E. Frick and J. W. Cherry.

UTAH AGRICULTURAL COLLEGE, a State co-educational institution, founded in 1888 and located at Logan, Utah. The college is a part of the public school system. It was opened to students in 1890; in 1901 the curriculum was considerably enlarged and an extra year's work required for entrance to the collegiate courses leading to a degree. In 1903 the college organization was made more complete and effective by the establishment of five schools—the school of agriculture, the school of domestic science and arts, the school of agricultural engineering and mechanic arts, the school of commerce and the school of general science; in 1904 a department of music was added, offering courses in vocal music, piano-forte, violin and theory of music. The State Experiment Station is connected with the college and offers opportunity for advanced work. The institution is organized on the quarter system, being thereby in practically continuous session. In 1922-23 it had a faculty of 90 members, 1,111 students enrolled up to 18 January, property valued at \$1,510,000 and an estimated income of \$313,000. Elmer G. Peterson, Ph.D., is president.

UTAH, University of, a State co-educational institution, founded in 1850 and located at Salt Lake City, Utah. It was incorporated as the University of the State of Deseret in 1850 and opened to students the same year. But, as it failed to secure patronage or adequate financial support, it was closed after one session until 1867. The governing board of regents, however, maintained their organization during this time and had general supervision over the public schools system. From 1867 to 1869 it was largely a commercial college, but in the latter year was reorganized with normal and classical departments. In 1894 a new charter was obtained, the name changed to the University of Utah and a 60-acre tract of land on the Douglas Reservation was granted to the university by the Federal government. In the same year the Salt Lake Literary and Scientific Association gave \$60,000 for the endowment of a chair of theology. In 1899 the Legislature provided for the erection of new buildings and the removal of the University to the new site, which was

first occupied in 1900. Subsequent to this the government granted the university land so that its campus was enlarged to 90 acres. The board of regents consists of the president of the university and the Secretary of State, ex-officio members, and 12 members appointed by the Governor for four years. The organization includes the school of arts and sciences, the school of education, school of mines and engineering, school of medicine, school of law, school of commerce and finance, the extension division, and in connection with the school of education the university high school, elementary training school and kindergarten. The schools of arts and sciences, education, commerce and finance offer courses leading to the degree of B.A. and B.S. The graduate division offers courses leading to the degree of M.A. and M.S. Other degrees conferred include those of B.S. in pharmacy and LL.D. in law. In 1922-23 it had a faculty of 156 members, an estimated student enrollment of 2,650, property valued at \$1,371,110 not including value of 92 acres of campus, which was the gift of the Federal government, and an income of \$514,000. George Thomas, Ph.D., is president.

UTLEY, George Burwell, American librarian: b. Hartford, Conn., 3 Dec. 1876. He was educated at Colgate University and at Brown University, receiving the degree of Ph.B. from the latter in 1899. From 1899-1901 he was assistant librarian of the Watkinson Library of Hartford, Conn.; from 1901-05 librarian of the Maryland Diocesan Library of Baltimore and from 1905-11 librarian of the Jacksonville (Fla.) Public Library. Mr. Utley served as secretary and executive officer of the American Library Association and its publicity board from 1911 to 1920. On 22 April 1920 he became librarian of the Newberry Library of Chicago. In 1917-9 he was executive secretary of the Library War Service of the American Library Association, which supplied reading matter to the military and naval forces during the war and the demobilization period. Mr. Utley is the author of: 'The Life and Times of Thomas John Claggett' (1913), also papers on libraries and library work in various professional journals.

V

VACCINATION. In *Health News*, issued by the United States Public Health Service, in 1922 it was stated that "Before the days of vaccination conservative estimates show that one-third of all persons had smallpox and one-tenth of all deaths were due to it. To-day smallpox is rare; many physicians have never seen a case; and, where vaccination is consistently practiced no deaths from it occur. Formerly smallpox was considered a children's disease; and it still is a child's disease—where infantile and school vaccination is neglected. Witness the Philippines, where four or five years ago, after years of neglect of vaccination, an epidemic swept away nearly 50,000 persons, a large percentage of whom were children under 10 years of age. In the United States, well-vaccinated communities show low smallpox rates—Maryland with one-tenth case per thousand population; New York with one-fortieth per thousand, and the District of Columbia with 0.14 per thousand. Poorly-vaccinated States tell another story: Oregon with 1.45; Washington with 1.72; and Kansas with 2.0 per thousand population. Some communities wait till an epidemic breaks out and then rush to vaccinate. These stop the disease—after it has caused many deaths and has "branded" many survivors. Sixteen months ago, in Kansas City, an epidemic of smallpox began, yielding 350 cases and 123 deaths; and a few months later another started in Denver and yielded 950 cases and 288 deaths. Such epidemics always end the opposition to vaccinations in the community—for a time."

Of especial interest was the decision on 13 Nov. 1922 of the Supreme Court of the United States affirming that city health officials have authority under the police power of the States to require school children to be vaccinated and in so doing are not acting in contravention of the "due process" or the "equal protection" clauses of the Fourteenth Amendment. The decision was in the case of *Zucht v. King et al.*, of San Antonio, Texas.

Ordinances in that city provide that no child or other person shall attend a public school or other place of education without having first presented a certificate of vaccination. Public officials had excluded the plaintiff from a public school because she did not have the required certificate and had refused to submit to vaccination. They also caused her to be excluded from a private school.

The plaintiff claimed that the ordinances violate the Fourteenth Amendment, since they deprived her of liberty without due process of law, and that as administered they denied equal protection of the laws. The case came to the Supreme Court on a writ of error.

VALLEY OF TEN THOUSAND SMOKES. See GEOGRAPHIC SOCIETY, NATIONAL.

VALPARAISO UNIVERSITY, a non-sectarian co-educational institution, founded in 1873 and located at Valparaiso, Ind. In 1922-23

it had a faculty of 55 members. No figures as to property value, number of students and income supplied in response to request. Dr. Horace M. Evans is president.

VANADIUM. See METALLURGY.

VANDERBILT UNIVERSITY, a non-sectarian, co-educational institution, chartered in 1872, opened in 1875 and located at Nashville, Tenn. In 1922-23 it had a faculty of 150 members, 1,250 students, property valued at \$13,000,000 and an income of \$500,000. James H. Kirkland, LL.D., is president.

VAN DEVENTER, Sir Louis Jacob, South African soldier: b. Orange Free State, South Africa, 1874; d. Johannesburg, 27 Aug. 1922. He was of Boer lineage and acquired English comparatively late in life. Even when he assumed chief command in East Africa he had great difficulty in expressing himself fluently in that campaign. He spent his early life in his native state and took part in the Anglo-Boer War becoming second in command to Gen. Jan Smuts in 1899-1902. After Vereeniging, he loyally accepted the new order of affairs. When the World War broke out he was colonel in the permanent staff of the South African Defence Force. At the end of 1915 when General Botha, then Prime Minister of the Union, decided to raise a South African Force for service in East Africa, Brigadier-General Van Deventer was selected to command a division; and when General Smuts was given the chief command a still more important position was assigned to Van Deventer. In March 1916, his skilful turning movement ousted the Germans from Taveta and contributed greatly to the success of the Kilimanjaro fighting. In January 1917, when General Smuts went to London to join the War Cabinet, Van Deventer accompanied him; but he returned in May 1917 to East Africa as commander-in-chief and held this position until the end of the war. Shortly after the surrender of General von Lettow, Van Deventer resigned his command December 1918, and returned to South Africa. He was considered one of the most brilliant soldiers South Africa has ever produced. In 1917 England made him Companion of the Bath and Knight Commander of the Bath.

VAN FLEET, Walter, American horticulturist: b. Piermont, N. Y., 18 June 1857; d. Miami, Fla., 26 Jan. 1922. He was educated in public and private schools and in 1880 was graduated from Hahnemann Medical College, Philadelphia, with the degree of M.D. He practiced medicine in central Pennsylvania, 1880-92 and was horticultural editor of the *Rural New Yorker*, 1890-1910; vice-president, Rural Publishing Company, 1902-10. In the latter year he became expert plant breeder and physiologist of the Bureau of Plant Industry, United States Department of Agriculture, which position he still held at the time of his death. In 1910-11, he was in charge of the United States Plant Introduction Garden, Chico, Calif., and only a few

days before his death went to Miami to conduct experiments at the Plant Introduction Garden in that city. Most of his time, after 1872, was devoted to plant breeding, and he had come to be recognized as one of the leading plant breeders of the country, especially because of his work in the development of gladioli, garden roses, and chestnuts. He published 'Bird Portraits' (1888); 'The Gladiolus' (with M. Crawford, 1911); (brochures) 'Vegetable Breeding' (1907); 'Breeding Hardy Roses' (1907); 'Hybridizing Gladiolus Species' (1909); 'Cultivation of American Ginseng'; 'Goldenseal under Cultivation'; 'The Cultivation of Peppermint and Spearmint' (bulletins, Department of Agriculture, 1913, 1914, 1915). In 1918, he was awarded the George Robert White medal of honor for eminent services in horticulture by the Massachusetts Horticultural Society. He was a member of the American Association for the Advancement of Science and of the American Genetic Association. See HORTICULTURE.

VAN NAME, Addison, American librarian: b. Chenango, N. Y., 15 Nov. 1835; d. New Haven, Conn., 29 Sept. 1922. He was graduated from Yale in 1858 as validictorian, and studied in German universities until 1862 when he became a tutor at Yale. He also taught Hebrew in the theological seminary. In 1865 he was appointed librarian and held that post until 1904, when he became librarian emeritus. Professor Van Name was the last of the faculty scholars of the pre-Civil War period. He was noted for his knowledge of languages and he wrote extensively on Oriental subjects.

VAN WYCK, Augustus, American lawyer and politician: b. New York City, 14 Oct. 1850; d. there, 8 June 1922. He was a son of William Van Wyck, a well-known lawyer and for many years a member of the Board of Aldermen of the old city of New York. A brother, Robert Anderson Van Wyck, who died in Paris, France, 14 Nov. 1918, was the first Mayor of Greater New York, having been elected to that office in 1897. Augustus Van Wyck received his preliminary education at Phillips-Exeter Academy, Exeter, N. H., was graduated from the University of North Carolina with the degree of A.B. in 1864 and later received the degree of A.M. from the same institution. He practised law in Richmond, Va., for a time but in 1871 moved to Brooklyn, N. Y., and shortly thereafter began to take an active interest in politics, allying himself with the regular Democratic organization in Brooklyn. He was a member of the State Democratic Committee of New York for many years, was a delegate to numerous Democratic national, city and district conventions, and in 1882 was president of the Kings County General Committee. From 1884-96 he was judge of the Superior City Court of Brooklyn and from 1896-98 was justice of the Supreme Court of New York. In the fall of 1898 he was the Democratic candidate for Governor of New York against the late Col. Theodore Roosevelt, the Republican nominee. Colonel Roosevelt was elected and thereafter Mr. Van Wyck returned to the practice of law, manifesting during the remainder of his life but little interest in politics. With his brother, Robert A. Van Wyck, he was one of the founders of the Holland Society of

New York and was its president in 1892 and in 1919-20. He was grand master of the Zeta Psi Fraternity of North America in 1882; president of the New York Association of Zeta Psi, 1913; member of the Long Island Historical and various other societies and social clubs.

VASSAR COLLEGE, a non-sectarian educational institution for women, founded 18 Jan. 1861 and located at Poughkeepsie, N. Y. In 1922-23 it had a faculty of 151 members, 1,148 students, property valued at \$8,885,373.22 and an income of \$1,079,445.69. Henry Noble MacCracken, Ph.D., LL.D., L.H.D., is president.

VAUGHAN, Bernard, English Jesuit priest: b. Courtfield, Hertfordshire, England, 20 Aug. 1847; d. Roehampton, 31 Oct. 1922. He was the 12th of 14 children of Col. J. F. Vaughan. Seven of the sons became priests and all the five daughters nuns. Educated at Stonyhurst, he entered the novitiate of the Society of Jesus in 1868 and was ordained priest in 1876. He spent 18 years in Manchester, where his work as philanthropist, scholar, lecturer and preacher attracted great attention. In 1901 he went to London, in charge of the Jesuit Church in Farm Street, Westminster; and here he became the companion and friend of the children of the streets and organized clubs, concerts, bazaars and many other entertainments for their benefit. Here, too, he became conspicuous for his attacks on "the Smart Set" and talked freely on all the questions and evils of the age. He also helped the poor Roman Catholics in the East End, hired a cheap lodging there and went to it one day a week. He also addressed open air audiences. His sermons on the "Sins of Society" in 1906 drew large audiences; also his Lenten course 'The Sins of Society Gauged by the Passion of Christ,' (1907); and 'Why Believe in Christ and Christianity?' (1907). In 1910 he was cathedral preacher at the Eucharistic Congress, Montreal; in 1911 he lectured in the United States and Canada and crossed the Pacific to speak before Waseda and Imperial universities at Tokio. He also addressed the House of Peers and society ladies before he left for a lecture tour in China. He lectured in Italy and France and again in the United States in 1912; and in New York gave a series of sermons against Socialism. In 1914 he preached in Dublin a Lenten course on 'Jesus Christ as Guest and Host,' and in 1916 received a letter from Pope Benedict XV, congratulating him on his religious jubilee and granting him privilege of portable altar. Father Vaughan was a great friend of King Edward VII, who frequently congratulated him on his sermons. His publications are: 'The Roman Claims'; 'Faith and Reason'; 'The Triple Alliance'; 'The Demon of Drink in the Temple of God'; 'Her Golden Reign'; 'The Sins of Society' (1906); 'Society, Sin and the Savior' (1907); 'Life Lessons from Joan of Arc, the Matchless Maid'; 'Socialism' (1910); 'The Our Father, Our Country's Need To-Day' (1911); 'Socialism from the Christian Standpoint' (1913); 'What of To-Day?' (1914); 'The Menace of the Empty Cradle' (1917); and 'The Worker's Right to Live' (1918). Father Vaughan was a striking looking man, above the average height, with massive, well-shaped head. As compared with his

famous brother, Cardinal Vaughan, there was more boldness and less delicacy in his mien. The contrast in looks between the two brothers was no less striking than their contrast of temperaments. Father Vaughan was very devout. An English critic writes: "Few men of any sort in England had an equal power over large audiences in his day. He played on them as an instrument with conscious mastery; could find his way surely to their humor; call them to tears; move them to indignation; or fill them with pity or enthusiasm."

VEDDER, Elihu, American painter and modeler: b. New York, 26 Feb. 1836; d. Rome, Italy, 29 Jan. 1923. He received his general education at the Brinkerhoff School, Brooklyn, N. Y.; studied painting with Mattison, at Sherburne, N. Y., and (1856) with Picot, in Paris. He worked in Italy for five years (1857-61) and then returned to the United States. He found that on account of a defective arm, he was disqualified to serve as a soldier (Civil War), so in 1865 he returned to Paris and remained there until 1867. He then went to Rome, where he established his permanent studio, but he made frequent trips to the United States. His work reflects two prominent characteristics; idealism, and a vivid imagination. One of his most famous accomplishments was his illustration of Edward Fitzgerald's 'Omar Khayyam,' in 1884. Among other well known and typical works are: The mosaic 'Minerva' and five decorative panels, New Congressional Library, Washington, D. C.; a large panel executed for Bowdoin College, Me.; a decorative ceiling for the Huntington house, New York City; and the oil paintings, 'The Greek Actor's Daughter,' 'Venetians on the Main,' 'The Crucifixion,' etc. He was a member of the Society of American Artists; Academician, National Academy of Design (from 1865); member of the Century Association of New York; Academician, American Institute of Arts and Letters; member, American Society of Mural Decorators. He was awarded the gold medal at the Columbian Exhibition, Chicago. His versatility is evidenced by the fact that he was author also of the following works: 'The Digressions of V.' (1910) and 'Miscellaneous Moods in Verse' (1914).

VEGETABLES. See HORTICULTURE.

VENEERS. Statistics compiled by the Federal Bureau of Census, acting in co-operation with the United States Forest Service, show that the total quantity of wood used in the manufacture of veneers in the United States during 1921, was 400,388,000 feet, a decrease of 30.6 per cent compared with the quantity consumed in 1919, and 8.2 per cent compared with the quantity consumed in 1909. Red gum continued as the leading species in the industry and the quantity of this wood used in 1921 was 146,740,000 feet, as against 198,641,000 feet used in 1919, and 129,930,000 feet used in 1909. Among the other more important native woods used were yellow pine, birch, cottonwood, tupelo and yellow poplar, while mahogany and Spanish cedar were the leading imported woods used. Of the total quantity used in 1921, 87 per cent was cut by the rotary method, 7.6 per cent was sliced, and 5.4

per cent was sawed. The number of establishments engaged in the industry in 1921 was 353, compared with 362 in 1919, and 637 in 1909.

VENEREAL DISEASES. See PUBLIC HEALTH SERVICE, UNITED STATES.

VENEZUELA, a Republic of South America, officially known as Los Estados Unidos de Venezuela (the United States of Venezuela), situated on the north coast of the continent and bounded on the land side by British Guiana on the east and Colombia and Brazil on the south and Colombia on the west. The area of the republic is about 398,594 square miles with a population of 2,411,952 on 1 Jan. 1921. This area is divided into a federal district, 20 states and two territories. The Federal capital is Caracas, with a population of 92,212. Other cities are Maracaibo (46,706); Valencia (29,466); Barquisimeto (23,943); San Cristobal (21,385); Ciudad Bolivar (19,712); Cumana (16,342); Caro (15,533); Maturin (15,465); San Felipe (15,506); and Merida (14,082).

Religion.—The Roman Catholic is the state religion. This church has one archbishop and five bishops. There exists full toleration for all denominations.

Education.—Primary education is free and in a measure compulsory. The state prescribes the courses of study in all schools, both public and private. For higher education there is a university at Merida, the University de Los Andes. Higher instruction is divided into schools or faculties.—philosophy, natural sciences, medical science, political science, ecclesiastical science, etc. These schools may exist separately or unite to form universities. At the University of Los Andes there are at present eight schools or faculties. In the capital there are schools of medical science, and ecclesiastical science, besides private schools of political science. There are also a number of special schools, music, art and trade, commerce, etc. The total expenditure on education in 1921-22 was 4,425,587 bolivars, of which 2,493,538 bolivars went for elementary education.

Production and Industry.—Agriculture is a staple source of the wealth of the republic, but does not represent all of its natural riches, as the country abounds in minerals. Agriculturally, the republic is divided naturally into three zones—the purely agricultural, the pastoral and the forest zones. Coffee, cocoa, cane sugar, Indian corn, cotton and beans are the chief crops cultivated. Coffee is the chief of all crops, about 200,000 acres being devoted to it. There are 33,000 coffee plantations, 11,000 sugar plantations and 5,000 cocoa plantations. The pastoral zone affords good runs for cattle and other live stock. The live stock of the country is estimated as follows: 2,077,684 head of cattle, 2,154,716 goats, 512,086 swine, 113,439 sheep, 167,708 horses, 200,439 asses, and 54,565 mules. The forest zone produces the typical products of the tropics, such as caoutchouc, balata, a gum closely resembling rubber, copaiba, tonka beans, vanilla, etc. Cattle-raising is retarded by the great droughts incident to the dry season. One of the most potential and promising fields of development in Venezuela especially for foreign capital, is the petroleum industry. Both British and American oil interests have secured concessions on large tracts of prospective oil lands, principally in the

Maracaibo district, but calculations as to the possible production made from geological observations are yet to be proved. The production for 1921 was 1,433,000 barrels. The law concerning hydrocarbons was promulgated 30 June 1920, and states clearly the rights and privileges of foreigners in the development of this resource of Venezuela. One of the principal mineral products is gold. In 1920 about 835,000 grammes of gold were produced. Copper is produced to the extent of about 25,000 tons annually. Coal is worked to a similar extent. Salt mines are worked by the government in several states and asphalt from Lake Bermudez was exported to the United States of North America to the extent of 23,452 tons in 1920. Pearl fishing is an important industry in the coastal inlets. Manufacturing industries are still in their infancy, nearly all manufactured articles being imported. There are four cotton mills in the republic which produce a coarse cheap cloth. Fibre sacks, cement and glass about complete the list of articles made in the country. Matches and salt are monopolies of the government.

Communications.—The total mileage of roads in Venezuela is 1,636. There are few good main roads but the capital is now connected with the nearby cities with good roads. Apart from river transport the inland traffic is still mainly by means of pack animals and mule cart. The republic has a total of 644 miles of public railways. The chief line is that from Caracas to Valencia (113 miles). Other main lines are: Caracas-Guaira (22 miles); the Venezuela Central (45 miles); Puerto Cabello-Valencia (34 miles); the Bolivar Railway (143 miles); the Great Tachira (74 miles); and the La Ceita Railway (52 miles).

Finance.—The revenues of the Venezuelan government increased from 67,414,974 bolivars for the fiscal year 1913-14 to 81,560,716 bolivars for the fiscal year 1920-21. Expenditures increased from 72,276,987 bolivars in 1913-14 to 102,655,743 bolivars in 1920-21. For the fiscal year 1921-22 the budget estimate of revenues was 63,234,000 bolivars, with estimated expenditures of the same amount. Similarly it was estimated in the budget for the year 1922-23 that revenues and expenditures would balance at 61,706,000 bolivars. The Venezuelan debt decreased from 171,624,375 bolivars in 1914 to 124,790,291 bolivars in 1921. Of the total indebtedness in 1914, 110,992,451 bolivars represented external obligations and 60,631,834 bolivars, internal obligations. In 1921, the external debt was 78,210,186 bolivars and the internal debt 46,580,105 bolivars.

Commerce.—Imports for the year 1920 were valued at 298,943,659 bolivars (19 cents at normal exchange). Imports for the first six months of 1921 were valued at 49,397,419 bolivars. Imports from the United States to Venezuela in the first half of 1921 were valued at 26,696,237 bolivars. The chief articles imported in 1920 were: cotton, linen and woolen cloth, automobiles, cotton blankets, alcoholic liquors, canvas, cement, drugs and medicines, wheat flour, iron manufactures, machinery, cotton hose, paper, toilet preparations, thread, stearine, toys, rice, rubber, and vegetable oils. The following table, furnished by the United States Department of Commerce, shows the exports from the

republic, exclusive of parcel post shipments, during 1920 and for the first half of 1921

* Kilos.

Of these exports the United States took goods to the value of 19,642,014 in 1920 and to the value of 11,351,924 bolivars in the first half of 1921.

Defense.—All citizens must serve two years with the active army. The army personnel consists of about 18,000 officers and men. The navy consists of a cruiser, three gunboats, a transport, tug, torpedo boat and several coast patrol boats. The personnel of the navy consists of one battalion distributed among the vessels of the fleet.

Government.—The executive power is vested in a President, elected for seven years by the Congress. He exercises his executive functions through responsible ministers. The legislative power is vested in a bicameral Congress—the Senate and the Chamber of Deputies. The Senate has 40 members, elected for three years and two from each state. The members of the chamber are chosen by direct suffrage for three

years in the proportion of one to every 35,000 inhabitants, and one more for an excess of 15,000. A state with less than 35,000 inhabitants is allowed one deputy. The states are autonomous and politically equal, each with a legislative assembly, chosen according to their several constitutions. At the head of each state is a president and a general secretary. The federal district and the two territories are administered by the President of the Republic, who appoints the governors thereof. At the beginning of 1922 the President of the Republic was General Juan Vicente Gomez, whose term expired during the year. A Provisional President, Dr. V. Marquez Bustillos was chosen ad interim on 19 April 1914, and, the President-elect failing to take office and retaining his post of Commander-in-Chief of the Army, continued to act as head of the Republic until 26 June 1922 when General Gomez assumed the Presidency.

History.—The history of Venezuela during 1922 is a record of attempts at reconstruction, of progressive development and of efforts on the part of the government to encourage the investment of foreign capital in the country. The year opened with the putting into force of the decree of the previous December, liberating political prisoners not confined for crimes which the law of the land could not condone. This created a better social feeling and gave added strength to the administration. The boundaries between Colombia and Venezuela, long in dispute, were finally settled by a commission meeting in Switzerland; which rendered a decision satisfactory, on the whole, to both countries.

During the year the International Red Cross Association met in Caracas while the government showed special activity in sending deputies to international congresses and other assemblies of a scientific and cultural nature, especially to those of Latin America. Notwithstanding the many and varied activities of the government, both at home and in foreign lands, and the fact that the interest was promptly paid on the foreign debt, the national expenditures were kept well within the previously arranged budget, raised almost altogether by internal taxation and customs duties. Much attention was given to the sanitation of the capital and the port towns in accordance with plans which promise ultimately to make Venezuela one of the most healthful of Latin-American republics. Considerable money was spent on much needed public works. The national army, which had been of a more or less nondescript character, was reorganized on a more efficient basis. The inefficient were weeded out and the military body reduced to 18,000 well-equipped and trained men with experienced officers.

Anticipatory steps had been taken to meet the world-wide crisis following the World War, with the result that the national currency, which had declined in value, continued to recover until it reached par. So Venezuela felt the pressure of the abnormal conditions less than most of the Latin-American nations, due to the encouragement given commerce and trade and foreign capital. Notwithstanding the unfavorable balance of trade in most of the Latin-American countries bordering on the Gulf of Mexico,

Venezuela showed an excess of 30 per cent of exports over imports. This was one of the primary causes of the re-establishment of the stability of exchange and of the maintenance at par of the national currency. The liberal attitude of the government toward foreign capital brought into the country during 1922, for the development of the national resources immense sums, over \$100,000,000 of which was invested in the oil fields and in the construction of works pertaining thereto. This capital was principally of American, English and Dutch origin. The development of Venezuelan oil fields is of capital interest to the exploitation of her other numerous natural resources and the more rapid development of her national life. Explorations made in the Venezuelan oil fields tend to show that the vast oil region of Texas and the Gulf Coast of Mexico, stretching across the Gulf, extends down the coast of Colombia and Venezuela, so that the most notable event of the year, for the latter country, was the sudden attention which petroleum magnates gave to her oil fields. It means that the income of the government promises to be greatly increased in the near future; and that the nation will then be able to build new and improve old ports and construct or rebuild highways and furnish other means of communication imperatively needed. It means also that there will be sufficient funds for the building of schools, colleges and universities.

The two most important purely political events of the year were the assumption of the presidency by Juan Vicente Gomez (26 June 1922) and the re-establishment of the Central University of Venezuela, which was placed in a position to extend the benefits of popular education to a much larger percentage of the Venezuelan people than under any previous regime.

JOHN HUBERT CORNYN.

VERMONT, a New England State, bounded north by Canada, east by New Hampshire, south by Massachusetts and west by New York. For over 100 miles its western boundary line is marked by Lake Champlain. The area of the State is 9,564 square miles and in 1920 it had a population of 352,428. It is 42d in order of size and 45th in order of population. Of the population in 1920, 351,817 were whites, 572 negroes, 24 Indians and 15 Asiatics. The foreign-born population numbered 44,526, and included 14,181 French Canadians, 10,687 English Canadians, 2,884 Irish, 2,197 English and 1,854 natives of Scotland. The chief cities, with their populations in 1920, are: Burlington, 22,779; Rutland, 14,954; Barre, 10,008; Montpelier, the capital, 7,125; Saint Johnsbury, 8,705; Bennington, 9,982; Saint Albans, 7,588 and Springfield, 5,283.

Religion.—The principal Christian denominations have a combined membership of 145,682, of whom 78,178 are Roman Catholics, 22,912 Congregationalists, 16,808 Methodists, 9,797 Baptists, 6,000 Episcopalians and 1,157 Presbyterians.

Education.—In the school year ending June 1922 there were in the primary schools of the State, 2,990 teachers and 63,539 pupils. School attendance is compulsory for children between the ages of six and 16. For higher education there are in the State the University of Ver-

mont, Middlebury College and Norwich University.

Finances.—On 1 July 1921 the balance on hand in the State treasury was \$2,022,932.10. Receipts during the following fiscal year amounted to \$5,090,430.08. Disbursements for the same period totaled \$5,776,852.26, leaving a balance on hand 1 July 1922 amounting to \$1,336,509.92. The bonded debt of Vermont in 1922 was \$2,111,531.90. The assessed value of real property the same year was \$193,887,873.73; of personal property, \$66,856,300.83.

Agriculture.—Agricultural production covers a wide range. Dairy products form one of the leading industries and the State is first in the production of maple sugar. There are in the State 29,075 farms, having a total area of 4,663,577 acres, of which 1,691,595 acres is improved land. The value of all farm property in 1920 was \$222,736,620. The value of all farm crops the same year was \$47,999,600. The value of dairy products the same year was \$31,573,340. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 82,000 acres, 3,444,000 bushels, \$3,134,000; spring wheat, 9,000 acres, 189,000 bushels, \$274,000; barley, 10,000 acres, 290,000 bushels, \$281,000; oats, 87,000 acres, 3,132,000 bushels, \$1,754,000; buckwheat, 4,000 acres, 96,000 bushels, \$88,000; tame hay, 909,000 acres, 1,273,000 tons, \$22,278,000; potatoes, 25,000 acres, 3,000,000 bushels, \$2,790,000; apples, 960,000 bushels, and pears, 10,000 bushels. On 1 Jan. 1923 there were in the State 76,000 horses, valued at \$7,904,000; 385,000 milk cows, valued at \$21,560,000; other cattle, 82,000, valued at \$1,542,000; 43,000 sheep, valued at \$301,000, and 59,000 swine, valued at \$826,000.

Mining and Other Products.—The chief mineral wealth of the State is its granite and marble quarries, the output of which was valued at over \$5,000,000 in 1920. Other mineral products are asbestos and talc.

Manufactures.—The State has 1,790 manufacturing establishments, employing 33,500 and capitalized at \$134,314,000. The cost of materials at the time of the last manufacturing census was \$95,173,000, and the value of the products, \$168,108,000. The chief industries are cotton goods, foundry and machine shop products, lumber and timber products, marble and stone work, paper and pulp, and machine tools.

Communications.—The State has a steam railroad mileage of 1,076 and 103 miles of electric railways. There is also considerable water borne traffic over the lakes, rivers and canals.

Legal Holidays.—1 January; 22 February; 30 May; 4 July; 16 August; the first Monday in September (Labor Day); 12 October; 11 November; 25 December, and a day appointed or set apart by the Governor or by the President of the United States as a day of thanksgiving.

Charities and Corrections.—Industrial school, 242 boys and girls; State Hospital for Insane, 791; Brattleboro Retreat for Insane, 481; State School for Feeble-Minded, 162; State's Prison for Men, 327, and State's Prison for Women, 30.

Recent Legislation.—In 1919 legislation was enacted by means of which the appointment of district health officers was authorized. In the same year provision was made for the writing

of a history of Vermont's part in the World War, and at the same session acts were passed giving women the right to vote. In 1921 Armistice Day was made a legal holiday. Winooski was incorporated as a city. Restrictions on office-holding by women were removed. A uniform law of sales was enacted and teachers' training schools were established.

Recent Political History.—In 1920 James Hartness was elected Governor. Warren G. Harding carried Vermont in the Presidential election by a plurality of 47,283 over James M. Cox. In 1922 Redfield Proctor was elected Governor. Frank L. Green was elected United States Senator and succeeded Carroll S. Page. Frederick G. Fleetwood was elected Representative in Congress from the first district to succeed Frank L. Green, and Porter H. Dale was elected Representative in Congress from the second district to succeed himself.

Government.—The State executive is a Governor, who is elected for two years and receives a salary of \$3,000. The State legislature is composed of a Senate of 30 members and a House of Representatives of 246. Vermont sends two Senators and two Representatives to the Federal Congress. The State is divided into 14 counties for purposes of local administration.

Officials.—(1922) Governor, James Hartness; Lieutenant-Governor, Abram W. Foote; Secretary of State, Harry A. Black; Attorney-General, Frank C. Archibald; Auditor, Benjamin Gates; Treasurer, Walter F. Scott, and Commissioner of Education, Clarence H. Dempsey. The officials in 1923 are: Governor, Redfield Proctor; Lieutenant-Governor, Frank S. Billings; Secretary of State, Harry A. Black; Attorney-General, Frank C. Archibald; Auditor, Benjamin Gates; Treasurer, Thomas H. Cave, and Superintendent of Education, Clarence H. Dempsey.

Judiciary.—Members of Supreme Court: John H. Watson, Chief Justice; George M. Powers, William H. Taylor, Willard W. Miles, and Leighton P. Slack, associate justices.

VERMONT, University of, a State co-educational institution, founded in 1791 and located at Burlington, Vt. In 1922-23 it had a faculty of 150 members, a student enrollment of 1,137 regular session, exclusive of 650 in summer session, property estimated at \$5,000,000 and an income of \$410,000. Guy W. Bailey, LL.D., is president.

VETERANS' BUREAU, United States. The original Act to authorize the establishment of a Bureau of War Risk Insurance in the Treasury Department was approved 2 Sept. 1914, creating an insurance of American vessels and their cargoes against risks of war. This was intended as a temporary measure.

By the Act of 12 June 1917, provisions were made for the insurance of masters, officers and crews of those vessels against loss of life, or personal injury by risks of war and detention following capture.

For the carrying out of this Act, the Division of Marine and Seamen's Insurance was established. Payment of indemnities was based on a definite schedule and in ratio to the amount of insurance carried. Loss of life or disability from injury had to result within 90 days di-

rectly and exclusively from the date of injury.

The Government had the right to examine the master, officer, or member of the crew who made any claim under the policy. Such cases were referred to the Chief Medical Advisor, who in turn referred them to the officers of the United States Public Health Service wherever possible. The Commissioner of Marine and Seamen's Insurance was advised as to the medical findings in the case.

The Division of Military and Naval Insurance, in charge of a Commissioner (Assistant Director) was created within the amendatory Act of 6 Oct. 1917, which Act, with its amendments constituted the basic law under which the insurance and compensation benefits to veterans of the World War were determined. This Act, with its amendments, provided in part that "for death or disability resulting from personal injury suffered or disease contracted in the line of duty on or after 6 April 1917, or for aggravation of disability existing prior to examination, acceptance and enrollment for service, when such aggravation was suffered and contracted in the line of duty on or after 6 April 1917, by any commissioned officer or enlisted man, or by any member of the Army Nurse Corps (female) or of the Navy Nurse Corps (female) when employed in the active service under the War Department or Navy Department, the United States shall pay to such commissioned officer or enlisted man, member of the Army Nurse Corps (female) or of the Navy Nurse Corps (female) or in the discretion of the Director separately to his or her dependents, compensation as hereinafter provided; but no compensation shall be paid if the injury, disease, or aggravation has been caused by his own wilful misconduct." The important amendment of 1 Aug. 1921, establishing a Veterans' Bureau, further provided that an ex-service man who is shown to have an active pulmonary tuberculosis or neuro-psychiatric disease (of more than 10 per centum degree of disability) developing within two years after separation from active military or naval service of the United States should be considered to have acquired his disability in such service, or to have suffered an aggravation of a pre-existing pulmonary tuberculosis or neuro-psychiatric disease in such service. In addition to the compensation, the Act provided that an injured person should be furnished by the United States such reasonable governmental medical, surgical and hospital services, and with such prosthetic and orthopedic supplies and appliances as the director might determine to be useful and reasonably necessary, provided the disability was of service origin. Permanent ratings of disability are based as far as is practicable upon the average impairments of earning capacity resulting from such injuries in civil occupations and not upon the impairment in earning capacity in each individual case, so that there can be no reduction in the rating of compensation for individual success in overcoming the handicap of a permanent injury. Temporary ratings are based on the impairment in earning capacity in each individual case.

Distinct from the Bureau of War Risk In-

surance there was established on 27 June 1918, a Federal Board for Vocational Education, which provided in part for vocational rehabilitation and return to civil employment of disabled persons discharged from military and naval forces of the United States.

On 9 Aug. 1921, there was approved the Act establishing a Veterans' Bureau. By this Act, functions, powers and duties conferred by previously existing law on the Bureau of War Risk Insurance were transferred to and made a part of the Veterans' Bureau. The functions, powers and duties conferred upon the Federal Board of Vocational Education were transferred to and made a part of the Veterans' Bureau. Furthermore, all personnel facilities, property and equipment of the Bureau of War Risk Insurance, of the U. S. Public Health Service (so far as it related to the medical care and treatment of beneficiaries of the then Bureau of War Risk Insurance) and of the Rehabilitation Division of the Federal Board of Vocational Education were transferred and made a part of the Veterans' Bureau.

Under the present organization of the Veterans' Bureau there is a Central Office at Washington, D. C., and 14 district offices. These district offices, with the State areas over which they have jurisdiction, are as follows: (1) Boston.—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island; (2) New York.—New York, New Jersey, Connecticut; (3) Philadelphia.—Pennsylvania and Delaware; (4) Washington, D. C.—Virginia, West Virginia, Maryland, District of Columbia; (5) Atlanta.—North Carolina, South Carolina, Tennessee, Georgia, Florida; (6) New Orleans.—Alabama, Mississippi, Louisiana; (7) Cincinnati.—Indiana, Ohio, Kentucky; (8) Chicago.—Illinois, Michigan Wisconsin; (9) St. Louis.—Missouri, Nebraska, Iowa, Kansas; (10) Minneapolis.—Minnesota, North Dakota, South Dakota, Montana; (11) Denver.—Colorado, Wyoming, Utah, New Mexico; (12) San Francisco.—California, Arizona, Nevada; (13) Seattle.—Washington, Oregon, Idaho; (14) Dallas.—Texas, Oklahoma, Arkansas.

Each district area is further sub-divided into sub-district offices of which there is a total of 126 within the United States, and in addition a sub-district office at Honolulu, Hawaii, and Manila, Philippine Islands.

Prior to 1 May 1922, medical facilities available to beneficiaries of the Veterans' Bureau were largely under the direction of the U. S. Public Health Service, but upon that date all hospital facilities of the Public Health Service, devoted specifically to the hospitalization of Veterans' Bureau beneficiaries, were transferred by Executive Order to the control and jurisdiction of the Director of the Veterans' Bureau. There is at the present time established at each district office and to a lesser extent at sub-district offices adequate and complete dispensary equipment for the examination and out-patient treatment of the Bureau beneficiaries. In addition to this, there was as of 10 Aug. 1922, a total of 17,635 hospital beds available under the jurisdiction of the Veterans' Bureau. In addition to this, there were available hospital beds under the jurisdiction of the following other govern-

mental agencies: U. S. Public Health Service (Marine Hospitals), 781; U. S. Army, 3,083; U. S. Navy, 1,623; National Homes for Volunteer Disabled Soldiers, 3,256; Interior Department (St. Elizabeth's Hospital, Washington, D. C.), 870.

In these governmental facilities there was being hospitalized as of 10 Aug. 1922, a total of 17,936 patients classified as follows: Tuberculosis, 7,916. Neuro-Psychiatric diseases, 4,775; General medical and surgical conditions, 5,245. In addition to these patients there was being hospitalized as of that date a total of 8,054 patients in civil institutions, classified as follows: Tuberculosis, 2,716; Neuro-Psychiatric, 4,120; General medical and surgical, 1,218. There was a total of 25,990 patients of the Veterans' Bureau being hospitalized as of 10 Aug. 1922. For the fiscal year, 1 July 1921, to 30 June 1922, there was admitted to all hospitals a total of 134,829 beneficiaries of the Veterans' Bureau. Prior to 1 July 1921, there had been reported a total of 146,219 admissions to all hospitals. As an indication as to the amount of out-patient treatments and examinations furnished by the Veterans' Bureau, there was given during the month of July, 1922, a total of 116,680 physical examinations, and there was furnished as of that same period a total of 140,249 out-patient treatments.

To 1 Aug. 1922, there had been filed a total of 846,560 claims for compensation, 171,033 of which were death claims and the balance of 675,527 were disability claims. Of this number of 675,527 disability claims, there was a total of 174,364 receiving compensation, the balance of claims having been either disallowed, discontinued, or were pending adjudication. To 1 July 1922, there had been registered a total of 633,199 claims for rehabilitation, of which number there were 103,108 men and women in training. The balance of claims had either been declared ineligible, non-feasible because of physical condition, discontinued, not yet assigned or in the process of induction, or the men had been rehabilitated. To 1 July 1922, there had been reported rehabilitated a total of 16,966 trainees.

As of August 1922, there was a total of 570,570 insurance policies in force, classified as follows: Term Insurance, 286,963; U. S. Government Life, 283,607.

Insurance claims on which payments were being made totaled 142,675, representing a monthly disbursement in benefits of approximately \$8,500,000.

The total disbursements made by the Veterans' Bureau to 1 August 1922, totaled \$1,840,272,922.16, of which amount \$345,473,596.92 had been disbursed for insurance; \$369,619,864.40 for compensation; \$138,961,332.15 for medical and hospital services; \$583,510,275.62 for allotment and allowances; Marine and Seamen's Insurance, \$35,093,773.30; Hospital facilities and service, \$998,080.00; and administrative, \$52,196,538.91.

The appropriation for the fiscal year ending 30 June 1923, totaled \$418,063,844.95 for all purposes, although the annual expenditures will exceed this figure, the difference made available

from balances of continuous appropriations and special funds.

In addition to the hospital facilities now available to the U. S. Veterans' Bureau, additional facilities are being made available through the appropriations provided for by the First and Second Langley Bills. Certain of these facilities provided for out of these funds are included in the figures presented above. The First Langley Bill provided a total of 6,169 hospital beds, classified as follows: Tuberculosis, 3,005; Neuro-Psychiatric, 2,914; General, 250. This appropriation totaled \$18,600,000. The Second Langley Bill provides for a total of approximately 3,680 beds, classified as follows: Tuberculosis, 1,100; Neuro-Psychiatric, 2,380; General, 200. The amount of this appropriation is \$17,000,000. With the increase in governmental hospital facilities it is anticipated that there will be a material reduction in the utilization of civil hospital facilities, as well as a withdrawal from existing governmental institutions of temporary construction. See also PENSIONS.

CHARLES R. FORBES,

Former Director, Veterans' Bureau.

VETERANS OF FOREIGN WARS OF THE UNITED STATES,

a national organization composed of ex-service men who served in the Army, Navy or Marine Corps of the United States during wars and campaigns conducted by the United States on foreign soil or in foreign waters. It had its beginnings in Columbus, Denver, Pittsburgh, Altoona and Philadelphia. At Columbus, on 23 Sept. 1899, the American Veterans of Foreign Service was organized. On 10 October following, this order was chartered by the State of Ohio. The society kept up its activities until 1905 when it was amalgamated with a society of the same name which was formed in Pennsylvania several years before. On 12 Dec. 1899, there was formed in Denver, the Colorado Society, Army of the Philippines, with Gen. Irving Hale as sponsor. The following year the society became national. Stewart Post No. 1, still flourishing, is the oldest post of the Veterans of Foreign Wars. Early in 1901 a group of foreign service men in Altoona, Pa., formed a society, while on 13 Oct. 1901 another group formed a similar society in Pittsburgh. The latter was called the Society of Philippine War Veterans but later the name was changed to Foreign Service Veterans. In the summer of 1902 there was formed in Philadelphia the Society of American Veterans of the Philippine, Cuban and China Wars. The following year the three Pennsylvania groups met at Altoona and formed a united society which took the name of American Veterans of Foreign Service and, in 1905, amalgamated with the Ohio society of the same name. The Army of the Philippines and the American Veterans of Foreign Service met at Denver in 1913 and, amalgamating, formed the Veterans of Foreign Wars of the United States. The objects of the society are "to preserve and strengthen comradeship among its members; to foster true patriotism and maintain true allegiance to the United States of America; to assist disabled and needy veterans of all wars through the maintenance of service bureaus and relief committees, and to take care of and assist

the widows and orphans of deceased ex-service men, and to educate posterity in the principles of true Americanism through publications and work in public schools and institutions." The organization's revenue is derived from the annual dues of the members and from donations and is used to carry out the purposes outlined above. The organization in 1922 had 1,000 posts with a total of approximately 100,000 members. The organization has its national headquarters at 32 Union Square, New York City. The officers for 1922-23 are: Commander-in-Chief, Tillinghast L. Huston; Adjutant-General, Reuel W. Elton; Quartermaster-General, Walter I. Joyce.

VETERINARY MEDICINE AND SURGERY. Education.—During 1922 the attendance in the veterinary schools of America increased slightly. The courses of study have been strengthened and more attention has been given to short courses for graduate veterinarians. In most veterinary colleges more stress has been placed upon training veterinary students in the feeding, breeding, and handling of livestock. In order to better meet the needs for veterinary training along these lines the Ontario Veterinary College has been moved to Guelph, Ontario, where it is affiliated with the Ontario Agricultural College.

State Veterinary Medicine.—In addition to the Bureau of Animal Industry of the United States Department of Agriculture and the various State veterinary departments for the control of transmissible animal diseases, there is noted a tendency to employ county and district veterinarians, generally in connection with organizations of farmers or stockmen, to assist in the suppression of transmissible animal diseases and to advise farmers and stockmen in hygiene, sanitation and feeding, that their flocks and herds may be kept free from disease.

Army Veterinary Service.—During 1922 the number of veterinary officers in the United States Army was reduced to 126, as required by Congress. To meet the requirements of the Army in case of national emergency, active efforts have been made to secure veterinary reserve officers that are commissioned and assigned to army units.

Organizations.—The American Veterinary Medical Association, representing the veterinarians of America, has steadily increased in size and influence. Plans are being put into effect to provide for closer co-operation between the State associations and the National association. There has been a notable increase in local veterinary associations for the consideration of local problems.

Medicine.—During the past year carbon tetrachloride has been introduced in veterinary practice for the destruction of certain intestinal round worms of animals as recommended by Dr. Maurice Hall. Carbon tetrachloride has been proved to be the most efficient vermicide for hook worms in animals. As a result of tests upon animals, carbon tetrachloride is being used very successfully in the treatment of hook worm infestation in man as it is more effective, safer, more economical, convenient, and causes less discomfort to the patient.

Transmissible Animal Diseases.—So far as

known, no animal plagues have been introduced from abroad, although foot-and-mouth disease has caused serious losses of livestock in England and on the Continent. This disease has broken out in Jamaica also. Rigorous quarantine measures have been established by the Bureau of Animal Industry against animals or material that might carry the infection of this disease.

Tuberculosis.—Progress is being made in the control of bovine tuberculosis, particularly by the accredited herd plan, the number of herds of pure bred cattle on the accredited list being steadily increased. During the past year efforts were made to eradicate bovine tuberculosis from definite areas, such as a county, but at the present time the value of this plan cannot be definitely estimated. In testing cattle for tuberculosis the subcutaneous, intra-dermal, and ophthalmic methods are used, singly and combined.

Swine Tuberculosis.—Tuberculosis in swine appears to be increasing to such an extent that it is a serious problem in certain localities. Swine probably contract the disease from the excreta of infected cattle, or from infected dairy byproducts, such as skimmed milk or whey that has not been properly pasteurized.

Avian Tuberculosis.—Tuberculosis among chickens has increased, or its presence has been recognized particularly among farm flocks in the North Central States. The disease is diagnosed by the intradermal tuberculin test applied to the comb or wattles. The only satisfactory method of combating avian tuberculosis is destruction of infected birds and thorough disinfection of the premises.

Abortion Disease.—Ranking next in economic importance to bovine tuberculosis is abortion disease of cows. The disease also prevails to a limited extent in sows and mares. No satisfactory method of dealing with the disease has been found, except by quarantine, disinfection and proper hygiene and diet. While some results have been obtained from the use of a living vaccine, the risks of spreading the disease, except when very carefully handled, are considerable.

Anthrax.—Sporadic outbreaks of anthrax have occurred, particularly in the Southern States. These have been controlled by vaccination, disinfection and quarantine. Authorities believe that before a spore vaccine is used to control an outbreak of suspected anthrax, a definite diagnosis should be made both bacteriologically and by inoculation, to prevent the possible introduction of anthrax into a locality by the spore vaccine.

Texas Fever.—The losses of cattle from Texas or tick fever have been of relatively little importance. The work of eradicating the cattle tick by dipping infested cattle in a solution of arsenic is progressing steadily. Most of the Southern States are now free from cattle ticks, except the southern half of Florida and the southeastern part of Texas. It is expected that within a few years the United States will be entirely free from cattle ticks.

Rabies.—During the year 1922 a large number of animals, particularly dogs, were vaccinated against rabies according to the Japanese method of Dr. S. Kondo. This method is re-

ported to give the vaccinated animal immunity for one year. At present a definite statement as to the true value of this method of immunization cannot be made, as more time is necessary to determine its efficiency.

Hog Cholera.—The ravages of this disease continue in spite of the proved efficiency of hog anti-cholera serum, and its general use in the principal swine growing regions of the United States. It is thought that the rather indiscriminate use of hog cholera virus by incompetent persons is one of the most important means of spreading the disease, and various State authorities are taking measures to reduce the danger by proper police regulations.

Forage Poisoning.—The losses of livestock by forage poisoning were relatively small during the past year. It has been definitely proved that poisoning of livestock by the *bacillus botulinus* is not as frequent as was formerly thought. The greatest losses of livestock occur on the Western ranges from eating poisonous plants, but losses also occur from feeding decomposing mouldy foods.

Parasitic Diseases.—While sheep scab, cattle and horse mange exist to a limited extent in some of the Central and Western States, careful inspection and dipping of infected stock by State and Federal veterinary inspectors has prevented any serious outbreaks of these diseases. Stomach worms in sheep are very common but the disease is controlled by giving a solution of copper sulphate orally. Experiments are being carried out to determine how long pastures remain infected. Now that the life history of this common parasite is known, practical field measures have been devised so that premises can be freed from these parasites.

Meat and Food Inspection.—The veterinary inspection of meat, milk, cheese, butter, and other foods of animal origin, is being efficiently carried out by the United States Bureau of Animal Industry for interstate trade. Veterinary inspection of animal food products for intra-state and municipal trade is increasing. Public abattoirs, stables, and establishments where animal foods are prepared, are becoming more sanitary and the foods of better quality.

Research.—Investigation of the causes of various animal diseases are being carried on by scientific workers in the various State experiment stations, by the United States Department of Agriculture, the Health of Animals Department of the Canadian Government and various endowed and private research laboratories. Among the most important animal diseases being studied are tuberculosis, abortion disease, hog cholera and related diseases, swamp fever of horses and parasitic diseases. No outstanding discoveries with reference to animal diseases were announced in 1922.

VIGNAUD (Jean) Henry. American diplomat; b. New Orleans, La., 27 Nov. 1830; d. Paris, France, 19 Sept. 1922. He came of an old Creole family, taught in public schools in New Orleans in 1852-56 and wrote for *Le*

Courier and other New Orleans papers. In 1857-60 he was editor of *L'Union de Lafourche*, Thibodeaux, La., and in 1860-61 of a weekly review, *La Renaissance Louisianaise*. During the Civil War he served as Captain of the Sixth Louisiana Regiment in the Confederate Army, and, as secretary of the Confederate Diplomatic Commission, was sent to Paris in 1863. In 1869 he was secretary of the Roumanian Legation in Paris; in 1872 was connected with the Alabama Claims Commission at Geneva; in 1873 was United States delegate, International Diplomatic Metric Conference; and was second secretary, American Legation and Embassy at Paris from 1875-82 and first secretary from 1882 to 1909. In that year he became honorary chancellor. On several occasions in succeeding years he acted as *chargé d'affaires*. During this long diplomatic service in Paris 27 ministers and ambassadors came and went while Henry Vignaud was a permanent figure. He trained the novices and had made so many friends among the French statesmen that he possessed an enormous influence. When he resigned in 1909 he was the oldest man in the American diplomatic service in Europe. As he was without private means, a number of Americans, including three former ambassadors, Levi P. Morton, Whitelaw Reid, T. J. Coolidge and Henry White, raised a modest fund to provide for his remaining days. Mr. Vignaud was president of the Société des Americanistes in Paris. He was a man of scholarly attainments and great polish of manner. He specialized on the life and voyages of Christopher Columbus; but his theory that Columbus's ambition to discover a new route to India was mythical has not been accepted by many authorities on this subject. His publications are: 'La Lettre et la Carte de Toscanelli sur la Route des Indes' (1901); 'Toscanelli and Columbus—The Letter and Chart of Toscanelli on the Route to the Indies by Way of the West' (1902); 'Letters to Sir Clements R. Markham and C. Raymond Beazley' (1903); 'The Real Birth Date of Columbus, 1451' (1903); 'La Maison d'Albe et les archives Colombiennes' (1904); 'Etudes critiques sur la Vie de Colomb' (1905); 'Histoire critique de la grande entreprise de 1492' (2 vols., 1911); 'Amerigo Vespucci' (1911); and 'Les expéditions des Scandinaves en Amérique, (1911).

VILLANOVA. Augustinian College of, a Roman Catholic educational institution for men, founded in 1843 and located at Villanova, Pa. In 1922-23 it had a faculty of 41 members, 736 students (including those in the extension school), and property valued at \$1,500,000. Income figures not given. Francis A. Driscoll, O.S.A., is president.

VILLIERS, Frederic, English artist and war correspondent; b. London, 23 April 1852; d. there 5 April 1922. He received his early education in France, and later studied at South Kensington and the Royal Academy, England. A war artist for *The Graphic* in Serbia, 1876, he was with the Russian army in Turkey, 1877-78; witnessed the Alexandrian bombardment, 1882; and was afterwards in Abyssinia, Bulgaria, Serbia and Burma. He made a lecture tour in the United States in 1887. In 1894 he was with

the Japanese army, as special artist and correspondent; in 1897 (Græco-Turkish War) he was representative for the *London Standard*; in 1898 he was with Kitchener in the Sudan; in 1899 (Boer War) he served as correspondent in South Africa for the *Illustrated London News*. During the Græco-Turkish War he used the cinematograph camera for the first time during the history of campaigning. He also introduced the use of the bicycle for the first time in any European campaign. Following the outbreak of the Russo-Japanese War, he left for the Far East early in 1904, and was with the Japanese army, the only war artist present, at the siege of Port Arthur. In 1909 he accompanied the Spanish army that operated in Morocco; in 1911 he joined the Italian army invading Tripoli; 1912-13 he was with the Bulgarian army during the Balkan War, being present at the siege of Adrianople. During the World War he spent two and one-half years with the British and French armies. He later left France and visited other fronts; lectured in Australia, Ceylon, South Africa and India; saw fighting on Mohmund territory; and continued his lecture tour through the Federated Malay States, the Straits Settlements, Japan, China, Canada and the United States. He was an exhibitor of war pictures at the Royal Academy and the Institute of Painters in Oil Colors, Piccadilly. During his remarkable career he was the recipient of 12 English and foreign war medals and decorations of various kinds. He was author of the following works: 'Pictures of Many Wars' (illustrated by himself, 1902); 'Port Arthur' (with original sketches, 1905); 'Peaceful Personalities and Warriors Bold' (illustrated by himself, 1907); 'Villiers: His Five Decades of Adventure' (1921). One of the most striking of all his paintings is a 20-foot canvas, representing a battle siege, and entitled 'Sap and Shell.'

VIRGINIA, one of the 13 original States, popularly known as the Old Dominion, bounded north by West Virginia and Maryland, east by Maryland and the Atlantic Ocean, south by North Carolina and west by West Virginia and Kentucky. The area of Virginia is 42,627 square miles and in 1920 it had a population of 2,309,187. It is 33d in order of size and 20th in order of population. In 1920 the population included 1,617,908 whites, 690,017 negroes, 824 Indians and 437 Asiatics. The foreign-born residents of the State the same year numbered 30,785, of whom 5,421 were Russians, 3,752 English, 2,802 Germans, 1,732 Irish, and 1,327 Scotch. The rural population in 1920 was 70.8 per cent of the total. The chief cities, with their populations in 1920, are: Richmond, the capital, 171,667; Norfolk, 115,777; Portsmouth, 54,387; Roanoke, 50,842; Newport News, 35,596; Petersburg, 31,002; Lynchburg, 29,956; Danville, 21,539; Alexandria, 18,060; Staunton, 10,623; Charlottesville, 10,688; Suffolk, 9,123; Hampden, 6,138; Fredericksburg, 5,882; Clifton Forge, 6,164; Bristol, 6,729; Covington, 5,623; Harrisonburg, 5,875; South Norfolk, 7,724; Winchester, 6,883, and Pulaski, 5,282.

Religion.—The principal Christian denominations have an aggregate membership of 949,136, of whom 456,095 are Baptists, 147,954 are Methodists, 49,186 Presbyterians, 36,671 Roman

Catholics, 33,593 Episcopalians, 14,610 Lutherans; 2,440 members of the Reformed Church, and 360 Congregationalists.

Education.—Primary education is free and for illiterates compulsory between the ages of 8 and 12. Children under 12 may not be employed in any mining or manufacturing work. Separate schools are provided for white and colored children. There are 14,904 public school teachers and 524,856 pupils in the primary schools. There are 673 high schools with 1,809 teachers and 29,157 pupils, and seven normal schools with 167 professors and 4,288 students. The State appropriation for education in 1920 was \$3,784,028.17. Within the State there are several institutions of higher learning, the chief of which are the University of Virginia, William and Mary College, Washington and Lee University, Virginia Polytechnic Institute, Virginia Military Institute, Hampden-Sidney College, and Virginia Union University for colored students. In addition, there are in the State three law schools, three medical schools, two schools of dentistry, two schools of pharmacy, two schools of theology and many commercial schools and schools for industrial and manual training.

Finances.—At the beginning of the last fiscal year the balance on hand amounted to \$2,052,427.69. Receipts during the fiscal year amounted to \$24,149,136.55. Disbursements during the same period amounted to \$23,702,124.14, leaving a balance on hand at the beginning of the current fiscal year of \$2,499,440.10. Receipts for the current fiscal year are estimated at \$22,298,046.38, while appropriated and assigned expenditures for the same period amount to \$22,381,402.16. At the end of 1922 the bonded debt of the State amounted to \$21,658,607.45. The assessed value of real property in 1922 was \$986,143,697. The assessed value of personal property: tangible, \$146,276,631; intangible, \$334,402,326; money, \$69,937,084; shares of bank stock, \$86,404,583.06 and public service corporations, real estate and personal, \$204,447,669.

Agriculture.—Virginia is basically an agricultural State. Much of its manufactures are based on the products of the soil. The census of 1920 reported 186,242 farms in the State with an aggregate area of 18,561,112 acres, of which 9,460,492 acres was improved land. In the same year the value of all farm property was \$1,196,555,772. In 1920 the value of all crops was \$292,824,260. The State ranked third in tobacco production, the yield for 1920 being 102,391,226 pounds. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 1,904,000 acres, 53,312,000 bushels, \$42,116,000; winter wheat, 830,000 acres, 10,375,000 bushels, \$12,658,000; barley, 9,000 acres, 248,000 bushels, \$198,000; oats, 166,000 acres, 3,320,000 bushels, \$1,959,000; buckwheat, 17,000 acres, 332,000 bushels, \$272,000; rye, 40,000 acres, 460,000 bushels, \$414,000; tame hay, 976,000 acres, 1,220,000 tons, \$19,520,000; sorghum sirup, 13,000 acres, 1,222,000 gallons, \$1,039,000; potatoes, 155,000 acres, 16,585,000 bushels, \$10,780,000; sweet potatoes, 46,000 acres, 6,210,000 bushels, \$5,403,000; cotton, 53,000 acres, 25,000 bales, \$2,875,000; tobacco, 209,000 acres, 156,750,000 pounds, \$37,620,000; peanuts, 130,000 acres, 78,000,000 pounds, \$4,290,000; apples, 8,360,000

bushels; peaches, 764,000 bushels, and pears, 270,000 bushels. The State produces all the cereals, vegetables and fruits of the temperate zone. It is one of the great peanut producing States. In recent years livestock raising has been greatly extended and the quality of the stock improved through the introduction of pure bred herds. On 1 Jan. 1923 there were in the State 300,000 horses, valued at \$24,600,000; 97,000 mules, valued at \$9,991,000; 430,000 milk cows, valued at \$18,275,000; 469,000 other cattle, valued at \$12,804,000; 338,000 sheep, valued at \$2,569,000, and 792,000 swine, valued at \$8,316,000.

Minerals.—Virginia has considerable mineral resources, the chief of which is coal. The output of coal in 1922 was 11,100,000 tons. Iron ore the same year was produced to the extent of 74,021 tons. Other minerals worked are copper, lead and zinc, salt, granite and other building stone, lime, and clay products.

Manufactures.—The State has considerable manufactures. The value of the products of all industries in 1920 was \$702,803,083. The manufacture of tobacco and cigars is the most important. The value of the output in 1920 was \$117,391,621. Abattoirs and meat packing is also a leading industry, with products in 1920 valued at \$41,319,836. The cotton mills of the State consume much more cotton than the State produces. The products of Virginia cotton mills in 1920 were valued at \$39,734,430. Smelting of iron and machine manufactures in 1920 were valued at \$50,533,822. Other large industries are ship building, paper making, flour milling, trunks, bags, glass, canning of fruits and vegetables, leather, coke, saw mill machinery, woodenware, clothing, silk and knit goods, and agricultural implements.

Communications.—The State is divided by the great Chesapeake Bay. Many rivers which flow into the bay are navigable, such as the James, the York, the Rappahannock and the Potomac. In Hampton Roads the Federal government maintains a great navy yard, and there are extensive ship building yards at Newport News. Norfolk is the largest port of the State and has extensive shipping interests, both coastal and foreign. It is one of the chief centres of the manufacture and distribution of fertilizers. The steam railroad mileage is 4,693 miles and electric railroad mileage is 440 miles. Telegraph and telephone lines total 12,090 miles of line.

Legal Holidays.—1 January; 19 January (Lee-Jackson Day); 22 February; 30 May (Confederate Memorial Day); 3 June (Jefferson Davis Day); 4 July; Labor Day; November, Tuesday next following first Monday (General Election Day); 11 November (Armistice Day); November, Thursday designated by President as Thanksgiving Day; 25 December.

Charities and Corrections.—The principal State institutions, with their location and number of inmates in 1922, are: Penitentiary, Richmond, 464; State Farm, Lassiter Post Office, 235; State Convict Lime Plant No. 1, Staunton, 41; State Convict Lime Plant No. 2, Irvington, 39; State Convict Road Force, 1,440; Central State Hospital, Petersburg, 1,746; Eastern State Hospital, Williamsburg, 1,073; Southwestern State Hospital, Marion, 851; Western State Hospital, Staunton, 1,285; Virginia State Epileptic Colony, Madison Heights, 576; Blue Ridge Sanatorium,

Charlottesville, 124; Catawba Sanatorium, Catawba, 304, and Piedmont Sanatorium, Burkeville, 89.

Legislation.—At the 1922 session of the legislature measures were enacted relating to child welfare. The State Highway Department was reorganized and a State Purchasing Committee created. A commission was also instituted to submit a plan of administrative reorganization. The question of calling a constitutional convention was submitted to the electorate. A Board of Censorship for motion pictures was created and county school administration was effectively reorganized.

Government.—The State executive is a Governor, elected for a term of four years, who receives a salary of \$5,000. The legislature, officially called the General Assembly, consists of two chambers, a Senate and a House of Delegates. The Senate contains not over 40 nor under 33 members, and the House of Delegates not over 100 nor less than 90 members. Senators are elected for four years and members of the House of Delegates for two years. Qualified electors, with the usual exceptions, are all citizens of 21 and over, residents of the State for two years and for 30 days in the county, town or precinct in which the election is held, who have paid the State poll taxes and registered. Virginia sends two Senators and 10 Representatives to the Federal Congress. The legislature meets biennially on the second Wednesday of January in even years.

State Officials.—Governor, E. Lee Trinkle; Lieutenant-Governor, J. E. West; Secretary of State, B. O. James; Attorney-General, John R. Saunders; Auditor, C. Lee Moore; Treasurer, Chas. A. Johnston, and Superintendent of Education, Harris Hart.

Judiciary.—Members of Supreme Court: Judge Joseph L. Kelly, President; Judge Frederick W. Sims, Judge Robert R. Prentiss; Judge Martin P. Burks, and Judge Jesse F. West.

VIRGINIA AGRICULTURAL AND MECHANICAL COLLEGE. See VIRGINIA POLYTECHNIC INSTITUTE.

VIRGINIA MILITARY INSTITUTE, a State educational institution for men, founded in 1839 and located at Lexington, Va. In 1922-23 it had a faculty of 45 members, 610 cadets, property valued at \$1,000,000 and an income of \$225,500. Edward W. Nichols is superintendent.

VIRGINIA POLYTECHNIC INSTITUTE, a State co-educational institution, founded in 1872 and located at Blackburg, Va. In 1922-23 it had a faculty of 134 members, 1,485 students, property valued at \$1,250,000 and an income of \$611,188. Julian A. Burruss, Ph.D., is president.

VIRGINIA THEOLOGICAL SEMINARY AND COLLEGE, a Baptist co-educational institution for colored students, founded in 1888 and located at Lynchburg, Va. In 1922-23 it had a faculty of 30 members, 560 students, property valued at \$350,000 and an income of \$85,000. Robert C. Woods, D.D., is president.

VIRGINIA UNION UNIVERSITY, a Baptist educational institution for colored men.

founded in 1899 (although the schools from which it grew were founded in 1865), and located at Richmond, Va. In 1922-23 it had a faculty of 20 members, 400 students, property valued at \$500,000 and an income of \$80,000. William J. Clark, B.D., is president.

VIRGINIA, University of, a State institution of higher learning for men, (co-educational however in graduate and professional departments) founded in 1819 and located at Charlottesville, Va. In 1922-23 it had a faculty of 124 members, 1,722 students, property valued at \$2,550,000 exclusive of investments in bonds and other endowment securities, and an income of \$1,000,000. Edwin Anderson Alderman, LL.D., is president.

VIRGIN ISLANDS OF THE UNITED STATES, formerly the Danish West Indies. This island group consists of three islands, Saint Thomas, Saint Croix and Saint John, with about 50 smaller islands, mostly uninhabited. The islands lie about 60 miles east of Porto Rico. The language in general use is English. The islands were bought for \$25,000,000 from Denmark on 25 Jan. 1917. The area of the group is 132 square miles and the population at the census of 1917 was 26,051. The capital is Charlotte Amalie on the island of Saint Thomas, population 7,747. The islands are administered by the Navy Department under an act of Congress of 3 March 1917. The Governor is appointed by the President of the United States. He is assisted by six heads of departments, health, education, judiciary, public works, police and fire, and supplies. The legislative function is vested in a Colonial Council, in each of the two municipalities—Saint Thomas and Saint John, and Saint Croix. About two-thirds of the members of each council are elected by popular vote and the remaining one-third appointed by the Governor. Members of the council serve for four years. The Danish legal code remains in force until Congress shall provide otherwise. Agriculture and cattle raising are the chief industries. Bay rum is one of the chief exports. Education is compulsory. In the public schools there are 68 teachers and 2,108 pupils. Some junior high schools have been established in the three towns, and night schools also. The revenues, mostly derived from customs, income tax, building tax, etc., amounted to 1,409,868 francs in 1921. The deficit in the government operation is made up by appropriations by the Congress of the United States. Danish currency is still legal. Commerce of the United States with the Virgin Islands in 1921-22 was: Exports, \$754,729; imports, \$1,836,567. The Governor in 1922 was Captain Sumner E. W. Kittelle. U. S. N. The Government Secretary was Lieutenant C. C. Timmons, U. S. N.

VIRUS SERUM CONTROL. See ANIMAL INDUSTRY, UNITED STATES BUREAU OF.

VITAL STATISTICS. In March 1923 the Department of Commerce announced that provisional birth figures compiled by the Bureau of the Census for the first nine months of 1922 indicated lower birth rates than for the corresponding nine months of 1921. The birth rate for the first nine months was 22.8 in 1922

against 25 in 1921. The highest birth rate was shown for North Carolina (30), and the lowest for Washington (18.3). Slightly higher death rates were reported for the same period. The death rate for the nine months was 11.7 in 1922 as against 11.6 for the first nine months of 1921. The highest mortality rate was shown for Maine (14.3), and the lowest for Idaho (7.8).

Declines in the death rates from heart diseases, influenza and pneumonia and tuberculosis in all its forms, the three principal causes of death in the United States, were the outstanding features of 1921, which showed the lowest death rate recorded in any year since the beginning of the annual compilations in 1900, the Census Bureau announced 27 Dec. 1922. Increases were shown in the rate for cancer, automobile accidents and injuries, diphtheria, typhoid, suicide and homicide and several other causes.

The 1921 death rate was 11.6 per 1,000, compared with 13.1 in 1920. Those rates are for the registration area of continental United States, comprising 34 States, the District of Columbia and 16 cities in non-registration States, with a total estimated population on 1 July of 88,667,602, or 82.2 per cent of the estimated population of the United States on that date, which was 109,248,393.

The total number of deaths in the registration area was 1,032,000, compared with 1,142,558 in 1920. The rate per 100,000 was 1,163.9, compared with 1,306 in 1920. Based on the death rate for the registration area, the number of deaths for the whole United States for 1921 approximates 1,271,444.

Heart diseases were responsible for one-eighth of all deaths, or 130,351 deaths in 1921, but the rate per 100,000 declined from 149.7 to 147. Influenza and pneumonia in all forms caused 88,458 deaths, compared with 182,205 in 1920, the rate declining from 200.3 to 99.8. Tuberculosis in all its forms resulted in 88,135 deaths, compared with 99,916 in 1920, the rate declining from 114.2 to 99.4. Cancer and other malignant tumors were responsible for 76,274 deaths, compared with 72,931 in 1920, the rate increasing from 83.4 to 86.

Automobile accidents and injuries resulted in 10,168 deaths, compared with 9,103, the rate increasing from 10.4 to 11.5 per 100,000 of population.

Suicides numbered 11,136, compared with 8,959 in 1920, the rate increasing from 10.2 to 12.6. Of the suicides 4,122 were by firearms, 1,942 by hanging or strangulation, 1,739 by poison, 1,401 by asphyxiation, 712 by cutting or piercing instruments, 710 by drowning, 271 by jumping from high places, 130 by crushing and 109 by other means.

Homicides also increased, numbering 7,545, compared with 6,205 in 1920, the rate increasing from 7.1 to 8.5. Firearms accounted for 5,509 of the homicides, cutting and piercing instruments 768, and other means 1,268.

Declines were shown in the number of deaths from railroad accidents and injuries, mine accidents and injuries, machinery accidents and injuries, street car accidents and injuries.

VITAMINS. Research work on food and digestion long ago discovered the fundamental

difference between the flesh-forming and the heat-producing foods. It was found that no amount of heat-producing foods would replace flesh-formers, and that, deprived of these last, animals and men alike wasted and died almost as rapidly as though subjected to total starvation. The essential factor present in the flesh-forming foods is nitrogen. The importance of the nitrogen atom led to attention being diverted from all other elements in the food.

About the beginning of this century it became apparent that the problems of food and health were infinitely more complex than had previously been supposed. Professor Hopkins, of Cambridge University, and others observed that quantities of known foods (proteins, sugars and fats), amply sufficient in theory to enable full development to proceed, proved in practice insufficient even to sustain life if given in a pure state. Both life and growth, however, could continue if to these diets were added quantities, often extremely small, of natural substances such as milk. It was therefore concluded that in these substances were contained some additional ingredients, present in the tiniest of amounts, but still vital to the existence of life. These substances, the "accessory food factors," received the name of "vitamins," and it is around their constitution and indeed their actual existence that controversy is acute to-day. It must first be said that the existence of any actual substance corresponding to the name is a matter of pure theory. Nobody has at any time isolated any such concrete chemical substance. Nevertheless, from the researches carried out by Hopkins, Mellanby, Chick, and others in Great Britain and America, it has been decided to assume the existence of three of these substances, called respectively vitamin A, vitamin B, and vitamin C.

Vitamin A is associated with many fats and oils, especially those of animal origin, and has on this account received the name of fat soluble A. It is believed by some to be the specific factor whose absence determines the onset of rickets, and it has thus received another name, the anti-rachitic vitamin. Our greatest safeguard against rickets is undoubtedly cod-liver oil. It has been stated recently by American observers that cod-liver oil is just as specific in rickets as quinine in malaria. It is therefore assumed that cod-liver oil is especially rich in vitamin A. Many experiments have been carried out to separate the supposed vitamin from the cod-liver oil, but so far practically without any success. The substances containing these anti-rachitic qualities lose them to some extent on being heated.

The second supposed accessory food factor—vitamin B—is present in very many natural foodstuffs. In cereals it seems to be present only in the outer layers of the seeds, so that in white bread, for instance, where this layer has been removed, it is almost completely absent. Men who live for a long time on a diet of highly-milled cereals, such as polished rice or white wheat flour, tend to develop a diseased condition known as beri-beri. The condition is well marked in other animals, and birds are peculiarly susceptible to this illness. Pigeons fed on polished rice alone will develop a con-

dition of weakness very closely resembling the disease of beri-beri in man within 30 days. This substance, whatever it is, seems to be resistant to heat, and cooking does not diminish the value of any food containing it.

The third accessory food factor, present in fresh fruit and vegetables, has received the name of vitamin C. Its qualities, whatever they are, are very easily destroyed by heat, and therefore cooked or canned fruits seem almost completely deficient in this substance. It is claimed that the small quantities of vitamin C present in fresh vegetables are responsible for the prevention of scurvy, and that it is the lack of this vitamin which causes scurvy in human beings deprived for long periods of time of access to fresh vegetables. Oddly enough, milk seems to have a low percentage of this vitamin, and it is said that young children should have an addition of fresh orange juice or turnip juice to their daily diet.

Vitamins are the latest fashion in medicine. The modern specialist is as much subject to the latest fashions as any Parisian dressmaker, and some doctors have attributed an altogether ridiculous importance to these substances. (Walter Elliott, D.Sc., M.P. in "Proceedings of British Medical Association Congress." 1922.)

VIZETELLY, Ernest Alfred, English author, editor, translator, and war correspondent: b. 29 Nov. 1853; d. Hampstead, England, 26 March 1922. He was the third of the six sons of Henry Richard Vizetelly. He was educated at "The Gables," Eastbourne, England, and at the Lycee Imperial Bonaparte, now the Condorcet, Paris, and, in 1870, upon the outbreak of the Franco-German War, became a newspaper correspondent and artist (the youngest on record) for the London *Daily News*, and the *Pall Mall Gazette*, and served as secretary to his father who was special correspondent for the *Illustrated London News*. Ernest Vizetelly was in Paris during part of the German siege, but, passing out, joined the Army of the Loire, as a correspondent, being attached to the staff of the Third Division of the 21st Army Corps. With his father and brother, Arthur, Mr. Vizetelly was in Paris during the Commune that followed the evacuation of the city by the Germans. He continued to act in a journalistic capacity on the Continent for *The Yorkshire Post*, Leeds, until 1886 when he returned to London and was engaged as a translator by the publishing house of Vizetelly and Company, of which his father was the founder and head. After the liquidation of the business of Vizetelly and Company, consequent upon its prosecution for publishing translations of some of Zola's novels, Mr. Vizetelly reverted to journalism, but in later years revised and condensed English versions of most of Zola's works. He published: 'The Heptameron' (English Bibliophiles' edition, 5 vols., 1894); 'The True Story of the Chevalier d'Eon' (1895); 'With Zola in England' (1899); 'Bluebeard, Comorre the Cursed and Gilles de Rais' (1902); 'Emile Zola, Novelist and Reformer' (1904); 'The Anarchists, Their Creed and Record' (1911); 'The Scorpion' (a romance of Spain, 1894); 'A Path of Thorns' (1901); 'The Lover's Progress' (1902); 'Le Petit Homme Rouge: The Court of the

'Tuileries' (1907); 'The Favourites of Henry of Navarre' (1910); 'The Favourites of Louis "XIV"' (1912); 'Republican France, 1870-1912' (1912); 'My Days of Adventure' (1914); 'My Adventures in the Commune of Paris' (1914); 'In Seven Lands' (1916); 'The True Story of Alsace-Lorraine' (1918), and 'Paris and Her People' (1919).

VOLUNTEERS OF AMERICA, an organization along the lines of the Salvation Army, founded in 1896, for the prosecution of Christian, social, and philanthropic work in the United States. There are 10,000 enrolled workers in the several departments, such as employment bureaus, trade classes, hospital nursing, fresh air camps, food and clothing distribution, etc. The headquarters of the organization is at 34 West 28th street, New York. The president is General Ballington Booth and Secretary, J. A. Merrill.

VORARLBERG, a province of the Republic of Austria, a Crownland of the former Kingdom, with an area of 1,005 square miles and a population of 133,212. Bregenz is the chief town.

VOS, Bert John, American university professor: b. Katwykaan Zee, The Netherlands, 27 Oct. 1867. In 1888 he was graduated with the degree of A.B. from the University of Michigan and the following three years was scholar and fellow at Johns Hopkins University. He received the degree of D. Ph. from Leipzig in 1892. In 1892-93 he was instructor in German at the University of Chicago; from 1893-98 he was associate in German; from 1898-1908, associate professor of German at Johns Hopkins University. In 1908 he was made professor of German at Indiana University, which position he still holds. Doctor Vos has published: 'The

Diction and Rime-Technic of Hartman von Aue' (1896); 'Materials for German Conversation' (1900); 'Essentials of German' (1903); and has translated: Chantepie de la Saussaye's 'Religion of the Teutons' (1902). He is the editor of 'Schiller's Wilhelm Tell' (1911); Grimm's 'Kinder und Hausmächen' (1903); Heine's 'Harzreise' (1907). Doctor Vos is also a contributor to current German and American periodicals. In 1918-19 he was special assistant to the American Legation at The Hague and in the same year was member of the American mission to Berlin.

VROOMAN, Carl (Schurz), American publicist: b. Macon, Mo., 25 Oct. 1872. He was educated at Washburn College, Topeka, Kan. (1890-91), Harvard University (1891-94) and Oxford University, England (1895). In 1893 he represented Harvard University in debate with Yale University and two years later represented Oxford in debate with Cambridge University. In 1894 he began writing on public questions, his articles appearing in *McClure's*, *The Outlook*, *The Twentieth Century*, *Le Courier European*, *Review of Reviews*, *The Century*, etc. From 1898-1900 he was regent of the Kansas State Agricultural College. Mr. Vrooman spent seven years abroad, between 1894 and 1910 investigating social and economic conditions in Europe. From August 1914 to 1 Jan. 1919 he was Assistant Secretary of Agriculture and during the World War spent eight months in Europe on a special agricultural mission. At present he is farming scientifically 4,300 acres of land in central Illinois and Iowa. Mr. Vrooman has published: 'Taming the Trusts' (1900); 'American Railway Problems' (1910); 'The Lure and the Love of Travel' (1914).

W

WABASH COLLEGE, a non-sectarian educational institution for men, founded 21 Nov. 1834 and located at Crawfordsville, Ind. In 1922-23 it had a faculty of 26 members, 465 students, property valued at \$1,600,000 and an income of \$94,000. George L. Mackintosh, D.D., LL.D., is president.

WAGE LAWS, Minimum. See LABOR LEGISLATION.

WAKE FOREST COLLEGE, a Baptist educational institution for men, founded in 1834 and located at Wake Forest, N. C. In 1922-23 it had a faculty of 40 members, 815 students, property, including endowment, valued at \$1,020,000, and an income of \$150,000. William Louis Poteat, LL.D., is president.

WALES, a division of the United Kingdom, situated to the west of the central shires of England, and often called a Principality. It has an area of 7,466 square miles and in 1921 had a population of 2,206,712. Wales is divided into 12 shires: Anglesey, Brecknock, Cardigan, Carmarthen, Carnarvon, Denbigh, Flint, Glamorgan, Merioneth, Montgomery, Pembroke and Radnor. See GREAT BRITAIN.

WALKER, Williston, American university professor: b. Portland, Me., 1 July 1860; d. New Haven, Conn., 9 March 1922. He was graduated from Amherst College with the degree of A.B. in 1883; from Hartford Theological Seminary in 1886, and from Leipzig University with the degree of Ph.D. in 1888. In 1888-89, he was an associate in history at Bryn Mawr College and then went to Hartford Theological Seminary where he was associate professor of church history from 1889-92 and professor of Germanic and Western church history from 1892-1901. He was made professor of ecclesiastical history at Yale University, 1 Oct. 1901, and held that position until his death. He was a trustee of Amherst College from 1896, and secretary of the board of that institution from 1899. The degree of D.D. was conferred upon him by the Western Reserve University, Amherst College, Yale University, University of Geneva (Switzerland), and Harvard University. Marietta College conferred the degree of L.H.D. upon him in 1910. He was president of the New Haven Colony Historical Society, 1903-13; a member of the American Society of Church History, the American Historical Association, the American Antiquarian Society, the New England Historical and Genealogical Society, the Colonial Society of Massachusetts, the Connecticut Academy of Arts and Sciences, the Connecticut Society of Colonial Wars, and a fellow of the American Academy of Arts and Sciences. He published 'On the Increase of Royal Power under Philip Augustus' (1888); 'The Creeds and Platforms of Congregationalism' (1893); 'A History of the Congregational Churches in the United States' (1894); 'The Reformation' (1900); 'Ten New England Leaders' (1901);

'John Calvin' (1906); 'French Trans-Geneva' (1909); 'Great Men of the Christian Church' (1908); 'History of the Christian Church' (1918).

WALLACE, Henry Cantwell, United States Secretary of Agriculture: b. Rock Island, Ill., 11 May 1866. He was graduated B.S.A. from the Iowa State College in 1892. From 1887-91 he farmed and raised purebred live-stock in Adair County, Iowa; from 1893-95 he was professor of dairying in the Iowa State College, and editor of the *Creamery Gazette and Farm and Dairy*; from 1895-1916 he was manager and associate editor of *Wallace's Farmer*, and thereafter editor until 4 March 1921 when he became Secretary of Agriculture in President Harding's cabinet. He is recognized as one of the most efficient of the cabinet members, and his administration of his office has been generally commended. Mr. Wallace was a member of the United States Livestock Industry Commission (executive committee) during the World War; member, National War Work Council, Y. M. C. A.; member, International Committee, Y. M. C. A.; chairman, State Executive Committee, Iowa, Y. M. C. A. (1914-20); secretary, Corn Belt Meat Producers' Association (14 years); permanent chairman, National Shippers' Conference; member, Executive Committee, Roosevelt Memorial Association; member, National Forest Reservation Commission, and War Finance Corporation. He is a member of the Delta Tau Delta and Phi Kappa Phi fraternities, and of the Prairie, Des Moines, Grant, Golf, and Country clubs, Chevy Chase and other clubs.

WALLACHIA, a district of the Kingdom of Rumania. Area, 29,916 square miles with a population of 4,716,291. Bucharest is the chief city. See RUMANIA.

WALLER, Augustus Désiré, English physiologist: b. Paris, France, 12 July 1856; d. London, England, 11 March 1922. His father, Augustus Volney Waller, was a well-known physician and a Fellow of the Royal Society. The younger Waller was educated in Geneva and at the universities of Aberdeen and Edinburgh, taking the degree of M.D. at the latter. From the beginning he was more interested in research than medical practice and after his marriage devoted himself entirely to physiological research. He first gained distinction by his discovery of the electromotive action of the human heart and his invention of the first electrocardiogram for displaying and recording this action. Following the work of the Hyderabad Chloroform Commission, he investigated conditions relating to chloroform anesthesia together with the dangers incident to its use. It was his contention that the latter depended not so much on the total dose administered as upon the percentage of chloroform vapor in the inhaled air. He devised a balance for regulating this pro-

portion and claimed that for human beings and animals chloroform administered in accordance with his methods was the safest anæsthetic. Doctor Waller also made extensive investigations into the electrical phenomena of plants and during the last two years of his life devoted much of his time to devising apparatus for displaying and recording emotional states by means of a mirror galvanometer. He demonstrated in his own laboratory, in the Royal Institution and in Paris, that in normal persons the apprehension of pain caused a greater effect than pain itself and that emotional states could be revealed against the will of the patient. He entertained the idea that practical use might be made of his apparatus by attaching it to suspected persons while they were undergoing cross-examination. For several years prior to his death Doctor Waller had been director of the physiological laboratory of the University of London. He was a Fellow of the Royal Society; corresponding member and associate member of Société de Biologie, Paris; member, Physiological Society of Moscow; member, Royal Academies of Medicine, Rome and Belgium; honorary member, Council of University of Tomsk. Many universities and other institutions of learning conferred upon him academic distinctions, including the degrees of LL.D. and Sc.D. He published 'Introduction to Human Physiology'; 'Animal Electricity' (1897); 'Signs of Life' (1903); 'Physiology: The Servant of Medicine' (1910); 'The Psychology of Logic' (1912), also numerous scientific papers in the *Journal of Physiology* and other periodicals.

WANAMAKER, John, American merchant: b. Philadelphia, Pa., 11 July 1838; d. there, 12 Dec. 1922. He was the son of Nelson and Elizabeth (nee Kochersperger) Wanamaker. He was educated in the public schools of Philadelphia, leaving school at 14 to become errand boy in a book store at \$1.25 a week. He removed with the family to Indiana but returned to his native city in 1856 and there secured employment as salesman in a clothing store. While so employed he wrote, edited and published a small newspaper called *Everybody's Journal*. In 1861, with Nathan Brown, he established the clothing house of Wanamaker & Brown in Philadelphia. About the same time he married Mary B. Brown, his partner's sister, who died 20 Aug. 1920. In 1876, Mr. Wanamaker established his department store in Philadelphia and there began to give full sway to those pioneer selling ideas which made his business unique. In 1896 the A. T. Stewart business in New York was in financial difficulties. Mr. Wanamaker bought it and rehabilitated it, and at his death it was one of the great stores of the country.

Mr. Wanamaker was organizer and director of the Merchants Bank of Philadelphia and for several years served as director of the Southern Railway. He was one of the founders and directors of the Presbyterian Hospital, of which he and Mrs. Wanamaker built the children's ward. For a number of years he was manager of the University Hospital. He founded the Bethany Dispensary and was founder and president of the First Penny Savings Bank. In June 1921 Mr. Wanamaker was made honorary chairman of the Board of Directors of the Sesqui-

Centennial Association, which plans to hold a world's fair in Philadelphia in 1926.

Both politics and finance absorbed Mr. Wanamaker's interest and activity. He became active in his city and State as a Republican of independent proclivities, firmly opposed to the tactics of "the machine." He declined nomination to the 48th Congress as well as the independent candidacy for mayor of Philadelphia in 1886. He was, however, Presidential elector two years later and served as member of the Republican National Committee, 1889-93. He became Postmaster-General in the Cabinet of President Harrison, serving throughout the four years of that administration. He advocated many important business changes in the postal administration. He urged that the rates of postage be lowered, that a parcel post system be established and that the Government take over the telegraph lines and furnish telegraph service for 10 cents.

The merchandising policy of Mr. Wanamaker was regarded as revolutionary in his day. He marked every piece of merchandise in his store in plain figures; he extended to his customers the then revolutionary privilege of returning any purchases which they found unsatisfactory; he bought advertising space in staggering quantities and converted it into plain-spoken announcements of things offered on the Wanamaker counters that his multitude of customers learned to believe, and to the very end he wrote himself those little "editorials" that became a feature of the Wanamaker advertisements. A great tribute to his merchandising career was accorded him in 1921. In the ceremony at Congress Hall in Philadelphia, Mr. Wanamaker was presented with the freedom of the city and was later the guest of honor at a dinner attended by prominent men of all parts of the country. Among the tributes of the day were a gift and message from the Emperor and Empress of Japan.

Mr. Wanamaker was the first salaried secretary in America of the Young Men's Christian Association in 1858 and was one of the founders of the Christian Commission during the Civil War and one of the organizers of the Centennial Exposition of 1876. Mr. Wanamaker was a Presbyterian. As a comparatively young man he founded a Sunday school in the Bethany Presbyterian Church which was one of his life interests and which became one of the largest in the country. His service of 64 years as superintendent of this school is believed to be a world's record. For many years he served as president of the Pennsylvania State Sunday School Association, finally becoming honorary president. For some 25 years he was a member of a special committee on Sabbath observance of the Presbyterian Church and was also director of the Lord's Day Alliance. He founded and erected Y. M. C. A. and college buildings in India, China, Japan and Korea and built many churches and other institutions. In April 1916, in celebration of the 55th year of the founding of the house of Wanamaker, he endowed permanently the American University of Trade and Applied Commerce, an integral part of the stores. Mr. Wanamaker, during his wide travels about the world, gathered together a notable assemblage of art objects, but his collections were marred on three different occasions by destruc-

tive fires. The French Government made him an officer of the Legion of Honor and he received the degree of LL.D. from Ursinus College, Howard University and the University of Pennsylvania.

WAR FINANCE CORPORATION. This agency of the United States Government, was created in 1918 to give financial support to industries whose operations were "necessary or contributory to the prosecution of the war" and to banking institutions that aided in financing such industries. It was authorized also to make advances to savings banks and building loan associations, to buy and sell obligations of the United States Government, and to issue bonds secured by its own assets. Its paid in capital was fixed at \$500,000,000, all of which was subscribed by the Government, and provision was made for the administration of its activities through a board of five directors, with the Secretary of the Treasury as an ex-officio member and chairman of the board.

The Corporation was in existence only six months before the armistice was signed, but even in that short period it handled a large volume of business and fulfilled a useful and effective function in the program of war finance. When hostilities ceased, its operations were contracted automatically but its continued usefulness was soon demonstrated when it was called upon to undertake the burden of financing the railroads, then under Federal control, because of the temporary failure of the Congress to make an appropriation for the maintenance of their operations.

Under its war-time powers, the Corporation made advances totaling \$306,742,154. Its authority to buy and sell obligations of the United States Government also was exercised on a large scale, the Corporation serving as an intermediary between the "Bond Purchase Fund" of the Treasury and the open market for Government securities, purchasing bonds whenever such action was necessary in order to stabilize the market and later turning them over to the Treasury for retirement when the condition of the Bond Purchase Fund permitted. Altogether, the Corporation bought from 22 May 1918, to 16 April 1920, Government securities having an aggregate par value of \$1,889,122,000.

In March 1919, in order that it might assist in the transition from the conditions of war to the new conditions of peace, the Corporation was granted authority by the Congress to make advances, to the extent of \$1,000,000,000, to American exporters and to American banking institutions which chose to extend credits to foreign buyers. A number of loans were made under this authority and many applications were pending when the activities of the Corporation were discontinued in May 1920, at the request of the then Secretary of the Treasury. In January 1921, the Congress passed a joint resolution ordering the Corporation to resume operations. Its powers, which were then restricted to the financing of exports, were subsequently enlarged by the passage of the Agricultural Credits Act in August 1921, which authorized it to make loans for agricultural purposes to banking and financing institutions and to co-operative marketing associations.

The Corporation's activities under this Act

have been conducted on a nation-wide scale. To 30 Nov. 1922, it has made or approved advances for agricultural and live stock purposes aggregating \$433,647,000 in 37 States. The loans authorized on live stock in the West total \$90,000,000; on cotton in the South, \$81,847,000; on grain in the Northwest, Middle West, and Southwest, \$36,790,000; on peanuts in Virginia, \$2,044,000; on tobacco in Kentucky, Indiana, and Ohio, as well as in North Carolina and neighboring States, \$40,000,000; on rice in California, Arkansas, and Louisiana, \$10,250,000; on sugar beets in Utah, \$11,438,000; \$2,098,000 on other agricultural commodities; and for general agricultural purposes, \$159,180,000. These loans have reached the farmers and stockmen through 4,400 banks, through 34 co-operative marketing associations having a total membership of about three-quarters of a million farmers, and through 100 live stock loan companies. In addition, the Corporation since January 1921, has authorized advances totaling \$53,000,000 to assist in financing exports principally of grain, tobacco, cotton, and other agricultural products.

The loans made by the Corporation for agricultural purposes strengthened the banking situation in the country districts and relieved the necessity for forced liquidation. They put the banks in position to carry their farmer customers for a longer period and also to make new loans. They checked demoralization, helped to restore confidence, aided in the stabilization of markets for agricultural commodities, and were a vital factor in bringing about a marked improvement in the business and economic situation throughout the country.

The Board of Directors is composed of the following members: The Secretary of the Treasury, Chairman; Eugene Meyer, Jr., Managing Director; George R. Cooksey, Fred Starek and Frank W. Mondell, directors. The Secretary of Agriculture was added to the Corporation by the Agricultural Credits Act.

EUGENE MEYER, JR.,
Managing Director.

WARD, Geneviève (Lucy Geneviève Teresa, COMTESSE DE GUERREL), American singer and tragedienne: b. New York, 27 March 1838; d. Hampstead, England, 18 Aug. 1922. She was a daughter of Col. Samuel Ward and a granddaughter of Gideon Lee, once Mayor of New York City. At the age of 17 she married Count Constantine de Guerbel, a Russian, but the union proved to be an unhappy one and the couple separated. Having studied vocal music in Italy and Paris, Mme. Ward made her debut as an opera singer under the name of Mme. Ginevra Guerrabella at Milan in 1856 in Paino's opera 'Stella di Napoli.' She sang for two more seasons in Italy before going to Paris to take the part of Elvira in 'Don Giovanni.' Thereafter she appeared in concerts in London where her success was striking. In 1862 she returned to America where she made her first appearance as Violetta in 'La Traviata.' The following season she appeared in Cuba and while there contracted diphtheria which destroyed her singing voice and brought her operatic career to a premature close. She then determined upon a dramatic career and while studying for the stage earned a livelihood by teaching singing. She re-

turned to England in 1873 and recorded an instantaneous success in her first appearance upon the dramatic stage as Lady Macbeth in the Theatre Royal, Manchester. Thereafter she appeared in many tragic roles, winning the distinction of being one of the greatest tragediennes of her time. She revisited the United States in 1878 and made her first appearance on the American dramatic stage at Booth's Theatre, New York, as Jane Shore in a play of that name, following it with several Shakespearean roles. Returning to London the following year, she leased the Lyceum Theatre and produced 'Forget-Me-Not' and 'L'Aventuriere.' During 1881-82 she toured the United States and Canada in 'Forget-Me-Not,' in which she appeared more than 2,000 times and which was her greatest success. She played with Sir Henry Irving, 1893-97. After 1900 her stage appearances were rare. However, in 1910 she joined F. R. Benson's company and appeared for a time in a repertory of Shakespearean plays. On her birthday in 1921 King George V conferred upon her the Order of Dame Commander of the British Empire. Consult: Wickoff, 'Memoir of Ginerva Guerrabella' (New York, 1863); Gustafson, 'Geneviève Ward' (Boston, 1882); William Winter 'Shadows of the Stage' (New York, 1892).

WARD, Sir Leslie, British caricaturist: b. London, England, 21 Nov. 1851; d. there, 15 May 1922. He was the only son of the late E. M. Ward, R.A., and his great grandfather was the famous painter, James Ward, and so he claimed connection through marriage with George Morland. His mother, who survived him, was Henrietta Ada Mary Ward and she too had considerable success as an artist. At first young Ward was intended, after leaving Eton, for the profession of architect, but after studying under Sidney Smirke he withdrew from the pursuit and entered the Royal Academy as an ordinary student. Brought up amongst artists and literary men, he was accustomed to celebrities from his earliest days, and when at the age of 21 he contributed his first caricature to *Vanity Fair* he had already a fair knowledge of his subject. His first cartoon was of Professor Owen. He adopted the pseudonym of "Spy" by a chance opening of the dictionary. From 1873 to 1909 his cartoons appeared in the periodical above named, but in his later years he devoted considerable time to portraiture. He was a member of the Royal Society of Portrait Painters. In 1899 he married Judith Mary Topham-Watney, by whom he had one daughter. From time to time he exhibited architectural, oil-color and water-color portraits in the Royal Academy and elsewhere. In 1918 he was knighted. Sir Leslie in his sprightly volume, 'Forty Years of Spy,' published in 1915, gives a full and candid account of the life of a popular caricaturist. Everyone, he said, was caricaturable, even the man who said, "Now I myself, for instance, I have nothing peculiar about me. If you were to caricature me my friends would not recognize me." Another type was the man who posed, and then said, "Oh, I forgot. The photographer tells me this is my worst side. I must turn the other towards you, if you don't mind." Ward thanked him for the tip. So expert did he become that,

once getting a sudden impression of his own face from the side in a mirror, he came to this rapid conclusion, "I looked the sort of person sideways that I should have disliked if I had known him." Writing of the art of caricature, he said, "In the early days of *Vanity Fair* people viewed caricature as something entirely new and, in the light of this novelty, viewed it in the right spirit. Later they grew particular, and as they frequently paid (from which I did not benefit), an entirely new type of subject came to me. It was as though a spirit of commercialism crept between me and my sitter."

For two generations Ward was known as the chief caricaturist of England. Rarely did he wound anyone and he counted most of his subjects as his friends. His art was indeed that of humorous portraiture, and just as Lawrence would paint his ladies until their friends saw a likeness coming and then he would leave off, so "Spy" seemed to leave off whenever his sitter's friends saw a caricature coming. He was a shy man who seemed to feel his position keenly when hunting his quarry, and there are no records of biting and explosive sayings from him like those that made Peregrini feared and followed. Some of his early cartoons are the most forceful, such as his sketch of the first Lord Lytton and his caricatures of Mr. Charles Cox, Sir James Spoforth, Lord Haldon, and, especially Disraeli.

WAREHOUSES, Federal Licensed. See AGRICULTURE, UNITED STATES DEPARTMENT OF.

WARREN, Lloyd, American architect: b. 1870; d. New York, 25 Oct. 1922. He studied seven years in Paris in the Atelier Daumet Esquie, and after returning to New York in 1899 became interested in the formation of the Society of Beaux-Arts Architects. He was for a time connected with the firm of Warren & Wetmore, with his brother, Whitney Warren, but 20 years before his death withdrew to devote himself to the building up of a system of architectural instruction in the United States. He began with a studio in New York with 10 students and from this he built up a system which passes upon the work of students in 26 universities and many more studios and which in 1921 examined more than 2,500 designs submitted by 1,400 pupils throughout the country. About 1912 he organized a School of Sculpture, Painting and Decorations in the Beaux-Arts Building, 126 East 75th Street and was its director. He also instituted the Paris prize which has a recognized rank abroad. Mr. Warren also organized the Art School of the A. E. F. in France after the armistice. He was made a member of the Legion of Honor and Yale gave him the degree of M.A. in 1921.

WARTBURG COLLEGE, a Lutheran educational institution for men, founded in 1868 and located at Clinton, Iowa. In 1922-23 it had a faculty of 9 members, 114 students, property valued at \$145,000 and an income of \$40,000. Rev. Otto L. Proehl, A.B., is president.

WASHINGTON, a Pacific Coast State, bounded north by British Columbia, east by Idaho, south by Oregon and west by the Pacific Ocean. It has an area of 69,127 square miles.

and in 1920 had a population of 1,356,621. The State is 19th in order of size and 30th in order of population. During the decade from 1910 to 1920, the population increased 18.8 per cent. The distribution of population in 1920 according to color was: white, 1,319,777; negroes, 6,883; Indians, 9,061; Japanese, 17,387; Chinese, 2,363, and all others 1,150. The foreign-born white population in 1920 numbered 250,055. Within the State there are 18 Indian reservations with a combined area of 2,655 square miles and with a total population of 11,114. The chief cities, with their populations in 1920, are: Seattle, 315,652; Spokane, 104,437; Tacoma, 96,965; Everett, 27,644; Bellingham, 25,585; Walla Walla, 15,503; Yakima, 18,539; Aberdeen, 15,337; Vancouver, 12,637; Hoquiam, 10,058; Olympia, the capital, 7,795; Brenerton, 8,918; Centralia, 7,549; Wenatchee, 6,324, and Puyallup, 6,323.

Religion.—The principal Christian denominations have a combined membership of 283,709, including 97,418 Roman Catholics, 40,020 Methodists, 30,559 Presbyterians, 17,738 Baptists, 16,137 Congregationalists, 17,359 Lutherans and 10,881 Episcopalians.

Education.—The State appropriation for education in 1922 was \$9,540,793. There are 10,586 teachers in the public schools of the State and 294,013 pupils; 281 high schools with 1,795 teachers and 42,419 pupils, and three public normal schools with 168 professors and about 1,000 students. For higher education there are in the State the University of Washington, the University of Puget Sound, State College at Pullman, Gonzaga College, Whitman College, and a number of special schools.

Finances.—On 1 April 1921 the balance in the State treasury amounted to \$9,492,444.65. Receipts during the fiscal year, 1 April 1921 to 31 March 1922, amounted to \$37,886,381. Disbursements for the same period totaled \$40,529,956.19, leaving a balance on hand 1 April 1922 amounting to \$6,848,869.46. The estimated receipts for the fiscal year 1 April 1922 to 31 March 1923 totaled \$21,786,992, while authorized expenditures for the same period amount to \$23,629,182.11. The bonded debt of the State is \$12,500,000 incurred for a soldiers' bonus. The assessed value of real property in 1922 was \$822,823,009; of personal property, \$208,850,224. The assessed value of steam and electric railways and telephone companies in the same year was \$145,566,007.

Agriculture.—Agriculture is developing rapidly in Washington. All the cereals, vegetables, forage crops and fruits of the temperate zone are produced. The value of all farm crops in 1920 was \$227,212,008. In that year there were 66,288 farms having a land value of \$797,651,020, buildings valued at \$122,741,321, implements and machinery \$54,751,377, and livestock \$82,316,130. The land area of the farms of the State was 13,244,720 acres. Eastern Washington contains the famous wheat areas known as the Big Bend, and Palouse country, also the Yakima and Wenatchee apple districts. Western Washington is becoming noted as a dairy country and some of the largest condensaries and butter and cheese plants are operated in this area. Irrigation is being developed more and more by government and private installation. It is most ad-

vanced in the Yakima, Wenatchee, Okanogan, Spokane and Walla Walla valleys on the east of the Cascades. Of the entire land in farms 7,129,343 acres is improved land, while 1,813,061 acres comprise the area of the woodland in farms. In 1920 the State produced 474,764,169 pounds of milk, valued at \$11,869,104; 24,313,252 pounds of creamery butter, valued at \$13,960,736; full cream American cheese, 1,468,916 pounds, valued at \$398,935. The value of by-products was \$2,686,706, and there were 2,114,833 gallons of ice cream, valued at \$2,712,089. The wool clip of the State is over 5,000,000 pounds yearly. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 67,000 acres, 2,747,000 bushels, \$2,884,000; spring wheat, 1,000,000 acres, 9,200,000 bushels, \$9,568,000; winter wheat, 1,426,000 acres, 23,244,000 bushels, \$24,174,000; barley, 74,000 acres, 1,813,000 bushels, \$1,342,000; oats, 202,000 acres, 7,959,000 bushels, \$4,616,000; rye, 19,000 acres, 169,000 bushels, \$161,000; hops, 1,000 acres, 1,550,000 pounds, \$155,000; tame hay, 987,000 acres, 2,310,000 tons, \$37,422,000; potatoes, 65,000 acres, 9,425,000 bushels, \$4,241,000; apples, 25,678,000 bushels; peaches, 1,125,000 bushels, and pears, 1,708,000 bushels. The livestock interest is centred mostly in the east on the great ranges. On 1 Jan. 1923 there were in the State 278,000 horses, valued at \$19,460,000; 22,000 mules, valued at \$1,826,000; 283,000 milk cows, valued at \$17,263,000; 253,000 other cattle, valued at \$6,679,000; 520,000 sheep, valued at \$4,160,000 and 217,000 swine, valued at \$3,212,000. To this may be added about 3,500,000 chickens and 53,940 hives of bees.

Mining.—All the basic minerals are found in the State. Coal was produced to the extent of 2,400,000 tons in 1922. Other minerals are gold, copper, silver, lead and zinc. There are granite, sandstone, marble and limestone quarries, and cement is becoming an important product. The value of the gold, silver, copper, lead and zinc produced from mines in Washington in 1922 was \$573,000, as compared with \$332,313 in 1921. The improvement of the metal market, especially during the last part of the year, resulted in an increase of all five metals, but the total value was much less than the average of the last 10 years. The mine production of gold increased from \$128,486 in 1921 to \$181,700 in 1922. The mine output of silver increased from 142,450 ounces in 1921 to 192,000 ounces in 1922. A large part of the silver was recovered in smelting silver-copper ore from Chewelah. The mine output of copper increased from 251,544 pounds in 1921 to 335,000 pounds in 1922. The mine output of lead increased from 143,553 pounds in 1921 to 1,500,000 pounds, valued at \$85,500 in 1922.

Forestry and Lumber.—There are nearly 10,000,000 acres under forests in the State, containing about 330,000,000,000 feet of standing timber, including Douglas fir, yellow and white pine, larch, cedar, spruce and other trees. The average cut is 4,000,000,000 feet yearly, which makes Washington the chief lumber producing State. Its lumber product goes all over the globe.

Manufactures.—The latest report on the manufacturing industries of Washington shows 4,919 industrial establishments, employing 150-

480 persons and having capital invested amounting to \$553,125,000, and turning out goods to the value of \$809,635,000. The leading industries, arranged according to value of products, are as follows: Lumber and timber products, flour and grist mill products, canning and preserving, slaughtering and meat packing; butter, cheese, eggs, milk and poultry, printing and publishing, foundry and machine shop products, cars and general railroad shop work, bread and bakery products, confectionery and ice cream. The value of the 1920 lumber cut in Washington was \$195,000,000. In that year 4,847,000,000 shingles were produced in the State and 404,942,000 pieces of lath.

Communications.—The State has 42,428 miles of highways, exclusive of the streets in cities and towns. Of this mileage 2,040 miles are improved State highways, while 25,260 miles are county roads. The total cost of the State highways to date is \$50,362,030. In the completed highways there are 794 miles of concrete pavement. In 1922 up to 23 August, Washington had 164,146 licensed pleasure automobiles and 32,345 commercial cars. The fees collected from these were approximately \$3,000,000. This money is used for maintenance and new highway construction after the administrative expense is deducted. There is also paid into the road fund of the State a tax of one cent per gallon on all gasoline sold for motor vehicle use. Steamers ply regularly on the Columbia and other rivers and several lines of steamers sail from Seattle to China, Japan and the Philippines and also to Europe. There are 7,592.26 miles of steam railways in the State and 1,059.93 miles of electric railways.

Charities and Corrections.—In 1922 the number of inmates in the principal State institutions were as follows: Custodial School, 763; Girls School, 128; Training School, 196; Penitentiary, 742; Reformatory, 360; Eastern Hospital, 1,262; Northern Hospital, 988; Western Hospital, 1,435; Soldiers' Home, 177; Veterans Home, 383; Deaf School, 117, and Blind School, 56.

Legal Holidays.—1 January; 12 February; 22 February; 30 May; 4 July; Labor Day; 12 October; 11 November; Thanksgiving Day; Christmas Day, and General Election Day.

Government.—The executive is a Governor, elected for a term of four years, who receives a salary of \$6,000. The legislature consists of two chambers, a Senate and a House of Representatives. The lower house is composed of not less than 63 nor more than 99 members. The number of Senators must not be more than half nor less than one-third of the members of the House. Senators are elected for four years and Representatives for two years. The legislature meets biennially on the first Wednesday after the first Monday of January in odd years.

Officials.—The officials in 1922 were: Governor, Louis F. Hart; Lieutenant-Governor, W. J. Coyle; Secretary of State, J. Grant Hinkle; Attorney-General, L. L. Thompson; Auditor, C. W. Clausen; Treasurer, Clifford L. Babcock, and Superintendent of Education, Josephine Corliss Preston.

Judiciary.—Members of Supreme Court: (1922) Emmett V. Parker, Chief Justice; John F. Main, John R. Mitchell, O. R. Holcomb, Ken-

neth Mackintosh, W. W. Tolman, Mark A. Fullerton, J. B. Bridges and C. R. Hovey, Associate Justices. The members of the Supreme Court in 1923 are: John F. Main, Chief Justice; Emmett N. Parker, John R. Mitchell, O. R. Holcomb, Kenneth Mackintosh, W. W. Tolman, Mark A. Fullerton, J. B. Bridges and J. H. Pemberton, Associate Justices.

WASHINGTON COLLEGE, a non-sectarian, co-educational institution, founded in 1723 and located at Chestertown, Md. Statistics for 1922-23 show a faculty of 13 members, 165 students, property valued at \$350,000 and an income of \$59,000. Clarence P. Gould, Ph.D., is president.

WASHINGTON CONFERENCE. The history of the Washington Conference opens in December 1920, when the *New York World* began what immediately became much more than a newspaper campaign in favor of disarmament. What especially stirred public opinion was the growing tension between the United States and Japan in the Near East. Messages advocating disarmament were received from an impressive array of public men, officially and unofficially representative of the Vatican, the other religious communions, Great Britain, Japan and many nations. The names included Chief Justice Taft, General Pershing, General Tasker Bliss, Judge E. H. Gary, Bernard Baruch, Herbert Hoover, Colonel E. M. House, W. J. Bryan, Lloyd George (then Prime Minister), Cardinal Gasparri (writing for Pope Benedict XV), Viviani (former Prime Minister of France), Tardieu (former French High Commissioner to the United States), Viscount Uchida, Japan's Foreign Minister, Baron Hayashi (Japanese Ambassador in London), and the German writer, Maximilian Harden—to mention but a few of the responses. On 24 Dec. 1920, Walter H. Long, First Lord of the British Admiralty cabled: "We (the British) have had different standards: our strength was at one time superior to the three next strongest powers; then to the two; now all that we are suggesting is that our strength be equal to the next power."

This meant that Britain surrendered command of the ocean and was prepared for naval equality with the United States.

The Senator who seized the opportunity was William E. Borah. He brought forward a resolution, calling for a Conference of the three naval powers, the United States, Great Britain and Japan, the object of which would be to reduce armaments at sea by one-half. Senator Walsh, Democrat, proposed an alternative resolution, calling upon the President—Woodrow Wilson—to appoint an American delegate to the Disarmament Commission of the League of Nations. In February 1921, Sir Auckland Geddes, the British Ambassador to the United States, proceeded to London, there to discuss the situation, about which uneasiness was increasing. On the one hand, the United States Navy had been concentrated at bases, facing the Pacific, instead of the Atlantic Ocean. On the other hand, Great Britain had to decide upon what pretext, if any, she could break the Anglo-Japanese Alliance, renewable in 1921, and so disentangle herself from any possible dif-

ferences with the United States. In 1911, a clause was inserted in the treaty whereby it was made clear that "nothing in the alliance shall entail upon a contracting power the obligation to go to war with any third power which has concluded 'a treaty of general arbitration' with the said contracting power." By this formula, it was assumed that Great Britain would be relieved of all obligation to take the side of Japan against the United States, with whom she was negotiating such a treaty of general arbitration. But in 1912, the Senate rejected this treaty and no substitute was found except in the so-called Bryan treaty which provides for a commission of enquiry into disputes and not for arbitration. Critics of British policy thus held that technically she was still bound to Japan, even against the United States, on which matter, however, Great Britain formally declared that she was not so bound but regarded the Bryan Treaty as one of general arbitration. Historically, the Anglo-Japanese Alliance was entered into at a time when opinion in the United States favored Japan. The objective of the alliance was not the United States but Russia and Germany which were then formidable empires.

In March 1921, President Harding took office. While Congress had not as yet passed any resolution calling for a Conference, it had forced upon President Wilson a reduction in the strength of the army, first from 500,000 men, demanded by the administration, to 280,000 men, and later to 175,000 men, to reach which figure recruiting was suspended. In the House of Representatives (5 Feb. 1921), this reduction, after veto by the President, was carried by 271 votes to 16.

The agitation for disarmament continued. Favorable mass meetings were held in Japan. In Great Britain, the Navy League announced (30 April 1921): "With the disappearance of the German fleet, the world's naval position changed completely, and civilization is no longer threatened by any maritime power. This committee now reiterates its deliberate opinion that there is no halfway house between the suicidal policy of competitive building and international agreement."

The Navy League, therefore, demanded "at the earliest possible moment, a conference between the naval powers with a view to the limitation of armaments." Such an opinion from the big navy group itself in Great Britain was significant. Cynics might and did attribute it to Britain's desire to scrap battleships that had become obsolete and to her knowledge that in any competition on sea, the United States had the longer purse. But Viscount Grey put the case more truly when he said (February 1921): "I prefer the chance of Utopia to the certainty of destruction." More incisive still was the message from William G. McAdoo, "disarm or bust," (10 May 1921).

It was public opinion that carried Congress and ultimately the administration. Despite the opinion of General Pershing, the House of Representatives refused to vote an army of more than 150,000 men, and on 8 June 1921, the Senate reluctantly abandoned the higher establishment of 175,000 men. For the navy, the Senate voted

\$494,000,000. The House cut this figure to approximately \$417,000,000 and—more important than the figures—there was attached to the bill a resolution in the name of Senator Borah. This resolution asked the President to call a conference of the United States, Great Britain and Japan to be "charged with the duty of promptly entering into an understanding or agreement by which the naval expenditures and building programs of each of the said governments . . . shall be substantially reduced annually during the next five years." On 25 May 1921, the Senate, with 74 voting, unanimously accepted this resolution which passed the House of Representatives on 29 June by 330 votes to 4. On 26 July 1921, Samuel Gompers, President of the American Federation of Labor, wrote approving of the proposed Conference.

In June 1921, an Imperial Conference of the British Dominions was held in London where it was abundantly clear that opinion favored overtures for a conference from the United States. Such overtures were made and on 11 Aug. 1921, President Harding issued invitations for a Conference to open on Armistice Day, 11 November.

It was only with Japan that any preliminary difficulty arose. The invitation called for a conference, not only on disarmament but on Pacific or Far Eastern questions. This meant that the United States insisted on a settlement with Japan accompanying an agreement to limit navies. Japanese feeling was deeply stirred and her acceptance of the invitation was subject to a promise that she should be consulted as to the agenda, so that "introduction therein of problems such as are of sole concern to certain particular powers, or matters that may be regarded as accomplished facts, should be scrupulously avoided." The object was clearly to exclude from discussion questions like the mandate over the Pacific Islands north of the equator and especially Yap; Shantung; Korea; and the Japanese occupation of Siberia. It was with some hesitation that Japan accepted the agenda finally adopted. At Washington, Korea, Port Arthur and Dairen were, in fact, treated as settled items, while the future of Yap was considered privately between the United States and Japan alone.

Five great powers were included in the conference—the United States, the British Commonwealth, France, Italy and Japan. But, for the discussion of Pacific questions only, four other powers were invited, namely Belgium, China, the Netherlands and Portugal. The United States was represented by Secretary Hughes, Chairman of the Conference, ex-Secretary Elihu Root, Senator Lodge (Republican Chairman of the Senate Foreign Affairs Committee), and Senator Oscar W. Underwood (Democrat, Alabama).

Great Britain was represented by A. I. Ralfour, former Prime Minister (who was also delegate for Australia); Lord Lee of Fareham, First Lord of the Admiralty; Sir Auckland Geddes, Ambassador at Washington; Sir Robert Borden, Former Prime Minister of Canada; G. F. Pearce, Defence Minister, Australia; Sir John Salmond, New Zealand, and Srinivasa Sastri, India. David Lloyd George was not

able to attend. France was represented by Aristide Briand, Prime Minister; Rene Viviani, Former Prime Minister; Albert Sarraut, Colonial Minister, and Jules Jusserand, her Ambassador at Washington. The spokesmen for Italy were Senator Carlo Schanzer; Ambassador Vittorio Rolando-Ricci; Senator Luigi Albertini; Representative Filippo Meda. Japan was represented by Admiral Tomisaburo Kato, Minister of the Navy; Ambassador Kijuro Shidehara; Prince Iyesato Yokugawa, President of the House of Peers, and Masanao Hanihara, Vice Minister of Foreign Affairs.

Of the other powers, the leading delegates were: Belgium, Ambassador Baron de Cartier; China, Sao-Ke Alfred Sze, Minister to the United States and V. K. Wellington Koo, Minister to Great Britain; Netherlands, Jonkheer H. A. van Karnebeek, Foreign Minister, and Portugal, Viscount de Alte, Minister to the United States. The Secretary General of the Conference was John W. Garrett. The agenda was as follows:

Disarmament.—(1) Limitation of naval armament; basis of limitation, extent of limitation; fulfillment of conditions; (2) Rules for control of new agencies of warfare; (3) Limitation of land armament.

Pacific and Far Eastern Questions.—(1) Questions relating to China; principles to be applied; (2) Application to subject: (a) Territorial integrity; (b) Administrative integrity; (c) Open door; equality of administrative, and industrial opportunity; (d) Concessions, monopolies and other economic privileges; (e) Development of railways; (f) Preferential railroad rates; (g) Status of existing commitments; Similarly questions for Siberia; (3) Mandated islands.

Hitherto, all international conferences of this magnitude had been held in some city of the Old World. The transference of such diplomacy to the New World was thus an event of historic significance. The Conference was attended by a numerous army of correspondents, who included W. J. Bryan, H. G. Wells, Colonel Repington and many other men of world-wide reputation. The frankness with which foreign newspapermen were accorded the same right as their American colleagues to attend at the White House and the State and other Departments created an excellent impression and dispelled many suspicions. While the proceedings were translated into French, the language chiefly employed at the Conference was English, which again marked a new departure in diplomacy. Not less startling were the solemn ceremonies with which the Conference was inaugurated. On 11 November, being Armistice Day, an Unknown Soldier of the United States was buried at Arlington, where President Harding's address concluded with the Lord's Prayer and was the first utterance by man to be heard on delivery from the Atlantic to the Pacific, by radiophone. On the 12th, at the first Plenary Session, the Conference was formally inaugurated with an invocation by Dr. W. S. Abernathy, Pastor of Calvary Baptist Church, which the president attended. These preliminaries created an atmosphere which affected the subsequent deliberations. On the

other hand, the glitter of militarism was evident in the presence of Marshal Foch and Admiral Beatty.

The Conference met in the Continental Hall of the Daughters of the American Revolution. Congress occupied the galleries and the floor was also crowded. An important element in the proceedings was the applause which broke out unrestrained, when important things were said. These demonstrations of enthusiasm, unusual at such an international gathering, showed clearly that of the two main problems to be solved—Disarmament and the Far East—it was Disarmament for which public opinion in the United States really cared. There was interest taken in an Open Door for China but far keener was the interest in preventing war.

With a reputation for cold detachment, Secretary Hughes surprised even his admirers by his warmth of generous sympathy. He started the serious business of the Conference with a speech which mapped out the entire field of discussion. First, he relegated Far Eastern problems to committees which would deal with them in detail; secondly, he stated in explicit terms the proposals to which the United States would agree for limiting armaments at sea, and, thirdly, he left it open to France or one of the other military powers to bring forward similar proposals for disarmament on land. At the second Plenary Session 15 Nov. 1921, Mr. Balfour accepted in principle the scheme of naval limitation, as did Japan, Italy and France. On 21 November, however, M. Briand, in an eloquent speech, explained why France could not at the moment, initiate a measure of disarmament on land, which item, despite the desire of Italy to advance it, is thus "unfinished business."

On 6 Feb. 1922, the Conference adjourned and on the 10th, President Harding submitted to the Senate seven treaties or agreements, as follows: (1) Covenant limiting naval armaments; (2) Treaty on noxious gases and submarines; (3) Four Power Treaty dealing with the Pacific; (4) Declaration on American rights in mandated territories; (5) Agreement defining the phrase "insular possessions and insular dominions" in the Four Power Treaty; (6) Treaty defining principles and policy in China; (7) Treaty dealing with Chinese Customs. The cost of the Conference was \$250,000.

Reduced to simple terms, the Covenant on Naval Armaments limits the ultimate battleship fleets of the five signatory powers, as follows:

Country	Tons
United States	525,000
Great Britain	525,000
Japan	315,000
France	175,000
Italy	175,000

No battleship may exceed 35,000 tons displacement nor carry guns of a calibre exceeding 16 inches.

Vessels retained by the United States are (tonnage in parentheses): *Maryland* (32,600); *California* (32,300); *Tennessee* (32,300); *Idaho* (32,000); *New Mexico* (32,000); *Mississippi* (32,000); *Arizona* (31,400); *Pennsylvania* (31,400); *Oklahoma* (27,500); *Nevada* (27,-

500); *New York* (27,000); *Texas* (27,000); *Arkansas* (26,000); *Wyoming* (26,000); *Florida* (21,825); *Utah* (21,825); *North Dakota* (20,000); *Delaware* (20,000); Total 500,650 tons.

The United States is permitted to complete two battleships of the *West Virginia* class and so replace the *North Dakota* and the *Delaware*. When this is done, her tonnage will be 525,000.

The British battleships were to be (tonnage in parentheses): *Royal Sovereign* (25,750); *Royal Oak* (25,750); *Revenge* (25,750); *Resolution* (25,750); *Ramillies* (25,750); *Malaya* (27,500); *Valiant* (27,500); *Barham* (27,500); *Queen Elizabeth* (27,500); *Warspite* (27,500); *Bombow* (25,000); *Emp. of India* (25,000); *Iron Duke* (25,000); *Marlborough* (25,000); *Hood* (41,200); *Renown* (26,500); *Repulse* (26,500); *Tiger* (28,500); *Thunderer* (22,500); *King George V* (23,000); *Ajax* (23,000); *Centurion* (23,000); Total 580,450 tons.

With the scrapping of the *Thunderer*, *King George V*, *Ajax* and *Centurion*, and the substitution of two battleships of the latest design, the British displacement will be reduced to 558,950 tons, which later will fall to 525,000 tons as seen below.

Japan's battleships were to be (tonnage in parentheses): *Mutsu* (33,800); *Nagato* (33,800); *Hinga* (31,260); *Ise* (31,260); *Yamashiro* (30,600); *Fu-So* (30,600); *Kirishima* (27,500); *Haruna* (27,500); *Hiyei* (27,500); *Kongo* (27,500); Total 301,320 tons.

The French battleships were to be (tonnage in parentheses): *Bretagne* (23,500); *Lorraine* (23,500); *Provence* (23,500); *Paris* (23,500); *France* (23,500); *Jean Bart* (23,500); *Courbet* (23,500); *Condorcet* (18,890); *Diderot* (18,890); *Voltaire* (18,890); Total 221,170 tons.

Italy's battleships were to be (tonnage in parentheses): *Andrea Doria* (22,700); *Caio Duilio* (22,700); *Cote Di Cavour* (22,500); *Giulio-Cesare* (22,500); *Lu'do Da Vinci* (22,500); *Dante Alighieri* (19,500); *Roma* (12,600); *Napoli* (12,600); *Vittorio Em'n'le* (12,600); *Regina Elena* (12,600); Total 182,800 tons.

Under strict rules affecting guns, turrets, machinery, engines, fire-control, etc., all other battleships must be scrapped, either by sinking, breaking up or, in a special case, target practice. No battleship, scheduled for scrapping, may be reconverted to war-like use. Under the Treaty, the ships to be immediately scrapped are:

United States.—*Maine*, *Missouri*, *Virginia*, *Nebraska*, *Georgia*, *New Jersey*, *Rhode Island*, *Connecticut*, *Louisiana*, *Vermont*, *Kansas*, *Minnesota*, *New Hampshire*, *South Carolina*, *Michigan*, *Washington*, *South Dakota*, *Indiana*, *Montana*, *North Carolina*, *Iowa*, *Massachusetts*, *Lexington*, *Constitution*, *Constellation*, *Saratoga*, *Ranger*, *United States*. The United States may retain the *Oregon* and *Illinois* for non-combatant purposes—say as training ships.

Great Britain.—*Commonwealth*, *Agamemnon*, *Dreadnought*, *Bellerophon*, *St. Vincent*, *Inflexible*, *Superb*, *Neptune*, *Hercules*, *Indomitable*, *Temeraire*, *New Zealand*, *Lion*, *Princess Royal*, *Conqueror*, *Monarch*, *Orion*, *Australia*, *Agincourt*, *Erin*.

Four other ships are to be "scrapped" which are building or projected; but the *Colossus* and

Collingwood may be retained for non-combatant purposes.

Japan.—*Hizen*, *Mikasa*, *Kashima*, *Katori*, *Satsuma*, *Aki*, *Settsu*, *Ikoma*, *Ibuki*, *Kurama*, *Amagi*, *Akagi*, *Kaga*, *Tosa*, *Takao*, *Atago*. Japan "scraps" a program of eight projected ships, not laid down and may retain *Shikishima* and *Asahi* for non-combatant purposes.

The battleship fleets remaining are:

	Pre-Jutland	Post-Jutland
United States	15	3
Great Britain	21	1
Japan	8	2
France	7	...
Italy	6	...

The post-Jutland battleships, embodying as they do the results of experience in that battle, have rendered the pre-Jutland battleships already obsolescent.

The rules for replacement were based on the reckoning that the life of a battleship is 20 years. After 17 years, a new battleship may have its keel laid, three years being allowed to complete it. Also there must be no new construction begun for ten years, that is, until 1931, except in special cases already mentioned. The Japanese were unwilling to scrap the nearly completed *Mutsu*, which had been partly built by public subscription. Hence, we have the two *West Virginias* allowed, before 1931, to the United States and the two post-Jutland battleships allowed Great Britain.

The tables of replacement are:

UNITED STATES

The schedule of displacement for aircraft carriers was:

	Tons
United States.....	135,000
Great Britain.....	135,000
Japan.....	81,000
France.....	60,000
Italy.....	60,000

Aircraft carriers must not exceed 27,000 tons displacement, except that two are allowed up to 33,000 tons, which two may be converted battleships that otherwise would have been scrapped. There are careful and complicated provisions limiting the guns of aircraft carriers to six inch calibre or, at most, eight inch. Other than the above battleships, aircraft carriers and troopships, no vessels of war exceeding 10,000 tons displacement may be built within the countries of the five signatory powers. Nor, may such vessels of war carry guns of more than eight inch calibre. No merchant ship may be designed to carry, in the event of war, guns of more than six inch calibre. None of the five governments may dispose of warships, whether by gift or sale, to another power. And immediate information of the private manufacture of warships for non-participating powers must be given by the signatory powers to one another. Information must also be furnished of their own construction for replacements. In the event of national security requiring a modification of the treaty, or of possible scientific and technical developments, or of war, there are provisions enabling the signatory powers to enter into further conference for the modification of the Treaty. It will be seen that the general effect of the Treaty is to prevent any further naval competition except in small warships of 10,000 tons and under. A provision of momentous importance, was Article XIX. By this Article, the United States, the British Empire and Japan undertake that "no new fortifications or naval bases shall be established" in their distant possessions of the Pacific. In simple language, the Article allows the various countries to fortify their own home coasts, that is, the shores of America, New Zealand, Australia and Japan, but forbids any further fortifications on, let us say, the Philippines or Hongkong. The strategic significance of this arrangement is far-reaching. No navy can operate in war at a greater distance than 2,000 miles from its base. Hawaii is 2,100 miles from San Francisco and is, at present, the advance base of the United States Navy. But Japan is 3,300 miles and the Philippines 5,000 miles from Hawaii, which base is thus useless in the event of hostilities in Far Eastern waters.

The naval experts of the United States thus claimed that Guam, 3,300 miles west of Hawaii and about 1,500 miles both from Japan and the Philippines, should be fortified as a naval base in advance of Hawaii. Under Article XIX, not only Guam but the Philippines remain, virtually undefended. In December 1922 Admiral Sims described the position of the United States in the Pacific as "unfortunate" and added: "Anybody can spit on the Philippines and you can't stop them. They can take the Philippines any day. Anybody in the western Pacific who wants Guam can seize it. It could be taken by the troops of Japan. To support the fleet in the Philippines would require 30,000 tons of supplies a day, including fuel oil, and that would mean about 300 or 350 ships going out and the same number coming back every day. If you didn't hold Guam on the flank of this line of communication, an enemy could cut the line."

In the *Atlantic Monthly* (April 1922), the naval argument was set out on authority by William Howard Gardiner who explains that Singapore, the British base, is 6,000 miles from Hawaii and that Hongkong is defective in facilities as a base. It is thus undeniable that Article XIX has left the Japanese fleet without a rival in the Far East.

When the year 1922 closed the Naval Treaty had been ratified by the United States, Great Britain and Japan, the Powers most intimately concerned, but not by France, whose abstention prevented ratification by Italy. However, the Italian Chamber of Deputies approved the Treaty by a vote of 266 to 33 on 7 Feb. 1923. Poincaré and Mussolini, the Prime Ministers of these countries, had indicated that they hoped for ratification at an early date. And on 7 February also, it was announced that the Treaty soon would be presented to the French Parliament with a recommendation that it be ratified. Neither France nor Italy is attempting to build beyond their schedules or indeed at all. But the omission of France to ratify means that the Treaty is not yet in force, except as a gentleman's agreement which is being respected by all the powers concerned. The battleships, scheduled for the scrap heap, are either there or going there; Great Britain has also placed many subordinate vessels out of commission and out of 9,400 naval officers, 1,835 are retired from active service.

On the other hand, the construction of unrestricted ships has aroused some comment. According to the United States Naval Intelligence Bureau, (27 June 1922) this construction was as follows: *Great Britain*.—first-line cruisers, none; destroyer leaders, 1 of 1,750 tons; first-line destroyers, 3 of 3,725 tons; first-line submarines, 4 of 5,800 tons; fleet submarines, none. *United States*.—first-line light cruisers, 10 of 75,000 tons; destroyer leaders, none; first-line destroyers, 3 of 3,645 tons; first-line submarines, 36 of 31,561 tons; fleet submarines, 3 of 6,375 tons. *Japan*.—first-line light cruisers, 15 of 81,900 tons; destroyer leaders, none; first-line destroyers, 50 of 58,500 tons; first-line submarines, 23 of 30,394 tons; and 52 of tonnage unknown to American Naval Intelligence officers; fleet submarines, none. *France*.—first-line light cruisers, 3 of 24,000 tons; destroyer

leaders, 6 of 14,400 tons; first-line destroyers, 12 of 16,800 tons; first-line submarines, 12 of 13,200 tons; fleet submarines, none. *Italy*.—first-line light cruisers, 2 of 16,000 tons; destroyer leaders, 6 of 12,270 tons; first-line destroyers, 12 of 11,680 tons; first-line submarines, 4 of 2,600 tons; fleet submarines, none.

From these figures, the activity of Japan is obvious, as is her prospective superiority in submarines and the smaller vessels of war. In his original proposals, Secretary Hughes advanced the following schedules for auxiliary vessels. Total displacement of cruisers, flotilla leaders and destroyers—United States 450,000 tons; Great Britain 450,000 tons; Japan 270,000. Total displacement of submarines—United States 90,000 tons; Great Britain 90,000 tons; Japan 54,000 tons.

These schedules were dropped but on the Naval Bill of 18 Dec. 1922, the House of Representatives requests the President to enter into negotiations with the four other naval powers with a view to "limiting the construction of all types and sizes of sub-surface and surface craft of 10,000 tons standard displacement and of aircraft."

During the Conference, Great Britain pressed for the total abolition of submarines. Her argument was that submarines cannot be used without being abused and that experience had proved them to be of little value except against merchant shipping, which by the laws of war, they had no right to sink at sight. If there were submarines at all, argued Balfour, they would break the laws of war. Abolition was thus the only plan that would be effective. The contrary argument was that submarines are a valuable and unexpensive weapon in the hands of the smaller powers. The result of the argument was embodied in a second Treaty which deals, not with the building of submarines but only with rules for their use. For "the protection of the lives of neutrals and non-combatants at sea in time of war" it is laid down, as follows: (1) A merchant vessel must be ordered to submit to visit and search to determine its character before it can be seized. A merchant vessel must not be attacked unless it refuse to submit to visit and search after warning, or to proceed as directed after seizure. A merchant vessel must not be destroyed unless the crew and passengers have been first placed in safety. (2) Belligerent submarines are not under any circumstances exempt from the universal rules above stated; and if a submarine can not capture a merchant vessel in conformity with these rules the existing law of nations requires it to desist from attack and from seizure and to permit the merchant vessel to proceed unmolested.

Article II. The signatory powers invite all other civilized powers to express their assent to the foregoing statement of established law so that there may be a clear public understanding throughout the world of the standards of conduct by which the public opinion of the world is to pass judgment upon future belligerents.

Article III. The signatory powers desiring to insure the enforcement of the humane rules of existing law declared by them with respect

to attacks upon and the seizure and destruction of merchant ships, further declare that any person in the service of any power who shall violate any of those rules, whether or not such person is under orders of a governmental superior, shall be deemed to have violated the laws of war and shall be liable to trial and punishment as if for an act of piracy and may be brought to trial before the civil or military authorities of any power within the jurisdiction of which he may be found.

Article IV. The signatory powers recognize the practical impossibility of using submarines as commerce destroyers without violating as they were violated in the recent war of 1914-18, the requirements universally accepted by civilized nations for the protection of the lives of neutrals and non-combatants, and to the end that the prohibition of the use of submarines as commerce destroyers shall be universally accepted as a part of the law of nations they now accept that prohibition as henceforth binding as between themselves and they invite all other nations to adhere thereto.

By Article V, the use of poison gas is prohibited in these terms: "The use in war of asphyxiating, poisonous, or other gases, and all analogous liquids, materials, or devices, having been justly condemned by the general opinion of the civilized world and a prohibition of such use having been declared in treaties to which a majority of the civilized powers are parties. The signatory powers to the end that this prohibition shall be universally accepted as a part of international law binding alike the conscience and practice of nations, declare their assent to such prohibition, agree to be bound thereby as between themselves and invite all other civilized nations to adhere thereto."

While a measure of disarmament at sea was under consideration by Five Powers, there were Nine Powers discussing a settlement in the Far East. The first subject on the table was the Anglo-Japanese Alliance which was ripe, either for renewal or for termination. In India, there was unrest and Australia was acutely conscious of what might be her position if Japan, having assisted in the war, were to be now antagonized. Out of this situation, there was developed the Four Power Treaty, signed by the United States, the British Empire, France and Japan. The object of this Treaty was "the preservation of the general peace and the maintenance of their rights in relation to their insular possessions and insular dominions in the regions of the Pacific Coast." The Treaty is to run for ten years and is renewable. It was to be "ratified as soon as possible in accordance with the constitutional methods of the high contracting parties." The determining clauses of the Treaty are:

Article I. The high contracting parties agree as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean.

If there should develop between any of the high contracting parties a controversy arising out of any Pacific question and involving their said rights which is not satisfactorily settled by diplomacy and is likely to affect the harmonious accord now happily subsisting between them,

they shall invite the other high contracting parties to a joint conference to which the whole subject will be referred for consideration and adjustment.

Article II. If the said rights are threatened by the aggressive action of any other power the high contracting parties shall communicate with one another fully and frankly in order to arrive at an understanding as to the most efficient measures to be taken, jointly or separately, to meet the exigencies of the particular situation.

Briefly, these clauses pledge the parties to respect one another's possessions, to confer in case of a mutual difference and to consult in case of a difference with some outside power. Japan thus promises to refrain from aggression in the Philippines, Australia, New Zealand and India, while in return, she secures, not indeed an alliance with Western Powers but an association on equal terms. To the Four Power Treaty, China was not a Party.

To the Treaty, there were two reservations. By the first of these, signed by all Four Powers on 6 Feb. 1922 the phrase "insular possessions and insular dominions," was understood not to mean Japan proper—a country which happens to consist of islands. By the second, passed in the Senate on 27 March 1922, "the United States understands that under the statement in the preamble or under the terms of this treaty there is no commitment to armed force, no alliance, no obligation to join in any defence."

The position of China at the Conference was difficult. The Delegates Plenipotentiary represented whatever Government there was in Peking. But it was not easy to contend that this Government represented much of China. The South was in open revolt. Under military dictators, the provinces were often in civil conflict. The Treasury was empty and on the eve of the Conference, China defaulted on a loan, allowed her by a bank in Chicago. The plea of the Chinese delegates was, in general terms, that their country only deposed the Manchu dynasty in 1911, that she was slowly but surely recovering from revolution, that her recovery was retarded by the strangulation of treaties imposed on her by foreign powers and especially by the international limit on her customs to 3½ per cent at the values then ruling her imports. The hostility of the Chinese to the Japanese was obvious and was expressed in the country itself by a determined, commercial boycott. On the other hand, it was clear that China's troubles had been caused largely by her own fault. The concessions of which she complained often represented a corrupt bargain, by which her officials had enriched themselves.

Two Treaties were signed, dealing respectively with the open door in China and with her customs.

By the First Chinese Treaty, Articles I and II, the Powers agree: (1) To respect the sovereignty, the independence, and the territorial and administrative integrity of China; (2) To provide the fullest and most unembarrassed opportunity to China to develop and maintain for herself an effective and stable Government; (3) To use their influence for the purpose of effectually establishing and maintaining the principle of equal opportunity for the commerce

and industry of all nations throughout the territory of China; (4) To refrain from taking advantage of conditions in China in order to seek special rights or privileges which would abridge the rights of subjects or citizens of friendly States, and from countenancing action inimical to the security of such States; Article II. The contracting powers agree not to enter into any treaty, agreement, arrangement or understanding, either with one another or, individually or collectively, with any power or powers, which would infringe or impair the principles stated in Article I.

By Article III, "the open door" is defined as "equality of opportunity in China for trade and industry of all nations," which principle is held to debar the signatories from seeking—(a) Any arrangement which might purport to establish in favor of their interests any general superiority of rights with respect to commercial or economic development in any designated region of China; (b) Any such monopoly or preference as would deprive the nationals of any power of the right of undertaking any legitimate trade or industry in China, or of participating with the Chinese Government, or with any local authority, in any category of public enterprise, or which by reason of its scope, duration, or geographical extent is calculated to frustrate the practical application of the principle of equal opportunity. It is understood that the foregoing stipulations of this article are not to be construed as to prohibit the acquisition of such properties or rights as may be necessary to the conduct of a particular commercial, industrial, or financial undertaking or to the encouragement of invention and research.

China undertakes to be guided by these principles in dealing with applications for economic rights from foreign nations, "whether parties to the present treaty or not." Article IV pledges the powers not to support spheres of influence, while by Article V, China promises not to permit discrimination on her railways, whether in charges or facilities. By Article VI, China is assured of the status of a neutral in time of war. Article VII provides for mutual discussion by the signatory Powers of any point arising under the Treaty. Article VIII invites non-signatory Powers to adhere to the Treaty. By resolution, a Board of Reference was set up, the duty of which is to deal with any details arising out of the Open Door Treaty. Secretary Hughes moved a resolution by which concessions already granted by China were to be referred to this Board for advice, but France objected to any such retroactive measure, her attitude being that future concessions alone must be supervised. A Resolution in favor of unified Chinese railways under Chinese control was carried. A difficult case was the Chinese Eastern Railway, held and operated under the Russo-Asiatic Bank, pending normal conditions in Russia herself. This line is a final link in the Trans-Siberian Railway. It runs eastward from Manchouli on the Russian frontier through Manchuria to Suifenhoo, also on the Russian frontier and thence connects with Vladivostok. China objected to the continued surveillance over the line exercised by the Inter-Allied Technical Commission and the Conference passed a Reso-

lution calling for a more careful selection of staff and prevention of waste, with the reserved right to insist upon China performing her obligations to the stockholders.

The controversy over Shantung was discussed and settled outside the doors of the Conference by China and Japan in direct negotiation, Secretary Hughes and Balfour assisting as friends of both parties. On 4 Feb. 1922, a treaty was signed by the two Powers whereby, within six months, Japan agrees to restore to China the former leased German territory of Kiao-Chau, with archives and public property, excepting only premises for a consulate and Japanese schools, shrines and cemeteries. Japanese troops, including gendarmes along the Tsing-tao-Tsinanfu Railway are to be withdrawn and replaced by Chinese police and military, and the Custom House at Tsing-tao is included in the Chinese Maritime Customs. The Railway itself is bought by China from Japan for 53,406,141 gold marks, with additional sums for improvements. The mines are leased to a chartered company in which China and Japan share the capital. Japan surrenders her exclusive settlement at Tsing-tao which is thrown open to the trade of all nations. The Japanese salt industry in Kiao-Chau Bay is included, after compensation, in the Chinese Salt Monopoly Cables between Tsing-tao and Chefoo and between Tsing-tao and Shanghai. Japanese wireless stations at Tsing-tao and Tsinanfu are taken over by China at compensation. Japan renounces all preferential rights regarding persons, capital and material which were granted to Germany in her Treaty with China of 6 March 1898. China is to control the telephones and other facilities and is to appoint the staff of the railway.

In December 1922, the evacuation of Shantung was virtually complete and the Chinese flag was again flown at Tsing-tao, for the first time since 1898. China is to pay Japan the following sums: For Public Improvements 20,000,000 yen; For Salt Industry 8,000,000 yen; For Railways 55,000,000 yen; Total 73,000,000 yen.

This represents about \$35,000,000. The payment is made in Chinese notes. The Chinese Customs Treaty negotiated at Washington contains 10 clauses. It deals first with the tariff established by International Commission at Shanghai on 19 Dec. 1918. By this tariff an ad valorem duty of 5 per cent is paid on goods entering China. The Chinese argued that, at present prices, the duty is now only 3½ per cent and a Revision Commission was appointed by the treaty to proceed to Shanghai and there raise the tariff to a real 5 per cent of the values imported.

In previous treaties, signed by China in 1902 and 1903, China had promised to abolish *likin* and institute other reforms, in return for which she was to be permitted to charge a surtax of 2½ per cent on imports. By Article II of the Washington Treaty, a conference was appointed, to meet within three months, and put through the above conditions. This conference may authorize the additional 2½ per cent surtax. China has complained that her uniform tariff is unfair because it treats all commodities alike, whether they be necessities of life or only lux-

uries. Article III of the treaty allows China to levy on luxuries a surtax of 5 per cent, instead of 2½ per cent.

On 23 and 24 Jan. 1922, the presence of Japan in Siberia was a subject of two pronouncements by Ambassador Shidehara and Secretary Hughes. The Japanese spokesman explained that, in 1918, Japan, with the United States, entered Siberia, in order to help the Czechoslovakian troops withdrawing from Russia. Japan had since supported Kolchak against the Soviet government but was now ready to withdraw, except from the island of Saghalin which was held pending satisfaction by some future Russian government for the massacre of 700 Japanese at Nikolaievsk in 1920. This statement led to a frank rejoinder in which Secretary Hughes regretted the intention of Japan to occupy Saghalin. After prolonged negotiations with the Republic of Chita, Japan withdrew from Siberia, including Vladivostok, about the month of September, 1922. The Chita Republic was immediately incorporated with the Soviet government at Moscow. Japan's occupation had been expensive, costing her about \$175,000,000.

A final if indirect result of the Washington Conference was an agreement between the United States and Japan over the Pacific Islands and especially over Yap. By the Treaty of Versailles, former German Islands in the Pacific, north of the Equator, are held by Japan under mandate. The Senate declined to ratify the treaty and the said mandate, therefore, was administered by Japan without the approval of the United States. The island or islands of Yap are the most westerly of the Caroline group and are important as links for cables. On 13 Dec. 1921, there was published the agreement, Clause I of which states: It is agreed that the United States shall have free access to the island of Yap on the footing of entire equality with Japan or any other nation in all that relates to the landing and operation of the existing Yap-Guam cable or of any cable which may hereafter be laid by the United States or its nationals.

By Clause II, the United States reserves the right to establish a radio station on Yap, but agrees to suspend this right as long as Japan, by her station, maintains effective radio co-operation. Other clauses safeguard rights of residence, etc.

Japan's mandate over her Pacific islands is approved, subject to observance of the conditions prohibiting the slave trade, a traffic in arms and intoxicating liquor. Missionary enterprise is to be freely permitted. On 1 March 1922, the U. S. Senate ratified the so-called Yap Treaty by 67 votes to 22.

Summing up the results of the Washington Conference, we may say that it cleared the air in the Far East of much inflammatory poison, greatly improving relations between the United States and Japan. It stopped the naval race between the United States and Japan and furnished Great Britain with a convenient escape both from her Anglo-Japanese Alliance and her traditional, but now impossible, command of the ocean. It restored Shantung to China and Siberia to Russia. Its influence over Japan

has been liberal and beneficial and is reflected in some reduction of Japan's Army. To Europe, the Conference did not mean very much, owing to the veto of France on limitation of armaments on land. A resolution was indeed passed, appealing to China to disband the million or more troops, maintained by her provincial dictators for their own civil wars, but that was all. There is, too, a certain scepticism over the prohibition of poison gas. "You bet your life we'll use gas," declared Admiral Sims in June 1922, adding that the idea of gas being inhuman "was caused by Allied propaganda when the Germans were using it." In the *Atlantic Monthly* for that month, W. Lee Lewis presents the case for poison gas in terms which severely discount the prohibition.

In certain quarters, there has been a desire for a second Washington Conference, to deal with European Debts, German Reparations and Disarmament on Land. A resolution, tending that way, was actually advanced by Senator Borah, as the year 1922 drew to a close, but was not pressed. Negotiations between Russia and Poland for a reduction of their two armies were also undertaken during the autumn but failed. Disarmament on land is thus a problem still to be solved.

PHILIP WHITWELL WILSON.

WASHINGTON AND JEFFERSON COLLEGE, an interdenominational educational institution for men (co-educational in the Extension Department), founded in 1787 and located at Washington, Pa. In 1922-23 it had a faculty of 31 members, 468 students, and property valued at \$599,304.89. Income figures not given. Simon S. Baker, A.M., is president.

WASHINGTON AND LEE UNIVERSITY, a non-sectarian educational institution for men, founded in 1749 and located at Lexington, Va. In 1922-23 it had a faculty of 55 members, 770 students, property valued at approximately \$2,250,000, and an approximate income of \$240,000. Henry Louis Smith, LL.D., is president.

WASHINGTON MISSIONARY COLLEGE, a co-educational institution under the auspices of the Seventh Day Adventists, founded in 1904 and located at Takoma Park, D. C. In 1922-23 it had a faculty of 25 members, 325 students, property valued at \$200,000, and an income of \$109,000. Harvey A. Morrison, A.M., is president.

WASHINGTON, State College of, a State co-educational institution, founded in 1890 and located at Pullman, Wash. In 1922-23 it had a faculty of 239 members, including administrative officers, 2,113 students, property valued at \$2,138,682.30, and an income of \$1,068,576.25. Ernest O. Holland, Ph.D., is president.

WASHINGTON UNIVERSITY, a non-sectarian co-educational institution founded in 1853 and located at Saint Louis, Mo. In 1922-23 it had a faculty of 396 members, 5,053 students, property valued at \$5,125,104.53 and an income of \$721,450.05. Chancellor, Frederic A. Hall, LL.D.

WASHINGTON, University of, a State co-educational institution, founded in 1861 and

located at Seattle, Wash. In 1922-23 it had a faculty of 260 members, 7,000 students, and property valued at \$11,981,297.14. Its income in 1921-22 was \$2,280,243. Henry Suzzallo, Ph.D., LL.D., is president.

WATERMELON ACREAGE. According to the estimate of the United States Department of Agriculture, the commercial area planted to watermelons in 1922 in the nine leading producing States — Alabama, Arizona, California (southern district), Florida, Georgia, New Mexico, North Carolina, South Carolina and Texas — totaled 161,000 acres, compared with a harvested area in 1921 of 109,800 acres. This represents an increase over the preceding year of 47 per cent. Georgia, in 1922, as in 1921, led in acreage with an estimated planting of 57,800 acres as against 38,000 acres harvested in 1921. Texas came second, with a planting of 37,400 acres, compared with 29,000 acres harvested the preceding year. Florida, practically doubling its acreage, planted 35,400 acres in 1922, against 18,700 acres planted in 1921. Alabama's planting totaled 11,700 acres in 1922, against 7,700 in 1921. South Carolina planted 8,900 acres in 1922, compared with 6,600 acres in 1921. California (southern district) planted 4,700 acres in 1922, against 3,900 acres in 1921. North Carolina was the only State among those named to show a decrease in its watermelon acreage, its planting in 1922 being 3,500 acres, compared with 4,300 acres in 1921. Arizona's estimated planting of 1,200 acres in 1922 exactly equaled its harvested area of the year before, and, likewise, New Mexico's planting of 400 acres in 1922 just equaled its planting of 1921.

WATER METERS, Manufacture of. See GAS MACHINES AND GAS AND WATER METERS, MANUFACTURE OF.

WATER POWER. See HYDROELECTRIC DEVELOPMENT.

WATERPROOFING, New Method of. A method of waterproofing cloth by means of the direct application of fresh latex, or sap, is practiced in the Department of Beni, Bolivia. Cloth is coated with latex, or milk of the rubber tree — the latex must be less than 24 hours old — and then passed over the smoke of an ordinary wood fire. Good waterproof ponchos, bags, and pouches are made by this method and are giving satisfactory service.

WATER SUPPLY. During the past few years many notable increases and improvements in municipal water supplies have been made. Among the recent improvements deserving especial mention is that to the water supply of Jerusalem. Previous to British occupancy of Palestine and Zionist activity therein, Jerusalem had but one small fountain so that in recent times the people had to depend almost entirely upon cisterns. The military administration under General Allenby re-discovered strong springs in the Judean Hills about seven miles south of the city, built a reservoir on a neighboring hill, and pumped the water from the springs into it. From this reservoir the water flows to Jerusalem by gravity. But this supply proved inadequate and, as a result, early in 1923 machinery was put in motion to bring the waters of the Pools of Solomon to the Holy City. These pools, believed

actually to date from the Herodian period, have been out of repair for several hundred years. On 7 April 1923 it was announced in an Associated Press dispatch published in the *New York Times* that two of the pools had been cleaned and recemented and were then ready to increase the water supply of Jerusalem. With the completion of the third pool, the capacity will be 40,000,000 gallons, enough to last the city for three months. The source of these pools is three miles further south and for one half the distance the water is brought through a tunnel driven through solid rock. The following gives interesting information in regard to augmented and improved water supplies of some cities in the United States and Canada. In 1922 the Joint Board of Boston and Worcester, as a means of securing an additional water supply for these cities, recommended the diversion of Ware River into Wachusett reservoir. Later the waters of Swift and Miller rivers are to be taken. The flow of Ware River will increase the daily supply 22 million gallons, and the flow of the three rivers, 202 million gallons. A 410 billion gallon reservoir is to store the flood waters of the Swift and Miller rivers. Filter plants are also to be constructed.

New York City is to augment its water supply from the Catskill watershed by diverting the flow of Schoharie Creek from its natural channel in a horse-shoe shaped tunnel 18.1 miles long 10½ feet wide and 11½ feet high through Shandaken range of the Catskill Mountains into Esopus Creek. Schoharie Creek is being dammed at Gilboa and the Schoharie reservoir is being constructed, 5.8 miles long, 0.7 mile wide, and it is to have an average depth of 57 feet. The flow therefrom through the tunnel, down Esopus Creek into Ashokan reservoir will be at the rate of 250,000,000 to 600,000,000 gallons daily. This will insure a daily supply to New York of 500,000,000 gallons from that source. See TUNNELS.

Portland, Me., receives its water supply from Sebago Lake, 16 miles distant. The water flows by gravity to settling basins, and thereafter is treated by hypochlorite and thus rid of its pollution. As it enters the distributing mains, it is treated with liquid chlorine as a further precaution.

Burlington, Vt., pumps its supply from Lake Champlain to its filter plant and thereafter to its high and low service reservoirs.

Springfield, Mass., takes its supply from the Westfield Little River system. It is filtered at the West Parish sand filter and the quality is wholesome.

Albany, N. Y., pumps most of its supply from the Hudson River. The raw water passes into a sedimentation basin 600 feet long and 383 feet wide and 9 feet deep, where the reduction in bacterial count on gelatine from settling was 43.8 per cent, and from coagulation was 66.6 per cent. The water then passes to the 16 primary filters with sand beds 30 inches deep, resting on 18 inches of graded gravel over the underdrains. The effluent then passes into slow sand filters. Either liquid chlorine or hypochlorite of lime may then be applied. The Agar test showed a bacterial reduction in 1920 from 1,400 to 5 bacteria per cubic centimeter, and the gelatine tests showed a reduction from 25,000 to 57 bacteria per cubic centimeter. The other and early

sources of the city supply are not drawn upon except in cases of emergency.

Binghamton, N. Y., takes its water from the Susquehanna River, the water being purified by means of chemical precipitation (alum) and rapid sand filtration.

Providence, R. I., pumps its water supply from the Pawtuxet River to filter beds. After filtration it is elevated to Sockanosset reservoir, whence it flows partly to Hope reservoir and thence, in part, is pumped to Fruit Hill reservoir. An additional supply is being sought further up the Pawtuxet, where another filter plant will be installed and the Scituate reservoir will be constructed. An aqueduct 7 miles long will conduct the water to the distributing mains. There are several large reservoirs in the adjacent towns. All such supplies are subjected to sand filtration and other purification processes.

Hartford, Conn., takes its supply from Farmington River and its tributaries. It is filtered, chlorinated and frequently tested. At one time vegetable organisms, termed *pectinatella magnifica*, were found attached to the gates of the reservoir.

Philadelphia, Pa., is seeking additional sources of supply, but in May 1922 it had reached no conclusion. Its present supply from the Delaware and Schuylkill Rivers is subjected yearly to increasing pollution. The raw water of the Schuylkill is lifted to settling basins, then passes to preliminary filters and thereafter to slow or rapid sand filters. The raw water of the Delaware is pumped to the Torresdale purification plant, consisting of settling basins, preliminary filters and slow sand filters. Filtration in 1921 effected a reduction on gelatine at 20° for 48 hours from 44,300 bacteria per cubic centimeter of the raw Delaware water and from 67,900 bacteria per cubic centimeter of the raw Schuylkill water in both cases to 3, 4 or 5 bacteria per cubic centimeter.

Harrisburg, Pa., desiring to increase its supply, is about to install a new intake in the Susquehanna River, whence it derives its entire supply; also six new filters and other new purifying equipment.

Wilmington, Del., pumps its supply from Brandywine Creek. Its works include settling and coagulating basins with baffles (where sulphate of alumina is applied), and 6 rapid sand filters. The effluent is then chlorinated.

Baltimore, Md., recently tremendously increased its water supply by raising the height of the Loch Raven dam across the Gunpowder River and is to construct a dam across Falls Run, a tributary of the Patapsco River, to obtain an additional 100½ million gallons. It now claims to have a supply sufficient to meet its needs for the next 50 years. The water is thoroughly renovated.

Charleston, W. Va., obtains its supply from Elk River. It is both filtered and chlorinated.

Chattanooga, Tenn., pumps its supply from the Tennessee River. It is settled, filtered and sterilized.

St. Augustine, Fla., is supplied entirely from artesian wells. The quality is good.

Memphis, Tenn., at present is supplied from artesian wells. Such water contains 90 to 130 parts per million gallons of carbonic acid and some iron. Consulting engineers recommend the

extension of the wells, but eventually in all probability it will take its supply from the Mississippi River, as St. Louis is doing.

In the Compton Hill basin at St. Louis were found *diatoms*, *synedra*, *cyclops*, *daphnia*, *sida*, *simocephalus*, *moina* and *ergasilus* forms of crustacea. From experiments it was thought that snails in the water increase the bacteria, but the use of one-tenth part of copper sulphate per million gallons reduced the bacteria count to 100 per cubic centimeter.

Cincinnati, O., in 1921 used in purifying its supply from the Ohio River 1,658 tons of sulphate of iron, 895 tons of quicklime and 8.9 tons of liquid chlorine.

Indianapolis, Ind., obtains its supply from White River and from wells. It is filtered and sterilized.

Detroit, Mich., takes its supply from Detroit River and is now constructing a thoroughly modern purification plant.

Cleveland, O., takes its supply from Lake Erie. It is settled, filtered and sterilized.

Buffalo takes its supply from Lake Erie through a long tunnel. That city is about to construct a large purification plant. Its present supply is chlorinated.

Ann Arbor, Mich., pumps its supply from artesian wells. When such water is exposed to contamination from inflowing surface water, then the supply is chlorinated.

Springfield, Ill., obtains its supply from deeply driven wells and infiltration galleries in the valley of the Sangamon River, which intercept and collect the underground flow.

Chicago, Ill., pumps its supply from Lake Michigan. The water is chlorinated, which reduces the colon and typhoid bacilli by the oxidizing action of the chlorine, though the spores of *bacillus subtilis* require larger doses than do the common intestinal forms of organisms. If more than 5 colon bacilli are found in each 5 of the 10 cubic centimeter portions of water the dose of chlorine is increased.

Milwaukee, Wis., pumps its water from Lake Michigan and chlorinates it, but that has not reduced the bacteria to the minimum of safety, and that city is about to construct a filter plant to renovate its supply, which is exposed to sudden variations of contamination from sewage in lake storms, as are other lake cities.

Saint Paul, Minn., obtains two-thirds of its supply from small lakes north of the city and the other third from wells. It is to pump an additional supply from the Mississippi five miles above Minneapolis intake. That will pass through a mechanical filter plant of 42 million gallons capacity and then into low and high service reservoirs.

Omaha, Neb., pumps its supply from Missouri River. The water is settled and filtered.

Lincoln, Neb., draws its water from deep wells and treats it with chlorine gas against possible contamination from surface pollution.

Kansas City, Kan., subjects its supply to sedimentation, assisted by coagulation with aluminum sulphate and lime when necessary, and then to rapid sand filtration; thereafter to sterilization with liquid chlorine.

Little Rock, Ark., pumps its water from four wells in the valley of the Arkansas River into a settling basin, from which it flows to filters of

different types and then to the distributing system.

Denver, Col., obtains its supply from Lake Cheeseman by impounding the waters of the South Fork of the South Platte River and Goose Creek, which lake is 50 miles distant. The water is purified and sterilized.

Salt Lake City, Utah, takes its supply from three canyons, viz.: City Creek, Parleys and Big Cotton in the Wasatch Mountains, which watersheds have an elevation of 1,000 to 5,000 feet above the city, and are supplied mainly from winter snows, whose waters require no sedimentation or filtration.

Spokane, Wash., pumps its entire supply from three wells connected by tunnels which intercept the vast subterranean flow, and whose daily yield is 80,000,000 gallons. The water is entirely free of colon or typhoid or other pathogenic bacteria.

Seattle, Wash., obtains its supply from the watershed of the Cascade Mountains, 28 miles distant, through two pipe lines, which deliver the water by gravity into reservoirs. The water is as soft and pure as distilled water.

Portland, Ore., obtains its supply, through two large pipe lines, from the mountain stream known as Bull Run, fed from snows in the Cascade Mountains, 24 miles distant. The water is soft and remarkably pure.

San Francisco, Cal., has several peninsular and other sources of water supply. In addition to these, in 1921 it commenced its Hetch-Hetchy development and the Eleanor Lake project, which together take the flow of Eleanor and Cherry Creeks and Tuolumne River in the Yosemite National Park, 156 miles distant. Eleanor Lake reservoir will ultimately have a capacity of 50 or more billion gallons, and its crest elevation is 4,661 feet above sea level. The water will be conducted through a succession of tunnels, aqueducts and flumes, 87 miles long. The first of such tunnels is 18.3 miles long with an inside measurement of 10 $\frac{1}{4}$ feet. San Joaquin Valley is crossed by steel pressure pipes, and the coast range is pierced by a pressure tunnel 31.5 miles long from Tesla portal to Irving Gate House, 10 miles east of San Francisco Bay, which is crossed by three pipes leading into an aqueduct terminating in the Amazon reservoir of 300,000,000 gallons capacity. The supply from that source will be 200,000,000 gallons daily, which will be additional to its present Peninsular, Alameda Creek and Spring Valley supplies. The capacity of the Hetch-Hetchy aqueduct is 400,000,000 gallons daily, and it will supply other cities and towns beside San Francisco and develop 200,000 hydro-electric horse-power for heating, lighting, and for manufacturing purposes.

Los Angeles, Cal., obtains its water supply from the melting snows of Mount Whitney flowing into Owen River 240 miles distant, and from the Upper Fernando Basin draining into Los Angeles River, and from Crystal Springs and from numerous wells. At the Buena Vista station water is pumped into reservoirs, as it is at the Garvanza, Edendale, Wilmington and Mt. Washington stations. At such other stations as Slauson Avenue, Figueroa, Headworks and Las Palmas it is pumped to distributing mains. The waterworks include aqueducts, regulating tanks,

trunk line mains and several storage and high service reservoirs, including Haiwee storage reservoir, fed from the waters of Owens River, from which the waters are conducted into Los Angeles as described in the article on WATER SUPPLY in 'The Americana,' Vol. 29. The water is treated to arrest algal growths in the reservoirs, and the supply is chlorinated when necessary.

Winnipeg, Canada, formerly obtained its supply from the Assiniboine River, but it now receives the waters of Shoal Lake, 95 miles distant, by gravity, through an aqueduct of cut and cover section 85 miles long, 77.5 miles of which is concrete. There are several river siphons aggregating 7.1 miles in length and concrete pressure pipes 9.4 miles long and a tunnel under Red River 0.2 mile long. A pumping station lifts the water into high service reservoirs.

Regina, Canada, obtains its supply from springs and 50 or more wells, whose yield of pure sparkling water for seven months was 784 million imperial gallons.

Vancouver, Canada, receives its supply from Seymour and Capilano Creeks. Its only method of purification is passing the water through settling tanks, where the sand, silt and fine matters are deposited, and through screens, which remove the pine needles and other floating matter.

The foregoing items are sufficient to show the increasing public interest in America in municipal water supplies and their purification for potable purposes.

HENRY WAYLAND HILL,

Author of the Article "Water Supply" in 'The Americana,' Vol. 29, and President of New York State Waterways Association.

WATSON, Thomas E., American public official: b. Columbia County, Ga., 5 Sept. 1856; d. Washington, D. C., 26 Sept. 1922. He studied for two years in Mercer College, for some time taught school and later studied law. He was admitted to the bar in 1875, and practiced in Thomson, Ga. He was a member of the Georgia House of Representatives, 1882-83, and Democratic elector-at-large in 1888. From 1891-93 he served as a member of the 52nd Congress, as a Populist, and at the elections in 1892 and 1894 he was a candidate and, according to 'Who's Who in America,' claimed election (on honest count), but his opponent was given the certificate. While a member of the United States House of Representatives, he secured the first appropriation ever made by Congress for rural free delivery of mails. In 1895 he resumed for a while the practice of law. He was nominated for Vice-President at the St. Louis Populist convention, in 1896, at which time William Jennings Bryan was endorsed for President. In 1904 he was nominated for President by the People's Party, for the revival of which he conducted a vigorous campaign. He was engaged for some time in conducting a Populist paper at Atlanta. From 1921 until the time of his death he served as United States Senator from Georgia. "Tom" Watson's career was stormy and spectacular. He championed more than one cause in which he fought against an overwhelming numerical majority or a withering public sentiment. He was anti-Wilson, anti-war measures (including

conscription), anti-League of Nations, and anti-soldier bonus. He began publication of *Tom Watson's Magazine* in New York, 1905; published *Watson's Jeffersonian Magazine* and *The Weekly Jeffersonian* after 1906 (on account of his campaign, in 1917, against conscription, the United States mails were closed to these publications), and at the time of his death was publisher of *The Sentinel*. His books include: 'The Story of France' (1898); 'Life of Thomas Jefferson' (1900); 'Life of Napoleon' (1902); 'Bethany, a Study and Story of the Old South' (1904); 'Life and Times of Andrew Jackson' (1907); 'Handbook of Politics and Economics' (1908); 'Life and Speeches of Thomas E. Watson' (1908); 'The Methods of Foreign Missions Exposed' (1909); 'Socialists and Socialism' (1909); 'The Roman Catholic Hierarchy' (1910). For the publication of three of the chapters in the last named work, he was thrice indicted and twice tried in the United States Court, but was acquitted each time.

WAYNESBURG COLLEGE, a Presbyterian co-educational institution, founded in 1850 and located at Waynesburg, Pa. In 1922-23 it had a faculty of 10 members, 381 students, property valued at \$400,000, and an income of \$37,436.18. Paul R. Stewart is president.

WEATHER BUREAU. See METEOROLOGY.

WEEKS, John Wingate. United States Secretary of War: b. Lancaster, N. H., 11 April 1860. He was graduated from the United States Naval Academy in 1881, and served as a midshipman in the United States Navy until 1883. From 1886-88 he was assistant land commissioner of the Florida Southern Railroad. He then engaged in the banking business and was a member of the firm of Hornblower and Weeks from 1888-1912. He served as alderman in Newton, Mass., from 1900-03; was mayor of Newton, 1903-04; was chairman of the Massachusetts Republican State Convention in 1905, and served as a member of the lower house of Congress from 1905-13, representing the 12th Massachusetts District. On 14 Jan. 1913 he was elected to the United States Senate, and served until 1919. Since 4 March 1921 he has been Secretary of War in President Harding's Cabinet. In 1916, Mr. Weeks was a candidate for the Republican nomination for President and in the National Convention of his party, held at Chicago, received 105 votes. From 1890-98 Mr. Weeks commanded a division of the Massachusetts Naval Brigade with the rank of captain and in 1898-99 commanded the second division of the United States auxiliary naval force on the Atlantic coast. He was a member of the Military Advisory Board, of Massachusetts and Military Board of Examiners, 1894-1900, and a member of the board of visitors of the United States Naval Academy in 1896. He is a member of the Society of the Cincinnati; the Military Order of Foreign Wars; Society of the War of 1812; the Naval and Military Order of the Spanish-American War. He is a member also of various clubs, including the Metropolitan; Chevy Chase and Army and Navy of Washington.

WEEVILS, Alfalfa, Bean, Cowpea, Cotton Boll, Fly, Potato, Sweet Potato, Tomato. See ENTOMOLOGY, UNITED STATES, BUREAU OF.

WELLESLEY COLLEGE, a non-sectarian educational institution for women, founded in 1875 and located at Wellesley, Mass. In 1922-23 it had a faculty (administrative officers and instructing staff) of 199 members, and a student enrollment of 1,533. The institution's property is valued at \$4,955,095.93, and its income for the current year was \$783,307.94. Ellen Fitz Pendleton, Litt.D., LL.D., is president.

WELLS COLLEGE, a non-sectarian educational institution for women, founded in 1868 and located at Aurora, N. Y. In 1922-23 it had a faculty of 38 members, 219 students, property valued at \$642,542.97 and an income from invested funds of \$38,000. Kerr Duncan Macmillan, S.T.D., is president.

WENDELL, George Vincent, American physicist: b. Plainfield, N. J., 16 Aug. 1871; d. New York City, 15 March 1922. He was graduated from the Massachusetts Institute of Technology in 1892 with the degree of S.B. and took the degrees of A.M. and Ph.D. at the University of Leipzig, 1898. In 1898-99 he studied at the University of Berlin. From 1892-93 he was assistant in physics at the Massachusetts Institute of Technology; instructor from 1893-1901; assistant professor 1901-04 and associate professor 1904-07. From 1907-10 he was professor of physics and head of the department at Stevens Institute of Technology; from 1910 until his death, professor of physics at Columbia University. He established the department of physics at Simmons College, Boston, in 1902 and at Boston University in 1906.

WENDELL, James Augustus, American public official: b. Fort Plain, Montgomery County, N. Y., 1 Jan. 1869; d. Albany, N. Y., 10 May 1922. After being graduated from the Clinton Liberal Institute at Fort Plain, he studied law for a brief period and then accepted a position as clerk in the Fort Plain National Bank. In May 1894, through a competitive examination, he was appointed to a clerkship in the State Comptroller's office of New York and from that time until his death never severed his connection with that office. He served under 12 different comptrollers, was Deputy Comptroller for 10 years, and in November 1920 was elected Comptroller, defeating Charles W. Berry of Brooklyn by a majority of 588,884 votes.

WESLEYAN COLLEGE, an educational institution for women, under the auspices of the Methodist-Episcopal Church, South, founded in 1836 and located at Macon, Ga. In 1922-23 it had a faculty of 42 members, 547 students, and property, consisting of real estate and equipment, valued at approximately \$700,000. Income figures were not available. William Fletcher Quillian, A.B., D.D., is president.

WESLEYAN UNIVERSITY, a non-sectarian educational institution for men, founded in 1832 and located at Middletown, Conn. In 1922-23 it had a faculty of 52 members, 535 students, property valued at \$5,000,000 and an income of \$490,000. William Arnold Shanklin, LL.D., is president.

WEST AUSTRALIA. See AUSTRALIA.

WEST POINT ACADEMY. See UNITED STATES MILITARY ACADEMY.

WEST VIRGINIA, one of the South Atlantic States, set off during the Civil War from the original State of Virginia. It is bounded north by Ohio and Pennsylvania, east by Pennsylvania, Maryland and Virginia, south by Virginia and Kentucky, and west by Kentucky and Ohio. It is a mountainous State having an area of 24,170 square miles and in 1920 a population of 1,463,701. It ranks 40th in order of size and 27th in order of population. Of the population in 1920, 1,377,235 were whites, 86,345 negroes, 114 Asiatics and 7 Indians. The foreign-born numbered 61,906 and included 14,147 Italians, 3,798 Germans, 3,433 English and 1,459 Irish. The rural population was 74.8 per cent of the total in 1920. The chief cities, with their populations in 1920, are: Wheeling, 56,208; Huntington, 50,177; Charleston, the capital, 39,608; Parkersburg, 20,050; Fairmont, 17,851; Clarksburg, 27,869; Bluefields, 15,282; Martinsburg, 12,515; Morgantown, 12,127; Moundsville, 10,669; Grafton, 8,517; Williamson, 6,819; Princeton, 6,224; Elkins, 6,788 and Keyser, 6,003.

Religion.—The principal Christian denominations have a combined membership of 427,865, of whom 154,519 are Methodists, 78,679 Baptists, 60,337 Roman Catholics, 27,349 Presbyterians, 6,831 Episcopalians, 1,015 members of the Reformed Church and 316 Congregationalists.

Education.—The percentage of illiteracy in 1920 was 6.4, of native whites, 4.6, of negroes, 15.3, and of foreign-born 24. There are 12,885 teachers in the public schools and 370,000 enrolled pupils. Primary education is free for all children from the ages of 6 to 21 and attendance is compulsory for 20 weeks yearly for all children between the ages of 8 and 14. There are 172 high schools with 1,129 teachers and 18,502 pupils, and 6 normal schools for the training of elementary teachers with 123 professors and 2,262 students. For higher education there are West Virginia University, Bethany College and West Virginia Wesleyan College.

Finances.—On 1 July 1921 the State treasury had on hand \$2,761,537.42. Receipts during the ensuing year amounted to \$51,560,618.23. Disbursements during the same period amounted to \$37,145,211.77, leaving a balance on hand 1 July 1922 amounting to \$17,180,943.88. The legislative appropriation for the fiscal year 1923 totaled \$9,933,700. The bonded debt of the State totals \$15,000,000. In addition to which there is the so-called Virginia debt of \$10,300,000. The assessed value of real property in 1922 was \$1,208,796,000; of personal property, \$438,272,000.

Agriculture.—The Federal Census for 1920 reported 87,289 farms with a combined area of 9,569,790 acres. The value of all farm property in that year was \$496,439,617. The chief crops, with their acreage, yield and value for the year 1922, were: corn, 604,000 acres, 20,536,000 bushels, \$17,250,000; winter wheat, 240,000 acres, 2,760,000 bushels, \$3,367,000; oats, 200,000 acres, 4,600,000 bushels, \$2,668,000; buckwheat, 33,000 acres, 693,000 bushels, \$589,000; rye, 10,000 acres, 120,000 bushels, \$114,000; tame hay, 768,000 acres, 1,037,000 tons, \$17,422,000; sorghum sirup, 8,000 acres, 840,000 gallons, \$840,000; potatoes, 49,000 acres, 4,851,000 bushels, \$4,220,000; sweet

potatoes, 3,000 acres, 402,000 bushels, \$563,000; tobacco, 9,000 acres, 7,425,000 pounds, \$1,634,000; apples, 5,625,000 bushels; peaches, 715,000 bushels, and pears, 38,000 bushels. On 1 Jan. 1923 there were in the State 161,000 horses, valued at \$14,490,000; 15,000 mules, valued at \$1,530,000; 222,000 milk cows, valued at \$10,656,000; 365,000 other cattle, valued at \$12,374,000; 504,000 sheep, valued at \$3,478,000, and 316,000 swine, valued at \$3,887,000.

Mining.—Mining is the chief occupation of the inhabitants of the State, which ranks second in the production of coal, with 81,000,000 tons as the output for 1922. The State is first as a producer of natural gas, the yearly output being valued at approximately \$40,000,000. The State is also a large producer of petroleum, the 1922 yield being 7,026,000 barrels. The coal area extends over 17,280 square miles. All the basic minerals are found within the State and the total mineral output is considerably over \$200,000,000 in annual value.

Forestry, Lumbering.—The State is second in the production of hardwoods. Birch, ash, oak, spruce, hemlock and walnut are among its forest products.

Manufactures.—There are in the State approximately 3,000 manufacturing establishments with a total capital of \$225,000,000, and employing 110,000 wage earners, using raw materials valued at \$150,000,000, and turning out goods to the value of \$228,500,000. The leather industry is one of the most important. Other industries are foundry and machine shop products, car and railroad shops, etc.

Communications.—The State is well provided with waterways by the Ohio River and some tributary streams. The railroad mileage of the State is 4,012, and 660 miles of electric railways.

Government.—The State executive is a Governor, elected for four years, who receives a salary of \$10,000. The legislature is composed of two chambers, a Senate and a House of Delegates. The Senate has 30 members, elected for four years, and the House has 94 members, elected for two years. The State sends two Senators and six Representatives to the Federal Congress. For local administration the State is divided into 55 counties.

Officials.—(1922) Governor, E. F. Morgan; President of Senate, Harry G. Shaffer; Secretary of State, Houston G. Young; Attorney-General, E. T. England; Auditor, John C. Bond; Commissioner of Agriculture, J. H. Stewart; Treasurer, W. S. Johnson, and Superintendent of Education, George M. Ford.

Judiciary.—Members of Supreme Court.—President, W. N. Miller; James A. Meredith, J. H. McGinnis, Frank Lively, and M. O. Litz.

WEST VIRGINIA UNIVERSITY. a State co-educational institution, founded in 1867 and located at Morgantown, W. Va. In 1922-23 it had a faculty of 190 members, 2,672 students, property valued at approximately \$2,000,000 and an approximate income of \$1,500,000. Frank Butler Trotter, LL.D., is president.

WEST VIRGINIA WESLEYAN COLLEGE, a Methodist Episcopal co-educational institution, founded in 1890 and located at Buck-

hannon, W. Va. In 1922-23 it had a faculty of 30 members, 500 students, property valued at \$375,000 (exclusive of endowment), and an income of \$90,000. Thomas W. Haught was acting president in January 1923.

WESTERN COLLEGE FOR WOMEN, a non-sectarian educational institution, founded in 1855 and located at Oxford, Ohio. In 1922-23 it had a faculty of 38 members, 323 students, and property valued at \$1,500,000. Income figures for 1922-23 not given but for 1921-22 they were \$260,000. W. W. Boyd, Ph.D., is president.

WESTERN MARYLAND COLLEGE, a Methodist-Protestant co-educational institution, founded in 1868 and located at Westminster, Md. In 1922-23 it had a faculty of 32 members, 480 students, property valued at \$1,200,000 and an income of \$75,000. Albert Norman Ward, LL.D., is president.

WESTERN RESERVE UNIVERSITY, a non-denominational co-ordinate educational institution, founded in 1826 and located at Cleveland, Ohio. In 1922-23 it had a faculty of 347 members, a student enrollment of 2,354, not including extension students; property valued at \$9,684,064.50 and an income of \$276,647.65. James D. Williamson was acting president on 1 Feb. 1923.

WESTERN UNION COLLEGE, an Evangelical co-educational institution founded in 1900 and located at Le Mars, Iowa. In 1922-23 it had a faculty of 14 members, 265 students, and property valued at \$450,000. Income figures not given. Charles A. Mock, Ph.D., is president.

WESTMINSTER COLLEGE, a Presbyterian educational institution for men, founded in 1849 and located at Fulton, Mo. In 1922-23 it had a faculty of 13 resident members, 180 students, property valued at \$1,408,631.76 and an income of \$64,530. E. E. Reed, M.A., D.D., LL.D., is president.

WESTMINSTER COLLEGE, a United Presbyterian co-educational institution founded in 1852 and located at New Wilmington, Pa. In 1922-23 it had a faculty of 23 members, 303 students, property valued at \$550,000 and an income of \$100,000. W. Charles Wallace, D.D., is president.

WHEAT. The Department of Agriculture in its final report for the year estimated the 1922 wheat crop of the United States at 856,211,000 bushels, as compared with 814,905,000 bushels in 1921 and 833,027,000 bushels in 1920. Winter wheat production in 1922 totaled 586,204,000 bushels, as compared with 600,316,000 bushels in 1921 and 610,597,000 bushels in 1920. Spring wheat production in 1922 amounted to 270,007,000 bushels, as compared with 214,589,000 bushels in 1921 and 222,430,000 bushels in 1920. The total farm value of both varieties of wheat on 1 December of each of the three years mentioned was \$264,139,000 in 1922; \$754,834,000 in 1921, and \$1,197,263,000 in 1920. The per acre value of the crops was \$14.11 in 1922; \$11.85 in 1921, and \$19.58 in 1920. The yield per acre was 14 bushels in 1922; 12.8 bushels in 1921, and 13.6 bushels in 1920. The acreage totaled 61,230,000 in 1922; 63,696,000 in 1921, and 61,143,000 in 1920. The average farm price per bushel of

wheat on 1 December was 100.9 cents in 1922; 92.6 cents in 1921, and 143.7 cents in 1920. North Dakota led in production with a total yield of 123,234,000 bushels in 1922, as compared with 80,750,000 bushels in 1921 and 80,244,000 bushels in 1920. Kansas was second with 122,887,000 bushels in 1922, as compared with 128,695,000 bushels in 1921 and 143,078,000 bushels in 1920. Nebraska was third with 59,838,000 bushels in 1922, as compared with 59,875,000 bushels in 1921 and 60,480,000 bushels in 1920. Illinois was fourth with 55,432,000 bushels in 1922, as compared with 46,822,000 bushels in 1921 and 45,492,000 bushels in 1920. Montana was fifth with 40,370,000 bushels in 1922, as compared with 33,430,000 bushels in 1921 and 28,690,000 bushels in 1920. South Dakota was sixth with 40,012,000 bushels in 1922, as compared with 25,980,000 bushels in 1921 and 26,920,000 bushels in 1920. Missouri was seventh with 38,818,000 bushels in 1922, as compared with 34,952,000 bushels in 1921 and 37,653,000 bushels in 1920. Production in other States in 1922 was as follows: Maine, 275,000 bushels; Vermont, 189,000 bushels; New York, 9,014,000 bushels; New Jersey, 1,540,000 bushels; Pennsylvania, 25,444,000 bushels; Delaware, 1,766,000 bushels; Maryland, 9,537,000 bushels; Virginia, 10,375,000 bushels; West Virginia, 2,760,000 bushels; North Carolina, 5,508,000 bushels; South Carolina, 1,320,000 bushels; Georgia, 1,520,000 bushels; Ohio, 35,644,000 bushels; Indiana, 29,798,000 bushels; Michigan, 14,326,000 bushels; Wisconsin, 3,006,000 bushels; Minnesota, 27,036,000 bushels; Iowa, 16,867,000 bushels; Kentucky, 7,475,000 bushels; Tennessee, 4,484,000 bushels; Alabama, 218,000 bushels; Mississippi, 60,000 bushels; Texas, 9,992,000 bushels; Oklahoma, 31,350,000 bushels; Arkansas, 1,118,000 bushels; Wyoming, 3,060,000 bushels; Colorado, 21,776,000 bushels; New Mexico, 885,000 bushels; Arizona, 1,274,000 bushels; Utah, 5,682,000 bushels; Nevada, 550,000 bushels; Idaho, 24,275,000 bushels; Washington, 32,444,000 bushels; Oregon, 19,744,000 bushels, and California, 15,308,000 bushels.

Exports.—Exports of wheat from the United States during 1922 totaled 164,691,565 bushels, valued at \$206,338,408, as compared with 280,057,601 bushels, valued at \$433,053,336 exported in 1921. Exports of flour during 1922 totaled 15,024,628 barrels, valued at \$85,482,851, as compared with 16,800,805 barrels, valued at \$117,698,225, exported in 1921. According to the records of the Department of Commerce the United Kingdom was the United States' best customer for both wheat and flour in 1922, having taken 37,869,556 bushels of wheat and 2,228,838 barrels of flour. However, in 1921 shipments to the United Kingdom totaled 63,672,052 bushels of wheat and 3,997,691 barrels of flour. Exports to Canada in 1922 totaled 29,723,766 bushels of wheat and 50,367 barrels of flour. Exports to Italy in 1922 amounted to 29,044,942 bushels of wheat and 48,983 barrels of flour. The Netherlands took in the same year 13,026,462 bushels of wheat and 894,634 barrels of flour. The exports to France in 1922 totaled 13,022,101 bushels of wheat, while the name of France does not appear in the Department of Commerce's list of countries to which flour was exported in 1922.

World Production.—The International Institute of Agriculture at Rome on 5 Dec. 1922, estimated the world wheat crop of the year at 2,932,000,000 bushels, as compared with 2,967,000,000 bushels in 1921. At the same time it estimated the "carry-over" at 125,000,000 bushels, as compared with 84,000,000 bushels for the preceding year; and also estimated the exportable surplus of wheat at 950,000,000 bushels, as compared with 725,000,000 bushels for the preceding year. Its estimate of imports and import requirements was 923,000,000 bushels, as compared with 693,000,000 bushels for the year preceding. The exportable surplus of the principal exporting countries was estimated by the Institute as follows: Canada, 312,000,000 bushels; United States, 305,000,000 bushels; British India, 37,000,000 bushels; Argentina, 20,000,000 bushels; Australia, 33,000,000, and other countries, 29,000,000 bushels. Of the new (1922-23) crop in Argentina the exportable surplus was estimated at 147,000,000 bushels while that of Australia was estimated at 66,000,000 bushels. The 1922-23 wheat crop of Argentina was estimated by the International Institute of Agriculture at 215,320,000 bushels from an area of 16,081,000 acres, compared with 180,641,000 bushels from 13,927,000 acres in 1921-22. The latest estimate of wheat area in Australia was 10,000,000 acres, compared with 9,665,000 acres in 1921-22; and a forecast made late in 1922 placed production at 100,000,000 bushels, or about 28,000,000 bushels less than the production for 1921-22. The Canadian wheat crop of 1922 was reported on 4 Jan. 1923 by the Dominion Bureau of Statistics to have amounted to 391,425,000 bushels from an estimated area of 22,422,693 acres. This was the largest wheat crop reported for Canada since 1915. The yield per acre was 17½ bushels; also the highest since 1915, when 15,109,415 acres yielded an average of 26 bushels per acre. On 13 November, Alfred P. Dennis, special representative in Europe of the Department of Commerce, reported that the French wheat crop was then estimated at 255,000,000 bushels; the Spanish crop at 126,000,000 bushels, and the German crop about the same time was estimated at 69,670,000 bushels, compared with its 1921 crop of 107,798,000 bushels. The crop of Yugoslavia was estimated at 47,800,000 bushels, and the total European crop at 985,650,000 bushels, as compared with the 1921 crop, which was estimated at 1,215,084,000 bushels. According to the United States Department of Commerce the 1922 wheat crop of India, estimated at 9,813,000 tons, places that British colony third on the list of the great wheat producing countries of the world, being exceeded by only the United States and Canada. See also PLANT INDUSTRY.

WHEATON COLLEGE, a non-sectarian educational institution for women, founded in 1834 and located at Norton, Mass. In 1922-23 it had a faculty of 34 members, 358 students, and property valued at \$1,000,000. Income figures not given. Rev. Samuel V. Cole, A.M., D.D., LL.D., is president.

WHEELER, Edward Jewitt, American editor: b. Cleveland, Ohio, 11 March 1859; d. Lake Placid Club, Adirondacks, 11 July 1922. He was graduated at Ohio Wesleyan University in 1879, which college gave him the degree of

LL.D. in 1905. From 1884-98 he was editor of *The Voice* and from 1895-1905 of *The Literary Digest*. From 1905 until the time of his death he was editor of *Current Opinion* (once *Current Literature*). He was literary adviser to Funk & Wagnalls. Doctor Wheeler was the first president of the Poetry Society of America. He was also Vice-Chairman of the Citizens' Union of New York and a member of the Players', National Arts and MacDowell Clubs. During the World War he was one of a group of American editors who went to Europe as guests of the British government. At a dinner given by the *London Times* in London at which Doctor Wheeler presided, he was decorated by the French government in recognition of his editorial services in behalf of the Allies.

WHITENACK, Miller Royal, American physician: b. Newark, N. J.; d. there, 12 Dec. 1922. He was the son of Thomas C. Whitenack, a druggist, was graduated at Newark High School, Rutgers College and the College of Physicians and Surgeons, Columbia University. He became an interne in the City Hospital, Newark, and also engaged in general practice, which he abandoned 13 years before his death to specialize in the diseases of children. He was known to thousands as "The Children's Physician."

WHITE PINE BLISTER RUST. See AGRICULTURE, UNITED STATES DEPARTMENT OF; PLANT INDUSTRY, BUREAU OF.

WHITMAN COLLEGE, a non-sectarian co-educational institution, founded in 1859 and located at Walla Walla, Wash. In 1922-23 it had a faculty of 31 members, 493 students, property valued at \$1,452,350.12 and an income of \$156,394.18. Stephen B. L. Penrose, D.D., LL.D., is president.

WHITTEN, J. C., d. 5 June 1922. See HORTICULTURE.

WHITTIER COLLEGE, a Friends co-educational institution, founded in 1901 and located at Whittier, Calif. In 1922-23 it had a faculty of 25 members, 195 students, property valued at \$278,000 and an income of \$48,000. Harry N. Wright, Ph.D., is president.

WHITWORTH COLLEGE, a Presbyterian co-educational institution, founded in 1890 and located at Spokane, Wash. In 1922-23 it had a faculty of 15 members, and 120 students. No information given as to value of its property or income. Willard H. Robinson, Ph.D., is president.

WILBERFORCE UNIVERSITY, a co-educational institution for colored students, under the auspices of the African Methodist Episcopal Church, but non-sectarian. The industrial department is maintained by State of Ohio. It was founded in 1856 and is located at Wilberforce, Ohio. In 1922-23 it had a faculty of 65 members, 1,414 students and property valued at \$1,500,000. Income figures not given. J. A. Gregg, D.D., is president.

WILD ANIMALS. See BIOLOGICAL SURVEY, UNITED STATES BUREAU OF.

WILLAMETTE UNIVERSITY, a co-educational institution directed by the Methodist Episcopal Church, and located at Salem, Ore.

Trustees met 1 Feb. 1842; school opened 16 Aug. 1844. In 1922-23 it had a faculty of 38 members, 575 students, property valued at \$2,324,000 including campus, buildings, endowment, pledges, etc., and an income of about \$110,000. Carl G. Doney, Ph.D., is president.

WILLIAM AND MARY, College of, in Virginia, a non-sectarian co-educational institution founded in 1693 and located at Williamsburg, Va. Next to Harvard College, founded in 1636, it is the oldest institution of learning in the United States. In 1922-23, it had a faculty of 53 members, 800 students, property valued at \$600,000 (as of 1921) and an income of \$435,000. J. A. C. Chandler, LL.D., is president.

WILLIAMS COLLEGE, a non-sectarian educational institution for men, charter granted 22 June 1793 and located at Williamstown, Mass. In 1922-23 it had a faculty of 61 members, 630 students, property valued at \$6,864,715.02 and an income of \$376,651.39. Harry Augustus Garfield, L.H.D., LL.D., is president.

WILLIAM SMITH COLLEGE. See HOBART COLLEGE.

WILMINGTON COLLEGE, a Friends co-educational institution, founded in 1870 and located at Wilmington, Ohio. In 1922-23 it had a faculty of about 16 members, 260 students, property valued at \$750,000 and an income of \$73,576.70. J. Edwin Jay, A.M., is president.

WILSON, Sir Henry Hughes, British Field-Marshal: b. Edgeworthstown, Ireland, 5 May 1864; assassinated, London, 22 June 1922. He was the son of James Wilson, D.L.; J.P., of Currygrane. He was educated at Marlborough College and was graduated from the Royal Staff College. In 1884 he was given a commission in the Royal Irish Regiment but was transferred to the Rifle Brigade the same year. He took part in the Burma campaign in 1885-87 and was wounded; was again in service, 1887-89; was at the Staff College, 1892-94; served as Staff Captain, Intelligence Division, 1894-97; was Brigade-Major of the Second Brigade at Aldershot, 1897-99; with the Light Brigade in South Africa, 1899-1900, and in the year following was attached to Army Headquarters there. By the end of the Boer War he had reached the rank of Brevet Lieutenant-Colonel and was awarded the Distinguished Service Order. After the Boer War he was successively—assistant director of Staff Duties at the War Office, 1904-06; commandant of the Staff College, 1907-10; director of Military Operations at the War Office, 1910-14. It was a career of the kind that the army gives to those whom it regards as of commanding ability and brilliant intellect. Such men, however, are often the subject of sharply divided opinions in the British army, and throughout Field-Marshal Wilson's career there was as much difference among leading soldiers as to his professional merits as there was in the British navy on the subject of Fisher's. As Commandant of the Staff College, Wilson gave an impression of immense cleverness, mental agility, and power of exposition and persuasion, combined with a certain measure of "viewiness," a kind of fertility in ingenious strategic notions and fascinating, rather hit-or-miss, plans. There is a tradition that in one of his lectures some time before the war he pointed to Mons as the

likeliest place for a British expeditionary force to come into danger of defeat or envelopment in the event of an Anglo-French war with Germany. During those years before the great war he was more fully absorbed than any other British officer of note in the idea of such a war as actually followed. It is said that he spent several summers going over the terrain of northern France, familiarizing himself with its topographical features. When the war came General Wilson was first detailed as Assistant Chief of Staff to Sir John French. He probably showed to better advantage as a liaison officer than in any other capacity. He was certainly less happy as a Corps Commander, which he became when Sir John French's return to England closed the way to further rapid advancement for Wilson at G. H. Q. When in the spring of 1916 the British lost Vimy Ridge which through an extension of their lines they had taken over from the French, who had acquired it at an enormous cost of lives, Wilson lost his command and returned to England unemployed. In 1917, however, came the announcement of his appointment to the Versailles Advisory Committee which apparently astonished the British army in France. Wilson, thereafter was given the consolation of the Eastern Command. In 1917 there was an obvious Cabinet movement looking toward some kind of pooling of control—in short towards French control of the aggregate Allied forces. On 10 Nov. 1917, it was announced that a Supreme Political Council of the Allies had been created, and that this Council was to be assisted by a permanent central military committee to consist of Foch, Cadorna and Wilson. Thenceforth, till Haig spontaneously proposed at Doullens on 3 April 1918, that Foch should take sole and supreme command of all the Allied armies, Wilson was an eager and skilful worker to that end. His capacity for admiring French generals was great, and did not confine itself to Foch. According to Colonel Repington, Wilson caused intense irritation to the French Minister Painleve in April 1917 by extolling General Nivelle, whose failure in Champagne the sorely-tried Painleve was at that moment trying to liquidate. He was wiser or more fortunate in backing Foch. Nivelle, Foch and Wilson were all men who could talk extraordinarily well; they were perfect masters of the art of explaining a military project to the fullest advantage in conversation with civilian ministers, and possibly this common gift made a special bond between the trio. Marshal Wilson was the recipient of many decorations both British and foreign, including the Grand Cross of the Legion of Honor, the Grand Cross of the Russian White Eagle, and Grand Commander of the Bath. In 1921, he was made military adviser to the newly established Ulster Government and in this capacity advocated a policy of repression of Irish Nationalist sentiment which made him greatly disliked in the South and Southwest. He was assassinated before his London home by two men of Southern Irish sympathies, both of whom had served in the British armies during the war. The Field Marshal's funeral was one of the largest seen in the British capital in recent years. He was buried under the dome of the Cathedral of Saint Paul.

WILSON COLLEGE, a Presbyterian educational institution for women, opened in 1870 and located at Chambersburg, Pa. In 1922-23 it had a faculty of 36 members, 375 students, property valued at \$432,580 and an estimated income of \$250,000. Ethelbert D. Warfield, D.D., LL.D., Litt.D., is president.

WINDWARD ISLANDS, an insular group belonging to Great Britain and consisting of Grenada, Saint Vincent, half the Grenadines and Saint Lucia. The islands form the eastern barrier of the Caribbean Sea. Each island has its own institutions but there is a common court of appeals. Cocoa, sugar, rum, cotton, cottonseed, arrowroot and spices are the chief products. Saint Lucia also produces lime juice, syrups, bay oil, honey, hides, and logwood. There is a naval base at Port Castries. The Governor and Commander-in-Chief in 1922 was Sir G. B. Haddon-Smith, who resides at Saint George's, Grenada.

WINTER, Elizabeth Campbell, American authoress and actress, b. Loch Aroe, Scotland, 19 Dec. 1841; d. Los Angeles, Cal., 8 April 1922. She made her first appearance on the stage before the Civil War as a singer. Then she became a pupil of Edwin Booth and played Katharine to his Petruchio in 'The Taming of the Shrew.' She continued to play Shakespearean rôles, as well as other parts, appearing with Booth, James Henry Hackett, John Brougham, Lester Wallack. Emma Waller and Fanny Janauschek. About 1878 she turned her attention to writing. She wrote a number of short stories, several novels, including 'The Spanish Treasure' and 'The House of Daingerfield,' and wrote and adapted several plays, notably 'Deborah' and 'Mary Stuart,' for Helena Modjeska; 'The First Violin,' for Richard Mansfield; and 'Valjean,' based on Victor Hugo's 'Les Misérables.' In 1860 she became the wife of William Winter, the famous dramatic critic. Her pen-names were Elizabeth Campbell, Isabella Costellar, E. C. Winter and Elsie Snow.

WINTHROP COLLEGE, a State educational institution for women, founded in 1896 and located at Rock Hill, S. C. In 1922-23 it had a faculty of 146 members, 1,371 students, and property valued at \$2,500,000. Income figures not given. David B. Johnson, LL.D., is president.

WIRE INDUSTRY. The "classified" industry is confined to wire-drawing establishments that are not departments of rolling mills, although the larger part of the wire output comes from plants that both roll the rods and draw the wire. The Bureau of Census gave the total value of wire products reported by all classes of establishments equipped for drawing wire as \$251,234,800 in 1921; \$392,601,100 in 1919, and \$172,600,500 in 1914. The 1921 data were compiled from reports received from 107 establishments, comprising 61 independent wire-drawing mills (which constitute the classified industry); 26 wire-drawing departments of steel-rolling mills; and 20 other concerns, including wire-drawing departments of brass and copper rolling mills, manufacturers of electrical supplies, etc. The statistics, however, do not include the products of establishments which purchase wire to manufacture wire rope and cable,

wire fencing, wire nails, wire cloth, and various small articles made of wire. Plain steel and iron wire produced in 1921 totaled 1,725,400 tons, as compared with 2,508,900 tons produced in 1919; and 2,435,500 tons produced in 1914. Galvanized wire produced for sale in 1921 amounted to 204,400 tons as compared with 343,000 tons produced in 1919. There were 11,296,500 kegs of wire nails and spikes, of 100 lbs. each, produced in 1921, as compared with 12,429,200 kegs produced in 1919, and 12,886,600 kegs produced in 1914. Production of wire brads and tacks amounted to 2,646,400 lbs. in 1921, as compared with 5,461,800 lbs. produced in 1919. Wire staples produced in 1921 amounted to 41,735,500 lbs. as compared with 68,221,300 lbs. produced in 1919. Barbed wire (plain and coated) produced in 1921 totaled 139,100 tons as compared with 341,100 tons produced in 1919, and 343,700 tons produced in 1914. Wire rope, cable and strand produced in 1921 was 56,900 tons, as compared with 103,000 tons in 1919, and 52,700 tons in 1914. Woven-wire fence and poultry netting, plain and coated produced in 1921 amounted to 242,300 tons, as compared with 312,100 tons in 1919, and 411,500 tons produced in 1914. Cold-rolled flat wire produced in 1921 totaled 57,400 tons, as compared with the 1919 production of 45,900 tons. Bare copper wire produced in 1921 was 160,900 tons, as compared with 184,600 in 1919, and 138,900 tons in 1914. The total production of insulated copper wire and cables by all establishments in 1921 was in value \$98,333,000, as compared with \$128,682,000 in 1919, and \$69,506,000 in 1914. Brass wire produced in 1921 amounted to 21,972,000 lbs., as compared with 47,249,800 lbs. produced in 1919, and 39,614,500 lbs. produced in 1914.

WIRELESS TELEPHONY AND TELEGRAPHY. See RADIO TELEGRAPHY AND TELEPHONY.

WISCONSIN, one of the east north-central States, bounded north by Lake Superior and Michigan, east by Michigan and Lake Michigan, south by Illinois and Iowa, and west by Iowa and Minnesota. It has an area of 56,066 square miles, and in 1920 had a population of 2,632,067. It ranks 25th in size and 13th in population among its sister States. In 1920 the population included 2,616,938 whites, 5,201 negroes, 9,611 Indians, and 317 Asiatics. The foreign-born numbered 460,128, and included 151,250 Germans, 45,433 Norwegians, 22,896 Swedes, 11,187 Italians, 19,331 Canadians, 10,834 English and 7,809 Irish. Indian reservations in 1920 had a total area of 423 square miles, with a population of 10,313. The chief cities, with their populations in 1920, are: Milwaukee, 457,147; Racine, 58,593; Kenosha, 40,472; Superior, 39,624; Madison, the capital, 38,378; Oshkosh, 33,162; Green Bay, 31,017; Cheboygan, 30,955; La Crosse, 30,363; Fond du Lac, 33,427; Beloit, 21,284; Eau Claire, 20,880; Appleton, 19,561; Wausau, 18,661; Janesville, 19,293; and Manitowoc, 17,563.

Religion.—The principal Christian denominations have an aggregate membership of 1,162,032, of whom 594,836 are Roman Catholics, 297,310 Lutherans, 63,331 Methodists, 18,451 Congregationalists, 23,459 Presbyterians, 20,425 Baptists, 18,451 Episcopalians, and 10,427 members of the Reformed Church.

Education.—Attendance in the primary schools of the State is compulsory for all children between the ages of 7 and 14; in cities for the full school year, and in the smaller towns and villages for six months of the year. Where industrial and continuation schools exist children from 14 to 17 who are regularly employed must attend such schools for periods aggregating eight hours a week. There are in the State 14,122 primary school teachers and 405,467 pupils; 373 public high schools, with 3,179 teachers and 59,776 pupils, and 9 normal schools, with 347 professors and 3,773 students. There are about 20 colleges and academies which give courses in higher instruction. The State University is located at Madison.

Finances.—The balance on hand at the beginning of the fiscal year, 1 July 1921, was \$11,086,443.07. Receipts during the ensuing fiscal period amounted to \$51,958,421.07. Disbursements for the same period amounted to \$48,456,361.27, leaving a balance on hand at the beginning of the current fiscal year amounting to \$14,588,502.87. The appropriations for 1921 totaled \$33,267,402.42, while receipts amounted to \$32,359,536. For 1922-23, appropriations totaled \$28,967,715, against estimated receipts amounting to \$27,578,081.

The State has no bonded debt. The assessed valuation of all real property at the beginning of 1922 was \$3,670,090,188; of personal property, \$924,649,774.

Agriculture.—The State is largely agricultural and produces all crops grown in the north temperate zone. The chief crops, with their acreage, yield and value for the year 1922, were: Corn, 2,209,000 acres, 98,300,000 bushels, \$61,929,000; spring wheat, 81,000 acres, 1,239,000 bushels, \$1,276,000; winter wheat, 95,000 acres, 1,767,000 bushels, \$1,820,000; barley, 443,000 acres, 14,220,000 bushels, \$8,105,000; clover seed, 127,000 acres, 229,000 bushels, \$2,336,000; oats, 2,465,000 acres, 101,558,000 bushels, \$39,608,000; buckwheat, 25,000 acres, 360,000 bushels, \$313,000; rye, 489,000 acres, 7,139,000 bushels, \$5,140,000; cranberries, 2,000 acres, 62,000 bushels, \$620,000; tame hay, 3,155,000 acres, 5,553,000 tons, \$68,302,000; sorghum sirup, 2,000 acres, 120,000 gallons, \$132,000; beans, 8,000 acres, 76,000 bushels, \$274,000; potatoes, 328,000 acres, 40,672,000 bushels, \$13,422,000; tobacco, 40,000 acres, 45,600,000 pounds, \$9,120,000; apples, 2,024,000 bushels, and pears, 19,000 bushels. In 1920 there were 189,167 farms, having a combined area of 22,745,000 acres, of which 13,248,000 acres was improved land. On 1 Jan. 1923 there were in the State 643,000 horses, valued at \$66,872,000; 4,000 mules, valued at \$412,000; 2,195,000 milk cows, valued at \$125,115,000; 876,000 other cattle, valued at \$19,622,000; 341,000 sheep, valued at \$2,558,000, and 1,725,000 swine, valued at \$22,598,000. The wool clip of 1920 was 3,360,000 pounds.

Forestry.—Wisconsin was at one time covered with pine, hemlock and hardwood forests. However, most of these have been cut, the output in 1920 being one of the lowest on record, 1,275,000,000 feet. There remain in the State about 2,500,000,000 feet.

Mining.—Zinc is the principal mining output, followed by iron, granite, limestone, sand-

stone, natural cement, graphite and mineral waters. The 1922 iron ore output was 601,000 gross tons.

Manufactures.—The dressing of lumber is one of the principal industries, but in recent years dairying has advanced to first place. The value of the dairy products in 1921 was \$200,828,249.92. The State has more creameries than any other State. Other industries are those concerned with the refining of beet sugar, woodwork, agricultural implements, pig iron production, zinc smelting and fish curing.

Communications.—The State has 7,775 miles of steam railways and 847 miles of electric railways. There are 144,097 miles of telephone wires and 338,100 subscribers. The mileage of State roads aggregates 77,280 miles, of which 20,000 miles are improved. There are 7,500 miles of State trunk highways, and about \$10,000,000 is expended annually for maintenance and new construction. A huge tonnage of grain and flour, coal, lumber, ore and manufactured articles is shipped at the lake ports. Superior, at the head of the lake of that name, is one of the great arteries of traffic in the Northwest. There are many other resorts on the shores of the Great Lakes, and the smaller lakes of the State are also popular with recreation and vacationing parties.

Government.—The State executive is a Governor, who is elected for a term of two years and receives a salary of \$5,000. The legislature consists of a Senate of 33 members, elected for four years, and an assembly of 100 members, elected for two years. The State sends two Senators and 11 Representatives to the Federal Congress.

Officials.—Governor, John J. Blaine; Lieutenant-Governor, George F. Comings; Secretary of State, Elmer S. Hall; Attorney-General, William J. Morgan; Treasurer, Henry Johnson, and Superintendent of Education, John Callahan.

Judiciary.—Members of Supreme Court, A. J. Vinje, Chief Justice; M. B. Rosenberry, F. C. Eschweiler, W. C. Owen, C. H. Crownhart, Christian Doerfler, and B. W. Jones, Justices.

WISCONSIN, University of, a State co-educational institution, founded in 1848 and located at Madison, Wis. In the Fall of 1922 there were in the faculty 800 members including the part time staff. For the first semester in 1922-23, the student enrollment was 7,368. In 1921-22 the institution's property was valued at \$12,287,848.59 and its income for the year was \$5,680,219.92. Edward A. Birge, LL.D., is president.

WITTENBERG COLLEGE, a United Lutheran co-educational institution, founded in 1845 and located at Springfield, Ohio. In 1922-23 it had a faculty of 37 members, 1,350 students (all departments, 686 in the College proper), property valued at \$1,700,000 and an income of \$160,000. Rees Edgar Tulloss, D.D., Ph.D., is president.

WOFFORD COLLEGE, a Southern Methodist educational institution for men, founded in 1851 and located at Spartanburg, S. C. In 1922-23 it had a faculty of 19 members, 430 students, property valued at \$962,-

592.94 and an income of \$65,000. Henry Nelson Snyder, LL.D., is president.

WOMAN'S CHRISTIAN TEMPERANCE UNION, National, an organization founded in 1883 through the efforts of Frances E. Willard, and having as its objective worldwide prohibition, its international campaign, largely an educational one, designed to show the effect of alcohol on the human system, has been carried on in 40 different countries. While it does not put tobacco alongside of alcoholic beverages it, nevertheless, conducts, in the interests of boys and girls as a health measure an educational campaign upon that subject also. In 1917 the organization spent \$80,000 for patriotic and relief work. In March 1920 it launched a Jubilee Campaign to secure 1,000,000 members and to raise a fund of \$1,000,000. In December 1922 it was announced that since the beginning of the campaign more than 100,000 new members had been enrolled while the financial goal had been reached. Appropriations from the fund were made for native workers and scholarships in South America, China, India and Japan. During 1922, 2,000 new local unions were organized and over \$60,000 was spent in behalf of world prohibition, Americanization, child welfare, scientific temperance instruction and investigation, Christian citizenship, social morality and health, and to aid women in industry. The work of the National Woman's Christian Temperance Union is carried on by 25 departments. Among other activities it helps to maintain a Child Welfare Research Station at Iowa State University, contributing \$10,000 a year for a period of five years. Recently the Union completed new national headquarters at Evanston, Ill. The officers of the Union are: President, Miss Anna A. Gordon, Evanston, Ill.; Vice-President, Mrs. Ella Boole, Brooklyn, N. Y.; Corresponding Secretary, Mrs. Frances P. Parks, Evanston, Ill.; Treasurer, Mrs. Margaret Munns, Evanston, Ill.; Recording Secretary, Mrs. Elizabeth Preston Anderson, Fargo, N. D.; Assistant Recording Secretary, Mrs. Sara Hoge, Lincoln, Va.

WOMAN'S RELIEF CORPS, The, a national organization founded in 1883 as an auxiliary to the Grand Army of the Republic. Founded to afford relief to the Union veterans of the Civil War and to their dependents it has since broadened its field to include the veterans of all wars and their dependents. All loyal American women are eligible to membership, regardless of race, creed, or color. This organization is the only one, outside the Red Cross, privileged to wear the Red Geneva Cross. The headquarters of the organization is at Des Moines, Iowa. In 1922, there were 225,000 members. From its inception to 1922 the Corps has expended for relief and turned over to posts the sum of \$5,626,962.70. In 1922, it expended for relief \$205,533.84 and \$66,523.98 for patriotic work. Americanization etc.; donated \$1,000 for Southern Memorial Day; \$1,300 as Christmas gift to Civil War Army Nurses and \$50 to the London branch of the Civil War Veterans. In addition, it gave \$6,307.16 to World War Hospitals; \$688.38 to

Spanish War Veterans; \$2,116.37 to soldiers' homes; \$560.24 to widows' homes; \$249.13 to orphans' homes; \$3,115.38 for child welfare; \$355.21 for schools in the South; \$1,969.19 for Americanization; \$5,000 for scholarships at the International College, Springfield, Mass.; and \$2,000 for Near East Relief. The national President in 1922-23 is Mrs. Marie L. Basham, 803 Euclid Ave., Des Moines, Iowa; national Secretary, Mrs. Jenny Iowa Berry, 1407 Third Ave., Cedar Rapids, Iowa.

ELIZA BROWN-DAGGETT,
Past National President; National Counselor,
1922-23.

WOMEN IN INDUSTRY. See WOMEN'S BUREAU, UNITED STATES.

WOMEN IN POLITICS. According to a speech made in the French Senate in November 1922 during a discussion of the French Suffrage bill, there are 138,000,000 enfranchised women in the world. Although all but one feminine candidate for national office in the United States in 1922 was defeated, the representative women's organizations of the country claim this was a gala year for women in politics. On 7 Nov. 1922, Mrs. Rebecca Latimer Felton, long prominent in the feminist movement and known as the "Grand Old Woman of Georgia," was appointed to fill the unexpired term of the late United States Senator Thomas E. Watson. On 22 Nov. 1922, she took her seat, the first woman in the history of the country to do so. Mrs. Felton held her seat for one day only as she was replaced by the regularly elected senator who had delayed presenting his credentials in order that she might take part in one senatorial meeting.

Mrs. Winnifred Mason Huck of Chicago, was elected to Congress, to fill the unexpired term of her father, the late Representative William E. Mason. Mrs. Huck was the first mother to sit in Congress. Mrs. Mae Ella Nolan of San Francisco, was elected to the 67th Congress to fill the unexpired term of her husband, the late Representative John I. Nolan, and also to the 68th Congress for the full term, being now (1 April 1923), the only woman member of that body. Mrs. Nolan defeated six other candidates leading her closest opponent by 4,000 votes. Her husband was a labor leader in Congress and his widow will carry out his policies. With Miss Robertson of Oklahoma, who failed in her campaign for reelection, three women served in the fourth session of the 67th Congress.

Three women were defeated in November 1922 for the United States Senate. They were, Mrs. Anna Dickie Oleson, Democrat, of Minnesota; Mrs. Jack Cooper, Independent, of Wisconsin; and Mrs. Virginia Darlington Green, Independent, of Ohio. Thirty-three women were defeated for Congressional and Legislative seats in New York State, as was Miss Ruth Taylor, who ran for judge of the new Children's Court in Westchester County. Two women were elected to the Massachusetts Legislature, three to the New Jersey Assembly and six to the Ohio General Assembly—two to the Senate and four to the House.

On 10 Nov. 1922, Florence E. Allen, was elected to the Ohio Supreme Bench, leading her opponent, Judge Benson A. Hough, a candidate for re-election, by 20,000 votes. Miss Allen is the first woman to sit on the Supreme Bench of any State. She qualified 16 Dec. 1922. An interesting appointment was that of Miss Lucille Atcherson to a position in the Federal Department of State. She qualified 16 Dec. 1922. Dr. Ellen C. Porter, of Philadelphia, was appointed Commissioner of Public Welfare by Governor Gifford Pinchot of Pennsylvania, the first woman to hold a position in a governor's "Cabinet."

Other women holding high positions in Washington are Mrs. Mabel Walker Willebrandt, who succeeded Miss Annette Abbott Adams as Assistant Attorney General, and Mrs. Helen Hamilton Gardner, who is a member of the Civil Service Commission. Mrs. Bessie Parker Brueggeman, is chairman of the Employees' Compensation Commission; Miss Mary Anderson is director of the Women's Bureau, Department of Labor. Miss Grace Abbot succeeded Miss Julia Lathrop as head of the Children's Bureau in August 1921. Judge Kathryn Sellers, presides over the Juvenile Court of the District of Columbia; Miss Mary O'Toole is one of the five judges of the Municipal Court of the District.

In the United States comparatively little attention has been given by the various women's organizations to the election of women as public officials. Instead the women's clubs and associations which once worked for the enfranchisement of women are now working for the passage of welfare and equality laws. It is over an equality bill which is being urged by the National Woman's Party that this party is at loggerheads with the League of Women Voters, the Consumers League, the National Women's Trade Union League and numerous other organizations.

At the convention of the National Woman's Party held in Washington 12 Nov. 1922, it was decided to advocate a "blanket" measure based on the theory that women are the equals before the law of men and that "no distinction between the rights of the sexes should exist within the United States or any place subject to its jurisdiction." This organization wants the word "persons" substituted for "women" in all laws in which the latter word appears. While the representatives of the Party realize that women may lose the benefit of much of the special welfare legislation enacted to protect women in industry, they contend that, in the long run, women will benefit. At this meeting, the first held by the organization since the enfranchisement of women, Mrs. John Rogers of New York presided. Of a proposed budget of \$150,000 to cover legislative expenses, \$85,000 was pledged at the convention.

As a result of the resolutions passed at this convention, Senator Cotoilo, chairman of the Judiciary Committee of the New York Assembly, introduced therein on 23 Jan. 1923, 25 bills on behalf of the Party. The new measures provided for radical changes in the

Domestic Relations Law and in statutes affecting property. Of the 25 bills introduced, only four were favorably reported. One provides that the mother and father shall have equal rights in the property of any child dying intestate; another abolishes sex distinctions in the making of wills; a third provides that inheritances shall descend without sex distinction according to the common law rule; while the fourth asserts that in habeas corpus proceedings relative to a child detained by one parent, there shall be no prima facie right of custody in either but that the case shall be determined solely on its merits. The majority of the bills defeated were measures designed to guarantee the theoretical equality of women with men. According to an announcement, issued from the national headquarters of the party, similar bills will within the year be introduced in the legislatures of Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Idaho, Illinois, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, West Virginia, Wisconsin and Wyoming.

At a convention of the League of Women Voters held in Washington 24 April 1922, it was decided to continue the work of education in citizenship, and the advocacy of uniform laws relating to women; also to insist upon the right of women to serve on juries, to hold public office, and to enjoy equal rights, with men in respect to the guardianship of children, and equal rights in the inheritance of real estate. This organization also insists upon the right of a married woman to her earnings in her home and her right to collect wages should she work for her husband outside of the home.

At the Convention of the National Consumers League, held in Washington in the Fall of 1922, it was announced that numerous women's organizations were joining the League in its condemnation of the "blanket bill" proposed by the National Woman's Party. The basis of their objection is that, although women are entitled to the franchise, to the right to hold office, to jurisdiction over their children and to anything else concerning their mental or moral attributes, no amount of legislation can make men and women biologically the same. Certain legislation it was asserted is necessary for the protection of women in industry.

The Consumers League has the support of a number of other national organizations of women desiring the enactment of a law which will give to women equal guardianship with their husbands over their children and guaranteeing also the equal right of both parents to the earnings of their children. The League also advocates a law which will give married women, who are wage earners, control over their wages. Under existing laws in many States the wages of married women may be claimed by their husbands. It is asserted by the Consumers League that instead of abridg-

ing the privileges of women, the legislation it advocates would actually give them more privileges without detracting from those already held, as would the measure advocated by the National Woman's Party.

Under the auspices of the League of Women Voters, the 'Pan-American Women's Conference was held in Baltimore, Md., 20-22 April 1922. Two thousand delegates and alternates representing all countries of the Western Hemisphere attended. The declared purpose of the conference was the promotion of international friendliness. Discussions related largely to women and their economic and political problems. Lady Astor, the first woman to sit in the British House of Commons attended the convention and made a speech.

Supported by the General Federation of Women's Clubs, a bill establishing national divorce and marriage relations was introduced in the United States Senate, 23 Jan. 1923, by Senator Capper of Kansas, but failed of passage. The object of the bill was to make hasty marriage more difficult and to place both marriage and divorce under Federal rather than State control.

Great Britain.—Of 33 women who were candidates in November 1922 for membership in the British House of Commons, two were elected—Lady Astor and Mrs. Thomas Winttingham. Lady Astor, it will be remembered was born in Virginia, U. S. A. Dame Helen Gwynne-Vaughan came within 260 votes of being elected. One of the high lights in the feminist movement in England in 1922 was the petition of Viscountess Rhondda, a peeress in her own right, to be allowed to sit in the House of Lords. She claimed a seat under a clause in the Sex Disqualification Removal Act which, in part, is as follows: "A person shall not be disqualified by sex or marriage from the exercise of any public function." Her petition was refused on the ground that the House of Lords is not "a public function." There are 18 other women in England, peeresses in their own right, who would have been entitled to seats in the House of Lords had the petition of the Viscountess Rhondda been granted. She declared, while in the United States in the summer of 1922, that she would continue to urge her right.

The English women fared better in their candidacies for local offices than they did in their attempt to enter Parliament. Sixty-five were elected County Councilors in England and Wales, including 16 elected to the London County Council—nearly one-eighth of its total membership. To the London Borough Council 145 women were elected; to the town councils outside of London, 128; and to the urban district councils, 91. More than 2,000 women are now serving on Boards of Guardians, and more than 300 have been appointed justices of the peace.

For the first time in the history of the country women—20 of them—were admitted to the bar in England in 1922. The first of these passed her examination in April. Two women are included among the delegates of the British Commonwealth of Nations to the League of

Nations—Mrs. Coombe Tenant, as a substitute delegate for England and Mrs. Dale, for Australia.

In Great Britain the women's organizations have devoted comparatively little time to the passage of laws either for the equalization of citizenship or for the protection of women in industry. Their chief aim has been to elect women to public office, claiming that their only opportunity for the passage of just laws will come with an equal representation. The Woman's Local Government Society is an organization which grew out of the belief that half the battle will be won when women share equally with men in office holding. Particular stress is laid on the expediency of electing women to local offices as most members of the House of Commons, have been graduated from local offices.

Despite the effort to elect women to office there is little indication of any plans for the formation in England of a separate and distinct woman's party in opposition to the already established parties. Both the Woman's Freedom League and the National Council of Women contended that only by men and women working side by side for mutual welfare can any lasting good be accomplished. During 1922 Viscountess Rhonda headed the Six Point Group which is a remnant of the separate women's party that was led by Mrs. Pankhurst.

The Women's Freedom League advocates the following measures: A bill making women eligible to vote at the age of 21 (the age at which men now vote) instead of 30—the present voting age for women; a mother's equal guardianship law; a law providing that juries be composed of six men and six women; a law requiring an equal number of women on all local government bodies; a law making all government posts from the Premiership and Cabinet officers to the civil and consular service to be open to women; laws providing for equal opportunities in all trades and trade unions and in all professions and equal pay for equal work. The organization has started a campaign to elect 300 women to Parliament.

At the annual conference of the National Council of Women of Great Britain and Ireland, 26 Sept. 1922, the keynote of the meeting was the necessity of an international, rather than a national, outlook. Such topics as "Women in International Life," "Children's Laws in Norway," "Temperance Legislation in the United States," "Treatment of Criminals in the Various Countries," and "Moral and Economic Interdependence of States" were discussed. A particular point was made of the mistake of teaching "the imperial outlook" in schools. A strong force in the political life of women in England is the Consultative Committee, composed of representatives of 65 organizations of professional women, which meets once a month to discuss desired and desirable measures.

There are two women representatives in the Parliament of Northern Ireland—Miss Dehra Chichester, representing Londonderry county and borough, and Mrs. Julia M'Mordie, M.D., from South Belfast. Lady Londonderry is

Justice of the Peace of Durham County, Countess Dysart, and Mrs. Power are members of the Irish Free State Senate and several women are members of the Lower House. The Irish Free State has conferred complete political equality on the women of the country.

Other Countries. The French Senate on 21 Nov. 1922 defeated the woman's suffrage bill, which originated in the House of Deputies three and a half years ago, by a vote of 156 to 134, and it cannot be brought up again for three years. Madam De Witt-Schlumberger, president of the French Suffrage Association, states that the work to make the bill a law will be continued.

Notwithstanding the fact that the Dutch women were enfranchised in 1919, they voted for the first time in the summer of 1922, as Parliamentary elections in Holland are held only every four years. Seven women were returned to a Parliament of 100 members. Two of the seven had been in Parliament since 1918, owing to the fact that women were eligible to this office in that country before they were given the franchise. Three of the seven women elected were prominent lawyers. In 1922, a law was passed in Holland permitting women, otherwise qualified, to become judges.

There are 35 women in the German Reichstag and 40 in the Prussian Parliament. There are approximately 20 women in the Austrian Legislature. Iceland has a woman representative in its legislature (Alting) in the person of Miss Ingibjorgh Bjarnason, elected in November 1922. Mme. Alexandra Kolontay is Russian Minister to Norway.

In Mexico, Rafael Nieto, Governor of San Luis Potosi, submitted a project which would have given suffrage to the woman of that State, but the Legislature did not pass it. The National Suffrage Party of Cuba petitioned President Zayas for equal suffrage, but the petition was denied.

The trouble between the British Government and the Egyptian Nationalists proved a stimulus both to the growth of women's parties in Egypt and to a hitherto unheard of participation of women in politics. The Ladies' Delegation—sometimes called the Ladies' Waft—was an organization formed to promote the freedom of Egypt. It is headed by Mme. Zaad Zaghlul (Sophia Hanem), who became the standard bearer of the cause of Egyptian freedom when her husband was banished by the British Government, January 1922. With the aid of La Femme Nouvelle, and the Mohammed Ali Society, both women's organizations, the Ladies' Delegation carried on a boycott of British goods. In March 1922, more than 80 motor cars filled with women formed a procession in the streets of Cairo to protest against the imprisonment of Zaghlul Pasha, martial law, the Sarwats Ministry and, what the Egyptians called, the false independence of Egypt. Another leader among Egyptian women is Mme. Bahi-el Dine Bey Barakof, a very young woman who has ignored the law of seclusion which her religion imposes upon its women, in order to aid Mme. Zaad Zaghlul in her efforts to free Egypt. Practically all this activity of Egyptian women came within the last year or so.

The Women's International League of Peace and Freedom met at The Hague 7-10 Dec. 1922. It was presided over by its president, Miss Jane Addams of Chicago, and was attended by 350 delegates representing 20 countries and 111 organizations. A resolution was passed unanimously calling for the holding of "A World Congress of States," through the instrumentality of the League of Nations, of a single nation or of a group of nations, in order to achieve a new peace. The reason given for this action was that the present lamentable state of Europe and its reaction on the rest of the world is due, in a large measure, to existing peace treaties, which are contrary not only to the Armistice terms but infringe nearly all of ex-President Wilson's Fourteen Points. A resolution was sent by the League to the Conference of Ministers sitting in London 9 December, welcoming the suggestion advanced at the Assembly of the League of Nations that the question of reparations be considered from an international standpoint.

DOROTHY N. BRYANT.

WOMEN IN SPORTS. See SPORTS.

WOMEN'S BUREAU, United States, a bureau of the United States Department of Labor, which has as its function the formulation of standards and policies to promote the welfare of wage-earning women, to improve their working conditions, and to advance their opportunities for profitable employment. The need for a government agency to perform such a service is apparent from a bird's-eye view of the recent census statistics on women workers, and from an analysis of the activities of the Women's Bureau during the past year, 1922.

In continental United States 8,549,511 women 10 years of age and over were gainfully employed on 1 Jan. 1920. The occupational distribution of these women was as follows: 2,186,924 in domestic and personal service, 1,930,341 in manufacturing and mechanical industries, 1,426,116 in clerical occupations, 1,084,128 in agriculture, forestry, and animal husbandry, 1,016,498 in professional service, 667,792 in trade, 213,054 in transportation, 21,794 in public service (not elsewhere classified), and 2,864 in extraction of minerals.

Not far from three million women (2,832,981), or one-third of all those gainfully employed, were found in manufacturing and mechanical industries, trade, transportation, and public service; and it is with this group of women workers that the activities of the Women's Bureau have been chiefly concerned. An analysis of these several classifications may prove helpful to those not thoroughly familiar with census nomenclature:

Under manufacturing and mechanical industries are grouped not only all factory laborers and semi-skilled operatives, but all persons employed in the skilled building and hand trades, together with their apprentices, and all persons working in manufacturing industries in proprietary, official, and supervisory capacities. From a numerical standpoint, as far as women are concerned, the most important manufacturing industries in the country are given in the following summary of selected* industries arranged

in descending scale in regard to the number of women employed:

INDUSTRY	Number of women
Clothing factories.....	272,005
Cotton mills.....	165,854
Cigar and tobacco factories.....	97,822
Food industries.....	88,540
Knitting mills.....	86,022
Shoe factories.....	78,428
Silk mills.....	75,498
Iron and steel industries.....	70,410
Woolen and worsted mills.....	65,704

* All industries included in which 50,000 or more women were employed in 1920.

Under trade are listed wholesale and retail dealers and most of their employees; bankers, brokers, and money lenders; real estate and insurance agents; undertakers; and workers in coal and lumber yards, grain elevators, stockyards, and warehouses. There is no occupation listed under "trade" in which women are not engaged, although almost four-fifths of the women included in this division were listed under the two sub-classifications—saleswomen and clerks in stores.

The term "transportation" includes water, road, street, and railroad transportation, also transportation by express, post, telegraph and telephone. The 178,379 women telephone operators, the 16,860 women telegraph operators, and the 7,054 women laborers for the steam and street railroads were the most important groups. They comprised 95 per cent of the whole number of women employees in transportation enterprises in 1920.

The small proportion of women listed under public service constitute for the most part a residuary group, those working for the government, who could not be properly classified under any other general division of occupations. The only sub-classification in this division, showing more than 5,000 women employees, was that of officials and inspectors, there being 17,239 recorded for the county, city, State, and Federal governments.

The foregoing interpretation of terms and presentation of figures indicates the great variety of work and the tremendous task confronting the Women's Bureau, a young organization exceedingly limited in personnel and appropriation.

The chief activity of the Bureau during 1922 was its investigations of wages, hours, and working conditions of women in industry in a number of States. Emphasis has been put upon the collection of data in the States because of the great scarcity of such information, because of the insistent requests for it from local groups who need details upon which to base their programs, and because of the rapid changes in industry which render it important that up-to-date information shall be available not only as it is applicable to local conditions, but as it is combined with other data to give a broader picture of conditions affecting women in industry.

These investigations made during the year comprise 11,000 women and 151 establishments in South Carolina, 5,700 women and 129 establishments in Alabama, 3,100 women and 188 establishments in Arkansas, 16,900 women and 160 establishments in Missouri, 32,000 women and 300 establishments in Ohio, and 35,000 wo-

men and 300 establishments in New Jersey, making a total of 103,700 women and 1,228 establishments in the six States.

In other ways the Women's Bureau co-operated with the various States. In its relation with State labor departments, for example the Bureau found during the past year a constantly developing need for an interchange of ideas and experiences, among those who are most immediately concerned with the subject of wage-earning women. In conformity with its policy of serving as a clearing house for such material, the Bureau continued to issue the monthly news letters, and thereby to supply information on special activities in the States, by the Federal government, or in foreign countries, relating to women in industry. The Bureau also supplied data for the use of State officials upon request. For the use of the Industrial Commission of Wisconsin, the Bureau investigated rates of payment for women employed in the tobacco industry in the country. At the request of the Industrial Commission of North Dakota, the Bureau advised and assisted in making a study of the cost of living for a working woman in that State. A similar study was made by the Bureau for the Minimum Wage Commission of the District of Columbia.

Several investigations in connection with women in government service also were completed during the year. Two studies, one of the conditions of work for women employees in the Bureau of Engraving and Printing, and the other of the wages and working conditions for women employees in the mail equipment shops of the Post Office Department, both of which were initiated in 1921, were reported upon in the early months of 1922. In June, 1922, at the request of the Secretary of Labor, an investigation was made of the administration of the Government hotels, in view of the misunderstanding and lack of co-operation existing between the management and guests.

Because of the investigations already outlined and made at the request of various agencies, and because of the limitations in appropriation and personnel, it was not possible for the Bureau in 1922 to make extensive surveys of special conditions affecting wage-earning women. Nevertheless, two studies which had already been undertaken were completed and several additional ones made. The report on the home responsibilities of wage-earning women, which had been in preparation for some time, was finished. This report contains significant figures showing the importance of women as economic factors in the home, and the information thus made available should serve to clarify public opinion on the much discussed subject of women's need to work and the social significance of the living wage. A report on the hours, wages, and working conditions of 2,070 women in 31 candy factories in Chicago and 632 women in 19 candy factories in Saint Louis in 1920-21 also was completed. Another report undertaken in 1922 is that on women's contributions in the field of invention. This report was compiled and prepared after an analysis of the records of the United States Patent Office, the object being not only to show the progress in inventions made by women, but to open the way to the development

of practical suggestions for the reduction of the existing handicaps under which women labor.

Two special reports dealing with the census statistics regarding women were published by the Bureau in the latter part of the year. One, entitled "The Occupational Progress of Women" is an interpretation of census statistics of women in gainful occupations and a comparison of the number of women employed in such occupations in 1910 and 1920. The other report, "The Family Status of Breadwinning Women," is a study of material on the census schedules of a definite locality. Since the Bureau of Census, on account of limited appropriation, was unable to publish this material, the Women's Bureau at the request of the National League of Women Voters and with the consent of the Secretary of Commerce undertook to assemble and publish the facts about the breadwinning women in one typical industrial city. The purpose of this report was not only to disclose the kind of information obtainable from the census schedules but to show the value of such data as a guide to the sort of extensive surveys needed to remedy certain palpably serious conditions.

Although the investigations conducted by the Bureau form the most conspicuous part of its work, another very important function is the continuous research work necessary in order to reply to the requests which are constantly being made for detailed information on special topics. Definite data regarding the operation and application of labor laws, for which material there has been great demand, necessitates careful examination of labor legislation in the various States. Statistics from the Census, from the Bureau of Labor Statistics, and from other sources have been consulted frequently to meet the requests for general statistical information.

In order to disseminate the material secured through investigations and research work, it was necessary throughout the year to present such data and facts in popular form. Consequently, in connection with the reports published, efforts were made to secure general circulation of significant information through newspapers and magazines. Material was furnished special writers upon request. Articles and news releases were prepared and published. During November and December 1922, popular radio talks on various phases of women in industry were broadcast weekly. The exhibit material of the Bureau was increased greatly and very generally circulated throughout the country. In addition to the film "When Women Work," the 15-panel exhibit illustrating the standards for the employment of women in industry, the colored maps and charts depicting the labor legislation for women in various States—all of which were used constantly throughout the year—two special exhibits were prepared in the closing months. One of these is a large exhibit showing the importance of women in industry and the significance to the community of their working hours and earnings. The other is a series of six miniature theatres which illustrate standards of hours, wages, and working conditions for women in industry.

In general, during the year the Bureau maintained close contact with organizations and persons interested in all problems concerning women workers. The Director of the Women's Bureau

served on many industrial committees, co-operated in an advisory capacity with other agencies, and addressed a number of audiences on the subject of women in industry.

MARY V. ROBINSON,

Women's Bureau, United States Department of Labor.

WOODHEAD, SIR German Sims, English pathologist: b. Woodland Mount, Huddersfield, England, 29 April 1855; d. January 1922. He was the eldest son of the late Joseph Woodhead, editor of the *Huddersfield Examiner* and at one time a member of Parliament for Spen Valley. The younger Woodhead received his preliminary education at Huddersfield College, thereafter was graduated with the degree of M.D. from Edinburgh University, and later studied at Berlin and Vienna. From 1899 until his death he was professor of pathology at Cambridge University and was one of the leading pathologists of his day. In 1878 he was elected president of the Royal Medical Society. From 1887-90 he was superintendent of the laboratory of the Royal College of Physicians, Edinburgh; from 1892-95 he was assistant commissioner to the Royal Commission on Tuberculosis, and in 1902 was made a member of this commission. He was president of the Royal Microscopical Society from 1890-99. At one time he held a commission as lieutenant-colonel in the Royal Army Medical Corps. Other important positions held by him were: inspector of laboratories in the Military Hospitals in the United Kingdom; advisor in pathology to the War Office for the United Kingdom; medical officer of the Irish Command Depot, Tipperary; member of the executive committee of the Imperial Cancer Research Fund; member of the Scottish Universities Committee; and director of the laboratories of the Conjoint Board of the Royal Colleges of Physicians (London) and Surgeons (England). He was elected an honorary fellow of the Henry Phipps Institute of Philadelphia in 1902 and was an honorary fellow also of the Institute of Sanitary Engineers. He was a fellow of the Royal College of Physicians, Edinburgh, the Royal Society of England, and of Trinity Hall, Cambridge. The honorary degree of LL.D. was conferred upon him by the universities of Toronto and Birmingham. He was knighted in 1919. He was for many years president of the Edinburgh University Athletic Club; president of the British Medical Temperance Association, and president also of the British Temperance League. His publications include 'Practical Pathology' (1883); 'Practical Mycology' (with Arthur W. Hare, M.B. 1885); 'Bacteria and their Products' (1891); 'Report to the Royal Commission on Tuberculosis' (1895); 'Report on Diphtheria to the Metropolitan Asylums Board'; 'Village Settlements for Tuberculosis' (with P. C. Jones Varrier); and contributions to medical journals. For some time he was editor of the *Journal of Pathology and Bacteriology*.

WOODROW WILSON FOUNDATION. The awarding of the Nobel peace prize in 1920 to Woodrow Wilson gave Mrs. Charles E. Simonson and Mrs. Charles I. Tiffany, both of

New York, the idea that a similar foundation should be established in this country in recognition of the national and international services of Mr. Wilson, twice President of the United States, who "furthered the cause of human freedom and was instrumental in pointing out effective methods for the co-operation of the liberal forces of mankind throughout the world." The Foundation was actually established 23 Dec. 1920, when 23 women met at Mrs. Tiffany's home in New York. At a meeting held 15 March 1921, at the Hotel Biltmore, the organization of the Foundation was completed. The first appeal for funds was made 16 Jan. 1922 and at a meeting held in New York City on 27 Dec. 1922 when the permanent organization of The Foundation was accomplished, it was announced that the contributions to the proposed \$1,000,000 fund at that time amounted to over \$800,000. The fund was turned over on the date mentioned to the trustees of the Foundation and on the following day (28 December) the former President's 66th birthday, a committee was sent to Washington to notify Mr. Wilson of the actual creation of the Foundation in his honor.

The award or awards from the income of the Foundation will be made from time to time by a nationally constituted committee to the individual or group that has rendered, within a specified time period, meritorious service to democracy, public welfare, liberal thought or peace through justice. The following are the members of the permanent board of trustees which has charge of the administration of the Foundation and which will help to name the Jury of Award of 25 members. President, E. A. Alderman, of the University of Virginia; General Tasker H. Bliss, former Chief of Staff, U. S. Army, Washington, D. C.; Cleveland H. Dodge, New York; Hon. Samuel Gompers, Washington, D. C.; Ernest M. Hopkins, President of Dartmouth College; Dr. William J. Mayo, Rochester, Minn.; Mr. Cyrus H. McCormick, Chicago, Ill.; Henry Morgenthau, New York; Roland S. Morris, Philadelphia, Pa.; Franklin D. Roosevelt, New York; Mrs. Charles E. Simonson, 404 Henderson Ave., West New Brighton, Staten Island; Hon. T. J. Walsh, United States Senate Building, Washington, D. C.; William Allen White, Kansas; President Mary E. Woolley, Mount Holyoke College, Mass.; Mrs. Charles L. Tiffany. The National Headquarters of the Foundation are at 150 Nassau Street, New York City. The members of the board were installed 1 May 1923. Doctor Hopkins was elected president and Mrs. Tiffany, secretary.

WOOL. In a report issued 5 March 1923, the United States Department of Commerce, estimated the 1922 world wool clip of the commercially important wool-producing countries at 2,270,737,000 pounds, as compared with the 1921 clip of 2,354,735,000 pounds and the average clip for the years 1909-13 of 2,545,565,000 pounds. The 1922 clip of the United States, totaled 261,095,000 pounds, as compared with the 1921 clip of 273,064,000 pounds, and the five-year average clip for the years 1909-13 of 314,110,000 pounds. Australia is the leading country of the world in the production of wool, its 1922 clip coupled with that of Tasmania totaled 618,475,000 pounds as compared with 626,344,000 pounds in 1921,

and the five-year average clip for the years 1909-13 of 705,146,000 pounds. The following table, compiled by the Department of Commerce, indicates in thousands of pounds (i. e. last 000 omitted) the average pre-war (1909-12) production, the 1921 production and the 1922 estimated production of the commercially important wool producing countries. In instances where official 1922 returns were unobtainable, the 1921 figures, it was stated, were substituted tentatively.

* Shown in succession states.

"While the production estimates of the commercially more important countries show decreases from pre-war averages and a small decrease from 1921, it must be borne in mind" says the Department of Commerce, "that the post-war lowered standards of living in many European countries have had a coincidentally depressed effect upon wool consumption. The large wartime wool accumulations in certain countries, undoubtedly had a depressing effect

upon the sheep industry in these countries from which they have not fully recovered. Notable examples are Australia, New Zealand, Argentina, and Uruguay. Some stocks of wool from war accumulations still exist, 'BAWRA' holding on 31 Dec. 1922, amounted to 913,265 bales or somewhat less than 30 per cent of its peak stocks of two years previous. Other commercially important countries such as British South Africa and Spain are now showing increasing production. The Argentine situation is obscure and perplexing, the number of sheep having decreased in the course of the year owing to floods in some sections and droughts in others. Estimates of wool production in this country vary from 180,000,000 to 250,000,000 pounds—the estimate of 231,483,000 pounds of Ernesto Tornquist & Cia., Buenos Aires, is adopted in this survey tentatively."

The consumption of raw wool in the United States during 1922 was estimated as between 650,000,000 and 675,000,000 pounds. According to the Bureau of Foreign and Domestic Commerce, the outstanding feature of the wool import trade of the United States during the first nine months of 1922, was a large decrease in the receipts of fine wool with a corresponding increase in the receipts of coarser grades. The combined imports of cloth, combing and carpet wool during the 1922, January to September period, totaled 272,782,797 pounds, as compared with imports of 285,085,739 pounds during the corresponding period of 1921. Imports of clothing wool during the first nine months of 1922 totaled but 29,072,952 pounds as compared with 200,961,541 pounds imported during the corresponding period of 1921. Of the 1921 imports of clothing wool, 195,000,000 pounds were imported prior to 28 May, upon which date the Emergency Tariff Act became effective. Imports of combing wool during the 1922 period referred to, totaled 109,721,560 pounds as compared with 10,190,330 pounds imported during the corresponding period of 1921. Carpet wool imported during the January to September period of 1922 totaled 133,988,284 pounds as compared with 73,933,868 pounds imported during the corresponding period of 1921. Although the 1922 imports of all kinds of wool were 12,419,158 pounds less than those for 1921, they still exceed the imports for the corresponding period of 1913 by 158,851,557 pounds. Until the outbreak of the war, the wool import trade of the United States was quite regular, the annual receipts having averaged somewhat more than 200,000,000 pounds. Economic disturbances since 1913 and changes brought about by the tariff, however, have caused marked fluctuation in both the character and quantity of this trade. Moreover, according to the United States Department of Agriculture, the textile industry in most European countries is now approaching pre-war status and these countries are not only manufacturing for their own needs but for export trade as well. Wool imports into the United States reached their peak in 1916 when they registered 399,261,331 pounds during the first nine months. The explanation of this tremendous importation of raw wool is to be found in the war demand for finished materials particularly on the part of Italy, Russia, France and Canada.

The leading wool manufacturing countries are

the United States, England, France, Germany and Belgium, while the leading sheep raising countries are Australia, Argentina, Uruguay, South Africa, Russia, China, Great Britain and the United States. The United States and Great Britain are the only countries which both grow and manufacture wool on a large scale. Great Britain, however, produces less than half as much wool as the United States. The clip in this country during the last 35 years has averaged 300,000,000 pounds per year. However the greater part of the world's exportable surplus of wool suitable for clothing is produced in the British Commonwealth, while carpet wool is produced chiefly in China, India, Russia, Siberia, Turkey and the Balkan States. In addition to the production figures given in the table above, the Department of Commerce estimated the production of wool in other countries of the world in 1922 at a total of 413,416,000 pounds, but states that these figures are based solely on unofficial opinion without adequate statistical backing and that most of such countries with the possible exception of China and India, have practically no consequential commercial importance in the world wool trade. Of the total of wool produced in such countries, the production of Asia was estimated at 239,466,000 pounds and the production of European Russia at 150,000,000 pounds.

WOOSTER, College of, a Presbyterian co-educational institution, chartered in 1866 and located at Wooster, Ohio. In 1922-23 it had a faculty of 42 members in Arts Department and six in Music Department, 800 students, property valued at \$1,000,000; an endowment of \$1,500,000 and an income of \$200,000. Charles Frederick Wishart, D.D., LL.D., is president.

WORCESTER POLYTECHNIC INSTITUTE, a non-sectarian educational institution for men, founded in 1865 and located at Worcester, Mass. In 1922-23 it had a teaching faculty of 58 members, 504 students, property valued at \$4,170,000 and an income for 1921-22 of \$282,000. Income figures for 1922-23 were not available. Ira Nelson Hollis, Sc.D., is president.

WORK, Hubert, United States Secretary of the Interior: b. Marion Center, Pa., 3 July 1860. He received his early education at the State Normal School at Marion Center and subsequently attended the universities of Michigan and Pennsylvania and in 1885 was graduated in medicine from the latter. Removing to Greeley, Colo., he established a practice there for two years after which he moved to Fort Morgan and later to Pueblo, Colo., where he became a specialist in mental and nervous diseases. He founded in 1896 the Woodcroft Hospital for Mental and Nervous Diseases, of which he is director. His work at this institution attracted national attention among the members of the medical profession and in 1911 he was made president of the American Medico-Psychological Association. In 1921 he was elected president of the American Medical Association. For many years also he was president of the Colorado State Medical Society, the State Board of Medical Examiners and for 10 years was a member of the State Board of Health. When the United States entered the World War, Doctor Work relinquished his medical practice and volunteered for service

in the Medical Corps of the Army. He was commissioned a major and assigned to the staff of Provost Marshal General Crowder as acting liaison medical officer with supervision of medical details of the selective draft. In the course of the conflict he was advanced to the rank of colonel in the Medical Corps and at present is a colonel in the Officers Reserve Corps. From the time of his removal to Colorado, Doctor Work has been active in politics. He was delegate at large to the Republican National Convention of 1908, Republican State Chairman in 1912-14 and the Republican nominee for the United States Senate in 1916. He also served as Republican National Committeeman from 1916 to 1920. On 2 March 1922, Doctor Work was nominated Postmaster General by President Harding to succeed Will H. Hays, who had resigned. His nomination was confirmed by the Senate the same day and he took over the portfolio on 4 March 1922. Just one year later (4 March 1923) he succeeded former Senator Albert B. Fall, as Secretary of the Interior.

WORKMEN'S COMPENSATION. See LABOR LEGISLATION.

WORLD ASSOCIATION OF STATES. See PEACE AND ARBITRATION, INTERNATIONAL.

WORLD INTERNATIONAL TRADE. Statements in United States currency of world international trade in recent years are extremely difficult. Prior to the war the transformation of currencies of the principal countries of the world to United States dollars was comparatively easy by reason of the well established standard of par of exchange. With the large increases in paper currency of many of the countries of Europe during and following the war and the consequent fluctuation and reduction in exchange rate, the difficulties of transforming the official import and export figures of the respective countries into the common unit of United States dollars, increased year by year as exchange rates lowered and fluctuations grew more frequent. While records are readily available of the exchange rate, measured in dollars, of any currency at any given date or hour, the fact that fluctuations occur not only from hour to hour but day to day intensifies the difficulty of obtaining a reliable annual average upon which to transform the official trade records of the respective countries to United States dollars. This transformation has been made, however by the use of the annual averages established by high financial and statistical authorities.

World international trade in 1922 approximated \$45,000,000,000 against \$40,000,000,000 in 1921, \$65,000,000,000 in 1920, \$75,000,000,000 in the high record year 1919, and \$40,000,000,000 in the year preceding the war. This estimate of the value of world international trade in 1922 is based upon returns from 33 principal commercial countries transforming the currency valuations to United States dollars at the annual average rate of exchange for 1922, 1921 and 1920, utilizing the normal par of exchange for 1913. While higher prices are doubtless responsible for a considerable share of the increase in 1922, it is quite apparent that the quantity of merchandise moved is also greater than in 1921. In France the quantity of merchandise imported in 1922 is stated at 51,000,000

metric tons against 40,000,000 in 1921, and of exports 22,000,000 tons in 1922 against 16,000,000 in 1921. In Belgium, the importation was 21,000,000 tons in 1922 against 17½ million in 1921, though the exports show a slight decline. In Netherlands the tonnage of both imports and exports show an increase in 1922 compared with 1921, and this is also true in Czechoslovakia, Greece and certain other of the European countries. Apparently, however, a considerable part of the 1922 increase in value of international trade is due to higher prices. Of the 75 articles included by the U. S. Government in its monthly tabulation of import prices, about 60 per cent show higher prices in December than at the beginning of the year, while on the export side about 65 per cent of the 75 articles show higher prices at the close of the year than at its beginning. That the United States is steadily gaining in its share of world international trade is evidenced by a comparison of the 1922 figures with those of earlier years. Our share of world trade

grew from 9.8 per cent in 1910 to 10½ per cent in 1913, 14 per cent in 1916, 17½ per cent in 1920, and 16½ per cent in 1922.

The table which follows shows in United States currency the total imports and total exports of the principal countries of the world in 1920, 1921 and 1922 compared with the figures of 1913, the year immediately preceding the war. The 1920 figures are those of the Department of Commerce except as to the Latin American countries for which the statements issued by the Pan American Union in December 1922, are utilized. The 1921 and 1922 figures are based upon official reports of the respective governments transformed to United States dollars at average annual exchange rates. While the tabulation includes figures for all of the more important nations of the world, many of the smaller countries and political divisions have been necessarily omitted by reason of the absence of complete statistics for one or more of the years represented by the tabulation.

IMPORTS AND EXPORTS OF PRINCIPAL COUNTRIES IN 1922, 1921, 1920 AND 1913

(Stated in U. S. Dollars, Reduced at the Annual Average Rate of Exchange.)

WRAGGE, Clement Lindley, New Zealand astronomer: b. Stourbridge, England, 18 Sept. 1852; d. New Zealand, 10 Dec. 1922. He was educated at the Uttoxeter Grammar School, travelled extensively, became devoted to scientific research, and joined the Surveyor-General's Department, Adelaide, in 1876. He established three observatories, chiefly for problems of climatology at different heights in the Churnet Valley and moorlands of Northern Staffordshire, established and worked Ben Nevis Observatory receiving a gold medal for this in 1881; also Torrens Observatory near Adelaide, in 1884; and Mount Lofty, South Australia, in 1884. He inaugurated the chief Australasian weather-bureau at Brisbane in 1887; established meteorological stations throughout Queensland; Mount Wellington (Tasmania) High Level Station; reorganized meteorological service of Tasmania in 1895; established Mount Kosciuszko Observatory, New South Wales, the highest point in all Australia, and the correlative low level station at Merimbula, 1897-98. In the practical pursuit of meteorology he went to Australia many times and traveled on the Continent of Europe, Syria, Palestine, Egypt, North America, India and the South Seas. He presented a collection of shells, native Australian weapons, etc., to the town of Stafford, where it is known as the Wragge Museum. In 1889-1900 he established Capemba Botanical Gardens near Brisbane. In 1887-1900 he was government meteorologist of Queenstown and scientific lecturer. In 1910 he settled in New Zealand and established the Wragge Scientific Institute Museum and Waiata Botanical Gardens. He was a member of many meteorological societies and attended various international meteorological congresses. He was a fellow of the Royal Meteorological Society, of the Royal Geographical Society and of the Royal Colonial Institute. Mr. Wragge published many papers and brochures on meteorological and other scientific subjects and 'The Romance of the South Seas' (1905).

WRANGELL ISLAND, an island off the coast of Siberia and 400 miles west of Bering Strait, in lat. 71° N. and long. 180° W. It was discovered by the British in 1849 and was alternately occupied by Americans and British, both of whom permitted their claims to lapse, neither country providing for continuous occupation. The island is a grass-covered Arctic prairie, with great inland granite cliffs, 2,000 feet high. Strategically the island dominates northeast Siberia. An expedition fitted out by V. Stefannson reached the island in 1921 and raised the British flag there, claiming the island for Britain. The outside world learned of the expedition in 1922 when the *fait accompli* was announced by Doctor Stefannson.

WRESTLING. Ed. "Strangler" Lewis regained the heavyweight wrestling championship from Zybiszko in 1922 and on 14 December at Saint Louis, Mo., successfully defended it against the same contender. By this second

victory Lewis won permanent possession of the Rickard belt, having been victorious in three contests in which the trophy was at stake. In the amateur field, the intercollegiate championships were won by Cornell with 19 points. The meet was held at Lehigh University, Bethlehem, Pa., 25 March. Penn State was second with 12 points and Yale third with 11 points. The National Amateur Athletic Union championships were held at Boston, 8 April. Winners of the final bouts were: 118 lb. class, Valentine Vozen; 126 lb. class, Andrew Callas; 135 lb. class, Robin Reed; 147 lb. class, Russell Vis; 160 lb. class, Emil B. Wolf; 175 lb. class, Paul Berlenback; 192 lb. class, Fred Meyers; Heavy-weight class, Fred Meyers. The International Amateur Championships were held at Stockholm on 7 March. Nilsson of Sweden won the final bout in the heavyweight class; other winners were: middleweight, class A, Westergren of Sweden; class B, Rosenkzist of Finland; lightweight, Westerlund of Finland; featherweight, Anttila of Finland; bantamweight, Svenssen of Sweden.

WRIGHT, Luke E., American public official: b. Giles County, Tenn., 1846; d. Memphis, Tenn., 17 Nov. 1922. He was the son of the Hon. Archibald Wright, Chief Justice of Tennessee and at the age of 15 joined the Confederate Army and served under Breckenridge's command. After the war he studied law, was admitted to the bar of Tennessee, and practised law in Memphis. For eight years he was Attorney-General of Tennessee. His achievement in supervising relief work in Memphis during the yellow fever epidemic in 1878-79 was extraordinary. Although the town was under military control, he made himself Mayor and took charge of the relief measures. He was stricken with the plague, but recovered and lived to see Memphis, through the hygienic measures he introduced, become a model health city. President McKinley appointed him a member of the second Philippine Commission, and in 1903-04 he was its president. In 1904 President Roosevelt appointed him civil governor of the Philippines, and in the same year he was appointed Governor-General to succeed William H. Taft. In 1906 he was appointed by President Roosevelt the first American Ambassador to Japan, but after a year's service, he resigned and returned to his law practice in Memphis. In June, 1908, he was appointed Secretary of War by President Roosevelt, serving until 1909. In politics he was a Gold Democrat. His wife was a daughter of Admiral Raphael Semmes.

WU TING-FANG, Chinese diplomat: b. Hain-hui, near Canton, China, in 1842; d. Canton, 23 June 1922. This brilliant Chinaman will stand in time to come as one of the most gifted personalities of the Nineteenth Century. Few diplomats in Washington have been more popular and more highly respected. He possessed the great culture of China, its humor and wisdom and a great gift of oratory, which made him a much sought for public speaker. His early education was among the sons of merchant princes and in early manhood he went to London, where he studied law. In his own words: "I did not study at Oxford, as some papers say, but at Lincoln's Inn, London,

where I was admitted to the bar. I then returned to Hongkong, and was practising law when appointed by Li Hung Chang to his Ministry. I served under him 15 years when he was Viceroy of Chi-li and saw him every day. Naturally he learned to know me pretty well." Doctor Wu is said to have been the discoverer of the great Li Hung Chang, but, at any rate, he became his legal adviser and foreign deputy as early as 1882. One of his greatest public services was the construction of the first railway in China, about 100 miles long, between the mines of Taiping and the port of Taku. He was also the first president of the Imperial University at Tientsin. At the end of the Chinese and Japanese War of 1894-95, he went on the first peace mission to Japan as secretary and became in a short time plenipotentiary. The great talents he showed on this occasion for diplomacy led to his being sent to Washington, 1 May 1897. His assignment also included Spain and Peru. In 1900 he visited Madrid, but he did not go to South America until his Washington mission had ended. Although 20 years have passed since Doctor Wu's five, or more, years residence in Washington, his memory has not faded. His wife and their three children shared his popularity and his house at New Hampshire Avenue and Q Street was besieged by photographers and writers. The many Chinese officials in his suite were much in evidence and Wu Ting-Fang himself was frequently seen mounting his bicycle for a ride through the streets of Washington. When the bicycle craze died out, he was one of the first to purchase an automobile. When the Revolution of 1912 turned China, the oldest of monarchies, into a republic, Wu Ting-Fang labored hard for unity and espoused the cause of Canton. He always considered himself a Cantonese; and when he was invited by the Peking Government to be one of the delegates to the Washington Conference in 1921 he declined the honor. In 1916 he was made Foreign Minister of the Canton Government and held this post until late in 1921. In 1917 he was also for a time Premier. In May, 1921, he succeeded General Chen as Civil Governor of Kwantung and was mentioned as Foreign Minister in the all-China Cabinet which President Li Huan-hung was trying to form, and on 11 June he was mentioned for Premier. On 13 June he was reported to have fled from Canton with Doctor Sun and later to have been with Sun on the way to Shanghai. Doctor Wu endeavored to enlighten Americans as to the true situation in China, by means of documents, articles and cablegrams, during the last year of his life.

WYETH, John Allen, American surgeon: b. Missionary Station, Ala., 26 May 1845; d. New York City, 28 May 1922. He acquired a preliminary education at LaGrange Military Academy, and was graduated with the degree of M.D. from the University of Louisville in 1869 and from Bellevue Medical College in 1873. From 1873-74 he was assistant demonstrator in anatomy and from 1880-97 was professor to the chair of anatomy and surgery at Mt. Sinai Hospital, New York. In 1882 he organized and founded the New York Polyclinic Medical School and Hospital—the first post-graduate

medical school established in the United States—becoming professor of surgery therein and president of the faculty thereof, positions held by him until his death. During the Civil War Doctor Wyeth served as a private in the Confederate States Army and for 15 months was a prisoner at Camp Morton, Ind. He was president of the New York Pathological Society, 1885-86; of the New York State Medical Association, 1901; of the American Medical Association, 1902; of the New York Academy of Medicine, 1907-08, and of the Southern Society of New York, 1907. He published 'Essays on Surgical Anatomy and Surgery'; 'Textbook on Surgery'; 'Life of Gen. N. B. Forrest'; 'With Sabre and Scalpel, The Autobiography of a Soldier and Surgeon' (1914); also many medical, historical, and biographical sketches.

WYLIE, Walker Gill, American surgeon: b. Chester, S. C., 2 Sept. 1848; d. New York City, 13 March 1923. At the age of 16 he enlisted in the Confederate Army and commanded a company of boys in active service in 1864-65. After the close of the Civil War he matriculated at the University of South Carolina from which he was graduated A.B. in 1868. He then entered Bellevue Medical College (New York University) and received his M.D., in 1871. He served for some time as house surgeon at Bellevue Hospital and thereafter as house surgeon at the Woman's Hospital of the State of New York. He then went abroad to study nursing systems and upon his return submitted a report which resulted in the establishment at Bellevue Hospital of the first training school for nurses created in the United States. Doctor Wylie was appointed visiting gynecologist at Bellevue in 1882 and during the same year assisted in founding the Polyclinic Hospital and School of Medicine, becoming professor of gynecology therein. He was a member of numerous medical societies, including the American Gynecological Society and the Royal Society of Medicine in London. He published 'Hospitals, their Organization and Construction' (Boylston prize essay, Harvard, 1876) and numerous articles on surgery and gynecology.

WYNNE, Robert John, Postmaster-General in President Roosevelt's Cabinet: b. New York City, 18 Nov. 1851; d. Washington, D. C., 11 March 1922. He was educated in the public schools of his native city and worked as a telegrapher from 1870 to 1880 when he became Washington correspondent for the *Cincinnati Gazette*. He held the latter position until 1892 when he was made private secretary to the Secretary of the Treasury. This secretaryship he held until 1896 when he returned to journalism, serving as Washington correspondent of the *New York Press* until 1902, when he was made First Assistant Postmaster-General. Upon the death of Postmaster-General Payne in 1904, President Roosevelt appointed Mr. Wynne to fill the vacancy. He held the post until the change of administration in 1905, when he was appointed Consul-General at London. The latter position he resigned in 1910 and returning to Washington was made president of the First National Fire Insurance Company of the United States in 1915. He was a

member and ex-president of the Gridiron Club and member of the Army and Navy, National Press, and Columbia Country Club.

WYOMING, a Rocky Mountain State, bounded north by Montana, east by North Dakota and Nebraska, south by Colorado and Utah, and west by Utah, Idaho and Montana. Its area is 97,914 square miles and in 1920 it had a population of 194,402. The State ranks eighth in order of size and 47th in order of population. Of the population in 1920, 190,146 were whites, 1,538 were Asiatics, 1,375 negroes and 1,343 Indians. The foreign-born numbered 25,575 and included 2,292 Germans, 2,505 English, 2,042 Swedes, 1,948 Italians, 1,439 Scotch, 1,438 Canadians, 1,236 Greeks, and 956 Irish. Within the State there are Indian reservations with an area of 2,901 square miles and a population of 1,748. Seventy and five-tenths per cent of the total population was rural in 1920. The chief cities of the State, with their populations in 1920, are: Cheyenne, the capital, 13,829; Casper, 11,447; Sheridan, 9,175; Rock Springs, 6,456 and Laramie, 6,301.

Religion.—The principal Christian denominations have an aggregate membership of 39,505, of whom 12,801 are Roman Catholics, 4,293 Methodists, 3,890 Episcopalians, 2,514 Presbyterians, 1,951 Congregationalists, 1,841 Baptists and 704 Lutherans.

Education.—There are in the State 477 public schools with 1,950 teachers and 43,077 pupils, 88 high schools with 282 teachers and 4,476 pupils, and for higher education there is the University of Wyoming.

Finances.—The following shows the State finances for the two-year period 1 Oct. 1920–30 Sept. 1922:

Cash balance 1 Oct. 1920	\$2,120,347 70	
Receipts, first year.....	\$9,851,277 50	
Receipts, second year.....	9,844,174 74	
Investments repaid.....	19,695,452 24	
Disbursements, first year.....	1,546,831 16	
Disbursements, second year.....		
.....	7,130,490 07	
	\$14,030,209 27	
Investment made for permanent funds.....	4,040,320 64	
Cash and in banks, 30 Sept. 1922.....	5,292,101 19	
	\$23,362,631 10	\$23,362,631 10

Agriculture.—Wyoming is mostly a broad plateau. The State has a mean elevation of 6,000 feet. Much agriculture is carried on by irrigation and so-called dry farming methods. In 1920 the census reported 15,611 farms and a total value of all farm property of \$167,189,081. The wool clip in 1920 was 28,422,000 pounds. The chief crops, with their acreage, yield and value for the year 1922, were: corn, 65,000 acres, 1,560,000 bushels, \$936,000; spring wheat,

142,000 acres, 2,414,000 bushels, \$1,979,000; winter wheat, 38,000 acres, 646,000 bushels, \$530,000; barley, 10,000 acres, 310,000 bushels, \$186,000; oats, 158,000 acres, 5,056,000 bushels, \$2,022,000; rye, 21,000 acres, 294,000 bushels, \$153,000; tame hay, 710,000 acres, 1,349,000 tons, \$11,466,000; potatoes, 23,000 acres, 2,530,000 bushels, \$1,265,000; and apples, 45,000 bushels. Stock raising is the most important industry, and the State ranks second in sheep raising. On 1 Jan. 1923 there were in the State 198,000 horses, valued at \$6,534,000; 3,000 mules, valued at \$174,000; 46,000 milk cows, valued at \$3,082,000; 835,000 other cattle, valued at \$25,634,000; 2,396,000 sheep, valued at \$21,564,000, and 84,000 swine, valued at \$1,050,000.

Other Products.—About 8,000,000 acres of the State are covered with timber. Its mineral resources are extensive. The coal output in 1922 was 5,800,000 tons, and that of petroleum 26,232,000 barrels. Copper is also produced on an extensive scale. Other mineral products are gold, silver, iron ore, platinum and the base minerals. Manufactures are not extensive and are confined largely to the production of articles for home consumption. The chief manufacturing industries are railroad repair shops, lumber and timber, flour and grist mills, dairy products, etc.

Communications.—There are no navigable rivers within the State. The railroad mileage is 1,931 miles. There still remain several stage routes. The Yellowstone National Park in the northwest corner of the State is attracting greater and greater numbers of tourists each year.

Government.—The State executive is a Governor, elected for four years and who receives a salary of \$6,000. The legislature consists of a Senate of 25 members, who are elected for four years, and a House of Representatives of 54 members, who are elected for two years.

State Officials.—(1923) Governor, William B. Ross; Secretary of State, F. E. Lucas; Attorney-General, David J. Howell; Auditor, Vincent Carter; Treasurer, J. M. Snyder; and Superintendent of Education, Mrs. Katherine A. Morton.

Judiciary.—Members of Supreme Court: Charles N. Potter, Chief Justice; Ralph Kimball and Fred H. Blume, Associate Justices.

WYOMING, University of, a State co-educational institution founded in 1886 and located at Laramie, Wyo. In 1922–23 it had a faculty of 111 members including administrative officers, librarians, teaching staff, research workers, training school teachers, and resident extension staff. Its student enrollment was: 657 in the college, 800 in the summer school, and 838 taking correspondence study. The institution's property was valued at \$1,506,300 as of 1 July 1922 and its income for the same year was \$861,153.39. Arthur Griswold Crane, Ph.D., is president.

Y

YACHTING. See **SPORTS.**

YALE UNIVERSITY, a non-sectarian educational institution for men (women admitted to graduate and professional schools), founded in 1701 and located at New Haven, Conn. In 1922-23 it had a total faculty membership of 452, including professors, associate professors, instructors, etc., a student enrollment of 4,362, property valued at \$21,000,000, endowment funds amounting at \$32,662,011 and an income of \$3,098,549. James Rowland Angell, Litt.D., LL.D., is president.

YAMAGATA, yā-mā-gā'tā, **Aritomo**, PRINCE (early name KYŌSUKE), Japanese soldier and statesman: b. Chōshū (or Nagato) province, 22 April 1838; d. Odawara, Japan, 1 Feb. 1922. He was educated by the patriot, Shōin Yoshida; was active in the overthrow of the Shogunate, and was made second vice-minister of war under the new government. In 1869 he visited Russia and France for study of their military institutions. In 1876-77 he ably directed the Satsuma rebellion campaign, in 1878 was made commander of the imperial guard and chief of the general staff. He was Prime Minister in 1889-91, in which post he greatly strengthened the army and navy; and Minister of Justice in 1891-93. He was appointed to command the first army corps in the war with China in 1894, and quickly expelled the Chinese from Korea. His policy was throughout one of study of Western methods. He was a skilful strategist, and was made field-marshal in 1898, receiving also the title of marquis. He was again Prime Minister in 1898, and was chief of staff in the Russo-Japanese War. He became president of the Privy Council in 1905, and was raised to the rank of prince in 1907.

YANKTON COLLEGE, a non-sectarian co-educational institution, founded in 1881 and located at Yankton, S. Dak. In 1922-23 it had a faculty of about 24 members, 284 students, property valued at \$325,976.35 and an estimated income of \$62,750. Henry Kimball Warren, LL.D., is president.

YAP, an island of the Caroline Group in the Pacific Ocean, formerly a German possession, and now under mandate to Japan with certain cable rights reserved to the United States. There are 76 Japanese on the island, 8,537 natives and three Europeans. It is an important cable centre, several lines crossing here. See also **WASHINGTON CONFERENCE.**

YEATS, John Butler, Irish artist and author: b. Tullylish, County Down, Ireland, 16 March 1839; d. New York City, 3 Feb. 1922. He received his preliminary education at Athol Academy and thereafter was graduated from Trinity College, Dublin. Subsequently he studied law and was called to the Irish bar in 1866, but he never practised. In 1868 he went to London where he studied art. About 10 years later he returned to Dublin and opened a studio, which was a general gathering place for artists and writers. It was while occupying this Dublin

studio that he compiled a little volume of poems entitled 'Songs and Ballads of Young Ireland' to which William Butler Yeats, John Todhunter, Katharine Tynan, Rose Kavanagh, and T. W. Rolleston contributed. There also was designed the *Dublin University Review* which, however, had no connection with the university and was formally disowned by that institution. In 1887 Mr. Yeats removed to London where he did a great deal of excellent work in black and white — especially notable being his series of illustrations in sepia drawing for Dent's edition of De Foe. In 1902 he again returned to Dublin where he painted many portraits of interest. It was in 1908 that he went to New York, intending to remain only a few weeks but remaining instead until the end of his days. Always he kept saying that he intended to go back home and only a short while before his death the Arts Club of Dublin made him an honorary member so that he would not feel himself a stranger when he did return. Mr. Yeats left a great deal of work of a high artistic order. The list comprises a mass of book illustrations in black and white, a number of early paintings done in the Pre-Raphaelite tradition but in a manner suggestive of a later school, and a series of very beautiful portraits. Other works include drawings of the creators of the Irish Literary Revival — William Butler Yeats, the artist's son; John Millington Synge, and Padraic Colum; portraits in the Abbey Theatre, Dublin, of Maire Nic Shiubhlaigh, Miss Horniman, and Willie and Frank Fay; portraits in the Dublin Art Gallery, especially his magnificent crayon drawing of Isaac Butt and his head of John O'Leary, together with many beautiful pictures in private collections. His publications include 'Extracts from Letters by John Butler Yeats, R. H. A.,' edited by Ezra Pound; 'Further Letters of John Butler Yeats,' edited by Lennox Robinson; 'Essays, Irish and American,' and articles in American and Irish papers. At the time of his death he was painting a portrait of himself which he believed would prove to be his masterpiece.

YORK COLLEGE, a non-sectarian co-educational institution, founded in 1890 and located at York, Neb. In 1921-22 it had a faculty of 23 members, 457 students and property valued at \$146,000. Income figures not given. Hervia U. Roop, Ph.D., LL.D., L.H.D., is president.

YOUNG MEN'S CHRISTIAN ASSOCIATION, a world wide organization working under independent National Committees in 30 different lands. Representatives of these national associations form the World's Committee, with headquarters at Geneva. Besides these countries where associations have long been established, the work of the American associations with

troops in the World War led to requests for its introduction into many European countries where it had not before been known. The organization in these lands began with the work for the still mobilized soldiers and for prisoners and refugees and is being developed largely by native secretaries into civilian associations with their varied activities, although these are not yet (1 Dec. 1922) organized under independent national committees and still have advisory staffs of American secretaries with some financial aid. The central body of the North American Young Men's Christian Association is the International Committee which deals in an organizing and advisory capacity with the local associations of Canada and the United States, and aids in the development of the organization in foreign lands. The following data is that of the North American associations only.

According to the last year book, there are 1,978 local associations with a membership of 883,169, not including the thousands of men and boys who use the buildings and various advantages open to non-members. These local associations are combined under 47 provincial and State committees and five regional boards. The International Committee is elected at the triennial conventions and consists of about 200 volunteer business and professional men from every part of Canada and the United States. There are three schools for training association secretaries, with summer schools at 10 camps. Special courses in preparation for association work are given at Yale Divinity School and at universities in Toronto and Montreal.

The aim before the Association is the enlisting of young men and boys in the service of the Evangelical church, the community, and other young men. The local associations seek to provide religious services; educational opportunities; athletics and physical training; social rooms and entertainments. The work falls naturally into various departments as Army and Navy, Railroad, Merchant Marine, College, City, Town and Country, Indian, Colored, and Industrial. In the large cities dormitories and cafeterias are often part of the equipment. The Industrial Department works in the mining and oil regions, lumber camps and shops. A program of athletics, entertainments and classes is often carried on where the Association has no quarters.

Student and City Associations for colored men number 173 with 119 colored secretaries. What promises to be work of very great value in this field is that of the Inter-Racial Commission which was organized directly after the Great War by Southern men and women of both races and of high standing in their communities. Under this commission local committees are working in hundreds of communities throughout the South for real co-operation and mutual understanding between the races. Although welfare work for the army and navy within government reservations is now taken care of by War and Navy Departments, the Association has 34 stations at home and in the Canal Zone, at Hawaii, the Philippines, in China, and at Constantinople. Merchant marine branches have been opened at 11 ports. Those outside this country are Havana, Yokohama, Hamburg, Le Havre, London, and Liverpool. These associations for Americans away from home have taken

on a valuable international character making for friendliness between the men of various countries gathered in foreign lands. The United Y Schools is a development, since the war, of the classes that have always been a part of Association activities. In these schools, in which 129,779 students are now studying, the courses are co-ordinated, and recognized certificates and degrees conferred. Ninety per cent of these students are earning their own living. Fifty of the schools carry collegiate work and 20 of them under State departments of education have the right to grant college degrees. In the past two years \$5,000,000 has been spent in scholarships to 95,000 ex-service men. Correspondence courses were organized in 1920 and have proved of wide usefulness, the enrollment in the past two years having been 30,000. The same courses are used in this correspondence work as in local association schools. Student Associations are organized in 516 colleges and universities with a membership of 81,860. These Student Associations have always been actively interested in the work for the young men in other lands and in 1922 aided the World's Student Christian Federation in its care of destitute students in Europe to the amount of \$343,625.

The work for boys from 12 to 18 years has grown rapidly in the past few years, and they now constitute over 25 per cent of the Association's membership. Boys' Departments are reported by 811 associations. Over 1,800 Hi-Y clubs are organized and have an enrollment of 53,165 high school boys who are united "to create and maintain and extend throughout the schools and communities high standards of Christian character." The Town and Country department is also largely concerned with these junior members and work is carried on in 158 counties in 19 States and provinces. It is a non-equipment program, which aims to bring to the boy of the country, often in isolated regions, the advantages of work and play in groups, and which strives to strengthen and make the most of all forces for good already existing in rural communities. Under the International Committee 293 American secretaries are aiding the development of the organization in 27 different nations and colonies in all parts of the world, and working with the hundreds of thousands of Russian refugees who are scattered in nearly every country of Europe. The officers of the International Committee as appointed at the Convention in November, 1922, at Atlantic City, to serve for the next three years, are Chairman, Alfred E. Marling; Executive Secretary, John R. Mott; Treasurer, B. H. Fancher. The headquarters of the International Committee is at 347 Madison Avenue, New York City.

IRVING SQUIRE,
Bureau of Information.

YOUNG MEN'S CHRISTIAN ASSOCIATION COLLEGE. International, a non-sectarian educational institution for men, founded in 1885 and located at Springfield, Mass. In 1922-23 it had a faculty of 25 members, 412 students; property valued at \$1,000,000. Income figures for 1922-23 not given but for 1921-22 they were \$131,610. Lawrence L. Doggett, D.D., is president.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. The Young Women's Christian Associations in the cities, the colleges, and the rural communities of the United States are organized into a national association called the Young Women's Christian Association of the United States of America. The purpose of the organization is to "advance the physical, social, intellectual and spiritual interests of young women and to promote growth in Christian character and service, and to become a social force for the extension of the Kingdom of God." The National Board is the executive body of the organization chosen to carry out the policies adopted by the voting delegates at the national conventions which are the regular business meetings of the National Association. The conventions are held biennially in April. The officers of the Association (1 Jan. 1923) were: Mrs. Paist, of Philadelphia, Pa., president; Mrs. John Hanna, Dallas, Tex., and Mrs. C. R. Wilson, Detroit, Mich., vice-presidents; Mrs. E. B. Kinsworthy, Little Rock, Ark., and Miss Marjorie Collier, Colorado College, secretaries. The officers of the National Board (1 Jan. 1923) were: President, Mrs. Robert E. Speer; Chairman of the Executive Committee, Mrs. John French; Secretary, Miss Katharine Lambert; Treasurer, Mrs. Samuel J. Broadwell; General Secretary, Miss Mabel Cratty.

The National Board operates through its headquarters and five regional offices. The headquarters building and National Training School are located at 600 Lexington Avenue, New York City. The regional offices are in New York; Saint Louis, Mo.; Chicago, Ill.; Denver, Colo.; San Francisco, Calif.; Atlanta, Ga. This Board interests itself in the city, student, town and country associations throughout the United States and its territories, and, through its Foreign Division, it works with other members of the World's Committee of the Young Women's Christian Association in carrying on Association work for the women and girls in Europe, the Near East, the Orient, and

South America. Work in Oriental countries is undertaken by the Association only upon the invitation of the Mission Boards working in such countries. At the close of 1922 work was being carried on under this department in 15 countries, with a staff of 224 secretaries.

There were in the United States at the close of 1922 1,152 affiliated Young Women's Christian Associations, with 280 branches; 584,000 members and real property valued at over \$25,000,000. The gross budgets of local Associations for 1921, were approximately \$22,000,000, about 75 per cent of which was met by earnings from cafeterias, boarding homes, etc. The expenditures of the National Board in 1921 upon its regular work were \$2,679,245, of which \$299,821 was used for the promotion of work in China, Japan, India and South America. The endowment of the National Board yields, approximately, \$100,000 annually while its income producing features in 1921 brought in \$813,524. Contributions from Associations and individuals totalled \$1,242,872.

Under the Continuation Committee of the National War Work Council there was carried on during 1921 certain war work of post-war significance, which was financed out of the balance of sums originally appropriated for this work from war work funds.

YUKON, a Territory of the Dominion of Canada, bounded west by Alaska, south by British Columbia, east by the Northwest Territories and north by the Arctic Ocean. Its area is 207,076 square miles and its population in 1921 numbered about 8,000. Dawson, the capital, has about 2,500 inhabitants. White Horse, the second large centre, has about 700 inhabitants. Mining of gold, silver, copper, and coal is the chief occupation of the inhabitants. The Territory is governed by a Gold Commissioner and a Legislative Council of three members. Gold Commissioner in 1922: George P. MacKenzie; Territorial Secretary, J. A. M. H. Maltby.

Z

ZANZIBAR, a British African Protectorate comprising the island of Zanzibar in 6° south Latitude and separated from the mainland by a channel 23 miles wide at its narrowest point. The island has an area of 640 square miles. Pemba, with an area of 380 square miles, is under the same administration. Zanzibar has a population of 113,624 and Pemba, 83,109. There are 270 Europeans, mostly English. Zanzibar, the chief town and port, has a population of 35,000. Most of the natives are Mohammedans of the Sunni sect. There are three Christian missions, which maintain several schools. The government also maintains several free schools but attendance is voluntary. Several sects maintain special schools. There are 2,241 children attending school. Revenue in 1920 amounted to £330,113 and expenditure to £403,808. The public debt amounts to £100,000. The production of cloves is the chief industry of the Protectorate and the bulk of the world supply comes thence. The output in recent years averages 14,000,000 pounds. The cocoanut industry is next in importance. Copra was exported in 1920 to the extent of 12,654 tons. Local manufactures include pottery, rope, coir fibre, soap, oil and mats. Exports in 1920 were valued at £3,011,180 and imports at £2,738,095. The reigning Sultan in 1922 was Seyyid Khalifa bin Harub. The Government is administered by a High Commissioner and a British resident. Legislation consists of British and Indian statutes and decrees of the Sultan when countersigned by the British resident. High Commissioner in 1922, Maj.-Gen. Sir Edward Northey; British resident, J. H. Sinclair.

ZIONIST ORGANIZATION OF AMERICA. This organization is the American branch of the World Zionist Organization, which has as its aim "To establish a publicly recognized and legally secured home for the Jewish people in Palestine." The Zionist Organization of America with its headquarters in New York City (114 Fifth Avenue), has over 250 branches throughout the United States. The following Zionist bodies carrying on Zionist work are affiliated with it: (1) The Hadassah, the women's branch of the Zionist Organization, which helps maintain the organization of the American Zionist Medical Unit in Palestine; (2) The order, Sons of Zion, a fraternal and benefit organization, consisting of a purely Zionist membership; (3) The Young Judaea, a junior organization, having more than 1,000 clubs for children and youth; (4) The Zeire Zion of America, an organization of young men, whose program expresses the more progressive and radical tendencies in Zionism; (5) The Inter-collegiate Zionist Organization, which consists of students and college graduates.

The Zionist Organization carries on its activities through (1) The Keren Hayesod (The

Palestine Foundation Fund), which collects donations from the Jews of America for the purpose of settling pioneers on the land, for sanitation work, for general health and hospital work, for the care of immigrants and for the maintenance of elementary and intermediary Jewish schools; (2) The National Fund, which collects funds for the purpose of acquiring land for agricultural settlement; the land to be held in perpetuity in the name of the Jewish people.

The Zionist Organization of America also promotes the larger undertakings of Palestine, such as the Rutenberg Concession for the hydro-electrification of the country, and the floating of such securities which are in the nature of public utilities for the general benefit of the country. The organization has a direct affiliated membership of 32,000 grouped in district or local organizations. It carries on its propaganda through speakers, and through its two official organs, the *New Palestine* (in English) and *Dos Yiddishe Folk* (in Yiddish). It further subsidizes the Hebrew monthly *Hatoreh*, and the English monthly for children, the *Young Judaea*. The Zionist Organization also maintains a Palestine Department which collates and distributes information with regard to the industrial and agricultural resources of Palestine, and helps travelers going to Palestine obtain their passports and visas.

The outstanding events of American Zionism in 1922 were: (1) The Zionist resolution adopted unanimously by both houses of Congress reading as follows: "Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the United States of America favors the establishment in Palestine of a national home for the Jewish people, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of Christian and all other non-Jewish communities in Palestine, and that the holy places and religious buildings and sites in Palestine shall be adequately protected." This resolution was approved by President Harding on 21 Sept. 1922; (2) The Ratification of the Palestine Mandate. The unanimous passage of the Zionist resolution which was brought about by the efforts of the Zionist Organization of America, greatly facilitated the ratification of the mandate by the League of Nations, whereby Great Britain became the mandatory power for Palestine. The mandate embodies the famous Balfour Declaration issued in 1917 by the British Government; (3) The collections of the Keren Hayesod or the Palestine Foundation Fund during 1922 of over \$2,000,000, which were transmitted to Palestine for the purposes indicated above; (4) Through the initiative of the Zionists, the Jewish physicians, druggists, and dentists, organized themselves for the purpose of establishing a Hebrew University in Jerusalem, and raised in 1922 \$400,000 for this purpose.

The administration of the Zionist Organization is lodged in the National Executive Committee which is annually elected by a convention

composed of delegates from the various Zionist districts. While the National Executive Committee is responsible for the general policy of the Organization, its immediate affairs are supervised by an Administrative Committee consisting in 1922 of Herman Conheim, Abraham Goldberg, Boris Grabelsky, Emanuel Neumann, Louis Robison, Morris Rothenberg, and Jacob Siegel. Mr. Louis Lipsky is the Chairman of the National Executive Committee.

HARRY SACKLER,
Secretary.

ZOOLOGICAL PARK, National. See SMITHSONIAN INSTITUTION.

ZOOLOGY. The year 1922 will be distinguished in the history of zoology less in respect to startling additions to our knowledge of the structure and habits of animals, or by the announcement of some novel generalization, than for its extraordinary breadth of research. This is especially true of field-work and its product, which has furnished a vast amount of new materials for study in laboratories, and for exhibition in museums as a means of popular scientific education. This material has been gathered in most cases from remote regions, heretofore little explored zoologically; and the field-notes of the specialists engaged, filled with information obtained by personal observation of wild creatures in their native domains, have already proved most enlightening, especially in the provinces of ecology and zoogeography. An example is the discovery by Dr. Frank M. Chapman that the bird-fauna (and presumably that of the adjacent ocean) of the equatorial West-Coast region of South America is decidedly different from that south of Cape Paríria. The explanation is that south of this most westerly extension of the coast-line the cold Humboldt Current exerts an influence unfavorable to the fauna north of it, but favoring a different assemblage of animals south of that Cape, where the Humboldt Current glances out to sea. It is another example of the influence of temperature on animal distribution.

The establishment of the Tropical Research Station of the New York Zoological Society at Kartabo, British Guiana, has been enlarged in both its staff and its facilities. Its purpose is mainly the intensive study of the extremely prolific but poorly understood life of the American tropical forest as compared with the tropics of the Old World; but incidentally it has been able to supply to the Zoological Park in New York living animals never seen in the north before, such as certain monkeys and sloths. In this connection may be recorded the remarkable feat of the Society in importing, during this year, and exhibiting for six weeks at the Park, a living male duckbill, or ornithorhynchus, from Australia—a rare and strange little protothere not before seen in the United States and possibly never to be seen here again in life. The Kartabo station has already proved of great importance, and the outcome of its investigations have been published from time to time in the Society's valuable *Bulletin*.

This year witnessed the beginning of an extensive and most promising advance in zoological inquiry in another almost untouched field.

The reference is to the Third Asiatic Expedition, conducted by Roy Chapman Andrews for the American Museum of Natural History and the Asiatic Society. Two former expeditions under the leadership of Mr. and Mrs. Andrews, in southern China and India, have been in the nature of a preparatory reconnaissance, although rich in results. The designated field for 1922 was western Mongolia, and extraordinary preparations were made for work in that distant and difficult region. Heretofore camels and horses have been the only means of travel and transport; but this expedition was provided with automobiles as well, and carried the supplies and transported the collections in powerful motor trucks. The collections of native animals of all sorts soon passed all expectation, many of them of unnamed species. The principal attention, however, was given to the discovery and examination of fossiliferous rocks, since the geology of the interior of high central Asia is almost unknown. Strata of Cretaceous and Tertiary ages were found to be widespread in the Gobi region, and to abound in fossil remains of mammals and reptiles, including dinosaurs of huge size and novel characteristics. It is impossible at the present writing to speak descriptively of the results of this investigation, for neither detailed reports nor the cases of specimens have reached the United States, or at any rate have not been made public, but there is no doubt that they will throw much light on some vexed questions especially in paleontology.

A secondary outcome of great interest connected with this expedition is the proposed foundation of a natural history museum in Peking. Mr. Andrews had an audience with the President of the Republic of China, presented him with a set of photographs of the Museum in New York and its exhibits, and secured his cooperation in the effort to obtain one of the buildings in the "forbidden city" of Peking for the purpose. The Government of China has given much aid to Mr. Andrew's work.

Two expeditions to Ecuador have already given the American Museum large amounts of fresh material for exhibition and study. One of them was conducted by the eminent ornithologist Frank M. Chapman, and it spent several months in the mountains and forests of the western slope of that country, studying and collecting the birds, and photographing their haunts and nesting places. One general observation by these bird-hunters has been mentioned: another is the surprising fact that North American shore-birds are present along the Ecuador coast and southward in July, and in great numbers. The work of this season extends and correlates the studies previously made by Doctor Chapman in Colombia and the northern Andes.

The Field Museum in Chicago has also directed its attention this year to the zoology of the Pacific side of South America, and has sent a party of students under the direction of the veteran collector, Wilfred Osgood, to Chile. This party is working in the neighborhood of Ancud, Chile Island, and Corcovado Gulf, a region which has been little exploited by scientists. One object is to send or bring back living animals, especially the little hornless deer, pudu, which has not been seen in any of our zoological gardens.

Ecuador was visited in 1922 by another agent of the American Museum, G. H. H. Tate, for the purpose of collecting specimens and information of its quadrupeds, including amphibians and reptiles as well as mammals. Mammals, however, were Mr. Tate's chief concern, and he sent home in the summer skins and skeletons of more than 300 species of this class alone, including one species new to science and several others of great rarity—an astonishing performance. Among his prizes were three specimens of the mole-like marsupial *Cænolestes*, which is the only marsupial outside of Australasia except our opossums. Its existence here, coupled with its primitive structure, makes it exceedingly interesting in its bearing on the question of a possible antarctic land-union of South America with an Australasian continent.

Ever since naturalists had their attention called to the necessity of taking into account the peculiarities of the fauna of islands in considering the general subject of the geographical distribution of animals—one of the most important and fertile aspects of natural history—these isolated fragments of land have had a special interest for evolutionists, and several investigations this year have been directed toward the subject. An indication of some of the curious facts in respect to insular faunæ it may be mentioned that Professor Cockerell, of New York, reported that he found during the past summer in the Madeira group that each of several small islets, even when separated by less than half a mile of water, had one or several distinct species of snail. Similar conditions prevail in the Sandwich Islands.

An expedition financed by the American Museum of Natural History is engaged in searching the South Sea archipelagoes for desirable exhibition material, and is reported as having amassed extensive and varied collections. As these men have a vessel of their own they are able to visit and examine small and little known islands, thus adding to the general stock of information, and obtaining specimens of things that have become rare in the large islands, and of transporting them safely. Santo Domingo has been the scene of similar labors during the past year by Mr. and Mrs. G. K. Noble of the same Museum's staff, who are in search of reptiles and amphibians, particularly specimens of, and information about, the Dominican rhinoceros-iguana—a lizard four feet long, with a short horn on the tip of its snout. Its home is in the arid district of the southwestern part of the island, where, unlike most of the iguanas, it is wholly terrestrial, inhabiting burrows apparently

of its own digging. Another creature peculiar to Santo Domingo of which little is known is the giant tree-frog. Specimens of both these rarities will be exhibited in the Museum's new Hall of Reptiles and Amphibians which is now in preparation, and the completion of which will make a notable addition to the educational service of the institution. The only way to make such a collection of exhibits, not to speak of laboratory uses, truly representative of any animal group and of its geography, is to send trained observers and collectors to whatever "ends of the earth" may be necessary. This is the motive of the collecting-trip to East Africa to be made just now by Dr. and Mrs. James B. Clark.

An important movement in 1922 was an expedition, provided by several California institutions, whose delegates, in co-operation with Mexican naturalists, visited the Guadalupe Islands which lie off the coast of Lower California. The special object was to learn about and enumerate the elephant-seals still resident on those remote and sea-bound islets. Several hundreds were found—all old males, as tame as cows—but no females or young; and the puzzle as to the pelagic range of these creatures, and their general habits remains unsolved. Besides interesting collections, information was gained in this reconnaissance that enables the Governments of the United States and of Mexico to combine in measures protecting these seals from destruction by conscienceless hide-hunters.

The United States Biological Survey has continued through the year, in co-operation with State officials, its systematic campaign against predatory animals that infest ranches and farms in the wilder parts of the West; and it has met with great success, especially in the extermination of wolves, which have lately been actually decimating (by killing the young) flocks and herds among and near the mountain ranges. The killing off of these and the lesser natural enemies of the various gophers, ground-squirrels, and mice that prey on crops and orchards has, however, permitted these pests to agriculture to increase, so that an accompanying poisoning campaign has been necessary. The required study of the methods and capabilities of the animals involved in this intricate warfare with them has taught us much as to their life, both physical and mental, and hence may be added to the year's steps forward in the path of zoological progress.

ZULULAND, a district of the Province of Natal, Union of South Africa, annexed thereto in 1897. Its area is 10,424 square miles with a population of 212,700.
